- Indio – Tuesday: 15 vehicles (7:40 a.m. to 7:55 a.m.)

Based on this drive-through queuing information, the project queues could range from 14 to 28 vehicles during peak times of the day. However, it is important to note the distances from each Dutch Bros. Coffee shop to the next nearest location. The farther a Dutch Bros. Coffee shop is to the next nearest location, the longer the maximum drive-through queue. Conversely, the closer Dutch Bros. Coffee shop is to another, the shorter the maximum drive-through queue.

For example, the Eastvale Dutch Bros. Coffee shop, which had a maximum drive-through queue of 28 vehicles. is approximately 16 miles from the nearest Dutch Bros. Coffee shop in Rialto. The Apple Valley Dutch Bros. Coffee shop, which had a maximum drive-through queue of 22 vehicles, is approximately 9 miles from the nearest Dutch Bros. Coffee shop in Victorville. The La Quinta and Indio Dutch Bros. Coffee shops, which had maximum drive-through queues of 20 vehicles and 15 vehicles, respectively, are approximately 3.5 miles from each other.

As previously described, the proposed project is approximately 2.5 miles from the recently approved Dutch Bros. Coffee shop in La Habra. It is likely that the La Habra Dutch Bros. Coffee shop will be operational and well established before the proposed project is built. Therefore, the anticipated drive-through queues of the proposed project are anticipated to range from 15 to 20 vehicles during peak times of the day.

As shown on the project site plan, the proposed project drive-through could store 18 vehicles. Dutch Bros. Coffee has developed a traffic management plan (TMP) to maximize drive-through operations, facilitate drive-through vehicles, and minimize the drive-through queues. The Dutch Bros. Coffee TMP, which includes detailed staffing and signage plans, is provided in Attachment D.

Based on the proposed site plan and drive-through configuration, as well as the Dutch Bros. Coffee TMP, the proposed project queues are unlikely to extend into the public streets (Beach Boulevard and Rosecrans Avenue). As such, the proposed project drive-through lane and operations are not anticipated to affect the ability of patrons and employees to access, circulate, and park within the project site and the adjacent properties.

Conclusions

LSA analyzed the parking, trip generation, access and circulation, and drive-through queuing of the proposed project.

The proposed project would exceed the City's 4-space parking requirement by providing 8 parking spaces (7 regular spaces and 1 ADA space) .

Compared to the existing (approved) restaurant on site, the proposed project would result in a net reduction of 331 daily trips, including a reduction of 35 a.m. peak-hour and 22 p.m. peak-hour trips.

Consistent with Parcel Map No. 7794 and the Declaration of Establishment of Protective Covenants, Conditions, and Restrictions and Grants of Easements, access and circulation for the proposed project and the adjacent uses would continue to be shared via RIRO driveways on Beach Boulevard and Rosecrans Avenue, as well as internal drive aisles on the north and east sides of the project site.

Based on queuing surveys of similar existing Dutch Bros. Coffee shops in Eastvale, Apple Valley, La Quinta, and Indio, as well as the Dutch Bros. Coffee TMP, the drive-through configuration for 18 vehicles is anticipated to provide adequate storage capacity for the proposed project. As such, the proposed project is unlikely to cause any disruption to the access, internal circulation, or parking on site. Therefore, drive-through queues of the proposed project are not anticipated to extend into the public streets (Beach Boulevard and Rosecrans Avenue).

If you have any questions, please contact me at (949) 553-0666.

DECLARATION OF ESTABLISHMENT

OF PROTECTIVE COVENANTS, CONDITIONS,

AND RESTRICTIONS AND GRANTS OF EASEMENTS

FEE $ 23.00/D
121

This instrument is made as of the 14TH day of April 1977 by and between Colin Malcolm Gilbert Trust ("Gilbert") and ALPHA BETA COMPANY, a Delaware Corporation ("Alpha Beta").

The parties hereto contract with reference to the following facts:

A. Gilbert is presently the owner of the real property located in the City of La Mirada, County of Los Angeles, State of California, more particularly described in Exhibits A and B attached hereto, which real property is hereinafter called the "Shopping Center";

B. At the time of the recording of this Declaration Alpha Beta will be the owner of that portion of the Shopping Center described in Exhibit B attached hereto;

C. Gilbert and Alpha Beta desire to subject each and every portion of the Shopping Center to the covenants, conditions and restrictions hereinafter set forth, and to establish the appurtenant easements hereafter described, for the mutual benefit of the owners of any and all portions thereof and their respective heirs, successors assigns, grantees, mortagees, tenants and subtenants; and

D. For the purpose of this Declaration, the Shopping Center is divided into two categories which relate to use, which hereinafter are referred to respectively as "Building Area" and "Common Area".

NOW, THEREFORE, the parties hereto do hereby establish the covenants, conditions, and restrictions hereafter set forth, and grant the easements hereafter described.

Section 1. Definitions

1.1 The real property described in Exhibit "A" is sometimes hereinafter referred to as the Gilbert Parcel.

1.2 The real property described in Exhibit "B" is sometimes hereinafter referred to as the Alpha Beta Parcel.

Section 2. Building Area

As used in this Declaration, the term "Building Area" shall mean those portions of the Shopping Center on which permanent improvements are from time to time erected, other than permanent improvements which are part of the common area as hereafter described. Subject to the provisions of Section 4.1, Gilbert shall have the sole right to determine, from time to time, the location of Building and Common Area on the Gilbert Parcel, and Alpha Beta shall have the sole right to determine, from time to time, the location of Building Area and Common Area on the Alpha Beta Parcel. Notwithstanding the foregoing, after the initial construction of permanent improvements on the Alpha Beta Parcel, the location of Building Area and Common Area on the Alpha Beta Parcel shall not be significantly changed without the prior approval of the owner of the Gilbert Parcel, which approval shall not be withheld unreasonably.

Section 3. Common Area

3.1 For the purposes of this Declaration, all of the area within the Shopping Center to be used in common shall be referred to as "Common Area," and said Common Area includes all areas within the Shopping Center other than Building Areas.

3.2 The term "Common Area" as used herein shall mean and be deemed to include and permit only the following:

(a) The parking of passenger vehicles, and the pedestrian and vehicular traffic, of all persons or other entities who may own or hold portions of real property within the Shopping Center or any leasehold estate, or any security interest therein, or building space thereon; and the respective heirs, successors, assigns, grantees, mortgagees, tenants or subtenants thereof, and the officers, directors, concessionaires, agents, employees, customers, visitors, and other licensees and invitees of any of them;

(b) The ingress and egress of any of the above designated persons or entities designated in 3.2(a) above, and the vehicles thereof, to any and from any portion of the Common Area and the public streets adjacent to the Common Area;

(c) The installation, maintenance, and operation within the confines of the Common Area of public utilities services serving the Building Area, together with and including vaults, manholes, meters, pipelines, valves, hydrants, sprinkler controls, conduits, and related facilities, and sewage facilities, all of which (except hydrants) shall, wherever reasonably feasible, be even with or below the surface. In no event, however, shall such facilities be located

upon any parcel of the Shopping Center without the prior written consent of the owner thereof, which consent shall not be unreasonably withheld;

(d) Pedestrian and vehicular movement by the persons designated above in subparagraph (a) of this Paragraph 3.2 to and from adjacent streets and between mercantile, business, and professional establishments and occupants located or to be located within said business and professional establishments and occupants located or to be located within said Building Area;

(e) The provision of other facilities such as mail boxes, public telephones, and benches for the comfort and convenience of customers, visitors, invitees, licensees, and patrons of establishments and occupants located or to be located upon the Building Area or any portion thereof, as said owners and their respective heirs, successors, assigns, or grantees may from time to time deem appropriate. In no event, however, shall such facilities be located in such a manner as to hinder or impede the other uses and/or maintenance of any portion of the Common Area provided for in this Declaration, and in no event shall such facilities be located upon any parcel of the Shopping Center without the prior written consent of the owner thereof;

(f) The construction, maintenance, repair, replacement, rearrangement and reconstruction of parking sites or stalls, private streets, sidewalks, ramps, driveways, lanes, curbs, gutters, traffic control areas, signals, traffic islands, traffic and parking lighting facilities;

(g) Subject to applicable laws and regulations, the construction, maintenance, repair, replacement, and reconstruction of sign pylons (with appropriate underground electrical service).

(h) The construction, maintenance, repair, replacement; and reconstruction of any mall or landscaped area including planters, planting boxes, edgers, decorative wall and sprinklers and valves, all as may be required by competent local authority.

(i) The ingress and egress of delivery and service trucks and vehicles to and from the rear of the Building Area or any portion thereof and the public streets adjacent to the Shopping Center, for the delivery of goods, wares, merchandise, and the rendition of services to all persons or other entities who may own or hold portions of the Building Area or any leasehold estate, or any security interest therein, or building space thereon, and the respective heirs, successors, grantees, assigns, tenants, or subtenants thereof; and the officers, directors, concessionaires, agents, employees, and licensees of any of them.

(j) The parking of automobiles of the employees of the occupants of any Building Area, such use being subject to the provisions of Paragraph 6.8 set forth hereinbelow.

(k) The use by the occupant of any Building Area of the adjacent sidewalk and parking stalls for the sale by said occupant of certain seasonal and/or promotional merchandise; provided such use by such occupant of the sidewalk and parking stalls shall not

result in the obstruction of pedestrian and vehicular traffic between the Gilbert Parcel and the Alpha Beta Parcel and shall not be located within 100 feet of the Alpha Beta parcel.

3.3 Notwithstanding the foregoing, portions of the Common Area adjacent to Building Area may be used for:

(a) The installation, removal, repair, replacement, and maintenance of building canopies from their respective Building Area over pedestrian sidewalks and over other Common Area a distance from such Building Area not exceeding fifteen (15) feet, together with canopy support columns upon and over such sidewalks and other Common Area;

(b) Subject to the provisions of Section 2 hereinabove set forth, such advertising or identification signs of the Building Area occupants as may be desired to be attached to or mounted upon such canopies projecting from their respective Building Area;

(c) The installation, removal, replacement, repair, use and maintenance of fire hose connections, downspouts, hose bibbs, standpipes, yard or floodlights, subsurface building foundations, and such signs or shadow boxes of building occupants as may be attached to or form an integral part of a building at any time situated upon any portion of the Building Area;

(d) The operation of ramps and loading docks;

(e) Provided it would not prevent a reasonable flow of vehicular traffic, the construction, repair, reconstruction, and operation of trash rooms and/or trash bins adjacent to the Building Area which is to be serviced thereby;

(f) The opening thereover of doors of contiguous Building Area which open outward;

(g) The projection thereover of tracks extending outward from the Building Area which they are to serve, but not for a distance greater than twenty-four (24) inches; and

(h) The temporary maintenance of construction trailers, storage areas for materials and equipment, the erection of ladders, scaffolding, and store front barricades and other construction facilities during periods of construction, reconstruction, remodeling, or repair of buildings building appurtenances, and Common Area facilities, upon the condition, however, that such construction, reconstruction, remodeling, or repair is diligently performed, and subsequent to such performance such construction facilities are thereupon promptly removed.

3.4 The easements hereinafter granted in each instance shall run for the period of duration of the effectiveness of this Declaration as provided for in Section 11 hereinbelow set forth and shall be appurtenant to each designated Parcel of the grantee of such easement and in each instance shall be non-exclusive and for the use and benefit, in common with grantor and others, of such grantee, its heirs, executors, administrators, successors,assigns, tenants, subtenants.

3.5 Gilbert does hereby grant to Alpha Beta an easement appurtenant to the Alpha Beta Parcel for the purposes and with the restrictions stated in this Section 3 over, across, upon, in, under, and through the Common Area of the Gilbert Parcel.

3.6 Alpha Beta does hereby grant to Gilbert an ease-

ment appurtenant to the Gilbert Parcel for the purposes and with the restrictions stated in this Section 3 over, across, upon, in, under, and through the Alpha Beta Parcel.

Section 4. Common Area Restrictions:

4.1 No fence, division, rail, or obstruction of any type of kind shall ever be placed, kept, permitted, or maintained between the Gilbert Parcel and the Alpha Beta Parcel, or between any portion or division thereof, or upon or along any of the common property lines of any thereof, excepting within the confines of Building Area.

4.2 No charge, fee, toll, levy or expense shall ever be required, laid, assessed, or made to or received from any business guest, invitee, licensee, visitor, customer, or patron of any said mercantile, business, and professional establishments, the cost and expense of the operation, management, maintenance, and repair of the Common Area being borne and discharged only as provided for in this Declaration. However, any owner may require any tenant of such owner to pay a fee or charge for the management, maintenance, repair, and operation of the Common Area.

Section 5. Common Area Improvements

Gilbert shall have no obligation to Alpha Beta to construct improvements on the Common Area on the Gilbert Parcel, Gilbert's only obligation being to maintain the Common Area improvements presently located on the Gilbert Parcel in their present condition, reasonable wear and tear excepted. Gilbert may, however, from time to time, construct common area improvements on the Common Area of the Gilbert Parcel.

Section 6. Common Area Operation and Maintenance

6.1 Commencing on that day on which a restaurant opens for business within the building to be constructed on

Alpha Beta Parcel the owner of the Gilbert Parcel shall be, subject to the terms and conditions hereinbelow set forth, for purposes of this Section 6, hereinafter called the "Operator" and shall operate and maintain or cause to be operated and maintained the Common Area of the Shopping Center, which such operation and maintenance shall include but not be limited to:

(a) Maintaining the surfaces with the type of surfacing material presently in place, or such substitute as shall in all respects be equal or better in quality, use, and durability;

(b) Removing all papers, debris, filth, and refuse and washing or thoroughly sweeping the areas to the extent reasonably necessary to keep said areas in a neat, clean, and orderly condition;

(c) Placing, keeping in repair, and replacing any necessary appropriate directional signs, markers, and lines, and operating, keeping in repair, and replacing when necessary such artificial lighting facilities as shall be reasonably required (excluding operation of artificial lighting on the Alpha Beta Parcel);

(d) Maintaining any perimeter walls in a good condition and state of repair; and

(e) Maintaining all landscaped areas, making such replacements of shrubs, and other landscaping as is necessary, and keeping said areas at all times adequately weeded and watered, except that Alpha Beta shall maintain the landscaping immediately adjacent to the Building Area on the Alpha Beta Parcel.

6.2 As a part of said operation, the Operator shall obtain and maintain general public liability insurance insuring the Operator and all persons or entities that may own or hold portions of the Shopping Center or building space within the Shopping Center or any leasehold estate or other substantial interest therein as their respective interests may appear, provided that such persons or entities request the Operator, in writing, to obtain such insurance, against claims for bodily injury, death, or property damage occurring in, upon, or about the Common Area. Such insurance shall be written with an insurer licensed to do business in the state in which the Shopping Center is located. The limits of liability of all such insurance shall not be less than Three Hundred Thousand Dollars ($300,000) for injury or death to any one person, Five Hundred Thousand Dollars ($500,000) for injury or death of more than one person in one occurrence, and One Hundred Thousand Dollars ($100,000) with respect to damage to property. Upon request of any person having an insurable interest hereunder, the Operator shall cause to be issued proper certificates of insurance, or copies of the insurance policies required to be maintained hereunder.

6.3 The Operator shall expend only the monies reasonably necessary for such operation and maintenance in order to keep the Common Area in good repair and clean condition and to operate the same on a non-profit basis to the end that the expense in connection therewith will be kept at a minimum.

6.4 No single expenditure for any one item of a capital nature of more than $2,500.00 shall be treated as an expense of operating and maintaining the Common Area insofar as the Alpha Beta Parcel is concerned, unless the owner of the Alpha Beta Parcel consents, in writing, to such expenditure, which consent shall not be withheld unreasonably.

6.5 The Operator shall, from time to time, but not more often than once each month, send to the owner of the Alpha Beta Parcel a written statement of the total costs and expenses of operation and maintenance including a management fee of ten percent (10%) of such cost for the preceding period. Such management fee of ten percent (10%) shall not be applicable to the payment of real property taxes or insurance or that portion of the cost of any single capital expenditure which is in excess of Two Thousand Five Hundred and No/100 Dollars ($2,500.00) which is to be performed by the Operator. Within thirty (30) days after receipt thereof, such owner shall pay to the Operator the fractions of the total amount of said costs and expenses hereinafter described. Each owner or its authorized representative shall have the right to examine the records of expenses in connection therewith at reasonable business hours and at reasonable frequency.

6.6 If any of said total is not so paid, the same shall be deemed delinquent, and the amount thereof shall bear interest thereafter at the rate of ten percent (10%) per annum until paid. Any and all delinquent amounts with said interest shall be a lien and charge upon the Alpha Beta Parcel subject and junior, however, to the lien or charge of any bona fide full mortgage or first deed of trust upon the same or any part thereof at any time given or made.

6.7 If the Gilbert Parcel is subdivided, or if all or any part of the Gilbert Parcel is leased to any third person, then the transferee or lessee of the larger portion of the Gilbert Parcel shall assume any or all of the rights and obligations of the Operator, if and to the extent set forth in a written instrument between the owner of the Gilbert Parcel, or portion thereof, and such transferee or lessee, and recorded in the office of the County Recorder of Los Angeles County. Such

written instrument shall contain the promise of such transferee or lessee to fully and faithfully observe, perform and discharge each and every duty and obligation of the Operator (or so much thereof as is being assumed by such transferee or lessee). Upon the recordation of such instrument, the former Operator shall have no further executory obligations as such Operator except to the extent set forth in such written instrument. 12

6.8 In the event the maintenance of the parking and common area does not meet the standards of other shopping centers in which Alpha Beta restaurants are located, Alpha Beta shall have the right upon sixty (60) days written notice to the then current Operator to assume the obligations for the maintenance and the insurance of the parking and common area. The owner of the Gilbert parcel shall then reimburse Alpha Beta for its expenses as set forth in paragraph 6.5 above.

6.9 The Operator may at any time and from time to time promulgate reasonable and non-discriminatory rules and regulations for the use of the Common Area, which rules may prohibit employees from parking in the Common Area except in areas designated by the Operator as "Employee Parking" areas.

Section 7. Appertionment of Common Area Costs and Charges in Common Area

7.1 The Common Area costs and expenses shall be prorated as follows:

(a) As to real estate taxes and assessments on the Common Area of the Gilbert Parcel, the Alpha Beta Parcel shall be charged with 3.13% thereof;

(b) As to the costs of operating artificial lights on the Gilbert Parcel, the Alpha Beta Parcel shall be charged with 3.13% thereof;

(c) As to all other common area costs and expenses, 12% shall be charged to the Alpha Beta Parcel and 88% shall be charged to the Gilbert Parcel.

7.2 The owner of the Gilbert Parcel may, from time to time, at its election, elect to exclude any portion or portions of the Gilbert Parcel from the operation of this Declaration, except for that portion of the Gilbert Parcel lying within 100 feet of the boundary of the Alpha Beta Parcel. Such election shall be effective upon the owner of the Gilbert Parcel recording.

"

"

"

"

in the office of the County Recorder of Los Angeles County, written notice of its election to exercise its right to exclude the portion of the Gilbert Parcel specified in such notice, and service of a copy of such notice of election upon the then record owner of the Alpha Beta Parcel. The exercise of such right to exclude such portion of the Gilbert Parcel shall, inter alia, terminate the reciprocal easements and the maintenance obligations provided for in this declaration, but only to the extent such reciprocal easements or maintenance obligations benefit and burden the excluded portion of the Gilbert Parcel.

7.3 If the Common Area on the Gilbert Parcel is increased to more than 170,000 square feet, or decreased below 160,000 square feet, whether caused by the use of any portion of the Common Area being converted to Building Area, the conversion of any portion of the Building Area being converted to Common Area, or the exclusion of a portion of the Gilbert Parcel from the operation of this Declaration pursuant to the provisions of Section 7.2 hereof, then

(a) The portion of the Common Area costs and expenses borne by the Alpha Beta Parcel (other than taxes, assessments and the cost of operating artificial lights) shall thereafter be a fraction, the numerator of which is 29,790 square feet minus the square footage of the Building Area on the Alpha Beta Parcel, and the denominator of which is 248,000 square feet minus the Buiding Area on all of the Gilbert Parcel not excluded from this Declaration.

(b) The portion of the taxes and assessments on the Common Area of the Gilbert Parcel, and the costs of operating artificial lights on the Gilbert Parcel borne by Alpha Beta Parcel shall be a fraction, the numerator of which is 7,760 square feet and the

denominator of which is 248,000 square feet minus the Building Area on all of the Gilbert Parcel not excluded from this Declaration.

Section 8. Realty Taxes and Assessments

8.1 As to any portion of the Shopping Center, it is intended and agreed that subject to the provisions of Section 7.2, all real estate taxes and assessments by public authority relating to said land and improvements thereon or the ownership thereof, shall be paid prior to delinquency by the respective fee owners thereof.

Section 9. Miscellaneous Provisions

9.1 Each and all of the foregoing covenants, conditions, and restrictions:

(a) Shall apply to and bind the parties hereto as owners of the Shopping Center, and each and all of the owners of any and all portions of the Shopping Center and each and all of their respective heirs, successors, assigns, grantees, mortgagees, tenants, and subtenants;

(b) Are hereby imposed pursuant to a general plan for the improvement and use of the Shopping Center and are designed for the mutual benefit of said owners, tenants, and occupants of any and all portions thereof; and

(c) Shall obligate, inure to, and pass with each and every portion of the Shopping Center, and shall remain in force and effect as hereinafter provided.

9.2 The parties hereto covenant with each other that the legal description of each of the Shopping Center parcels as set forth on Exhibits A and B shall be deemed to include any

and all rights, title, and interest in that portion of the street, roadway, highway, or other public right-of-way abutting or bounding each of said Shopping Center parcels now or hereafter owned by all persons or other entities who may own said Shopping Center parcels or any portion thereof or any interest therein, and the respective heirs, successors, assigns, grantees, mortgagees, tenants, or subtenants thereof. Accordingly, such right, title and interest shall be in all respects subject and subordinate to the covenants, conditions, and restrictions established by and the easements granted in this Declaration.

9.3 Breach of any of the covenants or restrictions contained in this Declaration shall not defeat nor render invalid the lien of any mortgage or deed of trust made in good faith and for value as to the Shopping Center or any part thereof; but all of the foregoing provisions, restrictions, and covenants shall be binding and effective against any owner of any of said Shopping Center, or any part thereof, whose title thereto is acquired by foreclosure, trustee's sale, or otherwise.

9.4 The term "mortgagee", wherever used herein, shall be construed to include beneficiaries and trustees under deeds of trust.

9.5 Any person or persons owning or holding any portion of the Shopping Center may prosecute any proceedings at law or in equity against any person or entity violating, or attempting to violate, any of the covenants, conditions, and restrictions herein and either prevent it, him, or them from so doing, and to recover damages from or on account of such violation.

9.6 Invalidation of any one of the covenants, conditions, restrictions, or other provisions herein contained by judgment or court order shall in no way affect any of the other covenants,

conditions, restrictions, or provisions hereof and the same shall remain in full force and effect.

9.7 This Declaration shall create privity of contract and estate with and among all owners and grantees of all or any part of the said Shopping Center and their respective heirs, executors, administrators, successors, and assigns. In the event of a breach, or threatened breach, by any owner of any part of said Shopping Center of any of the terms, covenants, and conditions hereof, any one or all such other owners of the Shopping Center shall be entitled forthwith to full and adequate relief by injunction and all such other available legal and equitable remedies from the consequences of such breach; and any deed, lease, assignment, conveyance, or contract made in violation of this Declaration shall be void and may be set aside upon petition of one or more of the owners of the Shopping Center. All costs and expenses of any such suit or proceedings including attorney's fees, as hereinafter provided, shall be assessed against the defaulting owner and shall constitute a lien against the real property or the interest therein wrongfully deeded, leased, assigned, conveyed, or contracted for, until paid, effective upon recording notice thereof in the office of the county recorder of the county in which the Shopping Center is located, but any such lien shall be subordinate to any bona fide mortgage or deed of trust covering any portion of the Shopping Center, and any purchaser at any foreclosure or trustee's sale (as well as any grantee of deed in lieu of foreclosure or trustee's sale) under any such mortgage or deed of trust shall take title free from any such lien, but otherwise subject to the provisions hereof. The remedies permitted to law or equity of any one or all such owners specified herein shall be cumulative as to each and as to all.

9.8 In the event that suit is brought for the enforcement of this Declaration or as the result of any alleged breach thereof, the prevailing party or parties to such suit shall be entitled to be paid reasonable attorney's fees by the losing party or parties, and any judgment or decree rendered shall include an award thereof.

9.9 In the event of condemnation by any duly constituted authority for a public or quasi-public use of all or any part of the Shopping Center, that portion of the award attributable to the value of any land within the Common Area so taken shall be payable only to the owner in fee thereof, and no claim thereon shall be made by other owners of any other portion of the Shopping Center; provided, however, all other owners of the Shopping Center may file collateral claims with the condemning authority over and above the value of the land of the area to be taken; provided, further, however, that the owner of the fee of each portion of the area so condemned shall promptly repair and restore the remaining portion of the area so owned by such owner as near as practicable to the condition of same immediately prior to such condemnation and except to the extent that the proceeds of such award are insufficient to pay the costs of such restoration and repair. No contribution from any other owner shall be required by the terms of this Declaration.

9.10 The captions heading the various sections of this Declaration are for convenience and identification only, and shall not be deemed to limit or define the contents of their respective section.

9.11 All the provisions of this Declaration shall be covenants running with the land pursuant to applicable law, including, but not limited to, Section 1468 of the Civil Code of the State of California. It is expressly agreed that each

covenant to do or refrain from doing some act on the Shopping Center or any part thereof as the convenantor:

(a) Is for the benefit of the land of the covenantee;

(b) Runs with both the land owned by the covenantor and the land owned by the covenantee; and

(c) Shall benefit or be binding upon each successive owner, during his ownership, or any portion of the land affected hereby and each person having any interest herein derived through any owner of the land affected hereby.

9.12 The provisions of this Declaration shall not be deemed to constitute a dedication for public use nor to create any rights in the general public.

Section 10. Term and Termination

10.1 The covenants, conditions, and restructions contained in this Declaration shall run with the land and shall be binding upon each and all of the owners of any part thereof and upon all persons claiming under them; and the same shall continue to endure to and terminate at midnight December 31, 2075.

10.2 This Declaration may be cancelled, changed, modified, or amended in whole or in part only by a written and recorded agreement executed by the then record fee owners of and the beneficiaries of recorded first trust deeds encumbering not less than ninety-seven percent (97%) of the land area of the Shopping Center,excluding any portion thereof excluded pursuant to Section 7.2 of this Declaration.

10.3 This Declaration, executed as of the date hereof, shall take effect only upon, from and after its recording in

the office of the county recorder of the county in which the Shopping Center is situated.

Section 11. Use Restrictions

No portion of the Alpha Beta Parcel shall be utilized as a supermarket, drug store, convenience market, or liquor store without the written consent of the owner or owners of the Gilbert Parcel.

No portion of the Gilbert Parcel shall be utilized as a family restaurant such as "Denny's", "Sambos", or "Bobs" without the written consent of the owner of the Alpha Beta Parcel and Alpha Beta: Excepted from this restriction, however, shall be the "ethnic" type family restaurants.

IN WITNESS WHEREOF, this DECLARATION and GRANT is executed as of the day and year first above written.

MEMORANDUM

DATE: January 5, 2023

TO: Mark Shenouda, Pacific Retail Partners

FROM: Dean Arizabal, Principal, LSA

SUBJECT: Trip Generation, Vehicle Miles Traveled, and Drive-Through Queuing Analysis for the Beach & Lambert Commercial Project

LSA has prepared this trip generation, vehicle miles traveled (VMT), and drive-through queuing analysis for the proposed Beach & Lambert commercial project (project) in La Habra, California. The proposed project includes a 950-square-foot (sf) Dutch Bros. Coffee shop with drive-through and a 10,000 sf America's Tire store.

The proposed project site is on the west side of Beach Boulevard south of Lambert Road. Access to the proposed project is provided via one right-in/right-out (RIRO) driveway on Beach Boulevard and one RIRO driveway on Lambert Road. The proposed drive-through lane for the Dutch Bros. Coffee shop would accommodate 21 vehicles. The proposed project site plan is attached.

The purpose of this analysis is to identify the proposed project trip generation, determine whether the project requires a VMT analysis per the *Guidelines for Evaluating Vehicle Miles Traveled for the County of Orange* (September 17, 2020) and the North Orange County Collaborative (NOCC), and determine the potential drive-through queues of the proposed Dutch Bros. Coffee shop.

TRIP GENERATION

The daily and peak-hour trips of the proposed project were calculated using trip rates from the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, 11th Edition (2021) for Coffee/Donut Shop with Drive-Through (Land Use 937) and Tire Store (Land Use 848).

The trip generation was then reduced based on review of pass-by trip reduction percentages from the ITE *Trip Generation Manual* for each applicable land use type (e.g., coffee shop with drive-through) and as directed by the City of La Habra (City) Traffic Manager. Pass-by trips are made by drivers already on adjacent/nearby roadways (e.g., stopped by the coffee shop on the way to work or home) and therefore are not additive trips to the circulation system.

Table A presents the ITE trip generation summary for the proposed project.

Table A: Project Trip Generation

Land Use	Size	Unit	ADT[2]	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Trip Rates[1]									
Coffee Shop		TSF	533.57	43.80	42.08	85.88	19.50	19.49	38.99
Tire Store		TSF	27.69	1.67	0.94	2.61	1.61	2.14	3.75
Project Trip Generation									
Coffee Shop	0.950	TSF	507	42	40	82	19	18	37
Pass-By Reductions[2]			(253)	(21)	(20)	(41)	(9)	(9)	(18)
Total			254	21	20	41	10	9	19
Tire Store	10.000	TSF	277	17	9	26	17	21	38
Grand Total			**531**	**38**	**29**	**67**	**27**	**30**	**57**

Source: Compiled by LSA (2022).

[1] Trip rates from the Institute of Transportation Engineers (ITE) *Trip Generation* Manual, 11th Edition (2021).
Land Use 937 (Coffee/Donut Shop with Drive-Through Window)
Land Use 848 (Tire Store)

[2] 50% Daily, AM, and PM pass-by reductions have been assumed as directed by the City of La Habra Traffic Manager.

ADT = average daily trips
TSF = thousand square feet

As shown in Table A, the 950 sf Dutch Bros. Coffee shop with drive-through would generate 507 average daily trips (ADT), including 82 trips (42 inbound and 40 outbound) in the a.m. peak hour and 37 trips (19 inbound and 18 outbound) in the p.m. peak hour.

After applying 50 percent pass-by trip reductions (similar to other coffee shop and fast-food with drive-through uses), the net trip generation of the Dutch Bros. Coffee shop with drive-through is 254 ADT, including 41 trips (21 inbound and 20 outbound) in the a.m. peak hour and 19 trips (10 inbound and 9 outbound) in the p.m. peak hour.

The proposed 10,000 sf America's Tire store would generate 277 ADT, including 26 trips (17 inbound and 9 outbound) in the a.m. peak hour and 38 trips (17 inbound and 21 outbound) in the p.m. peak hour.

The total (net) trip generation of the proposed project is 531 ADT, including 67 trips (38 inbound and 29 outbound) in the a.m. peak hour and 57 trips (27 inbound and 30 outbound) in the p.m. peak hour.

VEHICLE MILES TRAVELED

According to the *Guidelines for Evaluating Vehicle Miles Traveled for the County of Orange*, neighborhood retail projects (e.g., local-serving retail uses less than 50,000 sf) are screened out from a VMT analysis and are presumed to have a less-than-significant transportation impact. In addition, the City, along with six other north Orange County cities (Brea, Buena Park, Fullerton, Orange, Placentia, and Yorba Linda), formed the NOCC to review and develop VMT methodologies, thresholds of significance, mitigation measures, and screening criteria. Based on the recommendations of the NOCC, local-serving retail uses less than 50,000 sf are screened out from a VMT analysis and are presumed to have a less-than-significant transportation impact.

The proposed project includes 10,950 total sf of local-serving retail use (a 950 sf Dutch Bros. Coffee shop with drive-through and an 10,000 sf America's Tire store). As such, the proposed project meets the City's and NOCC's VMT screening criteria.

The nearest Dutch Bros. Coffee shop with drive-through facilities are in Eastvale (approximately 33 miles away), Yucaipa (approximately 59 miles away), Victorville (approximately 68 and 72 miles away), and Apple Valley (approximately 77 miles away). In addition, the nearest America's Tire stores are in Fullerton (approximately 6 miles away), City of Industry (approximately 8 miles away), Norwalk (approximately 9 miles away), and Garden Grove (approximately 11 miles away). It is anticipated that customers in the project vicinity would utilize the proposed project as opposed to these existing facilities. As such, the proposed project would help reduce regional VMT.

Therefore, based on its land use types, size, and location, the proposed project is presumed to have a less-than-significant impact on transportation.

DRIVE-THROUGH QUEUING

To determine the potential drive-through queues of the proposed Dutch Bros. Coffee shop, queuing observations (in 5-minute increments) were conducted at a similar existing Dutch Bros. Coffee shop (13322 Limonite Avenue, Eastvale 92880) for the following days and times:

- Saturday (June 25, 2022): 9:00 a.m. to 1:00 p.m.
- Tuesday (June 28, 2022): 6:00 a.m. to 9:00 a.m., and 11:00 a.m. to 1:00 p.m.

The Counts Unlimited queuing surveys and the Eastvale Dutch Bros. Coffee shop site plan are provided as attachments.

At the request of the City Traffic Manager, the Counts Unlimited drive-through queuing surveys also include the following detailed information:

- Total vehicles in the queue (including vehicles that have not yet placed an order)
- Queue from the pick-up window (vehicles that have already placed an order and vehicles waiting to pick up their order)
- Queue from staff (vehicles placing an order and vehicles waiting to order)
- Queue beyond the drive-through entry
- Queue in the public street (if any)
- Number of staff in the drive-through lane taking orders
- Total wait time (for ordering and queuing)
- Wait time for ordering (time an order is placed, and time order is picked up)
- Wait time for queuing (total time in the queue even before placing an order)

Based on the two days of survey data, the maximum observed queues of the two Dutch Bros. Coffee shop locations are as follows:

- Saturday (June 25, 2022): 28 vehicles (11:50 a.m. to 11:55 a.m.)
- Tuesday (June 28, 2022): 24 vehicles (11:40 a.m. to 11:45 p.m.)

The 95th percentile queue lengths were also determined for each survey day. The 95th percentile queues (the estimated queue lengths with a 5 percent probability of being exceeded), are as follows:

- Saturday (June 25, 2022): 26 vehicles
- Tuesday (June 28, 2022): 23 vehicles

The 95th percentile queues at the Dutch Bros. Coffee shop suggest that providing a vehicle storage of 26 vehicles would accommodate 95 percent of the drive-through queues of the proposed Dutch Bros. Coffee shop. It is anticipated that proposed Dutch Bros. Coffee shop drive-through vehicles would only exceed this queue length 5 percent of the time for short durations.

It should be noted that drive-through queuing surveys were also conducted by Counts Unlimited at Dutch Bros. Coffee shops in Apple Valley (21690 Bear Valley Road), La Quinta (44-175 Jefferson Street), and Indio (81-776 Highway 111) on Saturday, January 29, 2022, and Tuesday, February 1, 2022. According to the two days of survey data (attached), the maximum observed drive-through queues of the three Dutch Bros. Coffee shop locations are as follows:

- Apple Valley – Saturday: 22 vehicles (11:30 a.m. to 11:40 a.m. and 1:10 p.m. to 1:15 p.m.)
- Apple Valley – Tuesday: 15 vehicles (7:10 a.m. to 7:15 a.m. and 8:10 a.m. to 8:20 a.m.)
- La Quinta – Saturday: 20 vehicles (10:05 a.m. to 10:10 a.m., 10:20 a.m. to 10:25 a.m., and 2:55 p.m. to 3:00 p.m.)
- La Quinta – Tuesday: 14 vehicles (11:10 a.m. to 11:15 a.m.)
- Indio – Saturday: 14 vehicles (11:35 a.m. to 11:45 a.m.)
- Indio – Tuesday: 15 vehicles (7:40 a.m. to 7:55 a.m.)

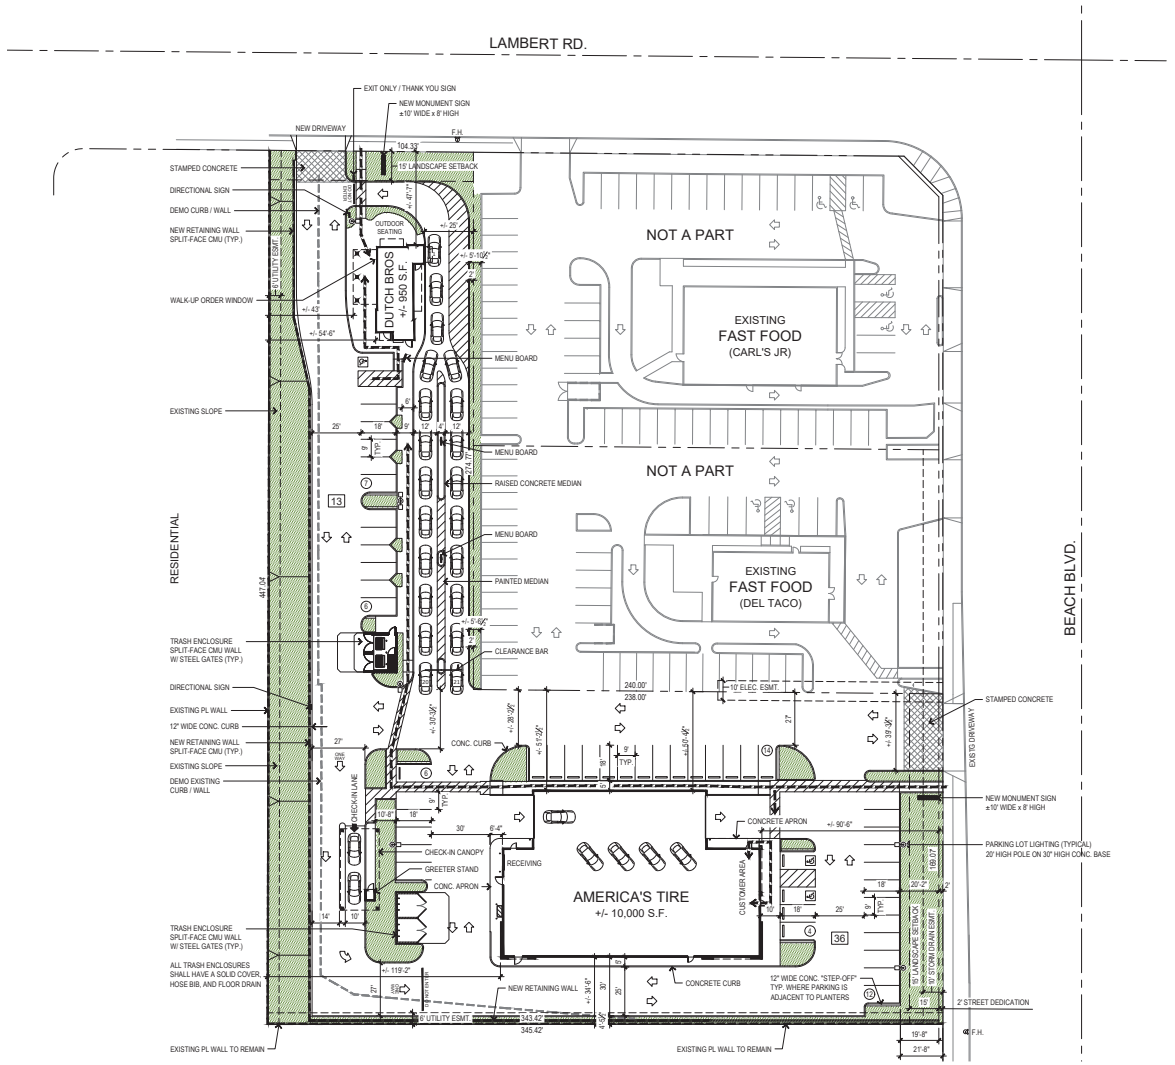
Based on this additional drive-through queuing information, the project queues could range from 14 to 22 vehicles during peak times of the day.

As shown on the project site plan, the proposed Dutch Bros. Coffee shop drive-through could store 21 project vehicles. In order to accommodate any temporary drive-through queues exceeding 21 vehicles for the Dutch Bros. Coffee shop, it is recommended that the proposed project utilize the internal drive aisle south of the drive-through entry as an additional drive-through storage area. This internal drive aisle could accommodate 7 additional vehicles for a total drive-through storage capacity of 28 vehicles. A graphic of the internal drive aisle and potential additional drive-through storage area is attached.

Based on the proposed project configuration and the recommendation for additional drive-through storage capacity, the Dutch Bros. Coffee shop queues are unlikely to extend into the public streets (Beach Boulevard and Lambert Road) or the main drive aisles serving the site and the surrounding parcels. As such, the proposed drive-through lane and operations of the Dutch Bros. Coffee shop are not anticipated to affect the ability of patrons and employees to access, circulate, and park within the project site and the adjacent properties.

CONCLUSIONS

LSA analyzed the trip generation of the proposed project. The proposed project is anticipated to generate 531 ADT, including 67 a.m. peak-hour trips and 57 p.m. peak-hour trips.



Because the proposed project does not exceed 50,000 sf of local-serving retail uses, it is screened out from a VMT analysis and is presumed to have a less-than-significant transportation impact. In addition, customers are anticipated to frequent the proposed project rather than drive to existing similar facilities located further away, resulting in reduced regional VMT.

LSA reviewed surveys of the drive-through operations of an existing Dutch Bros. Coffee shop in Eastvale for two days to determine the number of vehicles queued. Based on the Eastvale survey data, a maximum queue of 28 vehicles and a 95th percentile queue of 26 vehicles were identified for the Dutch Bros. Coffee shop. In addition, LSA reviewed the drive-through queuing survey data for existing Dutch Bros. Coffee shops in Apple Valley, La Quinta, and Indio that reflected maximum queues of 14 to 22 vehicles. The proposed project would provide a Dutch Bros. Coffee shop drive-through capacity of 21 vehicles. Although the 21-vehicle storage capacity could be temporarily exceeded by the drive-through queues for the Dutch Bros. Coffee shop, the proposed project could utilize an internal drive aisle for additional storage (7 additional vehicles within this drive aisle) for a total drive-through capacity of 28 vehicles.

As such, the proposed project is unlikely to cause any disruption to the access, internal circulation, or parking on site. Therefore, drive-through queues of the proposed project are not anticipated to extend into the public streets (Beach Boulevard and Lambert Road).

If you have any questions, please contact me at (949) 553-0666.

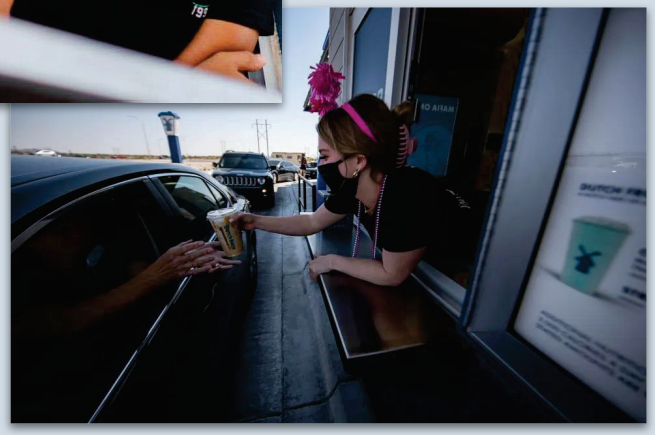
Traffic Management Plan



Property Management Team

CA6402 - La Mirada
14840 Beach Blvd,
La Mirada, CA 90638
West Region

Speed, Quality, Service

Timing Standards

45 seconds per car (at window). Speed timings conducted weekly in addition to a quarterly company wide evaluation.

Escape Lane

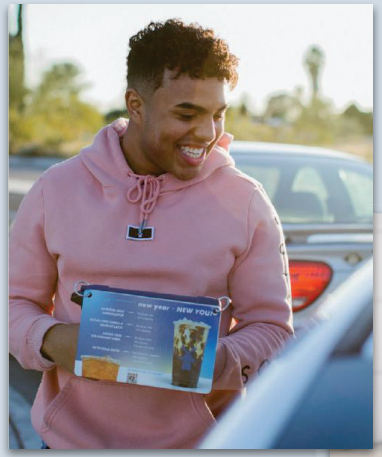
An escape lane permits customers to leave the line as soon as their drinks are delivered by a drink runner.

Peak Hours

DB will staff an additional traffic controller during peak hours as needed.

Speed, Quality, Service

Off-Site Operations



DB always evaluates the need of off-duty police officer support during our grand opening period.

Off duty police officers provide off-site support during business hours as determined necessary by DB leadership. Their job is to safely direct customer vehicles to and from a location. Prevent vehicles from blocking critical drives or otherwise restricting traffic flow (off-site).

Staffing Model

Schedules are written a minimum of 1-2 weeks in advance (in accordance with state and local guidelines) based on gross sales, trends, local events, and weather.

Speed, Quality, Service

Outside Traffic Management

Line Buster (LB)

Job Duty: Increase speed of the customers experience by taking orders while ensuring 2’ gap between cars. Ensuring when the line pulls forward the customers moves forward.

Drink Runner (DR)

Job Duty: Deliver completed drinks to the customer in line before reaching the window. Ensuring escape lane is used to minimize service time.

Dutch Bros Traffic Controller (DBTC)

Job Duty: Direct traffic in and out of location. Ensuring vehicles from blocking critical drives or otherwise restricting traffic flow (on-site).

Training and FAQ's

Full Shop Meetings:

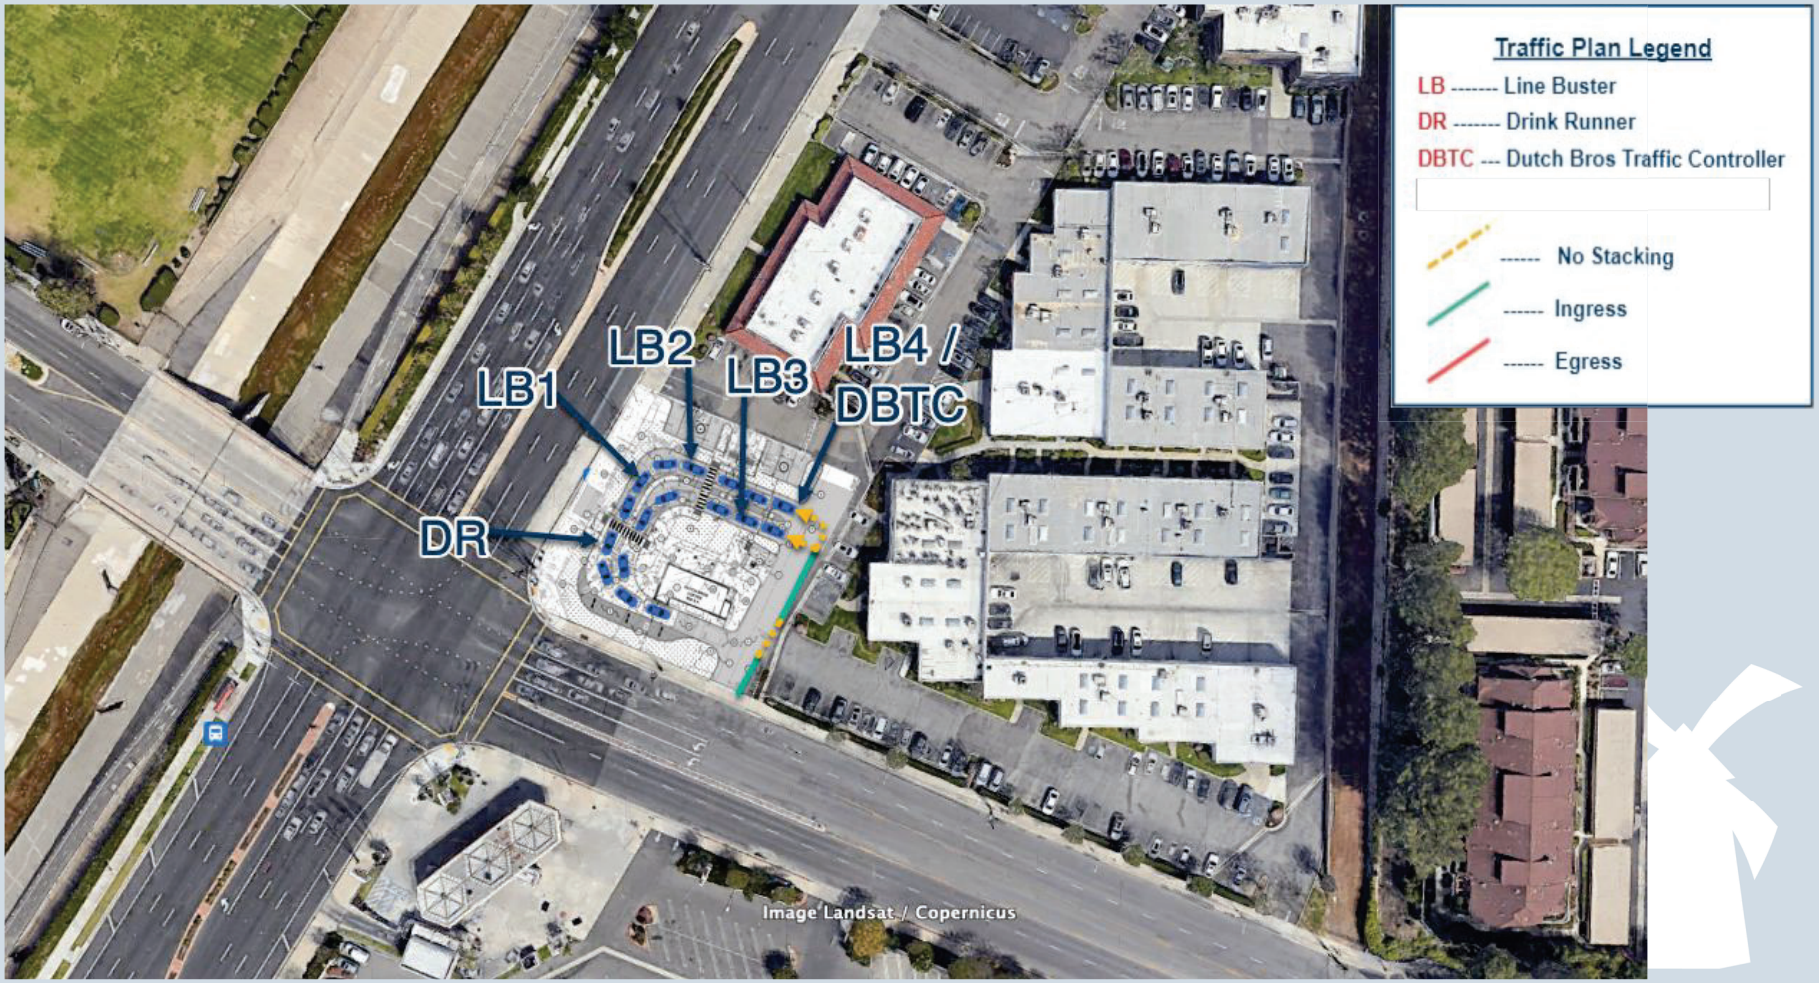
- Monthly meetings in which all shop personnel are required to attend. Discuss traffic plans and new commitments in detail.

Pre-Shift Huddles:

- Before each shift (morning, noon, night) the crew goes over updates, important communication, issues, and ensures strategy is set for the shift

Promotional Days / Major Holidays / Sticker Days:

- Dutch will determine if needed and hire a Third-Party Traffic Control Company to come in when the Stacking could possibly be an issue.



Evolving Traffic Plan:

- The Grand Opening plan will be utilized whenever necessary to mitigate traffic congestion that may occur from our new shop opening. We reserve the right to adjust the plan as conditions dictate, and expect that after the initial community response, our traffic patterns will settle to a predictable level within the first 90 days of operation.

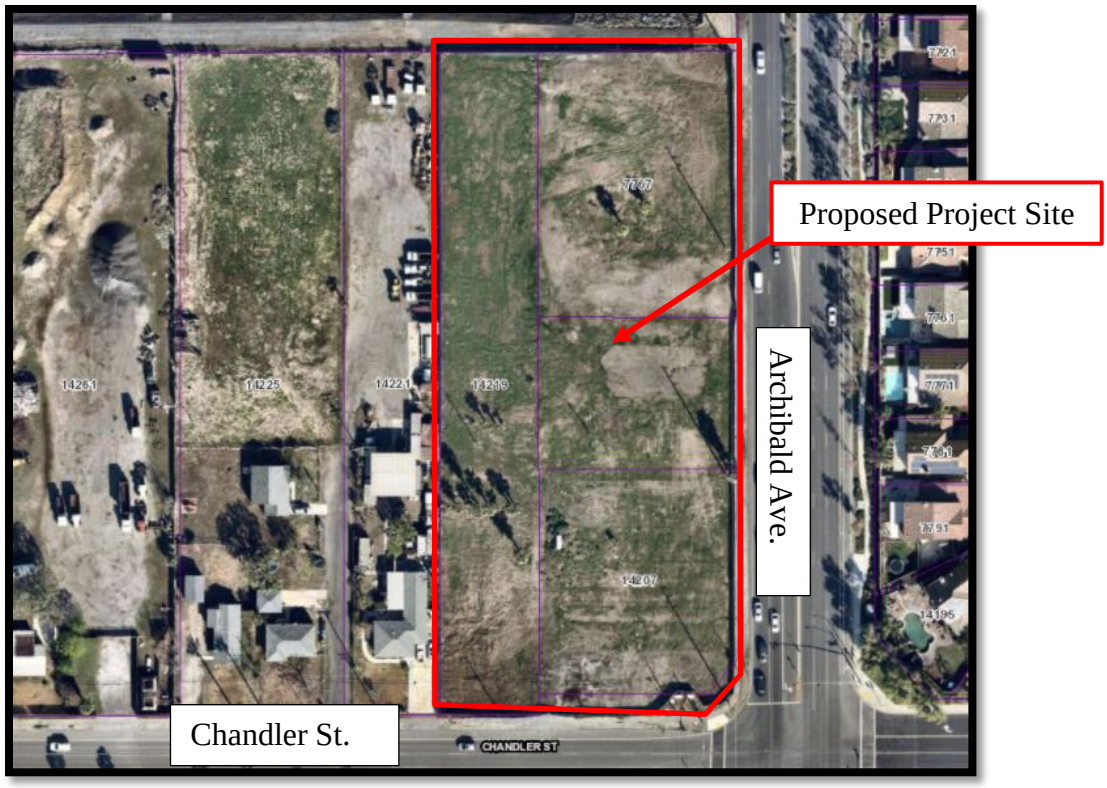
CITY OF EASTVALE
PLANNING COMMISSION NOTICE OF PUBLIC HEARING FOR PROJECT NO. PLN23-20018, PLN23-20019, PLN23-20020, AND PLN23-20021 FOR TENTATIVE PARCEL MAP NO. 37653, MAJOR DEVELOPMENT REVIEWS, AND CONDITIONAL USE PERMITS - CHANDLER AND ARCHIBALD RETAIL DEVELOPMENT

NOTICE IS HEREBY GIVEN that the City of Eastvale Planning Commission will hold a public hearing on **Wednesday, October 18, 2023**, at 6:00 p.m. at the Eastvale City Hall Council Chambers located at 12363 Limonite Avenue, Suite 910, Eastvale, CA 91752, to consider the following projects for commercial development located at the northwest corner of Chandler Avenue and Archibald Avenue:

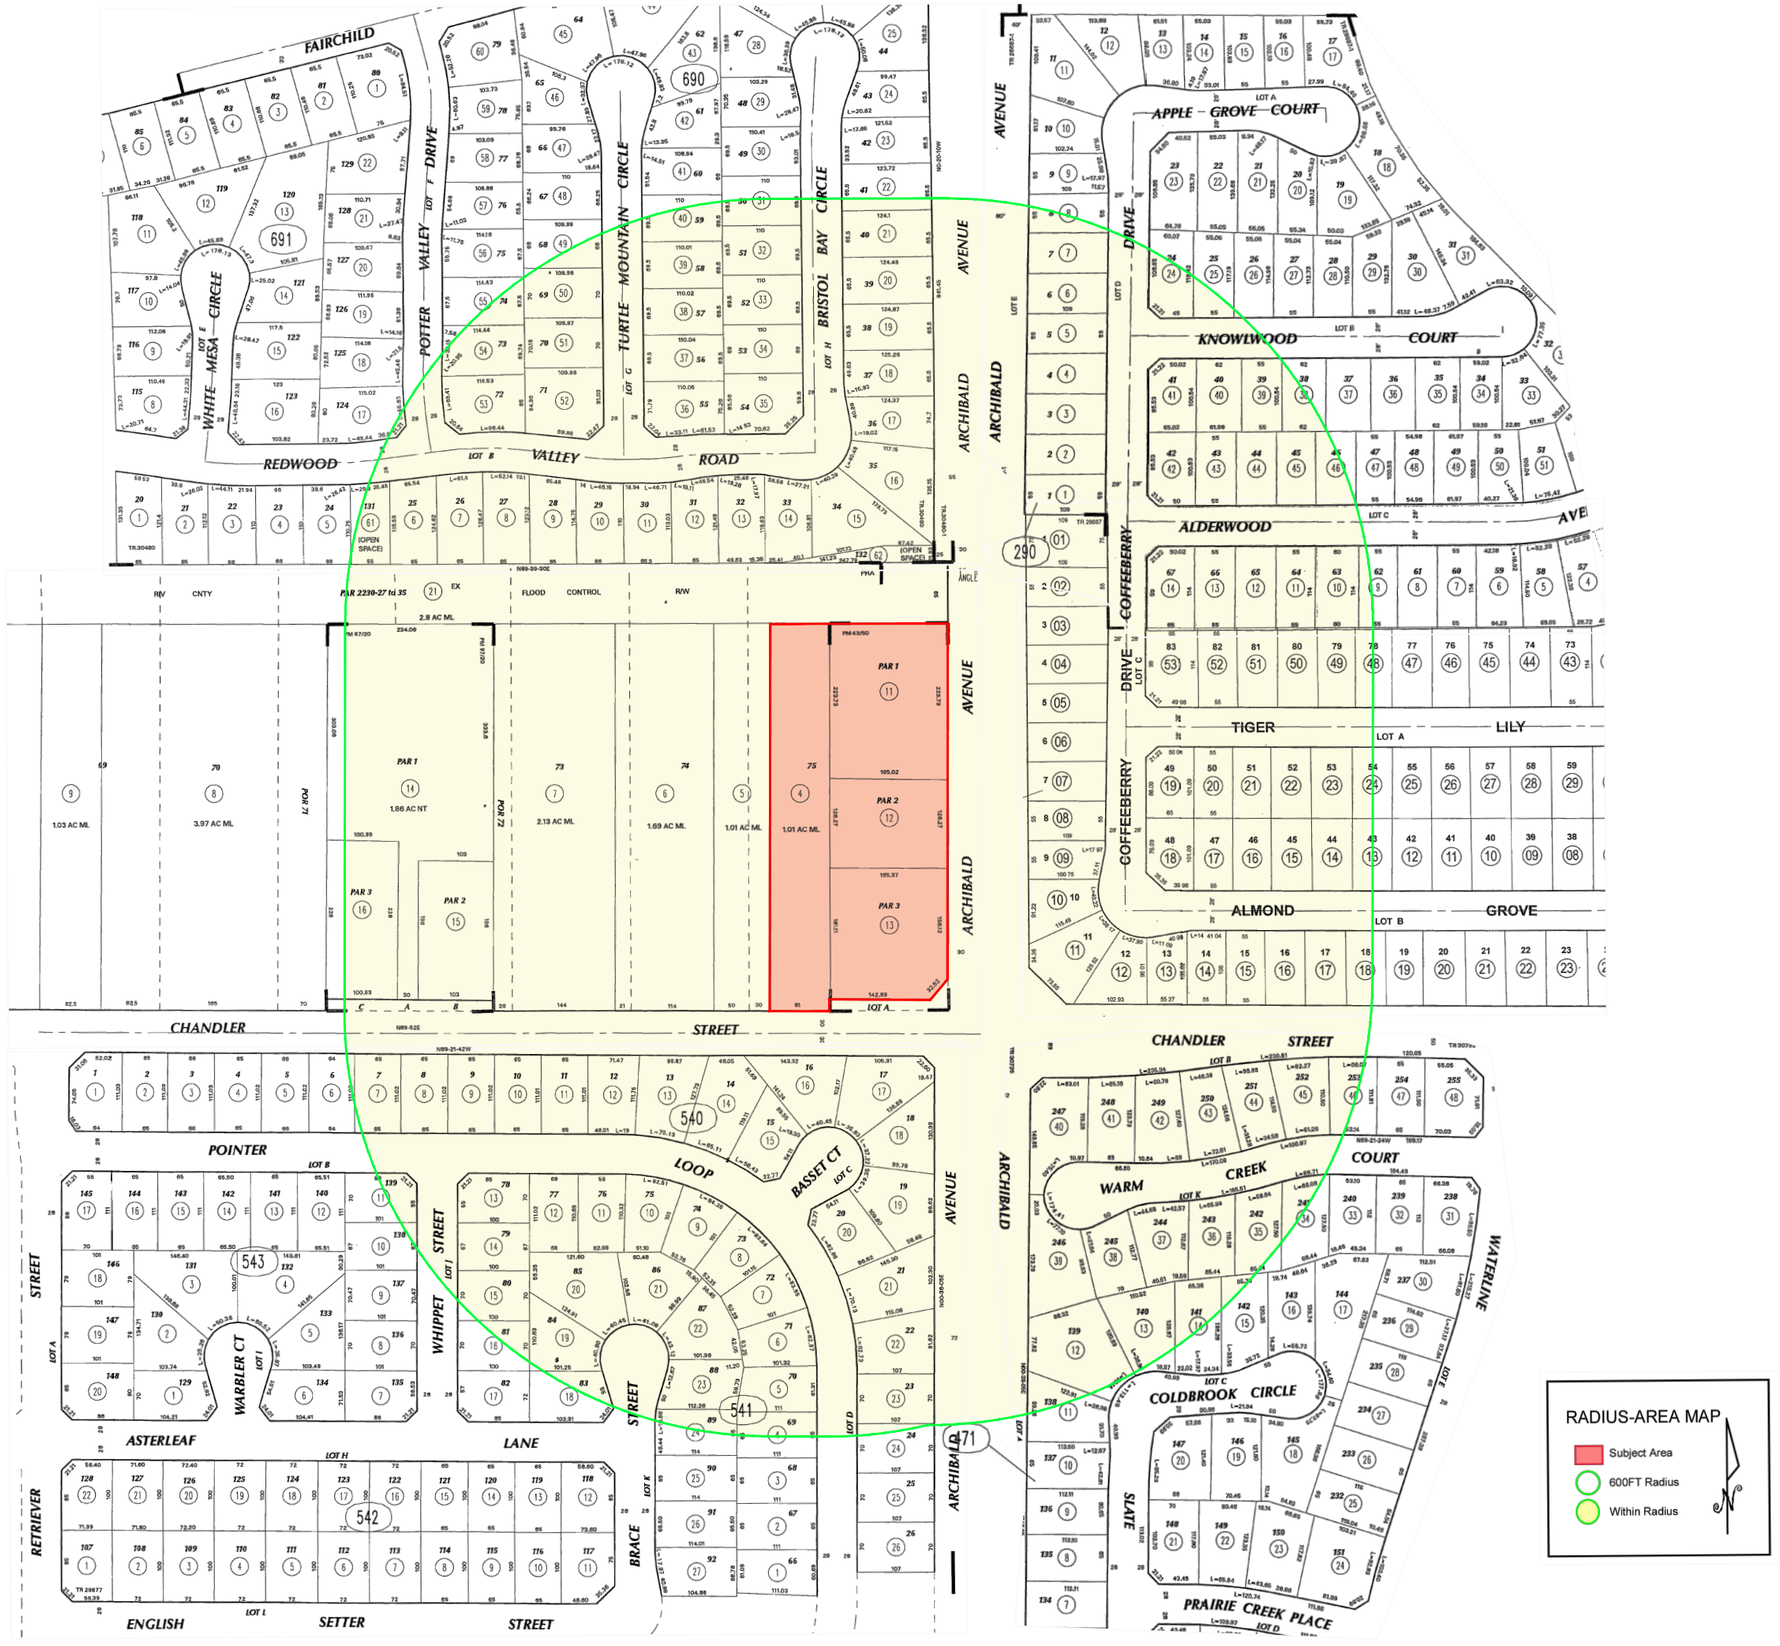
1. **Tentative Parcel Map No. 37653 (PLN23-20018)** for the subdivision of 2.76 acres into three (3) individual parcels;
2. **Major Development Review and Conditional Use Permit (PLN23-20019)** for the development and operation of a 950 square-foot drive-through coffee shop (Dutch Bros);
3. **Major Development Review and Conditional Use Permit (PLN23-20020)** for the development and operation of a 3,598 square-foot drive-through carwash (Quick Quack); and
4. **Major Development Review (PLN23-20021)** for the development of a 3,450 square-foot sit-down restaurant (Zendejas)

PROJECT DESCRIPTION: The proposed project includes a new retail center with a 950 square-foot drive-through coffee shop, a 3,598 square-foot drive-through carwash, a 3,450 square-foot sit-down restaurant, and Tentative Parcel Map No. 37653 for the development and subdivision of a 2.76-acre lot into three (3) individuals parcels at the northwest corner of Chandler Avenue and Archibald Avenue. The project applicant is REA/Eastvale LP.

PROJECT LOCATION: Assessor's Parcel Number: 144-130-004, -011, -012, -013, and -004; Chandler and Archibald Retail Development at the northwest corner of Chandler Avenue and Archibald Avenue. The project site is not located on a hazardous materials site listed under Government Code Section 65962.5.



ENVIRONMENTAL: Pursuant to Section 15162 of the California Environmental Quality Act (CEQA) Guideline, it is the independent judgement of the Lead Agency that the Project will not result in any new or more significant impacts to the environment other than those which have already been assessed under the 2021 Mitigated Negative Declaration (adopted by City Council via Resolution 21-35 on August 25, 2021) and an Addendum has been prepared in accordance with Sections 15162 and 15164 of the CEQA Guidelines.



Any person may submit written comments prior to the public hearing or may appear in person before the Planning Commission to be heard. Written comments may be mailed to the City of Eastvale Planning Division located at 12363 Limonite Avenue, Suite 910, Eastvale, CA 91752 or via email to Allen Lim at alim@eastvaleca.gov. **For the comments to be presented to the Planning Commission at the meeting, all comments made in writing or via e-mail prior to the public hearing must be received by the City of Eastvale Planning Division no later than Wednesday, October 18, 2023, at 5:00**

p.m. Oral and written comments may be submitted directly to the Planning Commission at the public hearing. If you challenge the project in court, you may be limited to raising only those issues you raised at the public hearing as described in this notice or in written correspondence delivered to the Eastvale Planning Commission prior to or at the public hearing.

If you have any questions on the project, contact Allen Lim at (951) 703-4461 or alim@eastvaleca.gov

Subject: Dutch bro, car wash, and zendejas

[The e-mail below is from an external source. Please do not open attachments or click links from an unknown or suspicious origin.]

Hi Mr. Lim

As someone who lives in the area of Archibald and chandler, this is an awful idea.

I have seen the mess at Dutch Bros on limonite and how cars are lined up on the street. And it is dangerous.

At chandler and archibald, it will be worse. Cars are traveling so fast down Archibald it is going to cause accidents.

I really don't see how a Mexican restaurant there will be successful. Or any restaurant. And having a bar on that corner is a horrible idea. Now drunk drivers will be in competition with the Dutch bros customers.

And we have 2 car washes in Eastvale. We do not need anymore.

This project will stick out like a sore thumb.

Also, are there anymore plans for chandler going west from Archibald?

To have this little standalone plot of 3 businesses is poor planning.

Thanks

Glen Billups

AGENDA STAFF REPORT

Planning Commission Meeting
PUBLIC HEARINGS
Agenda Item No. 8.3
October 18, 2023

PLN23-20043– Tentative Tract Map 38167 and Major Development Review for Magnolia Ranch Residential Development

Prepared By:

Jamie K. Cerda, AICP

Recommended Action(s)

Staff recommends that the Planning Commission take the following actions:

1. Adopt the Mitigated Negative Declaration (SCH #2023090664) prepared for the project, based on the findings and conclusions provided in the initial study, attached hereto and the conclusion that all impacts were adequately analyzed pursuant to applicable legal standards identified in the CEQA Guidelines;
2. Approve Tentative Tract Map No. 38167 to subdivide a single 10-acre lot (8.28 net acres) into 41 residential and three (3) lettered lots, subject to conditions of approval; and
3. Approve the Major Development Review for the master building architecture and site planning of 41 single-family residential lots and communal areas, subject to conditions of approval.

Summary

The applicant, Woodside 05s, LP, has submitted an application (PLN23-20043) for a tentative tract map (TTM 38167) to subdivide a single 10-acre partially developed lot (8.28 net acres) into forty-one (41) single family residential lots and three (3) lettered lots on property located north of Orange Street, south of Schleisman Road, east of Quarter Horse Drive and west of Scholar Way, identified as Assessor's Parcel Number 152-040-003. The marketing name for the project is "Magnolia Ranch." In addition to the tentative subdivision map, the project's land use application includes a Major Development Review for the architectural design and site planning of the community, new paseos

connecting Schleisman Road and Orange Street, as well as public benefit infrastructure improvements along Orange Street. The project is subject to Senate Bill 330, which requires the city to approve the project at the density permitted by the General Plan designation of the subject site. The requested entitlements are considered the "Project" under PLN23-20043. The Project is commonly referred to as "Magnolia Ranch."

Background

On May 6, 2021, MLC Holdings Inc. submitted an application (PLN21-20024) for a General Plan Amendment, Change of Zone, Major Development Review, and tentative tract map to subdivide (for condominium purposes) 10 acres of partially developed property into a single lot for development of 39 two-story motor court detached cluster homes and 89 three-story townhomes on the property located north of Orange Street, south of Schleisman Road, east of Quarter Horse Drive and west of Scholar Way, identified as Assessor's Parcel Number 152-040-003. Based on community feedback on the proposed density and proximity to the local schools, the applicant formally withdrew the application and submitted a revised project (PLN22-20024), effectively reducing the project density to take advantage of the provisions of Senate Bill 330 (SB 330). A summary of SB 330 can be found below.

The revised project (PLN22-20024), submitted on April 20, 2022, included a tentative tract map subdividing the 10-acre lot (8.28 net acres) into forty-one (41) single family residential lots and three (3) lettered lots. Staff reviewed the proposed project, prepared a Draft Initial Study/Mitigated Negative Declaration, deemed the project complete, and found it to be compliant with SB 330. The item was scheduled for the September 21, 2022, Planning Commission meeting; however, prior to the meeting, the applicant formally withdrew the application citing difficulty with the property owner. Following the withdrawal, MLC Holdings Inc. sold the project to Woodside Homes 05s, LP who has subsequently submitted the current request (PLN23-20043), a tentative tract map subdividing the 10-acre lot (8.28 net acres) into forty-one (41) single family residential lots and three (3) lettered lots under the provisions of SB 330. The requested entitlements are considered the "Project" under PLN23-20043. The Project is commonly referred to as "Magnolia Ranch."

California Senate Bill 330, "The Housing Crisis Act of 2019," (**Attachment 1**) was signed into law by Governor Newsom on October 9, 2019, and became effective January 1, 2020. SB 330 has two key phases: a pre-application phase and a formal submittal phase. The purpose of the pre-application phase is to collect specific site and project information to determine the zoning, design, subdivision, and fee requirements that will apply to the housing development project throughout the review and entitlement process. The day the pre-application is filed with the City, the City is required to vest the project and "freeze" all site development and design standards plus other land use related regulation that can be imposed on the project. The city is prohibited from applying new ordinance, polices, standards and/or fee increases to the development.

Under the provisions of SB 330, the city must give an applicant statutory rights to vest upon application submittal regardless of application completeness. The city can ask for only certain information during the pre-application phase. This provides some guarantees to the applicant that the city requirements will not be changed mid-review. The City may request compliance with design requirements during the formal submittal process.

The applicant is required to submit a formal application for a development project within 180

calendar days of submitting a complete preliminary application to preserve its vested rights. If the city determines that the application for the development project is not complete, the applicant is required to submit the specific information needed to complete the application within 90 days of receiving the agency's written identification of the necessary information. If the development proponent does not submit this information within the 90-day period, the preliminary application expires and has no further force or effect.

During the "formal submittal" phase, the city may hold no more than five (5) public meetings or hearings in connection with the project's approval. SB 330 was written very broadly to include community meetings, and study sessions in this definition. The city must account for any potential appeals, which count toward the five (5) public meeting or hearing maximum.

SB 330 requires the city to approve the project at the density proposed when a proposed housing development project complies with applicable, objective General Plan, zoning, and subdivision standards and criteria, including design review standards in effect at the time that the application was deemed complete. To take advantage of SB 330, the applicant cannot proposed densities higher than the project site's current General Plan designation.

If a local agency proposes to disapprove a project or to impose a condition that the project be developed at a lower density, the local agency shall base its decision regarding the proposed housing development project upon written findings supported by a preponderance of the evidence on the record that the housing development project would have a specific, adverse impact upon the public health or safety.

Analysis

Tentative Tract Map No. 38167

The applicant has submitted an application for a tentative tract map (TTM 38167) to subdivide a single 10-acre partially developed lot (8.28 net acres) into forty-one (41) single family residential lots and three (3) lettered lots for the purposes of water quality, common open space and pedestrian corridors on the project site and within the A-2 Heavy Agriculture zone. At present, the project site is developed with a 5,300 square foot vacant ranch-style home, an open-faced barn and several corrals, all of which would be demolished with the development of the proposed tract.

Municipal Code requirements pertaining to subdivisions (Tract Maps and/or Parcel Maps) are governed by the Subdivision Map Act (State of California Government Code § 66410-66499.58), and Title 130 (Subdivision) of the Eastvale Municipal Code. Furthermore, all subdivision maps must comply with the provisions of the City Zoning Code, and all other ordinances, statutes and laws pertaining to the use, sale, leasing or subdivision of land.

General Plan Consistency

The subject property is classified as Medium Density Residential in the Eastvale General Plan. This classification allows up to a maximum of five (5) dwelling units per acre. Tentative Tract Map No. 38167 (**Attachment 2**) proposes a density of 4.95 du/ac (i.e., 41 residential lots ÷ 8.28 acres = 4.95 du/ac), in accordance with the permitted density for the site per the General Plan.

Zoning Code Compliance

The property is zoned A-2 Heavy Agriculture. This designation is intended as an area for large lot single-family residential units with minimum lots sizes of 20,000 square feet and maximum density of 1.1-2 dwelling units per acre.

As proposed, TTM 38167 does not conform to the development standards in the A-2 zone in that the 41 proposed parcels do not satisfy the minimum lot size of 20,000 square feet, lot width of 100 feet, and lot depth of 150 feet. The smallest lots comprising TTM 38167 have minimums of 4,494 square feet in size, 47 feet in width, and 78 feet in depth.

However, under the provisions of SB 330 a housing development cannot be required to rezone the property if it is consistent with the objective General Plan standards for the property. As stated above the proposed project complies with the standards of the General Plan. The proposed development also needs to comply with the objective zoning code standards applicable to the property, but only to the extent they facilitate the development at the density allowed by the General Plan.

Since the development standards of the A-2 zone would preclude the development of the site at the density permitted by the General Plan, the applicant designed the community to reflect the development standards of the R-3 zone outlined in Table 3.2-2 of the Eastvale Zoning Code to the greatest extent feasible. While the minimum lot size, width, and depth of the proposed lots do not meet all the minimum standards outlined in Table 3.2-2 for the R-3 zone, the R-3 zone provides the smallest lot sizes, as well as the smallest widths and depths standards for single family detached residential units. Although the proposed lots are unable to meet the minimum lot dimensions for the R-3 zone, the site planning of the community (i.e., plotting) does comply with the setback and height standards of the R-3 zone, this will be discussed in greater detail later in this report. For these reasons, staff believes the project meets the intent of SB 330.

Access and Circulation

Access to the tract is proposed via a single-entry driveway along Orange Street. The entry road (i.e., Street "A") would extend into the site a distance of approximately 120 feet where it intersects a loop road providing vehicular access to all units within the project. At this key vantage point, the applicant proposes to locate community open space (i.e., Lot A). The entry road would include decorative paving treatment, community identification signage, and enhanced landscape nodes at either side to create an attractive "grand entry." The streets are designed with a 36-foot paved section within a 56-foot-wide right-of-way, which meets minimum street standards. A 5-foot sidewalk and 5-foot landscaped area within the public right-of-way is also proposed. The City Engineer and public safety have reviewed the proposed project access and on-site circulation design and support the design.

Grading and Drainage

The subject site is generally flat and presently drains in a sheet flow manner consistent with the existing topography of the property from north to south to an existing onsite lateral which ties into the existing storm drain system in Orange Street. The existing storm drain system runs across the site's frontage beginning as a 42" and transitioning to a 48" part way through the site.

Regional water quality regulations require storage and treatment of stormwater on-site to the maximum extent feasible in order to reduce pollutant loads, prior to discharge downstream. Accordingly, the applicant's Preliminary Water Quality Management Plan (PWQMP) proposes Low

Impact Design (LID) measures to meet performance criteria. The project proposes to treat storm water runoff with two (2) below surface retention/infiltration chamber systems. Once the retention/infiltration chamber system reaches capacity, it will overflow into the onsite storm drain system and finally drain to the existing storm drain system in Orange Street via a proposed 30-inch lateral.

The Engineering Division has reviewed the proposed grading and drainage plan for the project and has not expressed any concerns regarding the proposed design. Standard conditions of approval have been suggested that require final grading and drainage plans and the final Water Quality Management Plan (WQMP) to be reviewed and approved by the City Engineer prior to issuance of a grading permit.

Circulation

As part of the California Environmental Quality Act (CEQA) environmental analysis prepared for the project, Urban Crossroads Traffic Engineers prepared a Traffic Analysis for the proposed project (Attachment 8). The purpose of the traffic analysis is to identify potential traffic and circulation impacts associated with the development of the project. The traffic analysis examines six (6) scenarios:

- Existing Conditions
- Existing plus project conditions
- opening year (2025) conditions
- opening year (2025) plus project conditions
- horizon year (2040) conditions
- horizon year (2040) plus project conditions

The traffic analysis also studied eight (8) intersections:

- Sumner Avenue/Schleisman Road
- Sumner Avenue/Orange Street
- Driveway 1/Orange Street
- Scholar Way/Schleisman Road
- Scholar Way/Orange Street
- Scholar Way/Baltimore Street
- Scholar Way/Citrus Street
- Hamner Avenue/Schleisman Road

The aforementioned roadways were identified as key pathways of travel in the vicinity of the proposed project. To assess the traffic impacts anticipated for the project, trip generation rates were assigned using the Institute of Transportation Engineers, Trip Generation Manual, 11th Edition, 2017. On this basis, the proposed number of dwelling units (41) would be projected to generate 388 average daily vehicle trips with 28 peak hour trips occurring during the morning peak hour and 38 peak hour trips occurring during the evening peak hour.

To determine the effect that the proposed project's traffic would have on roadway function, the study employed the technique of Intersection Capacity Utilization (ICU), which compares the volume of traffic using an intersection to the capacity of the intersection, and which is expressed as a Level of Service (LOS) value from LOS A (free-flow conditions) through LOS F (extreme congestion and

system failure).

According to the Traffic Analysis (**Attachment 8**), under all scenarios acceptable LOS will be found with the implementation of the following roadway improvements: installing a stop sign for egress traffic from the proposed project at Driveway 1 on Orange Street (Mitigation Measure TRA-1) and constructing Orange Street from the western project boundary to the eastern project boundary at its ultimate half-section width as a 2-lane collector (74-foot right-of-way), in compliance with the General Plan (Mitigation Measure TRA-2).

The City Traffic Engineer has reviewed the project proposal and has determined that the surrounding public street circulation system is designed to accommodate the level of development proposed. Furthermore, the City Traffic Engineer is satisfied that the proposed project will not adversely impact traffic circulation along the surrounding streets nor will it compromise the level of traffic/pedestrian safety in the area.

Noise

In general, construction activities on the project site would increase ambient noise levels in the vicinity on an intermittent but temporary basis. Noise levels during construction would fluctuate depending on the construction phase, equipment type and duration of use, distance between the noise source and receptors (i.e., neighboring residences and schools in the vicinity), and the presence or absence of barriers between the noise source and receptors. Staff notes that construction related noise is exempt from the City's noise control ordinance, provided that construction noise occurs between 6:00 a.m. and 6:00 p.m. June through September and between 7:00 a.m. and 6:00 p.m. October through May. Staff has also included a condition of approval reiterating allowable construction hours and emphasizing the sensitivity of this issue to surrounding neighboring residents and the schools.

It is anticipated that the primary source of noise impacts to the project site would be traffic noise from Schleisman Road that is adjacent to the north side of the project site. The exterior noise levels have been calculated (**Attachment 7**) for the backyards of representative homes that are adjacent to Schleisman Road. The calculated noise levels for the backyards, that are adjacent to Schleisman Road show that without a sound wall, noise levels at all backyards adjacent to Schleisman Road would exceed the City's residential exterior noise standard of 60 dBA CNEL and would be considered a significant impact. The proposed homes would also experience some background traffic noise impacts from the proposed project's internal roadways and from Orange Street that is adjacent to the south side of the project site. As traffic on these local streets would consist of low traffic volumes at slower speeds, the traffic noise from these roads would not make a significant contribution to the noise environment.

The Draft Initial Study/Mitigated Negative Declaration identified that with the implementation of Mitigation Measure MM NOI-1 (which requires the installation of a 6'-6" tall concrete masonry wall along the site's northern boundary), the proposed homes exterior noise levels would be within the City's 60 dBA CNEL residential exterior noise standard and impacts would be reduced to a less than significant level. As such, the project has been conditioned to include a 6'-6" high split face block wall along the northern project boundary.

Public Infrastructure

Implementation of the proposed project will result in additional demand on existing public services,

including demand for fire and police services. However, as concluded in the Draft Initial Study/Mitigated Negative Declaration, this increase in demand can be accommodated by existing service levels, and therefore would be less than a significant impact. Additionally, the increase in demand to the utilities, i.e., water, gas, power, sewer, can be accommodated by existing service levels as there is sufficient capacity to serve the project site under present conditions. Jurupa Valley Community Services District (JCSD) has provided a will-serve letter for the proposed project confirming availability of sufficient water supply to serve the project.

In addition, Riverside County Fire Department has reviewed the proposed site plan for fire/emergency access and did not identify any significant issues of concern that would require further submittals to Riverside County Fire Department subsequent to any approval of the project granted by the City. Riverside County Fire Department suggest applicable standard conditions of approval, which staff has included in the attached conditions of approval.

Schools
The proposed project would not include significant or unplanned population growth as the proposed project is consistent with the General Plan. The project would be required to comply with SB 50 requirements, which allow school districts to collect impact fees from developers of new projects. According to Section 65997 of the California Government Code, payment of statutory fees is the exclusive method of mitigating environmental effects related to the adequacy of school facilities. Thus, upon payment of required fees by the applicant consistent with existing State requirements, impacts would be less than significant. Furthermore, Corona-Norco Unified School District has not expressed any issues of concern regarding the additional new homes.

Parks and Recreation
The proposed project will contribute to the need for additional park facilities in the general area; however, this impact will be fully mitigated through the development of Lot A and Lot C of Tentative Tract Map 38167. The project contains outdoor open space comprised of a 26,872 square foot common area (i.e., Lot A) with corn hole, picnic tables, outdoor seating, a shaded read nook and a succulent garden walk to be maintained by the future homeowners' association. At the request of the City, the applicant has agreed to grant a 30' wide trail easement (16,390 square feet) along the eastern project boundary (i.e., Lot C) for public use. This 30' paseo adjacent to Eastvale Elementary School will serve as a protected safe route to and from school. The paseo is designed to alleviate foot traffic along Scholar Way, with the intent to have parents drop off/pick up children at a new drop off/pick up zone being designed by Public Works along Schleisman Road and the project site's north boundary (i.e., public right-of-way). As a result of Lot A and Lot C, the applicant has satisfied its required park land dedication in accordance with Section 130.20.020 of the Eastvale Municipal Code.

Major Development Review

In order to safeguard and enhance the appearance and quality of development in the City of Eastvale, Section 120.02.010 of the Eastvale Zoning Code requires Major Development Review approval for any new single-family subdivision development. This scope of review is outline in the aforementioned code section, and includes, but is not limited to, exterior design, materials, textures, colors, as well as ensuring the proposed structures will be property related to the site and to the surrounding site in order to prevent structures detrimental to the character of the buildings already established in the area. The proposed project has been reviewed for compliance with the applicable

development standards and required findings for a Major Development Review as set forth in Section 120.02.010 (C)(5) of the Eastvale Zoning Code. The required findings are detailed in **Attachment 4 – Draft Resolution**.

Architecture and Treatments
As proposed, the forty-one (41) single-family homes are designed with quality urban design, architecture and landscaping that includes providing pedestrian and open space connectivity within the community, local schools and Schleisman Road and Orange Street. Based on staff's review, the project is consistent with the Eastvale Design Guidelines.

The applicant is proposing two (2) different model home plans. The table below provides a summary description of the models proposed:

Plan	Square Footages	No. of Stories	No. of Bedrooms	No. of Bathrooms	Garage Parking
Plan 4524	2,833	2	5	3.75	2/661 ft^2
Plan 4528	3,153	2	5	4.25	2/646 ft^2

In addition to the two (2) different plan types, the following three (3) architectural styles are also proposed as part of the master architecture:

- Coastal
- Contemporary
- Farmhouse

Included in the development plans (**Attachment 2**) the applicant proposes a total of nine (9) different color schemes, nine (9) different trim and siding colors, six (6) stone/brick accents, and (9) different roofing material types proposed for the above models. Additional architectural details include window shutters, wood siding, pronounced windowsills and ledges, board and batten, and decorative garage doors.

The variety of options available to all plans will ensure that a rich diversity of colors and materials will be apparent throughout the community. The illustrative color elevations contained within the project plan set provide further details regarding these proposed options. In addition, enhanced architectural treatments will be provided on those elevations that are visible from public views along Orange Street and Schleisman Road as well as the community open space and proposed trail.

Site Planning
Staff reviewed the site plan for each of the lots under consideration as part of this Major Development Review. As noted above, the proposed development needs to comply with the objective zoning code standards applicable to the property, but only to the extent they facilitate the development at the density allowed by the General Plan.

To create consistency with the surrounding single-family residential neighborhoods, the applicant designed the community to the R-3 General Residential zone development standards and in compliance with SB 330. With the exception of the front yard setback standard, noted below, all residential units are plotted in compliance with the standards applicable to the R-3 General Residential zone. It should be further noted that only one lot (i.e., Lot 15) is unable to meet this front

yard setback standard and it is unable to meet the minimum 10' setback by a single foot. Staff is supportive of the proposed plotting as it meets the intent of SB 330 and creates a compatible development within an existing developed portion of the city.

Compliance with R-3 General Residential Development Standards			
Standard	**Required**	**Proposed**	**Meets Standard**
Front Setback	10 feet	9 feet	No
Rear Setback	None	18 feet	Yes
Side Yard Setback (Interior)	5 feet	5 feet	Yes
Side Yard Setback (Street Side)	5 feet	10 feet	Yes
Building Height	50 ft. maximum	approximately 26'-5"	Yes
Off-Street Parking	2 covered spaces minimum	2 covered spaces and 2 driveway spaces	Yes

Parking

In terms of parking, each proposed dwelling unit would include two (2) garage spaces and two driveway spaces, for a total of 164 spaces, as well as an additional 58 on-street parking spaces. Pursuant to Section 120.05.060 of the Eastvale Zoning Code, the project would exceed the City's minimum parking requirement of 82 spaces (2 spaces per dwelling unity) by 140 parking spaces.

Common Area and Paseos

Incorporated into the site planning of TTM 38167 are three (3) lettered lots designed to serve the future residents of the Magnolia Ranch as well as the public at large. Lot A provides common open space for Magnolia Ranch residents with amenities such as corn hole, picnic tables, outdoor seating, a shaded read nook and a succulent garden walk. Lot B, located at the northwest portion of the site provides a 20-foot-wide direct pedestrian access from the community to a planned linear park currently in the design phase with the Public Works Department along the south side of Schleisman Road. Finally, the applicant, in partnership with the Public Works Department, proposes Lot C, a 30-foot-wide lot running along the site's entire eastern boundary, adjacent to Eastvale Elementary School to serve as a protected safe route to and from school The paseo would consist of an 8-foot-wide sidewalk and landscaping on both sides. Designed to alleviate foot traffic along Scholar Way, a new drop off/pick up zone for students is proposed along Schleisman Road and the project site's north boundary (i.e., public right-of-way).

Walls and Landscaping

The existing perimeter fencing around the applicant's property consists of metal corral fencing and a split face block wall. There is an existing seven foot (7') tall combination split face block retaining/garden wall along the western property line enclosing the developed single-family residential tract to the west. The remainder of the project site is enclosed with a five foot (5') tall brown metal corral fence. In addition to the five foot (5') tall corral fencing, the northern boundary also contains a small two-foot-tall retaining wall to support the grade difference between the project site and Schleisman Road. The property to the east (i.e., Eastvale Elementary School) has a six foot (6') tall chain-link fence with tan slats for additional privacy and protection of the children in attendance. As part of the request, the applicant has submitted a wall and fence plan for the

Planning Commission's consideration.

The applicant proposes to construct tract perimeter fencing along the northern, eastern, and southern boundaries of the site. The proposed fencing along the eastern and southern boundaries would consist of a six-foot (6') tall split face block with a tan concrete masonry unit (CMU) cap. In order to address noise impacts assessed in the environmental review, Mitigation Measure NOI-1 requires the construction of a minimum 6.5-foot tall CMU wall on the north side of all backyards that are adjacent to Schleisman Road. Staff has included a condition of approval requiring the tract perimeter fencing on Lots 9-15 and Lots 27 and 28 to consist of a 6.5-foot tall split face block with a tan CMU cap to be consistent with the tract perimeter fencing proposed along the east and south boundaries and comply with Mitigation Measure NOI-1. The existing combination split face block retaining/garden wall with CMU cap along the western boundary will remain.

At the recommendation of the Riverside County Sheriff's Office (RSO), the six foot (6') tall chain-link fence adjacent to the school and eastern boundary of the site is proposed to remain. Block walls on the east and west side of the paseo would create visibility concerns and public safety challenges for RSO. Finally, property walls for individual lots will consist of 5'6" tall tan vinyl fencing with return walls, visible from the public right-of-way consisting of six foot (6') tall split face block with tan vinyl gates.

Landscaped areas of the tract include the south (i.e., Orange Street) and east (i.e., 30' wide paseo) boundaries of the site in addition to Lot A, the common area located within the center of the tract as well as the 20-foot paseo located in the northwest portion of the site (**Attachment 2**). Lot A is a communal area to be owned and maintained by the future Homeowners' Association. As depicted on the Schematic Landscape Plan, Lot A would be landscaped with trees such as Specimen Magnolia, California Sycamore, Italian Cyprus, and citrus trees, a variety of shrubs such as Kangaroo Paw, Bougainvillea, and agave and ground covers such as turf, decomposed granite, and colored concrete. The project frontage (i.e., Orange Street) will be planted with Specimen Magnolia trees, the community's namesake, along with City approved street trees. Lot C, the Paseo, will be landscaped by the applicant to be consistent with the conceptual landscape plans for the future Schleisman Road Linear Park and maintained by the City to ensure long term maintenance and public safety. Finally, per the City of Eastvale's Residential Design Standards and Guidelines, each lot is required to plant a minimum of one (1) yard tree. The project proposes Australian Willow and Crape Myrtle yard trees to meet this requirement.

Overall, staff believes that the proposed landscape and wall plans are satisfactory. They are consistent with other approved tract wall/landscape plans and will ensure aesthetic treatment of the tracts common open space areas and other perimeter (publicly visible) portions of the tract, and will support a high-quality community design, similar to other developments areas throughout the city. A final landscape plan will be reviewed during the building permit process to ensure that the details of the proposed landscape plan comply with the City landscape regulations.

Public Hearing Notification and Comment

Consistent with state-mandated public noticing procedures, all legal property owners within 600-feet of the project site were sent a joint, Notice of Intent to Adopt a Mitigated Negative Declaration and public hearing notice for this project by direct mail on September 25, 2023, for the Planning Commission meeting on October 18, 2023. A map showing the properties that received notification are included as **Attachment 9** to this staff report. In addition, a public notice regarding the project

was duly published in the Press Enterprise on September 28, 2023. As of this writing, staff has not received any correspondence supporting or objecting to the proposed project.

Additionally, on August 15, 2023, the applicant provided all property owners within 600 feet of the project site a community outreach flyer (**Attachment 11**). The flyer introduced the project with the proposed site plan, architectural elevations, and a series of frequently asked questions. Additionally, project contact information was given to the residents extending an opportunity to schedule private meetings to discuss the project in more detail should additional questions arise. As of the writing, the applicant confirmed they met with a total of four residents, each providing positive feedback.

Environmental

Pursuant to California Environmental Quality Act (CEQA) Guidelines Section 15063, an Initial Study (IS) was prepared for the project to assess potential environmental impacts. The IS revealed that the project would not have any significant environmental impacts with implementation of the proposed mitigation measures. A Mitigated Negative Declaration (MND) (SCH #2023090664) was prepared and made available for public review and comment during a 20-day review period from September 28, 2023, to October 17, 2023. Notice to all interested persons and agencies inviting comments on the MND was published in accordance with the provisions of CEQA and posted at the Office of the County Clerk of Riverside County and at the State Clearinghouse on September 28, 2023. The MND does not set forth policy for the City of Eastvale about the proposed Project's desirability. Rather, it is an information document to be used by decision-makers, public agencies, and the public, in accordance with the CEQA. The IS/MND has been included as **Attachment 3** of this report.

Strategic Plan Action - Priority Level: N/A | Target #: B | Goal #: E

Diversify the housing stock with more options.

Fiscal Impact

Processing the proposed applications will have little to no fiscal impact on the City as the project is funded by the applicant.

Prior City Council/Commission Action

On September 21, 2022, Planning Commission removed Item 8.1 PLN22-20024- Tentative Tract Map 38167 and Major Development Review for Magnolia Ranch Residential Development from the Planning Commission's calendar, formally accepting the applicant's request to withdraw the project.

Senate Bill No. 330

CHAPTER 654

An act to amend Section 65589.5 of, to amend, repeal, and add Sections 65940, 65943, and 65950 of, to add and repeal Sections 65905.5, 65913.10, and 65941.1 of, and to add and repeal Chapter 12 (commencing with Section 66300) of Division 1 of Title 7 of, the Government Code, relating to housing.

[Approved by Governor October 09, 2019. Filed with Secretary of State October 09, 2019.]

LEGISLATIVE COUNSEL'S DIGEST

SB 330, Skinner. Housing Crisis Act of 2019.

(1) The Housing Accountability Act, which is part of the Planning and Zoning Law, prohibits a local agency from disapproving, or conditioning approval in a manner that renders infeasible, a housing development project for very low, low-, or moderate-income households or an emergency shelter unless the local agency makes specified written findings based on a preponderance of the evidence in the record. The act specifies that one way to satisfy that requirement is to make findings that the housing development project or emergency shelter is inconsistent with both the jurisdiction's zoning ordinance and general plan land use designation as specified in any element of the general plan as it existed on the date the application was deemed complete. The act requires a local agency that proposes to disapprove a housing development project that complies with applicable, objective general plan and zoning standards and criteria that were in effect at the time the application was deemed to be complete, or to approve it on the condition that it be developed at a lower density, to base its decision upon written findings supported by substantial evidence on the record that specified conditions exist, and places the burden of proof on the local agency to that effect. The act requires a court to impose a fine on a local agency under certain circumstances and requires that the fine be at least $10,000 per housing unit in the housing development project on the date the application was deemed complete.

This bill, until January 1, 2025, would specify that an application is deemed complete for these purposes if a preliminary application was submitted, as described below.

Existing law authorizes the applicant, a person who would be eligible to apply for residency in the development or emergency shelter, or a housing organization to bring an action to enforce the Housing Accountability Act. If, in that action, a court finds that a local agency failed to satisfy the requirement to make the specified findings described above, existing law requires the court to issue an order or judgment compelling compliance with the act within 60 days, as specified.

This bill, until January 1, 2025, would additionally require a court to issue the order or judgment previously described if the local agency required or attempted to require certain housing development projects to comply with an ordinance, policy, or standard not adopted and in effect when a preliminary application was submitted.

Existing law authorizes a local agency to require a housing development project to comply with objective, quantifiable, written development standards, conditions, and policies appropriate to, and consistent with, meeting the jurisdiction's share of the regional housing need, as specified.

This bill, until January 1, 2025, would, notwithstanding those provisions or any other law and with certain exceptions, require that a housing development project only be subject to the ordinances, policies, and standards

adopted and in effect when a preliminary application is submitted, except as specified.

(2) The Planning and Zoning Law, except as provided, requires that a public hearing be held on an application for a variance from the requirements of a zoning ordinance, an application for a conditional use permit or equivalent development permit, a proposed revocation or modification of a variance or use permit or equivalent development permit, or an appeal from the action taken on any of those applications. That law requires that notice of a public hearing be provided in accordance with specified procedures.

This bill, until January 1, 2025, would prohibit a city or county from conducting more than 5 hearings, as defined, held pursuant to these provisions, or any other law, ordinance, or regulation requiring a public hearing, if a proposed housing development project complies with the applicable, objective general plan and zoning standards in effect at the time an application is deemed complete, as defined. The bill would require the city or county to consider and either approve or disapprove the housing development project at any of the 5 hearings consistent with the applicable timelines under the Permit Streamlining Act.

(3) The Permit Streamlining Act, which is part of the Planning and Zoning Law, requires each state agency and each local agency to compile one or more lists that specify in detail the information that will be required from any applicant for a development project. That law requires the state or local agency to make copies of this information available to all applicants for development projects and to any persons who request the information.

The bill, until January 1, 2025, for purposes of any state or local law, ordinance, or regulation that requires a city or county to determine whether the site of a proposed housing development project is a historic site, would require the city or county to make that determination, which would remain valid for the pendency of the housing development, at the time the application is deemed complete, except as provided. The bill, until January 1, 2025, would also require that each local agency make copies of any above-described list with respect to information required from an applicant for a housing development project available both (A) in writing to those persons to whom the agency is required to make information available and (B) publicly available on the internet website of the local agency.

The Permit Streamlining Act requires public agencies to approve or disapprove of a development project within certain timeframes, as specified. The act requires a public agency, upon its determination that an application for a development project is incomplete, to include a list and a thorough description of the specific information needed to complete the application. Existing law authorizes the applicant to submit the additional material to the public agency, requires the public agency to determine whether the submission of the application together with the submitted materials is complete within 30 days of receipt, and provides for an appeal process from the public agency's determination. Existing law requires a final written determination by the agency on the appeal no later than 60 days after receipt of the applicant's written appeal.

This bill, until January 1, 2025, would provide that a housing development project, as defined, shall be deemed to have submitted a preliminary application upon providing specified information about the proposed project to the city or county from which approval for the project is being sought. The bill would require each local agency to compile a checklist and application form that applicants for housing development projects may use for that purpose and would require the Department of Housing and Community Development to adopt a standardized form for applicants seeking approval from a local agency that has not developed its own application form. After the submittal of a preliminary application, the bill would provide that a housing development project would not be deemed to have submitted a preliminary application under these provisions if the development proponent revises the project such that the number of residential units or square footage of construction changes by 20% or more until the development proponent resubmits the information required by the bill so that it reflects the revisions. The bill would require a development proponent to submit an application for a development project that includes all information necessary for the agency to review the application under the Permit Streamlining Act within 180 days of submitting the preliminary application.

The bill, until January 1, 2025, would require the lead agency, as defined, if the application is determined to be incomplete, to provide the applicant with an exhaustive list of items that were not complete, as specified.

The Permit Streamlining Act generally requires that a public agency that is the lead agency for a development project approve or disapprove a project within 120 days from the date of certification by the lead agency of an environmental impact report prepared for certain development projects, but reduces this time period to 90 days from the certification of an environmental impact report for development projects meeting certain additional conditions relating to affordability. Existing law defines “development project” for these purposes to mean a use consisting of either residential units only or mixed-use developments consisting of residential and nonresidential uses that satisfy certain other requirements.

This bill, until January 1, 2025, would reduce the time period in which a lead agency under these provisions is required to approve or disapprove a project from 120 days to 90 days, for a development project generally described above, and from 90 days to 60 days, for a development project that meets the above-described affordability conditions. The bill would recast the definition of “development project” for these purposes to mean a housing development project, as defined in the Housing Accountability Act.

(4) The Planning and Zoning Law, among other things, requires the legislative body of each county and city to adopt a comprehensive, long-term general plan for the physical development of the county or city and of any land outside its boundaries that relates to its planning. That law authorizes the legislative body, if it deems it to be in the public interest, to amend all or part of an adopted general plan, as provided. That law also authorizes the legislative body of any county or city, pursuant to specified procedures, to adopt ordinances that, among other things, regulate the use of buildings, structures, and land as between industry, business, residences, open space, and other purposes.

This bill, until January 1, 2025, with respect to land where housing is an allowable use, except as specified, would prohibit a county or city, including the electorate exercising its local initiative or referendum power, in which specified conditions exist, determined by the Department of Housing and Community Development as provided, from enacting a development policy, standard, or condition, as defined, that would have the effect of (A) changing the land use designation or zoning of a parcel or parcels of property to a less intensive use or reducing the intensity of land use within an existing zoning district below what was allowed under the general plan or specific plan land use designation and zoning ordinances of the county or city as in effect on January 1, 2018; (B) imposing or enforcing a moratorium on housing development within all or a portion of the jurisdiction of the county or city, except as provided; (C) imposing or enforcing new design standards established on or after January 1, 2020, that are not objective design standards, as defined; or (D) establishing or implementing certain limits on the number of permits issued by, or the population of, the county or city, unless the limit was approved prior to January 1, 2005, in a predominantly agricultural county, as defined. The bill would, notwithstanding these prohibitions, allow a city or county to prohibit the commercial use of land zoned for residential use consistent with the authority of the city or county conferred by other law. The bill would state that these prohibitions would apply to any zoning ordinance adopted or amended on or after the effective date of these provisions, and that any development policy, standard, or condition on or after that date that does not comply would be deemed void.

This bill would also require a project that requires the demolition of housing to comply with specified requirements, including the provision of relocation assistance and a right of first refusal in the new housing to displaced occupants, as provided. The bill would provide that these provisions do not supersede any provision of a locally adopted ordinance that places greater restrictions on the demolition of residential dwelling units or that requires greater relocation assistance to displaced households. The bill would require a county or city subject to these provisions to include information necessary to determine compliance with these provisions in the list or lists that specify the information that will be required from any applicant for a development project under the Permit Streamlining Act.

The bill would state that these prohibitions would prevail over any conflicting provision of the Planning and Zoning Law or other law regulating housing development in this state, except as specifically provided. The bill would also require that any exception to these provisions, including an exception for the health and safety of occupants of a housing development project, be construed narrowly.

(5) This bill would include findings that the changes proposed by this bill address a matter of statewide concern rather than a municipal affair and, therefore, apply to all cities, including charter cities.

(6) By imposing various new requirements and duties on local planning officials with respect to housing development, and by changing the scope of a crime under the State Housing Law, this bill would impose a state-mandated local program.

The California Constitution requires the state to reimburse local agencies and school districts for certain costs mandated by the state. Statutory provisions establish procedures for making that reimbursement.

This bill would provide that with regard to certain mandates no reimbursement is required by this act for a specified reason.

With regard to any other mandates, this bill would provide that, if the Commission on State Mandates determines that the bill contains costs so mandated by the state, reimbursement for those costs shall be made pursuant to the statutory provisions noted above.

(7) This bill would provide that its provisions are severable.

Bill Text

THE PEOPLE OF THE STATE OF CALIFORNIA DO ENACT AS FOLLOWS:

SECTION 1. This act shall be known, and may be cited, as the Housing Crisis Act of 2019.

SEC. 2. (a) The Legislature finds and declares the following:

(1) California is experiencing a housing supply crisis, with housing demand far outstripping supply. In 2018, California ranked 49th out of the 50 states in housing units per capita.

(2) Consequently, existing housing in this state, especially in its largest cities, has become very expensive. Seven of the 10 most expensive real estate markets in the United States are in California. In San Francisco, the median home price is $1.6 million.

(3) California is also experiencing rapid year-over-year rent growth with three cities in the state having had overall rent growth of 10 percent or more year-over-year, and of the 50 United States cities with the highest United States rents, 33 are cities in California.

(4) California needs an estimated 180,000 additional homes annually to keep up with population growth, and the Governor has called for 3.5 million new homes to be built over the next 7 years.

(5) The housing crisis has particularly exacerbated the need for affordable homes at prices below market rates.

(6) The housing crisis harms families across California and has resulted in all of the following:

(A) Increased poverty and homelessness, especially first-time homelessness.

(B) Forced lower income residents into crowded and unsafe housing in urban areas.

(C) Forced families into lower cost new housing in greenfields at the urban-rural interface with longer commute times and a higher exposure to fire hazard.

(D) Forced public employees, health care providers, teachers, and others, including critical safety personnel, into more affordable housing farther from the communities they serve, which will exacerbate future disaster response challenges in high-cost, high-congestion areas and increase risk to life.

(E) Driven families out of the state or into communities away from good schools and services, making the ZIP Code where one grew up the largest determinate of later access to opportunities and social mobility, disrupting family life, and increasing health problems due to long commutes that may exceed three hours per day.

(7) The housing crisis has been exacerbated by the additional loss of units due to wildfires in 2017 and 2018, which impacts all regions of the state. The Carr Fire in 2017 alone burned over 1,000 homes, and over 50,000 people have been displaced by the Camp Fire and the Woolsey Fire in 2018. This temporary and permanent displacement has placed additional demand on the housing market and has resulted in fewer housing units available for rent by low-income individuals.

(8) Individuals who lose their housing due to fire or the sale of the property cannot find affordable homes or rental units and are pushed into cars and tents.

(9) Costs for construction of new housing continue to increase. According to the Terner Center for Housing Innovation at the University of California, Berkeley, the cost of building a 100-unit affordable housing project in the state was almost $425,000 per unit in 2016, up from $265,000 per unit in 2000.

(10) Lengthy permitting processes and approval times, fees and costs for parking, and other requirements further exacerbate cost of residential construction.

(11) The housing crisis is severely impacting the state’s economy as follows:

(A) Employers face increasing difficulty in securing and retaining a workforce.

(B) Schools, universities, nonprofits, and governments have difficulty attracting and retaining teachers, students, and employees, and our schools and critical services are suffering.

(C) According to analysts at McKinsey and Company, the housing crisis is costing California $140 billion a year in lost economic output.

(12) The housing crisis also harms the environment by doing both of the following:

(A) Increasing pressure to develop the state’s farmlands, open space, and rural interface areas to build affordable housing, and increasing fire hazards that generate massive greenhouse gas emissions.

(B) Increasing greenhouse gas emissions from longer commutes to affordable homes far from growing job centers.

(13) Homes, lots, and structures near good jobs, schools, and transportation remain underutilized throughout the state and could be rapidly remodeled or developed to add affordable homes without subsidy where they are needed with state assistance.

(14) Reusing existing infrastructure and developed properties, and building more smaller homes with good access to schools, parks, and services, will provide the most immediate help with the lowest greenhouse gas footprint to state residents.

(b) In light of the foregoing, the Legislature hereby declares a statewide housing emergency, to be in effect until January 1, 2025.

(c) It is the intent of the Legislature, in enacting the Housing Crisis Act of 2019, to do both of the following:

(1) Suspend certain restrictions on the development of new housing during the period of the statewide emergency described in subdivisions (a) and (b).

(2) Work with local governments to expedite the permitting of housing in regions suffering the worst housing shortages and highest rates of displacement.

SEC. 3. Section 65589.5 of the Government Code is amended to read:

65589.5. (a) (1) The Legislature finds and declares all of the following:

(A) The lack of housing, including emergency shelters, is a critical problem that threatens the economic, environmental, and social quality of life in California.

(B) California housing has become the most expensive in the nation. The excessive cost of the state's housing supply is partially caused by activities and policies of many local governments that limit the approval of housing, increase the cost of land for housing, and require that high fees and exactions be paid by producers of housing.

(C) Among the consequences of those actions are discrimination against low-income and minority households, lack of housing to support employment growth, imbalance in jobs and housing, reduced mobility, urban sprawl, excessive commuting, and air quality deterioration.

(D) Many local governments do not give adequate attention to the economic, environmental, and social costs of decisions that result in disapproval of housing development projects, reduction in density of housing projects, and excessive standards for housing development projects.

(2) In enacting the amendments made to this section by the act adding this paragraph, the Legislature further finds and declares the following:

(A) California has a housing supply and affordability crisis of historic proportions. The consequences of failing to effectively and aggressively confront this crisis are hurting millions of Californians, robbing future generations of the chance to call California home, stifling economic opportunities for workers and businesses, worsening poverty and homelessness, and undermining the state's environmental and climate objectives.

(B) While the causes of this crisis are multiple and complex, the absence of meaningful and effective policy reforms to significantly enhance the approval and supply of housing affordable to Californians of all income levels is a key factor.

(C) The crisis has grown so acute in California that supply, demand, and affordability fundamentals are characterized in the negative: underserved demands, constrained supply, and protracted unaffordability.

(D) According to reports and data, California has accumulated an unmet housing backlog of nearly 2,000,000 units and must provide for at least 180,000 new units annually to keep pace with growth through 2025.

(E) California's overall homeownership rate is at its lowest level since the 1940s. The state ranks 49th out of the 50 states in homeownership rates as well as in the supply of housing per capita. Only one-half of California's households are able to afford the cost of housing in their local regions.

(F) Lack of supply and rising costs are compounding inequality and limiting advancement opportunities for many Californians.

(G) The majority of California renters, more than 3,000,000 households, pay more than 30 percent of their income toward rent and nearly one-third, more than 1,500,000 households, pay more than 50 percent of their income toward rent.

(H) When Californians have access to safe and affordable housing, they have more money for food and health care; they are less likely to become homeless and in need of government-subsidized services; their children do better in school; and businesses have an easier time recruiting and retaining employees.

(I) An additional consequence of the state's cumulative housing shortage is a significant increase in greenhouse gas emissions caused by the displacement and redirection of populations to states with greater housing opportunities, particularly working- and middle-class households. California's cumulative housing shortfall therefore has not only national but international environmental consequences.

(J) California's housing picture has reached a crisis of historic proportions despite the fact that, for decades, the Legislature has enacted numerous statutes intended to significantly increase the approval, development, and affordability of housing for all income levels, including this section.

(K) The Legislature's intent in enacting this section in 1982 and in expanding its provisions since then was to significantly increase the approval and construction of new housing for all economic segments of California's communities by meaningfully and effectively curbing the capability of local governments to deny, reduce the density for, or render infeasible housing development projects and emergency shelters. That intent has not been fulfilled.

(L) It is the policy of the state that this section be interpreted and implemented in a manner to afford the fullest possible weight to the interest of, and the approval and provision of, housing.

(3) It is the intent of the Legislature that the conditions that would have a specific, adverse impact upon the public health and safety, as described in paragraph (2) of subdivision (d) and paragraph (1) of subdivision (j), arise infrequently.

(b) It is the policy of the state that a local government not reject or make infeasible housing development projects, including emergency shelters, that contribute to meeting the need determined pursuant to this article without a thorough analysis of the economic, social, and environmental effects of the action and without complying with subdivision (d).

(c) The Legislature also recognizes that premature and unnecessary development of agricultural lands for urban uses continues to have adverse effects on the availability of those lands for food and fiber production and on the economy of the state. Furthermore, it is the policy of the state that development should be guided away from prime agricultural lands; therefore, in implementing this section, local jurisdictions should encourage, to the maximum extent practicable, in filling existing urban areas.

(d) A local agency shall not disapprove a housing development project, including farmworker housing as defined in subdivision (h) of Section 50199.7 of the Health and Safety Code, for very low, low-, or moderate-income households, or an emergency shelter, or condition approval in a manner that renders the housing development project infeasible for development for the use of very low, low-, or moderate-income households, or an emergency shelter, including through the use of design review standards, unless it makes written findings, based upon a preponderance of the evidence in the record, as to one of the following:

(1) The jurisdiction has adopted a housing element pursuant to this article that has been revised in accordance with Section 65588, is in substantial compliance with this article, and the jurisdiction has met or exceeded its share of the regional housing need allocation pursuant to Section 65584 for the planning period for the income category proposed for the housing development project, provided that any disapproval or conditional approval shall not be based on any of the reasons prohibited by Section 65008. If the housing development project includes a mix of income categories, and the jurisdiction has not met or exceeded its share of the regional housing need for one or more of those categories, then this paragraph shall not be used to disapprove or

conditionally approve the housing development project. The share of the regional housing need met by the jurisdiction shall be calculated consistently with the forms and definitions that may be adopted by the Department of Housing and Community Development pursuant to Section 65400. In the case of an emergency shelter, the jurisdiction shall have met or exceeded the need for emergency shelter, as identified pursuant to paragraph (7) of subdivision (a) of Section 65583. Any disapproval or conditional approval pursuant to this paragraph shall be in accordance with applicable law, rule, or standards.

(2) The housing development project or emergency shelter as proposed would have a specific, adverse impact upon the public health or safety, and there is no feasible method to satisfactorily mitigate or avoid the specific adverse impact without rendering the development unaffordable to low- and moderate-income households or rendering the development of the emergency shelter financially infeasible. As used in this paragraph, a "specific, adverse impact" means a significant, quantifiable, direct, and unavoidable impact, based on objective, identified written public health or safety standards, policies, or conditions as they existed on the date the application was deemed complete. Inconsistency with the zoning ordinance or general plan land use designation shall not constitute a specific, adverse impact upon the public health or safety.

(3) The denial of the housing development project or imposition of conditions is required in order to comply with specific state or federal law, and there is no feasible method to comply without rendering the development unaffordable to low- and moderate-income households or rendering the development of the emergency shelter financially infeasible.

(4) The housing development project or emergency shelter is proposed on land zoned for agriculture or resource preservation that is surrounded on at least two sides by land being used for agricultural or resource preservation purposes, or which does not have adequate water or wastewater facilities to serve the project.

(5) The housing development project or emergency shelter is inconsistent with both the jurisdiction's zoning ordinance and general plan land use designation as specified in any element of the general plan as it existed on the date the application was deemed complete, and the jurisdiction has adopted a revised housing element in accordance with Section 65588 that is in substantial compliance with this article. For purposes of this section, a change to the zoning ordinance or general plan land use designation subsequent to the date the application was deemed complete shall not constitute a valid basis to disapprove or condition approval of the housing development project or emergency shelter.

(A) This paragraph cannot be utilized to disapprove or conditionally approve a housing development project if the housing development project is proposed on a site that is identified as suitable or available for very low, low-, or moderate-income households in the jurisdiction's housing element, and consistent with the density specified in the housing element, even though it is inconsistent with both the jurisdiction's zoning ordinance and general plan land use designation.

(B) If the local agency has failed to identify in the inventory of land in its housing element sites that can be developed for housing within the planning period and are sufficient to provide for the jurisdiction's share of the regional housing need for all income levels pursuant to Section 65584, then this paragraph shall not be utilized to disapprove or conditionally approve a housing development project proposed for a site designated in any element of the general plan for residential uses or designated in any element of the general plan for commercial uses if residential uses are permitted or conditionally permitted within commercial designations. In any action in court, the burden of proof shall be on the local agency to show that its housing element does identify adequate sites with appropriate zoning and development standards and with services and facilities to accommodate the local agency's share of the regional housing need for the very low, low-, and moderate-income categories.

(C) If the local agency has failed to identify a zone or zones where emergency shelters are allowed as a permitted use without a conditional use or other discretionary permit, has failed to demonstrate that the identified zone or zones include sufficient capacity to accommodate the need for emergency shelter identified in paragraph (7) of subdivision (a) of Section 65583, or has failed to demonstrate that the identified zone or zones can accommodate at least one emergency shelter, as required by paragraph (4) of subdivision (a) of Section 65583, then this paragraph shall not be utilized to disapprove or conditionally approve an emergency shelter

proposed for a site designated in any element of the general plan for industrial, commercial, or multifamily residential uses. In any action in court, the burden of proof shall be on the local agency to show that its housing element does satisfy the requirements of paragraph (4) of subdivision (a) of Section 65583.

(e) Nothing in this section shall be construed to relieve the local agency from complying with the congestion management program required by Chapter 2.6 (commencing with Section 65088) of Division 1 of Title 7 or the California Coastal Act of 1976 (Division 20 (commencing with Section 30000) of the Public Resources Code). Neither shall anything in this section be construed to relieve the local agency from making one or more of the findings required pursuant to Section 21081 of the Public Resources Code or otherwise complying with the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).

(f) (1) Except as provided in subdivision (o), nothing in this section shall be construed to prohibit a local agency from requiring the housing development project to comply with objective, quantifiable, written development standards, conditions, and policies appropriate to, and consistent with, meeting the jurisdiction's share of the regional housing need pursuant to Section 65584. However, the development standards, conditions, and policies shall be applied to facilitate and accommodate development at the density permitted on the site and proposed by the development.

(2) Except as provided in subdivision (o), nothing in this section shall be construed to prohibit a local agency from requiring an emergency shelter project to comply with objective, quantifiable, written development standards, conditions, and policies that are consistent with paragraph (4) of subdivision (a) of Section 65583 and appropriate to, and consistent with, meeting the jurisdiction's need for emergency shelter, as identified pursuant to paragraph (7) of subdivision (a) of Section 65583. However, the development standards, conditions, and policies shall be applied by the local agency to facilitate and accommodate the development of the emergency shelter project.

(3) Except as provided in subdivision (o), nothing in this section shall be construed to prohibit a local agency from imposing fees and other exactions otherwise authorized by law that are essential to provide necessary public services and facilities to the housing development project or emergency shelter.

(4) For purposes of this section, a housing development project or emergency shelter shall be deemed consistent, compliant, and in conformity with an applicable plan, program, policy, ordinance, standard, requirement, or other similar provision if there is substantial evidence that would allow a reasonable person to conclude that the housing development project or emergency shelter is consistent, compliant, or in conformity.

(g) This section shall be applicable to charter cities because the Legislature finds that the lack of housing, including emergency shelter, is a critical statewide problem.

(h) The following definitions apply for the purposes of this section:

(1) "Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.

(2) "Housing development project" means a use consisting of any of the following:

(A) Residential units only.

(B) Mixed-use developments consisting of residential and nonresidential uses with at least two-thirds of the square footage designated for residential use.

(C) Transitional housing or supportive housing.

(3) "Housing for very low, low-, or moderate-income households" means that either (A) at least 20 percent of the total units shall be sold or rented to lower income households, as defined in Section 50079.5 of the Health

and Safety Code, or (B) 100 percent of the units shall be sold or rented to persons and families of moderate income as defined in Section 50093 of the Health and Safety Code, or persons and families of middle income, as defined in Section 65008 of this code. Housing units targeted for lower income households shall be made available at a monthly housing cost that does not exceed 30 percent of 60 percent of area median income with adjustments for household size made in accordance with the adjustment factors on which the lower income eligibility limits are based. Housing units targeted for persons and families of moderate income shall be made available at a monthly housing cost that does not exceed 30 percent of 100 percent of area median income with adjustments for household size made in accordance with the adjustment factors on which the moderate-income eligibility limits are based.

(4) "Area median income" means area median income as periodically established by the Department of Housing and Community Development pursuant to Section 50093 of the Health and Safety Code. The developer shall provide sufficient legal commitments to ensure continued availability of units for very low or low-income households in accordance with the provisions of this subdivision for 30 years.

(5) Notwithstanding any other law, until January 1, 2025, "deemed complete" means that the applicant has submitted a preliminary application pursuant to Section 65941.1.

(6) "Disapprove the housing development project" includes any instance in which a local agency does either of the following:

(A) Votes on a proposed housing development project application and the application is disapproved, including any required land use approvals or entitlements necessary for the issuance of a building permit.

(B) Fails to comply with the time periods specified in subdivision (a) of Section 65950. An extension of time pursuant to Article 5 (commencing with Section 65950) shall be deemed to be an extension of time pursuant to this paragraph.

(7) "Lower density" includes any conditions that have the same effect or impact on the ability of the project to provide housing.

(8) Until January 1, 2025, "objective" means involving no personal or subjective judgment by a public official and being uniformly verifiable by reference to an external and uniform benchmark or criterion available and knowable by both the development applicant or proponent and the public official.

(9) Notwithstanding any other law, until January 1, 2025, "determined to be complete" means that the applicant has submitted a complete application pursuant to Section 65943.

(i) If any city, county, or city and county denies approval or imposes conditions, including design changes, lower density, or a reduction of the percentage of a lot that may be occupied by a building or structure under the applicable planning and zoning in force at the time the housing development project's application is deemed complete, that have a substantial adverse effect on the viability or affordability of a housing development for very low, low-, or moderate-income households, and the denial of the development or the imposition of conditions on the development is the subject of a court action which challenges the denial or the imposition of conditions, then the burden of proof shall be on the local legislative body to show that its decision is consistent with the findings as described in subdivision (d), and that the findings are supported by a preponderance of the evidence in the record, and with the requirements of subdivision (o).

(j) (1) When a proposed housing development project complies with applicable, objective general plan, zoning, and subdivision standards and criteria, including design review standards, in effect at the time that the application was deemed complete, but the local agency proposes to disapprove the project or to impose a condition that the project be developed at a lower density, the local agency shall base its decision regarding the proposed housing development project upon written findings supported by a preponderance of the evidence on the record that both of the following conditions exist:

(A) The housing development project would have a specific, adverse impact upon the public health or safety unless the project is disapproved or approved upon the condition that the project be developed at a lower density. As used in this paragraph, a "specific, adverse impact" means a significant, quantifiable, direct, and unavoidable impact, based on objective, identified written public health or safety standards, policies, or conditions as they existed on the date the application was deemed complete.

(B) There is no feasible method to satisfactorily mitigate or avoid the adverse impact identified pursuant to paragraph (1), other than the disapproval of the housing development project or the approval of the project upon the condition that it be developed at a lower density.

(2) (A) If the local agency considers a proposed housing development project to be inconsistent, not in compliance, or not in conformity with an applicable plan, program, policy, ordinance, standard, requirement, or other similar provision as specified in this subdivision, it shall provide the applicant with written documentation identifying the provision or provisions, and an explanation of the reason or reasons it considers the housing development to be inconsistent, not in compliance, or not in conformity as follows:

(i) Within 30 days of the date that the application for the housing development project is determined to be complete, if the housing development project contains 150 or fewer housing units.

(ii) Within 60 days of the date that the application for the housing development project is determined to be complete, if the housing development project contains more than 150 units.

(B) If the local agency fails to provide the required documentation pursuant to subparagraph (A), the housing development project shall be deemed consistent, compliant, and in conformity with the applicable plan, program, policy, ordinance, standard, requirement, or other similar provision.

(3) For purposes of this section, the receipt of a density bonus pursuant to Section 65915 shall not constitute a valid basis on which to find a proposed housing development project is inconsistent, not in compliance, or not in conformity, with an applicable plan, program, policy, ordinance, standard, requirement, or other similar provision specified in this subdivision.

(4) For purposes of this section, a proposed housing development project is not inconsistent with the applicable zoning standards and criteria, and shall not require a rezoning, if the housing development project is consistent with the objective general plan standards and criteria but the zoning for the project site is inconsistent with the general plan. If the local agency has complied with paragraph (2), the local agency may require the proposed housing development project to comply with the objective standards and criteria of the zoning which is consistent with the general plan, however, the standards and criteria shall be applied to facilitate and accommodate development at the density allowed on the site by the general plan and proposed by the proposed housing development project.

(k) (1) (A) (i) The applicant, a person who would be eligible to apply for residency in the development or emergency shelter, or a housing organization may bring an action to enforce this section. If, in any action brought to enforce this section, a court finds that any of the following are met, the court shall issue an order pursuant to clause (ii):

(I) The local agency, in violation of subdivision (d), disapproved a housing development project or conditioned its approval in a manner rendering it infeasible for the development of an emergency shelter, or housing for very low, low-, or moderate-income households, including farmworker housing, without making the findings required by this section or without making findings supported by a preponderance of the evidence.

(II) The local agency, in violation of subdivision (j), disapproved a housing development project complying with applicable, objective general plan and zoning standards and criteria, or imposed a condition that the project be developed at a lower density, without making the findings required by this section or without making findings supported by a preponderance of the evidence.

(III) (ia) Subject to sub-subclause (ib), the local agency, in violation of subdivision (o), required or attempted to require a housing development project to comply with an ordinance, policy, or standard not adopted and in effect when a preliminary application was submitted.

(ib) This subclause shall become inoperative on January 1, 2025.

(ii) If the court finds that one of the conditions in clause (i) is met, the court shall issue an order or judgment compelling compliance with this section within 60 days, including, but not limited to, an order that the local agency take action on the housing development project or emergency shelter. The court may issue an order or judgment directing the local agency to approve the housing development project or emergency shelter if the court finds that the local agency acted in bad faith when it disapproved or conditionally approved the housing development or emergency shelter in violation of this section. The court shall retain jurisdiction to ensure that its order or judgment is carried out and shall award reasonable attorney's fees and costs of suit to the plaintiff or petitioner, except under extraordinary circumstances in which the court finds that awarding fees would not further the purposes of this section.

(B) (i) Upon a determination that the local agency has failed to comply with the order or judgment compelling compliance with this section within 60 days issued pursuant to subparagraph (A), the court shall impose fines on a local agency that has violated this section and require the local agency to deposit any fine levied pursuant to this subdivision into a local housing trust fund. The local agency may elect to instead deposit the fine into the Building Homes and Jobs Fund, if Senate Bill 2 of the 2017–18 Regular Session is enacted, or otherwise in the Housing Rehabilitation Loan Fund. The fine shall be in a minimum amount of ten thousand dollars ($10,000) per housing unit in the housing development project on the date the application was deemed complete pursuant to Section 65943. In determining the amount of fine to impose, the court shall consider the local agency's progress in attaining its target allocation of the regional housing need pursuant to Section 65584 and any prior violations of this section. Fines shall not be paid out of funds already dedicated to affordable housing, including, but not limited to, Low and Moderate Income Housing Asset Funds, funds dedicated to housing for very low, low-, and moderate-income households, and federal HOME Investment Partnerships Program and Community Development Block Grant Program funds. The local agency shall commit and expend the money in the local housing trust fund within five years for the sole purpose of financing newly constructed housing units affordable to extremely low, very low, or low-income households. After five years, if the funds have not been expended, the money shall revert to the state and be deposited in the Building Homes and Jobs Fund, if Senate Bill 2 of the 2017–18 Regular Session is enacted, or otherwise in the Housing Rehabilitation Loan Fund, for the sole purpose of financing newly constructed housing units affordable to extremely low, very low, or low-income households.

(ii) If any money derived from a fine imposed pursuant to this subparagraph is deposited in the Housing Rehabilitation Loan Fund, then, notwithstanding Section 50661 of the Health and Safety Code, that money shall be available only upon appropriation by the Legislature.

(C) If the court determines that its order or judgment has not been carried out within 60 days, the court may issue further orders as provided by law to ensure that the purposes and policies of this section are fulfilled, including, but not limited to, an order to vacate the decision of the local agency and to approve the housing development project, in which case the application for the housing development project, as proposed by the applicant at the time the local agency took the initial action determined to be in violation of this section, along with any standard conditions determined by the court to be generally imposed by the local agency on similar projects, shall be deemed to be approved unless the applicant consents to a different decision or action by the local agency.

(2) For purposes of this subdivision, "housing organization" means a trade or industry group whose local members are primarily engaged in the construction or management of housing units or a nonprofit organization whose mission includes providing or advocating for increased access to housing for low-income households and have filed written or oral comments with the local agency prior to action on the housing development project. A housing organization may only file an action pursuant to this section to challenge the disapproval of a housing development by a local agency. A housing organization shall be entitled to reasonable attorney's fees and costs if it is the prevailing party in an action to enforce this section.

(l) If the court finds that the local agency (1) acted in bad faith when it disapproved or conditionally approved the housing development or emergency shelter in violation of this section and (2) failed to carry out the court's order or judgment within 60 days as described in subdivision (k), the court, in addition to any other remedies provided by this section, shall multiply the fine determined pursuant to subparagraph (B) of paragraph (1) of subdivision (k) by a factor of five. For purposes of this section, "bad faith" includes, but is not limited to, an action that is frivolous or otherwise entirely without merit.

(m) Any action brought to enforce the provisions of this section shall be brought pursuant to Section 1094.5 of the Code of Civil Procedure, and the local agency shall prepare and certify the record of proceedings in accordance with subdivision (c) of Section 1094.6 of the Code of Civil Procedure no later than 30 days after the petition is served, provided that the cost of preparation of the record shall be borne by the local agency, unless the petitioner elects to prepare the record as provided in subdivision (n) of this section. A petition to enforce the provisions of this section shall be filed and served no later than 90 days from the later of (1) the effective date of a decision of the local agency imposing conditions on, disapproving, or any other final action on a housing development project or (2) the expiration of the time periods specified in subparagraph (B) of paragraph (5) of subdivision (h). Upon entry of the trial court's order, a party may, in order to obtain appellate review of the order, file a petition within 20 days after service upon it of a written notice of the entry of the order, or within such further time not exceeding an additional 20 days as the trial court may for good cause allow, or may appeal the judgment or order of the trial court under Section 904.1 of the Code of Civil Procedure. If the local agency appeals the judgment of the trial court, the local agency shall post a bond, in an amount to be determined by the court, to the benefit of the plaintiff if the plaintiff is the project applicant.

(n) In any action, the record of the proceedings before the local agency shall be filed as expeditiously as possible and, notwithstanding Section 1094.6 of the Code of Civil Procedure or subdivision (m) of this section, all or part of the record may be prepared (1) by the petitioner with the petition or petitioner's points and authorities, (2) by the respondent with respondent's points and authorities, (3) after payment of costs by the petitioner, or (4) as otherwise directed by the court. If the expense of preparing the record has been borne by the petitioner and the petitioner is the prevailing party, the expense shall be taxable as costs.

(o) (1) Subject to paragraphs (2), (6), and (7), and subdivision (d) of Section 65941.1, a housing development project shall be subject only to the ordinances, policies, and standards adopted and in effect when a preliminary application including all of the information required by subdivision (a) of Section 65941.1 was submitted.

(2) Paragraph (1) shall not prohibit a housing development project from being subject to ordinances, policies, and standards adopted after the preliminary application was submitted pursuant to Section 65941.1 in the following circumstances:

(A) In the case of a fee, charge, or other monetary exaction, to an increase resulting from an automatic annual adjustment based on an independently published cost index that is referenced in the ordinance or resolution establishing the fee or other monetary exaction.

(B) A preponderance of the evidence in the record establishes that subjecting the housing development project to an ordinance, policy, or standard beyond those in effect when a preliminary application was submitted is necessary to mitigate or avoid a specific, adverse impact upon the public health or safety, as defined in subparagraph (A) of paragraph (1) of subdivision (j), and there is no feasible alternative method to satisfactorily mitigate or avoid the adverse impact.

(C) Subjecting the housing development project to an ordinance, policy, standard, or any other measure, beyond those in effect when a preliminary application was submitted is necessary to avoid or substantially lessen an impact of the project under the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).

(D) The housing development project has not commenced construction within two and one-half years following the date that the project received final approval. For purposes of this subparagraph, "final approval" means that

the housing development project has received all necessary approvals to be eligible to apply for, and obtain, a building permit or permits and either of the following is met:

(i) The expiration of all applicable appeal periods, petition periods, reconsideration periods, or statute of limitations for challenging that final approval without an appeal, petition, request for reconsideration, or legal challenge having been filed.

(ii) If a challenge is filed, that challenge is fully resolved or settled in favor of the housing development project.

(E) The housing development project is revised following submittal of a preliminary application pursuant to Section 65941.1 such that the number of residential units or square footage of construction changes by 20 percent or more, exclusive of any increase resulting from the receipt of a density bonus, incentive, concession, waiver, or similar provision. For purposes of this subdivision, "square footage of construction" means the building area, as defined by the California Building Standards Code (Title 24 of the California Code of Regulations).

(3) This subdivision does not prevent a local agency from subjecting the additional units or square footage of construction that result from project revisions occurring after a preliminary application is submitted pursuant to Section 65941.1 to the ordinances, policies, and standards adopted and in effect when the preliminary application was submitted.

(4) For purposes of this subdivision, "ordinances, policies, and standards" includes general plan, community plan, specific plan, zoning, design review standards and criteria, subdivision standards and criteria, and any other rules, regulations, requirements, and policies of a local agency, as defined in Section 66000, including those relating to development impact fees, capacity or connection fees or charges, permit or processing fees, and other exactions.

(5) This subdivision shall not be construed in a manner that would lessen the restrictions imposed on a local agency, or lessen the protections afforded to a housing development project, that are established by any other law, including any other part of this section.

(6) This subdivision shall not restrict the authority of a public agency or local agency to require mitigation measures to lessen the impacts of a housing development project under the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).

(7) With respect to completed residential units for which the project approval process is complete and a certificate of occupancy has been issued, nothing in this subdivision shall limit the application of later enacted ordinances, policies, and standards that regulate the use and occupancy of those residential units, such as ordinances relating to rental housing inspection, rent stabilization, restrictions on short-term renting, and business licensing requirements for owners of rental housing.

(8) This subdivision shall become inoperative on January 1, 2025.

(p) This section shall be known, and may be cited, as the Housing Accountability Act.

SEC. 4. Section 65905.5 is added to the Government Code, to read:

65905.5. (a) Notwithstanding any other law, if a proposed housing development project complies with the applicable, objective general plan and zoning standards in effect at the time an application is deemed complete, after the application is deemed complete, a city, county, or city and county shall not conduct more than five hearings pursuant to Section 65905, or any other law, ordinance, or regulation requiring a public hearing in connection with the approval of that housing development project. If the city, county, or city and county continues a hearing subject to this section to another date, the continued hearing shall count as one of the five hearings allowed under this section. The city, county, or city and county shall consider and either approve or

disapprove the application at any of the five hearings allowed under this section consistent with the applicable timelines under the Permit Streamlining Act (Chapter 4.5 (commencing with Section 65920)).

(b) For purposes of this section:

(1) "Deemed complete" means that the application has met all of the requirements specified in the relevant list compiled pursuant to Section 65940 that was available at the time when the application was submitted.

(2) "Hearing" includes any public hearing, workshop, or similar meeting conducted by the city or county with respect to the housing development project, whether by the legislative body of the city or county, the planning agency established pursuant to Section 65100, or any other agency, department, board, commission, or any other designated hearing officer or body of the city or county, or any committee or subcommittee thereof. "Hearing" does not include a hearing to review a legislative approval required for a proposed housing development project, including, but not limited to, a general plan amendment, a specific plan adoption or amendment, or a zoning amendment, or any hearing arising from a timely appeal of the approval or disapproval of a legislative approval.

(3) "Housing development project" has the same meaning as defined in paragraph (2) of subdivision (h) of Section 65589.5.

(c) (1) For purposes of this section, a housing development project shall be deemed consistent, compliant, and in conformity with an applicable plan, program, policy, ordinance, standard, requirement, or other similar provision if there is substantial evidence that would allow a reasonable person to conclude that the housing development project is consistent, compliant, or in conformity.

(2) A proposed housing development project is not inconsistent with the applicable zoning standards and criteria, and shall not require a rezoning, if the housing development project is consistent with the objective general plan standards and criteria, but the zoning for the project site is inconsistent with the general plan. If the local agency complies with the written documentation requirements of paragraph (2) of subdivision (j) of Section 65589.5, the local agency may require the proposed housing development project to comply with the objective standards and criteria of the zoning that is consistent with the general plan; however, the standards and criteria shall be applied to facilitate and accommodate development at the density allowed on the site by the general plan and proposed by the proposed housing development project.

(d) Nothing in this section supersedes, limits, or otherwise modifies the requirements of, or the standards of review pursuant to, Division 13 (commencing with Section 21000) of the Public Resources Code.

(e) This section shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 5. Section 65913.10 is added to the Government Code, to read:

65913.10. (a) For purposes of any state or local law, ordinance, or regulation that requires the city or county to determine whether the site of a proposed housing development project is a historic site, the city or county shall make that determination at the time the application for the housing development project is deemed complete. A determination as to whether a parcel of property is a historic site shall remain valid during the pendency of the housing development project for which the application was made unless any archaeological, paleontological, or tribal cultural resources are encountered during any grading, site disturbance, or building alteration activities.

(b) For purposes of this section:

(1) "Deemed complete" means that the application has met all of the requirements specified in the relevant list compiled pursuant to Section 65940 that was available at the time when the application was submitted.

(2) "Housing development project" has the same meaning as defined in paragraph (2) of subdivision (h) of Section 65589.5.

(c) (1) Nothing in this section supersedes, limits, or otherwise modifies the requirements of, or the standards of review pursuant to, Division 13 (commencing with Section 21000) of the Public Resources Code.

(2) Nothing in this section supersedes, limits, or otherwise modifies the requirements of the California Coastal Act of 1976 (Division 20 (commencing with Section 30000) of the Public Resources Code).

(d) This section shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 6. Section 65940 of the Government Code is amended to read:

65940. (a) (1) Each public agency shall compile one or more lists that shall specify in detail the information that will be required from any applicant for a development project. Each public agency shall revise the list of information required from an applicant to include a certification of compliance with Section 65962.5, and the statement of application required by Section 65943. Copies of the information, including the statement of application required by Section 65943, shall be made available to all applicants for development projects and to any person who requests the information.

(2) An affected city or affected county, as defined in Section 66300, shall include the information necessary to determine compliance with the requirements of subdivision (d) of Section 66300 in the list compiled pursuant to paragraph (1).

(b) The list of information required from any applicant shall include, where applicable, identification of whether the proposed project is located within 1,000 feet of a military installation, beneath a low-level flight path or within special use airspace as defined in Section 21098 of the Public Resources Code, and within an urbanized area as defined in Section 65944.

(c) (1) A public agency that is not beneath a low-level flight path or not within special use airspace and does not contain a military installation is not required to change its list of information required from applicants to comply with subdivision (b).

(2) A public agency that is entirely urbanized, as defined in subdivision (e) of Section 65944, with the exception of a jurisdiction that contains a military installation, is not required to change its list of information required from applicants to comply with subdivision (b).

(d) This section shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 7. Section 65940 is added to the Government Code, to read:

65940. (a) Each public agency shall compile one or more lists that shall specify in detail the information that will be required from any applicant for a development project. Each public agency shall revise the list of information required from an applicant to include a certification of compliance with Section 65962.5, and the statement of application required by Section 65943. Copies of the information, including the statement of application required by Section 65943, shall be made available to all applicants for development projects and to any person who requests the information.

(b) The list of information required from any applicant shall include, where applicable, identification of whether the proposed project is located within 1,000 feet of a military installation, beneath a low-level flight path or within special use airspace as defined in Section 21098 of the Public Resources Code, and within an urbanized area as defined in Section 65944.

(c) (1) A public agency that is not beneath a low-level flight path or not within special use airspace and does not contain a military installation is not required to change its list of information required from applicants to comply with subdivision (b).

(2) A public agency that is entirely urbanized, as defined in subdivision (e) of Section 65944, with the exception of a jurisdiction that contains a military installation, is not required to change its list of information required from applicants to comply with subdivision (b).

(d) This section shall become operative on January 1, 2025.

SEC. 8. Section 65941.1 is added to the Government Code, to read:

65941.1. (a) An applicant for a housing development project, as defined in paragraph (2) of subdivision (h) of Section 65589.5, shall be deemed to have submitted a preliminary application upon providing all of the following information about the proposed project to the city, county, or city and county from which approval for the project is being sought and upon payment of the permit processing fee:

(1) The specific location, including parcel numbers, a legal description, and site address, if applicable.

(2) The existing uses on the project site and identification of major physical alterations to the property on which the project is to be located.

(3) A site plan showing the location on the property, elevations showing design, color, and material, and the massing, height, and approximate square footage, of each building that is to be occupied.

(4) The proposed land uses by number of units and square feet of residential and nonresidential development using the categories in the applicable zoning ordinance.

(5) The proposed number of parking spaces.

(6) Any proposed point sources of air or water pollutants.

(7) Any species of special concern known to occur on the property.

(8) Whether a portion of the property is located within any of the following:

(A) A very high fire hazard severity zone, as determined by the Department of Forestry and Fire Protection pursuant to Section 51178.

(B) Wetlands, as defined in the United States Fish and Wildlife Service Manual, Part 660 FW 2 (June 21, 1993).

(C) A hazardous waste site that is listed pursuant to Section 65962.5 or a hazardous waste site designated by the Department of Toxic Substances Control pursuant to Section 25356 of the Health and Safety Code.

(D) A special flood hazard area subject to inundation by the 1 percent annual chance flood (100-year flood) as determined by the Federal Emergency Management Agency in any official maps published by the Federal Emergency Management Agency.

(E) A delineated earthquake fault zone as determined by the State Geologist in any official maps published by the State Geologist, unless the development complies with applicable seismic protection building code standards adopted by the California Building Standards Commission under the California Building Standards Law (Part 2.5 (commencing with Section 18901) of Division 13 of the Health and Safety Code), and by any local building department under Chapter 12.2 (commencing with Section 8875) of Division 1 of Title 2.

(F) A stream or other resource that may be subject to a streambed alteration agreement pursuant to Chapter 6 (commencing with Section 1600) of Division 2 of the Fish and Game Code.

(9) Any historic or cultural resources known to exist on the property.

(10) The number of proposed below market rate units and their affordability levels.

(11) The number of bonus units and any incentives, concessions, waivers, or parking reductions requested pursuant to Section 65915.

(12) Whether any approvals under the Subdivision Map Act, including, but not limited to, a parcel map, a tentative map, or a condominium map, are being requested.

(13) The applicant's contact information and, if the applicant does not own the property, consent from the property owner to submit the application.

(14) For a housing development project proposed to be located within the coastal zone, whether any portion of the property contains any of the following:

(A) Wetlands, as defined in subdivision (b) of Section 13577 of Title 14 of the California Code of Regulations.

(B) Environmentally sensitive habitat areas, as defined in Section 30240 of the Public Resources Code.

(C) A tsunami run-up zone.

(D) Use of the site for public access to or along the coast.

(15) The number of existing residential units on the project site that will be demolished and whether each existing unit is occupied or unoccupied.

(16) A site map showing a stream or other resource that may be subject to a streambed alteration agreement pursuant to Chapter 6 (commencing with Section 1600) of Division 2 of the Fish and Game Code and an aerial site photograph showing existing site conditions of environmental site features that would be subject to regulations by a public agency, including creeks and wetlands.

(17) The location of any recorded public easement, such as easements for storm drains, water lines, and other public rights of way.

(b) (1) Each local agency shall compile a checklist and application form that applicants for housing development projects may use for the purpose of satisfying the requirements for submittal of a preliminary application.

(2) The Department of Housing and Community Development shall adopt a standardized form that applicants for housing development projects may use for the purpose of satisfying the requirements for submittal of a preliminary application if a local agency has not developed its own application form pursuant to paragraph (1). Adoption of the standardized form shall not be subject to Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code.

(3) A checklist or form shall not require or request any information beyond that expressly identified in subdivision (a).

(c) After submittal of all of the information required by subdivision (a), if the development proponent revises the project such that the number of residential units or square footage of construction changes by 20 percent or more, exclusive of any increase resulting from the receipt of a density bonus, incentive, concession, waiver, or similar provision, the housing development project shall not be deemed to have submitted a preliminary application that satisfies this section until the development proponent resubmits the information required by subdivision (a) so that it reflects the revisions. For purposes of this subdivision, "square footage of construction" means the building area, as defined by the California Building Standards Code (Title 24 of the California Code of Regulations).

(d) (1) Within 180 calendar days after submitting a preliminary application with all of the information required by subdivision (a) to a city, county, or city and county, the development proponent shall submit an application for a development project that includes all of the information required to process the development application consistent with Sections 65940, 65941, and 65941.5.

(2) If the public agency determines that the application for the development project is not complete pursuant to Section 65943, the development proponent shall submit the specific information needed to complete the application within 90 days of receiving the agency's written identification of the necessary information. If the development proponent does not submit this information within the 90-day period, then the preliminary application shall expire and have no further force or effect.

(3) This section shall not require an affirmative determination by a city, county, or city and county regarding the completeness of a preliminary application or a development application for purposes of compliance with this section.

(e) This section shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 9. Section 65943 of the Government Code is amended to read:

65943. (a) Not later than 30 calendar days after any public agency has received an application for a development project, the agency shall determine in writing whether the application is complete and shall immediately transmit the determination to the applicant for the development project. If the application is determined to be incomplete, the lead agency shall provide the applicant with an exhaustive list of items that were not complete. That list shall be limited to those items actually required on the lead agency's submittal requirement checklist. In any subsequent review of the application determined to be incomplete, the local agency shall not request the applicant to provide any new information that was not stated in the initial list of items that were not complete. If the written determination is not made within 30 days after receipt of the application, and the application includes a statement that it is an application for a development permit, the application shall be deemed complete for purposes of this chapter. Upon receipt of any resubmittal of the application, a new 30-day period shall begin, during which the public agency shall determine the completeness of the application. If the application is determined not to be complete, the agency's determination shall specify those parts of the application which are incomplete and shall indicate the manner in which they can be made complete, including a list and thorough description of the specific information needed to complete the application. The applicant shall submit materials to the public agency in response to the list and description.

(b) Not later than 30 calendar days after receipt of the submitted materials described in subdivision (a), the public agency shall determine in writing whether the application as supplemented or amended by the submitted materials is complete and shall immediately transmit that determination to the applicant. In making this determination, the public agency is limited to determining whether the application as supplemented or amended includes the information required by the list and a thorough description of the specific information needed to complete the application required by subdivision (a). If the written determination is not made within that 30-day period, the application together with the submitted materials shall be deemed complete for purposes of this chapter.

(c) If the application together with the submitted materials are determined not to be complete pursuant to subdivision (b), the public agency shall provide a process for the applicant to appeal that decision in writing to the governing body of the agency or, if there is no governing body, to the director of the agency, as provided by that agency. A city or county shall provide that the right of appeal is to the governing body or, at their option, the planning commission, or both.

There shall be a final written determination by the agency on the appeal not later than 60 calendar days after receipt of the applicant's written appeal. The fact that an appeal is permitted to both the planning commission and to the governing body does not extend the 60-day period. Notwithstanding a decision pursuant to subdivision (b) that the application and submitted materials are not complete, if the final written determination on the appeal is not made within that 60-day period, the application with the submitted materials shall be deemed complete for the purposes of this chapter.

(d) Nothing in this section precludes an applicant and a public agency from mutually agreeing to an extension of any time limit provided by this section.

(e) A public agency may charge applicants a fee not to exceed the amount reasonably necessary to provide the service required by this section. If a fee is charged pursuant to this section, the fee shall be collected as part of the application fee charged for the development permit.

(f) Each city and each county shall make copies of any list compiled pursuant to Section 65940 with respect to information required from an applicant for a housing development project, as that term is defined in paragraph (2) of subdivision (h) of Section 65589.5, available both (1) in writing to those persons to whom the agency is required to make information available under subdivision (a) of that section, and (2) publicly available on the internet website of the city or county.

(g) This section shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 10. Section 65943 is added to the Government Code, to read:

65943. (a) Not later than 30 calendar days after any public agency has received an application for a development project, the agency shall determine in writing whether the application is complete and shall immediately transmit the determination to the applicant for the development project. If the written determination is not made within 30 days after receipt of the application, and the application includes a statement that it is an application for a development permit, the application shall be deemed complete for purposes of this chapter. Upon receipt of any resubmittal of the application, a new 30-day period shall begin, during which the public agency shall determine the completeness of the application. If the application is determined not to be complete, the agency's determination shall specify those parts of the application which are incomplete and shall indicate the manner in which they can be made complete, including a list and thorough description of the specific information needed to complete the application. The applicant shall submit materials to the public agency in response to the list and description.

(b) Not later than 30 calendar days after receipt of the submitted materials, the public agency shall determine in writing whether they are complete and shall immediately transmit that determination to the applicant. If the written determination is not made within that 30-day period, the application together with the submitted materials shall be deemed complete for purposes of this chapter.

(c) If the application together with the submitted materials are determined not to be complete pursuant to subdivision (b), the public agency shall provide a process for the applicant to appeal that decision in writing to the governing body of the agency or, if there is no governing body, to the director of the agency, as provided by that agency. A city or county shall provide that the right of appeal is to the governing body or, at their option, the planning commission, or both.

There shall be a final written determination by the agency on the appeal not later than 60 calendar days after receipt of the applicant's written appeal. The fact that an appeal is permitted to both the planning commission and to the governing body does not extend the 60-day period. Notwithstanding a decision pursuant to subdivision (b) that the application and submitted materials are not complete, if the final written determination on the appeal is not made within that 60-day period, the application with the submitted materials shall be deemed complete for the purposes of this chapter.

(d) Nothing in this section precludes an applicant and a public agency from mutually agreeing to an extension of any time limit provided by this section.

(e) A public agency may charge applicants a fee not to exceed the amount reasonably necessary to provide the service required by this section. If a fee is charged pursuant to this section, the fee shall be collected as part of the application fee charged for the development permit.

(f) This section shall become operative on January 1, 2025.

SEC. 11. Section 65950 of the Government Code is amended to read:

65950. (a) A public agency that is the lead agency for a development project shall approve or disapprove the project within whichever of the following periods is applicable:

(1) One hundred eighty days from the date of certification by the lead agency of the environmental impact report, if an environmental impact report is prepared pursuant to Section 21100 or 21151 of the Public Resources Code for the development project.

(2) Ninety days from the date of certification by the lead agency of the environmental impact report, if an environmental impact report is prepared pursuant to Section 21100 or 21151 of the Public Resources Code for a development project defined in subdivision (c).

(3) Sixty days from the date of certification by the lead agency of the environmental impact report, if an environmental impact report is prepared pursuant to Section 21100 or 21151 of the Public Resources Code for a development project defined in subdivision (c) and all of the following conditions are met:

(A) At least 49 percent of the units in the development project are affordable to very low or low-income households, as defined by Sections 50105 and 50079.5 of the Health and Safety Code, respectively. Rents for the lower income units shall be set at an affordable rent, as that term is defined in Section 50053 of the Health and Safety Code, for at least 30 years. Owner-occupied units shall be available at an affordable housing cost, as that term is defined in Section 50052.5 of the Health and Safety Code.

(B) Prior to the application being deemed complete for the development project pursuant to Article 3 (commencing with Section 65940), the lead agency received written notice from the project applicant that an application has been made or will be made for an allocation or commitment of financing, tax credits, bond authority, or other financial assistance from a public agency or federal agency, and the notice specifies the financial assistance that has been applied for or will be applied for and the deadline for application for that assistance, the requirement that one of the approvals of the development project by the lead agency is a prerequisite to the application for or approval of the application for financial assistance, and that the financial assistance is necessary for the project to be affordable as required pursuant to subparagraph (A).

(C) There is confirmation that the application has been made to the public agency or federal agency prior to certification of the environmental impact report.

(4) Sixty days from the date of adoption by the lead agency of the negative declaration, if a negative declaration is completed and adopted for the development project.

(5) Sixty days from the determination by the lead agency that the project is exempt from the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), if the project is exempt from that act.

(b) This section does not preclude a project applicant and a public agency from mutually agreeing in writing to an extension of any time limit provided by this section pursuant to Section 65957.

(c) For purposes of paragraphs (2) and (3) of subdivision (a) and Section 65952, “development project” means a housing development project, as that term is defined in paragraph (2) of subdivision (h) of Section 65589.5.

(d) For purposes of this section, “lead agency” and “negative declaration” have the same meaning as defined in Sections 21067 and 21064 of the Public Resources Code, respectively.

(e) This section shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 12. Section 65950 is added to the Government Code, to read:

65950. (a) A public agency that is the lead agency for a development project shall approve or disapprove the project within whichever of the following periods is applicable:

(1) One hundred eighty days from the date of certification by the lead agency of the environmental impact report, if an environmental impact report is prepared pursuant to Section 21100 or 21151 of the Public Resources Code for the development project.

(2) One hundred twenty days from the date of certification by the lead agency of the environmental impact report, if an environmental impact report is prepared pursuant to Section 21100 or 21151 of the Public Resources Code for a development project defined in subdivision (c).

(3) Ninety days from the date of certification by the lead agency of the environmental impact report, if an environmental impact report is prepared pursuant to Section 21100 or 21151 of the Public Resources Code for a development project defined in subdivision (c) and all of the following conditions are met:

(A) At least 49 percent of the units in the development project are affordable to very low or low-income households, as defined by Sections 50105 and 50079.5 of the Health and Safety Code, respectively. Rents for the lower income units shall be set at an affordable rent, as that term is defined in Section 50053 of the Health and Safety Code, for at least 30 years. Owner-occupied units shall be available at an affordable housing cost, as that term is defined in Section 50052.5 of the Health and Safety Code.

(B) Prior to the application being deemed complete for the development project pursuant to Article 3 (commencing with Section 65940), the lead agency received written notice from the project applicant that an application has been made or will be made for an allocation or commitment of financing, tax credits, bond authority, or other financial assistance from a public agency or federal agency, and the notice specifies the financial assistance that has been applied for or will be applied for and the deadline for application for that assistance, the requirement that one of the approvals of the development project by the lead agency is a prerequisite to the application for or approval of the application for financial assistance, and that the financial assistance is necessary for the project to be affordable as required pursuant to subparagraph (A).

(C) There is confirmation that the application has been made to the public agency or federal agency prior to certification of the environmental impact report.

(4) Sixty days from the date of adoption by the lead agency of the negative declaration, if a negative declaration is completed and adopted for the development project.

(5) Sixty days from the determination by the lead agency that the project is exempt from the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code), if the project is exempt from that act.

(b) This section does not preclude a project applicant and a public agency from mutually agreeing in writing to an extension of any time limit provided by this section pursuant to Section 65957.

(c) For purposes of paragraphs (2) and (3) of subdivision (a) and Section 65952, “development project” means a use consisting of either of the following:

(1) Residential units only.

(2) Mixed-use developments consisting of residential and nonresidential uses in which the nonresidential uses are less than 50 percent of the total square footage of the development and are limited to neighborhood commercial uses and to the first floor of buildings that are two or more stories. As used in this paragraph, “neighborhood commercial” means small-scale general or specialty stores that furnish goods and services primarily to residents of the neighborhood.

(d) For purposes of this section, “lead agency” and “negative declaration” have the same meaning as defined in Sections 21067 and 21064 of the Public Resources Code, respectively.

(e) This section shall become operative on January 1, 2025.

SEC. 13. Chapter 12 (commencing with Section 66300) is added to Division 1 of Title 7 of the Government Code, to read:

CHAPTER 12. Housing Crisis Act of 2019

66300. (a) As used in this section:

(1) (A) Except as otherwise provided in subparagraph (B), "affected city" means a city, including a charter city, that the Department of Housing and Community Development determines, pursuant to subdivision (e), is in an urbanized area or urban cluster, as designated by the United States Census Bureau.

(B) Notwithstanding subparagraph (A), "affected city" does not include any city that has a population of 5,000 or less and is not located within an urbanized area, as designated by the United States Census Bureau.

(2) "Affected county" means a census designated place, based on the 2013-2017 American Community Survey 5-year Estimates, that is wholly located within the boundaries of an urbanized area, as designated by the United States Census Bureau.

(3) Notwithstanding any other law, "affected county" and "affected city" includes the electorate of an affected county or city exercising its local initiative or referendum power, whether that power is derived from the California Constitution, statute, or the charter or ordinances of the affected county or city.

(4) "Department" means the Department of Housing and Community Development.

(5) "Development policy, standard, or condition" means any of the following:

(A) A provision of, or amendment to, a general plan.

(B) A provision of, or amendment to, a specific plan.

(C) A provision of, or amendment to, a zoning ordinance.

(D) A subdivision standard or criterion.

(6) "Housing development project" has the same meaning as defined in paragraph (2) of subdivision (h) of Section 65589.5.

(7) "Objective design standard" means a design standard that involve no personal or subjective judgment by a public official and is uniformly verifiable by reference to an external and uniform benchmark or criterion available and knowable by both the development applicant or proponent and the public official before submittal of an application.

(b) (1) Notwithstanding any other law except as provided in subdivision (i), with respect to land where housing is an allowable use, an affected county or an affected city shall not enact a development policy, standard, or condition that would have any of the following effects:

(A) Changing the general plan land use designation, specific plan land use designation, or zoning of a parcel or parcels of property to a less intensive use or reducing the intensity of land use within an existing general plan land use designation, specific plan land use designation, or zoning district below what was allowed under the land use designation and zoning ordinances of the affected county or affected city, as applicable, as in effect on January 1, 2018, except as otherwise provided in clause (ii) of subparagraph (B). For purposes of this subparagraph, "less intensive use" includes, but is not limited to, reductions to height, density, or floor area ratio, new or increased open space or lot size requirements, or new or increased setback requirements, minimum frontage requirements, or maximum lot coverage limitations, or anything that would lessen the intensity of housing.

(B) (i) Imposing a moratorium or similar restriction or limitation on housing development, including mixed-use development, within all or a portion of the jurisdiction of the affected county or city, other than to specifically protect against an imminent threat to the health and safety of persons residing in, or within the immediate vicinity of, the area subject to the moratorium or for projects specifically identified as existing restricted affordable housing.

(ii) The affected county or affected city, as applicable, shall not enforce a zoning ordinance imposing a moratorium or other similar restriction on or limitation of housing development until it has submitted the ordinance to, and received approval from, the department. The department shall approve a zoning ordinance submitted to it pursuant to this subparagraph only if it determines that the zoning ordinance satisfies the requirements of this subparagraph. If the department denies approval of a zoning ordinance imposing a moratorium or similar restriction or limitation on housing development as inconsistent with this subparagraph, that ordinance shall be deemed void.

(C) Imposing or enforcing design standards established on or after January 1, 2020, that are not objective design standards.

(D) Except as provided in subparagraph (E), establishing or implementing any provision that:

(i) Limits the number of land use approvals or permits necessary for the approval and construction of housing that will be issued or allocated within all or a portion of the affected county or affected city, as applicable.

(ii) Acts as a cap on the number of housing units that can be approved or constructed either annually or for some other time period.

(iii) Limits the population of the affected county or affected city, as applicable.

(E) Notwithstanding subparagraph (D), an affected county or affected city may enforce a limit on the number of approvals or permits or a cap on the number of housing units that can be approved or constructed if the provision of law imposing the limit was approved by voters prior to January 1, 2005, and the affected county or affected city is located in a predominantly agricultural county. For the purposes of this subparagraph, “predominantly agricultural county” means a county that meets both of the following, as determined by the most recent California Farmland Conversion Report produced by the Department of Conservation:

(i) Has more than 550,000 acres of agricultural land.

(ii) At least one-half of the county area is agricultural land.

(2) Any development policy, standard, or condition enacted on or after the effective date of this section that does not comply with this section shall be deemed void.

(c) Notwithstanding subdivisions (b) and (f), an affected county or affected city may enact a development policy, standard, or condition to prohibit the commercial use of land that is designated for residential use, including, but not limited to, short-term occupancy of a residence, consistent with the authority conferred on the county or city by other law.

(d) Notwithstanding any other provision of this section, both of the following shall apply:

(1) An affected city or an affected county shall not approve a housing development project that will require the demolition of residential dwelling units unless the project will create at least as many residential dwelling units as will be demolished.

(2) An affected city or an affected county shall not approve a housing development project that will require the demolition of occupied or vacant protected units, unless all of the following apply:

(A) (i) The project will replace all existing or demolished protected units.

(ii) Any protected units replaced pursuant to this subparagraph shall be considered in determining whether the housing development project satisfies the requirements of Section 65915 or a locally adopted requirement that requires, as a condition of the development of residential rental units, that the project provide a certain percentage of residential rental units affordable to, and occupied by, households with incomes that do not exceed the limits for moderate-income, lower income, very low income, or extremely low income households, as specified in Sections 50079.5, 50093, 50105, and 50106 of the Health and Safety Code.

(iii) Notwithstanding clause (i), in the case of a protected unit that is or was, within the five-year period preceding the application, subject to a form of rent or price control through a local government's valid exercise of its police power, and that is or was occupied by persons or families above lower income, the affected city or affected county may do either of the following:

(I) Require that the replacement units be made available at affordable rent or affordable housing cost to, and occupied by, low-income persons or families. If the replacement units will be rental dwelling units, these units shall be subject to a recorded affordability restriction for at least 55 years.

(II) Require that the units be replaced in compliance with the jurisdiction's rent or price control ordinance, provided that each unit is replaced. Unless otherwise required by the affected city or affected county's rent or price control ordinance, these units shall not be subject to a recorded affordability restriction.

(B) The housing development project will include at least as many residential dwelling units as the greatest number of residential dwelling units that existed on the project site within the last five years.

(C) Any existing residents will be allowed to occupy their units until six months before the start of construction activities with proper notice, subject to Chapter 16 (commencing with Section 7260) of Division 7 of Title 1.

(D) The developer agrees to provide both of the following to the occupants of any protected units:

(i) Relocation benefits to the occupants of those affordable residential rental units, subject to Chapter 16 (commencing with Section 7260) of Division 7 of Title 1.

(ii) A right of first refusal for a comparable unit available in the new housing development affordable to the household at an affordable rent, as defined in Section 50053 of the Health and Safety Code, or an affordable housing cost, as defined in 50052.5.

(E) For purposes of this paragraph:

(i) "Equivalent size" means that the replacement units contain at least the same total number of bedrooms as the units being replaced.

(ii) "Protected units" means any of the following:

(I) Residential dwelling units that are or were subject to a recorded covenant, ordinance, or law that restricts rents to levels affordable to persons and families of lower or very low income within the past five years.

(II) Residential dwelling units that are or were subject to any form of rent or price control through a public entity's valid exercise of its police power within the past five years.

(III) Residential dwelling units that are or were occupied by lower or very low income households within the past five years.

(IV) Residential dwelling units that were withdrawn from rent or lease in accordance with Chapter 12.75 (commencing with Section 7060) of Division 7 of Title 1 within the past 10 years.

(iii) "Replace" shall have the same meaning as provided in subparagraph (B) of paragraph (3) of subdivision (c) of Section 65915.

(3) This subdivision shall not supersede any objective provision of a locally adopted ordinance that places restrictions on the demolition of residential dwelling units or the subdivision of residential rental units that are more protective of lower income households, requires the provision of a greater number of units affordable to lower income households, or that requires greater relocation assistance to displaced households.

(4) This subdivision shall only apply to a housing development project that submits a complete application pursuant to Section 65943 on or after January 1, 2020.

(e) The Department of Housing and Community Development shall determine those cities and counties in this state that are affected cities and affected counties, in accordance with subdivision (a) by June 30, 2020. The department may update the list of affected cities and affected counties once on or after January 1, 2021, to account for changes in urbanized areas or urban clusters due to new data obtained from the 2020 census. The department's determination shall remain valid until January 1, 2025.

(f) (1) Except as provided in paragraphs (3) and (4) and subdivisions (h) and (i), this section shall prevail over any conflicting provision of this title or other law regulating housing development in this state to the extent that this section more fully advances the intent specified in paragraph (2).

(2) It is the intent of the Legislature that this section be broadly construed so as to maximize the development of housing within this state. Any exception to the requirements of this section, including an exception for the health and safety of occupants of a housing development project, shall be construed narrowly.

(3) This section shall not be construed as prohibiting the adoption or amendment of a development policy, standard, or condition in a manner that:

(A) Allows greater density.

(B) Facilitates the development of housing.

(C) Reduces the costs to a housing development project.

(D) Imposes or implements mitigation measures as necessary to comply with the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).

(4) This section shall not apply to a housing development project located within a very high fire hazard severity zone. For purposes of this paragraph, "very high fire hazard severity zone" has the same meaning as provided in Section 51177.

(g) This section shall not be construed to void a height limit, urban growth boundary, or urban limit established by the electorate of an affected county or an affected city, provided that the height limit, urban growth boundary, or urban limit complies with subparagraph (A) of paragraph (1) of subdivision (b).

(h) (1) Nothing in this section supersedes, limits, or otherwise modifies the requirements of, or the standards of review pursuant to, Division 13 (commencing with Section 21000) of the Public Resources Code.

(2) Nothing in this section supersedes, limits, or otherwise modifies the requirements of the California Coastal Act of 1976 (Division 20 (commencing with Section 30000) of the Public Resources Code). For a housing development project proposed within the coastal zone, nothing in this section shall be construed to prohibit an affected county or an affected city from enacting a development policy, standard, or condition necessary to implement or amend a certified local coastal program consistent with the California Coastal Act of 1976 (Division 20 (commencing with Section 30000) of the Public Resources Code).

(i) (1) This section does not prohibit an affected county or an affected city from changing a land use designation or zoning ordinance to a less intensive use if the city or county concurrently changes the development standards, policies, and conditions applicable to other parcels within the jurisdiction to ensure that there is no net loss in residential capacity.

(2) This section does not prohibit an affected county or an affected city from changing a land use designation or zoning ordinance to a less intensive use on a site that is a mobilehome park, as defined in Section 18214 of the Health and Safety Code, as of the effective date of this section, and the no net loss requirement in paragraph (1) shall not apply.

(j) Notwithstanding subdivisions (b) and (f), this section does not prohibit an affected city or an affected county from enacting a development policy, standard, or condition that is intended to preserve or facilitate the production of housing for lower income households, as defined in Section 50079.5 of the Health and Safety Code, or housing types that traditionally serve lower income households, including mobilehome parks, single-room occupancy units, or units subject to any form of rent or price control through a public entity's valid exercise of its police power.

66301. This chapter shall remain in effect only until January 1, 2025, and as of that date is repealed.

SEC. 14. The Legislature finds and declares that the provision of adequate housing, in light of the severe shortage of housing at all income levels in this state, is a matter of statewide concern and is not a municipal affair as that term is used in Section 5 of Article XI of the California Constitution. Therefore, the provisions of this act apply to all cities, including charter cities.

SEC. 15. No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution for certain costs that may be incurred by a local agency or school district because, in that regard, this act creates a new crime or infraction, eliminates a crime or infraction, or changes the penalty for a crime or infraction, within the meaning of Section 17556 of the Government Code, or changes the definition of a crime within the meaning of Section 6 of Article XIII B of the California Constitution.

However, if the Commission on State Mandates determines that this act contains other costs mandated by the state, reimbursement to local agencies and school districts for those costs shall be made pursuant to Part 7 (commencing with Section 17500) of Division 4 of Title 2 of the Government Code.

SEC. 16. The provisions of this act are severable. If any provision of this act or its application is held invalid, that invalidity shall not affect other provisions or applications that can be given effect without the invalid provision or application.

Property Information

- APN: 152-040-003
- Street Address:
  13175 Orange Street
  Eastvale, CA 92880

- Existing Land Use: Residential
- Proposed Land Use: Residential
- Existing General Plan Designation:
- Medium Density Residential (2.1-5 du/ac
- Existing Zoning Designation:
- A-2 - Heavy Agriculture

Property Owner:
The Kraig A. Kirschner 1998 Revocable Trust
14058 Euclid Ave.
Chino, CA 91710

Project Summary
- Gross Site Area: 10.0 Acres
- Developable Area: 8.28 Acres
  Less Public Street Dedications)
- Number of Homes: 41 Single-family detached homes
- Zoning Density: 4.95 du/ac
  Per Developable Area)
- Building Coverage: 139,371 SF (Conditioned + Unconditioned)
- Gross Building Area: 112,384 SF (Conditioned)
- Occupancy: R-3
- Type of Construction: V-B
- Sprinkler System: NFPA 13D
- Number of Stories: 1 and 2 Stories

Development Criteria*	Provided
Minimum Lot Standards	
Lot Size	4769 SF
Lot Width	55'
Lot Depth	83'
Maximum Height	27'
Minimum Primary Building Setbacks	
Front (To Garage Face)	20'
Front (To Living Area)	10'
Side (Corner)	10'
Side (Interior)	5'
Rear	15'

* Accessory Structures shall be subject to City of Eastvale Zoning Code Section 5.12

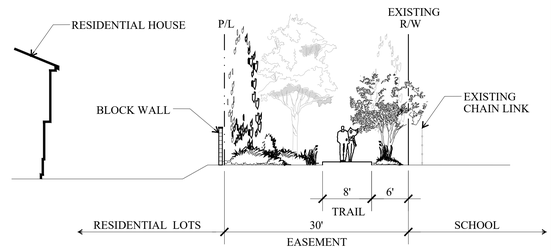
Project Summary

Gross Site Area: 10.0 Acres
Developable Area: 8.28 Acres
Total Units: 41 Homes
Density: 4.95 Units per Developable Acre

Legend
Plan 1 - (Two-Story, 2833 SF, 5 bedrooms + loft) 20 homes
Plan 2 - (Two_Story, 3153 SF, 5 bedrooms + loft) 21 homes
Total: 41 homes

Enhanced Elevation Locations

Parking Summary
- **Parking Required: 2 spaces/dwelling unit**
- **Parking Provided:**
  - **Garage: 2 spaces/dwelling unit**
  - **Driveways: 2 spaces/dwelling unit**
  - **Internal Streets: 58 spaces (parallel spaces on street)**



Open Space Summary
- **Net Site Area: 262,695 SF (excluding all streets + trail dedication)**
- **Common Area: 27,803 SF (Lot A + Lot B)**
- **Private Rear Yards: 98,012 SF**
- **Total: 125,815 SF (47.9% of net site area**

Trail Dedication
- **30' trail dedication to City**
- **Connection from Orange Ave to future Schleisman Road improvements**

Public Streets
- **56-foot right-of-way designed to County of Riverside Standards**
- **36-foot curb-to-curb section with parking on both sides**
- **5-foot sidewalk**
- **5-foot landscape area with street trees behind walk**

Amenity Space and Basin
- **63-foot wide paseo**
- **Variety of amenities including trail, bench and dog station, coffe table with seating, picnic tables, bocce ball.**
- **Maintained by Homeowners Association**

Orange Street Access & Frontage
- **Main Entry into Site**
- **Orange Street Frontage is designed to match existing frontage at subdivision to the west (attached walk, landscaping with street trees behind walk, community block wall, parallel parking on street)**
- **Existing power poles moved and replaced with metal poles to match adjacent developments**
- **Enhanced rear and side elevations where visible from public street**

NOTES:
1. Irrigations (including spray and or drip) will be provided, in the Construction Document phase, and to be installed per local California water regulations (AB1881).
2. Transformers, back-flow preventers & other above-ground utilities to be screened with landscape as permitted per local codes & regulations.
3. The plant palette listed provides a list of plant material to select from when preparing final landscape construction documents for this project. however, substitutions may be required due to availability, soils tests, or other conditions.
4. All trees within 5' of hardscape to be installed with deep root barriers.
5. Future shrub and groundcover planting proposed during Construction Documents must comply with the project's Water Quality Management Plan to ensure that the landscape layout aligns with the required Best Management Practices (BMPs) for the facilities.

1. INTRODUCTION AND PROJECT DESCRIPTION

A. PURPOSE AND PROJECT OVERVIEW

The City of Eastvale is processing applications for a Tentative Parcel Map and Major Development Review, referred to as PLN22-20024 (Magnolia Ranch Residential Project), for the development of a 41-unit single-family residential project on approximately 10 acres and located south of Schleisman Road, north of Orange Street, and directly west of Eastvale Elementary School. In addition, the City is processing a pre-application for the project under Senate Bill (SB) 330. PLN22-20024 is further described in Section I.C, below.

This Initial Study has been prepared pursuant to the California Environmental Quality Act (CEQA; California Public Resources Code Section 21000 et seq.) and the State CEQA Guidelines (California Code of Regulations Section 15000 et seq.).

B. PROJECT LOCATION AND DESCRIPTION OF SURROUNDING AREA

The Magnolia Ranch Residential Project (project) site is located in the City of Eastvale, south of Schleisman Road, north of Orange Street, and directly west of Eastvale Elementary School. The project site consists of one approximately 10-acre parcel, identified as Assessor Parcel Number (APN) 152-040-003. The project site is partially developed with one occupied single-family residence, an outbuilding, and a concrete driveway connecting the residence to Orange Street. The regional and local vicinity of the project site are shown in ***Exhibit 1, Regional Vicinity*****,** and ***Exhibit 2, Project Location***.

According to the City's most recent Land Use Map (2019), the project site currently has a land use designation of Medium Density Residential (MDR), with an allowable density range of 2.1 to 5.0 dwelling units per acre [du/ac]. This is consistent with surrounding MDR development to the north and west. According to the City's most recent Zoning Map (2019), the project site is currently zoned Heavy Agriculture (A-2). The properties to the south of the project site are also zoned Heavy Agricultural (A-2). The neighborhoods to the north and west are zoned One Family Dwellings (R-1). However, as discussed under Section C., *Project Description* below, because the project site has a Residential land use designation and is consistent with the objective General Plan standards for the site, the project is not required to obtain approval of a Change of Zone under the provisions of AB 3194 and SB 330.

Land uses surrounding the project have been fully developed with educational facilities (specifically, Eastvale Elementary School to the east and River Heights Intermediate School to the south) and single-family residential neighborhoods consistent with their respective permitted densities and complete with right-of-way improvements such as sidewalks, lighting, and landscaping.

C. PROJECT DESCRIPTION

The project would develop 41 single-family detached residential units on an approximately 10-acre site (8.28 acres of which are developable following public street dedications of 1.72 acres). The density of the proposed project would be 4.95 du/ac, which is within the allowable density range of 2.1 to 5.0 du/ac for MDR uses.

The entitlements are discussed individually in the bulleted list below and illustrated in ***Exhibit 3, Conceptual Site Plan*****.**

- **Tentative Parcel Map:** To subdivide an approximately 10-acre lot (APN 152-040-003) into 41 parcel lots.
- **Major Development Review:** Site planning and architecture for the development of 41 single-family detached residential units.

Prior to project grading and construction, the project would require the vacating and demolition of the existing single-family residence and appurtenant structures onsite. The project applicant is currently in escrow to purchase the property from the existing residential landowner.

Assembly Bill (AB) 3194 and Senate Bill (SB) 330

The City has identified the project site as being subject to SB 330 (the Housing Crisis Act of 2019). In 2021, the City adopted Chapter 120.08, *No Net Loss Program*, in the Eastvale Municipal Code in order to establish an SB 330 compliance density bonus program, in satisfaction of the "no net loss" requirements of SB 330. Projects requesting Density Bonuses through the No Net Loss Program are subject to preliminary application processing as specified in Eastvale Municipal Code Chapter 120.08, in addition to environmental analysis under CEQA.

Under the streamlining provisions of AB 3194 and SB 330, a housing development cannot be required to rezone the property if it is consistent with the objective General Plan standards for the property. The public agency may require the housing development to comply with the objective zoning code standards applicable to the property, but only to the extent they facilitate the development at the density allowed by the General Plan.[1,2]

Development Concept

The single-family residential development would consist of 41 five-bedroom units ranging from 2,833 square feet (SF) to 3,153 SF. All units constructed would be two stories. The total building coverage would be approximately 139,371 SF with a gross building area of approximately 112,384 SF. The maximum building height of the residences would be 27 feet.

Amenities within the development would include an approximately 27,803 SF common area with picnic seating area, coffee table with seating, a central lawn area with real turf, corn hole play area, a trail, and a dog station. Two paseos would be provided onsite including a 63-foot-wide paseo with a native succulent garden walk in the central portion of the project site, and a 30-foot-wide paseo that would extend along the easterly property line and would include an easement in favor of the City of Eastvale to provide a public trail connection between Schleisman Road and Orange Steet. A pedestrian connection located between lots 9 and 10 would provide a trail connection for residents to access a future linear park along Schleisman Road.

[1] Best, Best and Krieger, LLP. 2022. https://www.bbklaw.com/news-events/insights/2019/legal-alerts/10/sb-330-limits-local-laws-over-housing-developments Accessed June 21, 2022.

[2] Holland & Knight. 2019. https://www.hklaw.com/en/insights/publications/2018/10/californias-2019-housing-laws-what-you-need-to-kno

The project would be constructed to conform with Chapter 5, *Development Standards*, of the City's Zoning Code and the City's adopted *Design Standards and Guidelines*, which include design standards related to building size, height, setback, and materials, as well as landscaping, signage, and other considerations. Refer to ***Appendix 1, Architectural Plan Set***.

Utilities

The following utilities/infrastructure systems and services are available to the project. Refer to ***Appendix 2, Preliminary Grading and Drainage Plan***.

- *Water and Sewer*. Water and sewer services would be provided to the project by the Jurupa Community Services District (JCSD).
- *Drainage*. The drainage system that would serve the project site is under the jurisdiction of Riverside County in accordance with the County's Master Drainage Plan (MDP).
- *Dry Utilities*. Electricity and natural gas services would be provided by Southern California Edison (SCE) and Southern California Gas Company (SoCalGas), respectively.

Access and Circulation

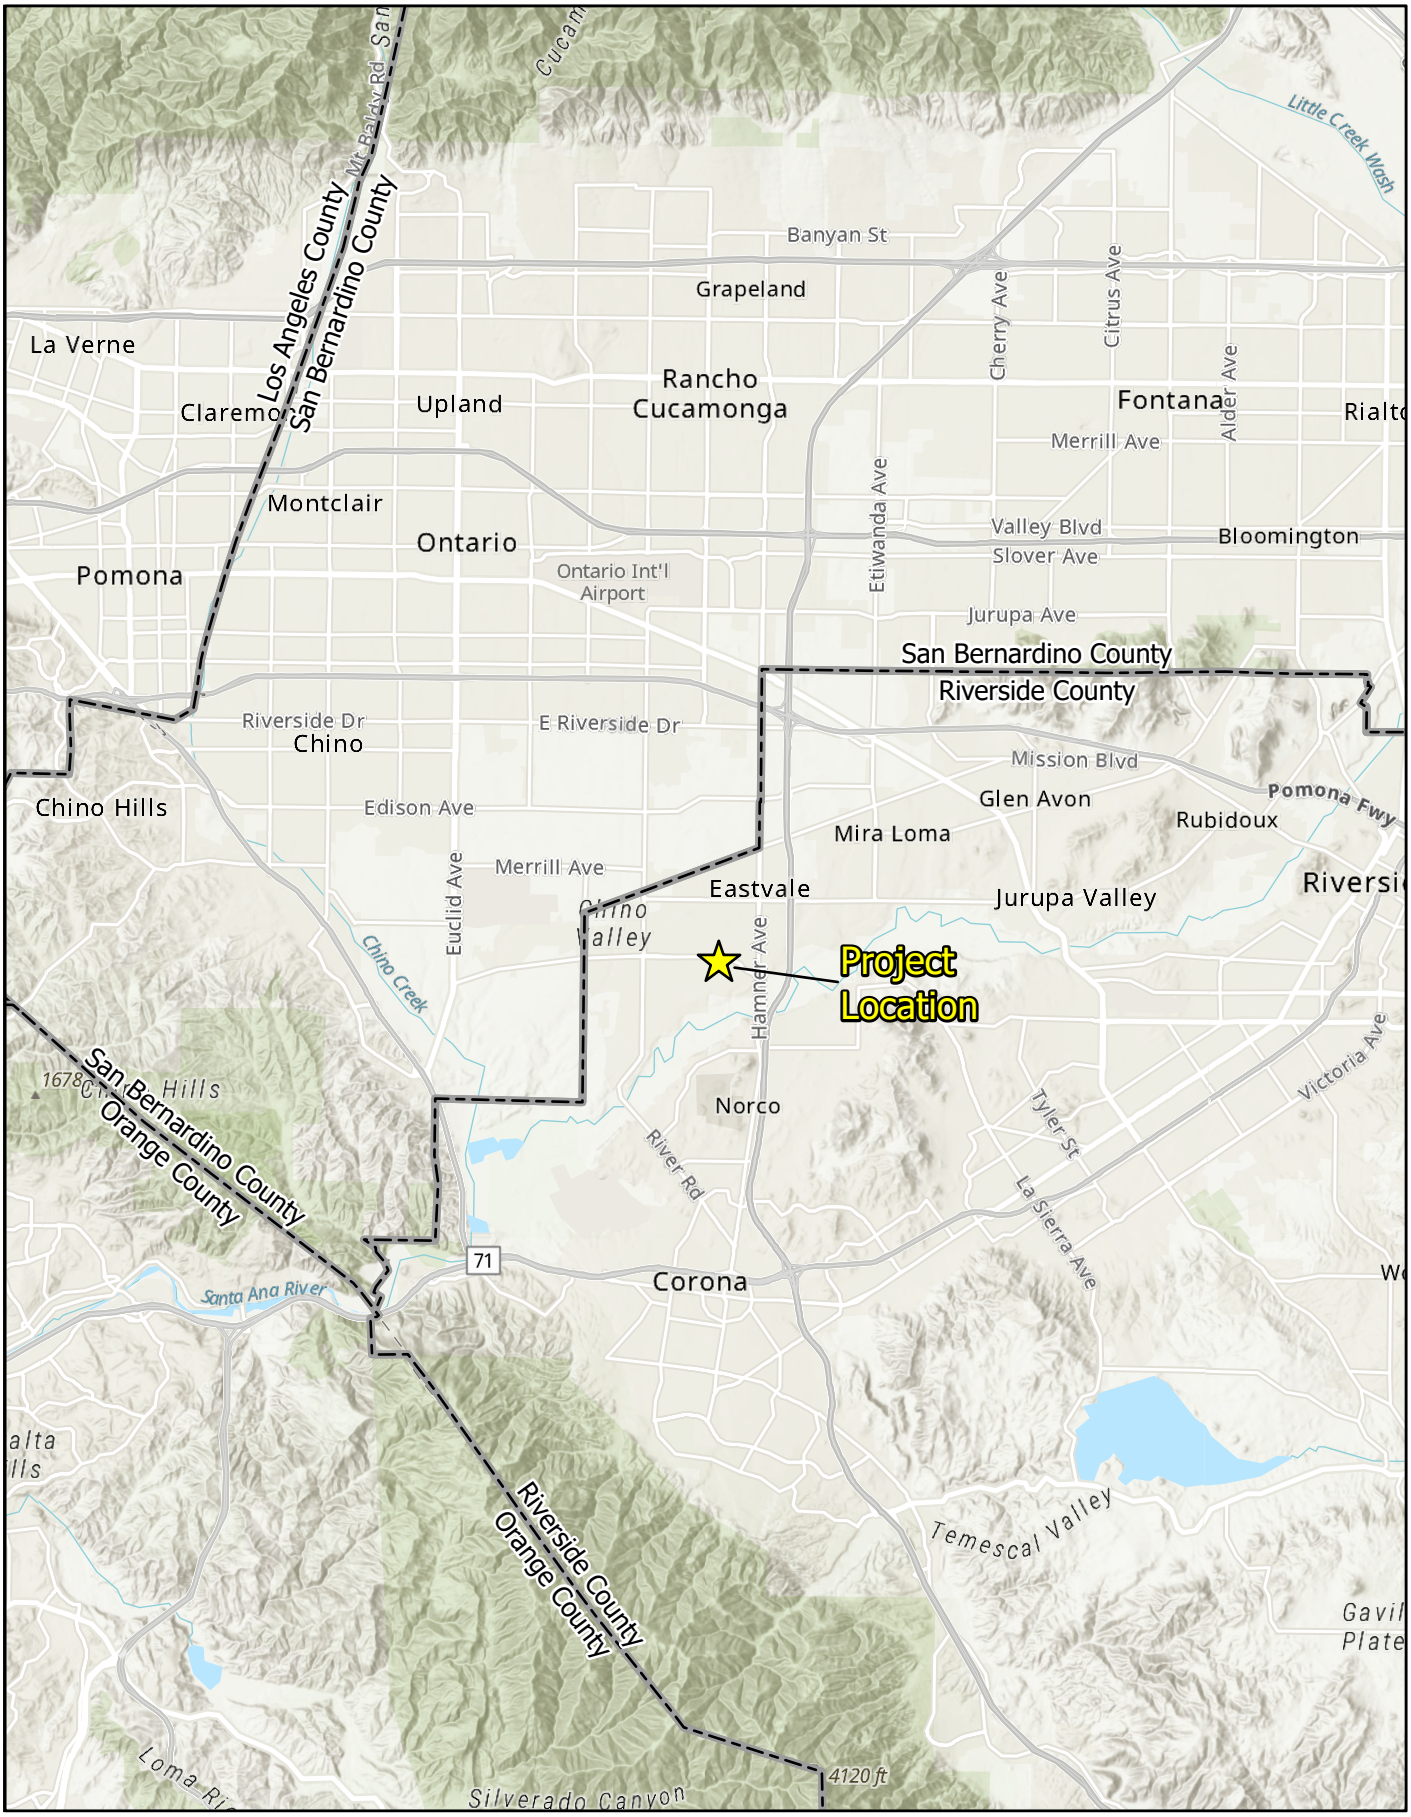
All project access and circulation improvements would be designed and constructed consistent with City design and engineering standards, as described in detail in Section 4.17, *Transportation*, of this IS/MND. The project would be subject to the City's Development Impact Fee (DIF) fee program and the Western Riverside Council of Governments' (WRCOG) Transportation Uniform Mitigation Fee (TUMF) program and would be required to pay the requisite DIF and TUMF fees at the rates then in effect pursuant to the DIF and TUMF ordinances.

As shown in ***Exhibit 3, Conceptual Site Plan***, on-site access/circulation would be provided via one driveway entrance located at Orange Street. Interior streets would be designed with a 56-foot right-of-way based on City standards with a 36-foot curb-to-curb section with parking on both sides. A 5-foot sidewalk and 5-foot landscaped area with street trees would be implemented.

Parking

Resident parking for the project would include a total of 222 parking spaces as follows: 2 garage spaces per dwelling unit; 2 driveway spaces per dwelling unit; and 58 parallel on-street spaces.

The project would exceed the City's minimum parking requirement of 82 spaces (2 spaces per dwelling unit) by 140 spaces, in accordance with Chapter 5, *Development Standards*, of the City's Zoning Code. Refer to ***Exhibit 3, Conceptual Site Plan***.



Landscaping

Ornamental water-efficient landscaping, including a variety of trees, shrubs, vines and ground cover and would be installed throughout the project site. A native succulent garden walk with decomposed granite, tree nooks for shade trees, aromatic citrus trees, and Adirondack seating would also be implemented in the central portion of the project site. Planting materials would be selected in accordance with Chapter 5, *Development Standards*, of the City's Zoning Code and the City's adopted *Design Standards and Guidelines.* Of the total 360,676 SF (8.28 acre) developable area on the project site, the total landscape coverage would be approximately

125,815 SF, equating to approximately 47.9 percent of the project site. Refer to ***Appendix 3, Conceptual Landscape Plan*****.**

Project Construction and Phasing

The project would be constructed in a single phase. Construction of the proposed project is anticipated to start around May 2024 and would be completed by July 2027.

2. ENVIRONMENTAL SETTING

A. Regulatory Setting

The Eastvale General Plan was adopted in 2012 and can be found on the City's website at https://www.eastvaleca.gov/home/showdocument?id=2360.

The City's Zoning Code was adopted in 2013 and can be found on the Eastvale Municipal Code hosting website at https://library.municode.com/ca/eastvale/codes/code_of_ordinances?nodeId= PTBLADECO. The Zoning Code is located under Part B of the Eastvale Municipal Code.

B. Physical Setting

The project site consists of approximately 10 acres located south of Schleisman Road, north of Orange Street, and directly west of Eastvale Elementary School. Schleisman Road is classified as a 6-lane Urban Arterial in the General Plan Circulation and Infrastructure Element, with three lanes of travel in each direction. The project site consists of one parcel, identified as APN 152-040-003, which is partially developed with one occupied single-family residence, an outbuilding, and a concrete driveway connecting the residence to Orange Street. The site topography can be considered as relatively flat terrain with elevations ranging from approximately 618 to 622 feet above mean sea level.

Land uses surrounding the project have been fully developed with educational facilities (specifically, Eastvale Elementary School to the east and River Heights Intermediate School to the south) and single-family residential neighborhoods consistent with their respective permitted densities and complete with right-of-way improvements such as sidewalks, lighting, and landscaping.

3. ENVIRONMENTAL CHECKLIST FORM

A. Project Information

1.	**Project Title:**	Magnolia Ranch Residential Project
2.	**Lead Agency Name and Address**	CITY OF EASTVALE Planning Department 12363 Limonite Avenue, Suite 910 Eastvale, CA 91752
3.	**Contact Person and Phone Number**	Jamie K. Cerda, Senior Planner (951) 703-4432
4.	**Project Location**	South of Schleisman Road, north of Orange Street, and directly west of Eastvale Elementary School (APN 152-040-003).
5.	**Project Sponsor Name and Address**	Woodside Homes Kori Liston 11870 Pierce Street, Suite 250 Riverside, CA 92505
6.	**General Plan Designation Existing**	Medium Density Residential (MDR)
	General Plan Designation Proposed	N/A
7.	**Zoning Existing**	Heavy Agriculture (A-2)
	Zoning Proposed	N/A
8.	**Description of Project**	Tentative Parcel Map, and Major Development Review, for the development of a 41-unit single-family residential project on approximately 10 acres.

9.	**Surrounding Land Use Designations and Zoning**		
	North	Land Use Designation	MDR, Medium Density Residential
		Zoning	R-1, One-Family Dwellings
	East	Land Use Designation	MDR, Medium Density Residential
		Zoning	A-2, Heavy Agriculture
	South	Land Use Designation	MDR, Medium Density Residential
		Zoning	A-2, Heavy Agriculture
	West	Land Use Designation	MDR, Medium Density Residential
		Zoning	R-1, One-Family Dwellings
10.	**Other Required Public Agency Approvals**		
	• Jurupa Community Services District (JCSD) – Water and wastewater connection permits • Santa Ana Regional Water Quality Control Board – Water Quality Management Plan (WQMP) Approval • State Water Resources Control Board – Stormwater Pollution Prevention Plan (SWPPP) Approval		
11.	**Have California Native American Tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3? If so, has consultation begun?**		
	Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21083.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File based on Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code Section 21082.3(c) contains provisions specific to confidentiality. The City has established a Tribal Historic Preservation Office (THPO) contact list pursuant to Public Resources Code Section 21080.3. The City has distributed letters to applicable THPOs on the City's contact list, providing initial information about the project and inviting consultation. See Section 4.18, *Tribal Cultural Resources*, of this IS/MND for additional information.		

B. Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact requiring mitigation to be reduced to a level that is less than significant as indicated in the checklist on the following pages.

☐ Aesthetics	☐ Greenhouse Gas Emissions	☐ Public Services
☐ Agriculture and Forestry Resources	☐ Hazards and Hazardous Materials	☐ Recreation
☐ Air Quality	☐ Hydrology and Water Quality	☒ Transportation
☒ Biological Resources	☐ Land Use and Planning	☒ Tribal Cultural Resources
☒ Cultural Resources	☐ Mineral Resources	☐ Utilities and Service Systems
☐ Energy	☒ Noise	☐ Wildfire
☐ Geology and Soils	☐ Population and Housing	☐ Mandatory Findings of Significance

C. Determination

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because of the incorporated mitigation measures and revisions in the project have been made by or agreed to by the project proponent. A **MITIGATED NEGATIVE DECLARATION** will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

City Representative

Gustavo Gonzales,
Community Development Director

Date

4. ENVIRONMENTAL ANALYSIS

4.1 AESTHETICS

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Have a substantial adverse effect on a scenic vista?			X	
b)	Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?				X
c)	Substantially degrade the existing visual character or quality of the site and its surroundings?			X	
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?			X	

DISCUSSION

1(a) Have a substantial adverse effect on a scenic vista?

Determination: Less Than Significant Impact.

According to the City's General Plan, the Santa Ana River corridor is an important resource of scenic beauty. The project site is located approximately one mile northwest of the Santa Ana River corridor. Views of the Santa Ana River are not afforded from the project site due to intervening topography, structures, and vegetation. Thus, the project would not have a substantial adverse effect on a scenic vista in this regard and impacts would be less than significant.

1(b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Determination: No Impact.

There are no officially designated State scenic highways in the City. The nearest scenic highway is State Route 91 (SR-91) (designated as eligible for listing), which is located 5.4 miles south of the project site.[3] Views of the project site are not afforded from SR-91 due to intervening

[3] California Department of Transportation State Scenic Highway System Map. nd. https://caltrans.maps.arcgis.com/apps/webappviewer/index.html?id=465dfd3d807c46cc8e8057116f1aacaa Accessed May 17, 2022.

topography, structures, and vegetation. Thus, the project would not substantially damage scenic resources within a State scenic highway. No impact would occur in this regard.

1(c) Substantially degrade the existing visual character or quality of the site and its surroundings?

Determination: Less Than Significant Impact.

The topography of the project site is relatively flat. The project site consists of one parcel, which is partially developed with one occupied single-family located at the center of the project site. The project site also includes an outbuilding and a concrete driveway connecting the residence to Orange Street. The site is surrounded by single-family residential development to the north and west, and by educational facilities to the south and east. The existing visual quality of the project site and surrounding area is low-to-moderate due to the urbanized setting of the project vicinity and lack of scenic resources.

The proposed project includes the demolition and removal of the existing single-family residence and appurtenances, storage buildings, and concrete driveway and foundations, followed by grading and construction of a 41-unit single-family residential development. The project would include installation of right-of-way improvements, including sidewalk, street lighting, and landscaping along Orange Street. The architectural design of the project (as illustrated in ***Appendix 1, Architectural Plan Set***), would adhere to the requirements of General Plan Policy DE-34, which requires that new project designs provide variation in color and materials to present aesthetically pleasing buildings and project features. The project design would also adhere to General Plan Policy DE-46, which states that security fencing shall be incorporated into the visual/architectural design of the project and be complementary to surrounding uses.

While project implementation would change the visual quality of the site and its surroundings, the proposed project would not degrade the visual quality of the project area because the project is consistent with the City's design guidelines and is consistent with the surrounding development. With adherence to the City's design policies and goals, impacts would be less than significant.

1(d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Determination: Less Than Significant Impact.

As the project is located in an urbanized area, existing sources of light and glare typically come from vehicles traveling on Orange Street and Schleisman Road, streetlights, exterior lighting on surrounding development and sports fields associated with River Heights Intermediate School to the south, and reflection from windows and roofs on the surrounding development.

Construction Impacts

Construction of the project would be restricted to the City's permitted construction hours in accordance with Eastvale Municipal Code Chapter 8.52, *Noise Regulation*, and Section 8.52.020, *Exemptions*. Construction would be prohibited between 6:00 PM and 6:00 AM during the months

of June through September and 6:00 PM and 7:00 AM during the months of October through May. Although some lighting may be required in the early morning or late evening, the lighting would be minimal and consistent with the surrounding residential uses, as well as the lights from the traffic along Orange Street and Schleisman Road. Therefore, no adverse light or glare impacts to adjacent properties would result from temporary construction activities.

Operational Impacts

Project operations would create new light sources from interior and exterior illumination associated with building materials, windows, exterior lighting, and security lighting. Interior and exterior lighting would conform to California Green (CALGreen) Building Standards Code and Eastvale Municipal Code Chapter 120.05, *Development Standards*, and Section 120.05.050, *Outdoor Lighting*. All outdoor lighting would be automatic and programmable to turn on at certain times as necessary as well as adjustable to dim the light intensity between 40 percent and 80 percent to meet the efficiency requirements of California's Building Energy Efficiency Standards (Title 24, Parts 6 and 11).

Although the project would increase light and glare in the surrounding area, light and glare produced on-site would be similar to that of the surrounding development. Adherence to State and local standards and regulations would reduce impacts to a less than significant level. Impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

4.2 AGRICULTURE AND FORESTRY RESOURCES

Would the proposed project:					
	Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the State's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. **Would the proposed project:**					
a)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?				X
b)	Conflict with existing zoning for agricultural use, or a Williamson Act contract?			X	
c)	Conflict with existing zoning for, or cause rezoning of, forestland (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?				X
d)	Result in the loss of forestland or conversion of forestland to non-forest use?				X
e)	Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forestland to non-forest use?			X	

DISCUSSION

2(a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

Determination: No Impact.

According to the California Department of Conservation's (DOC) Important Farmland Finder Map, the proposed project and surrounding areas are designated as Urban and Built-Up Land.[4] In addition, no agricultural uses are currently supported on the project site. Therefore, the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), to non-agricultural use. No impact would occur in this regard.

2(b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

Determination: Less Than Significant Impact.

The project site is zoned Heavy Agriculture (A-2) and is partially developed with one occupied single-family residence. The properties to the east and south of the project site are also zoned Heavy Agricultural (A-2). The neighborhoods to the north and west are zoned One Family Dwellings (R-1). However, because the project site has a Residential land use designation and is consistent with the objective General Plan standards for the site, the project is not required to obtain approval of a Change of Zone under the provisions of SB 330.

No agricultural operations currently occur at the project site. Further, the project site is not covered under an existing Williamson Act contract. Thus, impacts related to conflicting with existing zoning for agricultural use or a Williamson Act contract would be less than significant.

2(c) Conflict with existing zoning for, or cause rezoning of, forestland (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timber and zoned Timberland Production (as defined by Government Code Section 51104(g))?

Determination: No Impact.

The project site is zoned Heavy Agriculture (A-2) and is not occupied or used for forestland or timberland. Further, project implementation would not conflict with existing zoning or result in the rezoning of forestland, timberland, or timberland zoned Timberland Production. No impact would occur.

[4] California Department of Conservation. n.d. Important Farmland Finder website. Accessed May 17, 2022. https://www.conservation.ca.gov/dlrp/fmmp.

2(d) Result in the loss of forestland or conversion of forestland to non-forest use?

Determination: No Impact.

Refer to Response 4.2(c). No impact would occur in this regard.

2(e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to nonagricultural use or conversion of forestland to non-forest use?

Determination: Less Than Significant Impact.

Refer to Responses 4.2(a) through 4.2(d). Less than significant impacts would occur in this regard.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

4.3 AIR QUALITY

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Conflict with or obstruct implementation of the applicable air quality plan?			X	
b)	Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard?			X	
c)	Expose sensitive receptors to substantial pollutant concentrations?			X	
d)	Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?			X	

The analysis and findings throughout this section are based on the *Air Quality, Energy and Greenhouse Gas Emissions Impact Analysis Magnolia Ranch Residential Project, City of Eastvale* (Air Quality, Energy and Greenhouse Gas Evaluation) prepared by Vista Environmental, dated July 26, 2022, provided as **Appendix 4** of this IS/MND.

DISCUSSION

3(a) Conflict with or obstruct implementation of the applicable air quality plan?

Determination: Less Than Significant Impact.

Eastvale is located within the South Coast Air Basin (SCAB). The South Coast Air Quality Management District (SCAQMD) has jurisdiction in the SCAB, which has a history of recorded air quality violations and is an area where both State and federal ambient air quality standards are exceeded. Areas that meet ambient air quality standards are classified as attainment areas, while areas that do not meet these standards are classified as nonattainment areas. The SCAQMD is required, pursuant to the federal Clean Air Act, to reduce emissions of the air pollutants for which the SCAB is in nonattainment.

In order to reduce emissions, the SCAQMD adopted the *2016 Air Quality Management Plan* (AQMP), which establishes a program of rules and regulations directed at reducing air pollutant emissions and achieving State and federal air quality standards. The 2016 AQMP is a regional and multi-agency effort including the SCAQMD, California Air Resources Board (CARB), the Southern California Association of Governments (SCAG), and the US Environmental Protection Agency (EPA).

The 2016 AQMP pollutant control strategies are based on the latest scientific and technical information and planning assumptions, including the *2016-2040 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS), updated emission inventory methodologies for various source categories, and SCAG's latest growth forecasts. SCAG's latest growth forecasts were defined in consultation with local governments and with reference to local general plans. The SCAQMD considers projects that are consistent with the AQMP, which is intended to bring the SCAB into attainment for all criteria pollutants, to also have less than significant cumulative impacts.

A proposed project is considered to be consistent with the AQMP if it furthers one or more policies and does not obstruct other policies. The SCAQMD CEQA Handbook identifies two key criteria of consistency:

1. Whether the project will result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.

2. Whether the project will exceed the assumptions in the AQMP in 2016 or increments based on the year of project buildout and phase.

Criterion 1: Increase in the Frequency or Severity of Violations?

Based on the air quality modeling analysis contained in Section 9.1 of the Air Quality, Energy and Greenhouse Gas Evaluation, short-term construction impacts would not result in significant impacts based on the SCAQMD regional and local thresholds of significance. The Air Quality, Energy and Greenhouse Gas Evaluation also found that long-term operations impacts would not result in significant impacts based on the SCAQMD local and regional thresholds of significance; refer to Responses 4.3(b) and 4.3(c).

Therefore, the proposed project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP. The project would be consistent with the first criterion in this regard.

Criterion 2: Exceed Assumptions in the AQMP?

Projections for achieving air quality goals are based on assumptions regarding population, housing, and growth trends, and the 2016 AQMP addresses cumulative impacts in the Basin based on growth projections in the SCAG RTP/SCS. SCAG utilizes growth projections from local jurisdictions' adopted general plans; therefore, development consistent with the applicable general plan would be generally consistent with the growth projections in the 2016 AQMP. For this project, the City of Eastvale General Plan Land Use Map defines the assumptions that are represented in the AQMP.

The project site is zoned Heavy Agricultural (A-2). The properties to the east and south of the project site are also zoned Heavy Agricultural (A-2). The neighborhoods to the north and west are zoned One Family Dwellings (R-1). However, because the project site has a Residential land use designation and is consistent with the objective General Plan standards for the site, the

project is not required to obtain approval of a Change of Zone under the provisions of SB 330, as discussed further in Section 4.11, *Land Use and Planning*, of this IS/MND.

The SCAQMD acknowledges that strict consistency with all aspects of the AQMP is not required in order to make a finding of no conflict. Rather, a project is considered to be consistent with the AQMP if it furthers one or more policies and does not obstruct other policies. The project would implement contemporary energy-efficient technologies and regulatory/operational programs required per Title 24 (specifically CalGreen) and City standards. Generally, compliance with SCAQMD emissions reductions and control requirements also act to reduce project air pollutant emissions. In combination, project emissions-reducing design features and regulatory/operational programs are consistent with and support overarching AQMP air pollution reduction strategies. Project support of these strategies promotes timely attainment of AQMP air quality standards and would bring the project into conformance with the AQMP. Therefore, the proposed project is not anticipated to exceed the AQMP assumptions for the project site and is found to be consistent with the AQMP for the second criterion.

Based on the analysis above, the proposed project would not result in an inconsistency with the SCAQMD AQMP. Therefore, a less than significant impact would occur.

3(b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard?

Determination: Less Than Significant Impact.

Construction Impacts

Short-term project-related construction activities would have the potential to generate air emissions. The construction-related criteria pollutant emissions for each phase are shown below in ***Table 3.1, Construction-Related Regional Criteria Pollutant Emissions*** and in ***Table 3.2, Construction-Related Local Criteria Pollutant Emissions***. As shown in ***Table 3.1*** and ***Table 3.2***, none of the project's short-term construction emissions would exceed regional or local SCAQMD criterial pollutant thresholds. Therefore, construction-related air quality impacts would be less than significant.

Table 3.1: Construction-Related Regional Criteria Pollutant Emissions

Source: Vista Environmental. *Air Quality, Energy and Greenhouse Gas Emissions Impact Analysis Magnolia Ranch Residential Project, City of Eastvale*, July 26, 2022, Table N – *Construction-Related Local Criteria Pollutant Emissions.*

Notes:

1. The Pollutant Emissions include 100% of the On-Site emissions (off-road equipment and fugitive dust) and 1/8 of the Off-Site emissions (onroad trucks and worker vehicles), in order to account for the on-road emissions that occur within a ¼ mile of the project site.
2. Demolition, Site Preparation and Grading phases based on adherence to fugitive dust suppression requirements from SCAQMD Rule 403.
3. The nearest offsite sensitive receptors to the project site are single-family homes located as near as 25 feet (8 meters) west of the project site. According to SCAQMD methodology, all receptors closer than 25 meters are based on the 25-meter threshold.
   Source: Calculated from SCAQMD's Mass Rate Look-up Tables for two and five acres in Air Monitoring Area 22, Norco/Corona.

Operational Impacts

Operation of the proposed project would result in a long-term but insignificant increase in air quality emissions. This increase would be due to emissions from the project-generated vehicle trips, emissions from energy usage, onsite area source emissions, and off-road equipment created from the on-going use of the proposed project.

Mobile Sources

Mobile sources include emissions from the additional vehicle miles generated from the proposed project. The vehicle trips associated with the proposed project have been analyzed by inputting the project-generated vehicular trips from the Trip Generation Assessment into the CalEEMod model.

The project's Traffic Analysis (**Appendix 11**) found that the proposed project would generate approximately 388 trips per day.

Area Sources

Area sources include emissions from consumer products, landscape equipment and architectural coatings. Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers, as well as air compressors, generators, and pumps. As specifics were not known about the landscaping equipment fleet.

Energy Usage

Energy usage includes emissions from the generation of electricity and natural gas used on-site.

Project Impacts

The worst-case summer or winter VOC, NO_x, CO, SO_2, PM_{10}, and $PM_{2.5}$ daily emissions created from the proposed project's long-term operations have been calculated and are summarized below in **Table 3.3, *Operations-Related Regional Criteria Pollutant Emissions*** and in **Table 3.4, *Operations-Related Local Criteria Pollutant Emissions.*** As shown in **Table 3.3** and **3.4**, a less than significant regional air quality impact would occur from operation of the proposed project.

Table 3.3: Operations-Related Regional Criteria Pollutant Emissions

	Pollutant Emissions (pounds/day)					
Activity	**VOC**	**NO_x**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**

Notes:
[3] Mobile sources based on 1/8 of the gross vehicular emissions, which is the estimated portion of vehicle emissions occurring within a quarter mile of the project site.
[2] The nearest sensitive receptors to the project site are single-family homes located as near as 25 feet (8 meters) west of the project site. According to SCAQMD methodology, all receptors closer than 25 meters are based on the 25-meter threshold.
Source: Calculated from SCAQMD's Mass Rate Look-up Tables for two and five acres in Air Monitoring Area 22, Norco/Corona.

3(c) Expose sensitive receptors to substantial pollutant concentrations?

Determination: Less Than Significant Impact.

Those who are sensitive to air pollution include children, the elderly, and persons with preexisting respiratory or cardiovascular illness. For purposes of CEQA, the SCAQMD considers a sensitive receptor to be a location where a sensitive individual could remain for 24 hours, such as

residences, hospitals, or convalescent facilities. Commercial and industrial facilities are not included in the definition because employees do not typically remain on-site for 24 hours.

Construction Impacts

Local Air Quality Impacts from Construction

The SCAQMD has published the "Fact Sheet for Applying CalEEMod to Localized Significance Thresholds." CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily disturbance activity possible for each piece of equipment. In order to compare CalEEMod reported emissions against the localized significance threshold (LST) lookup tables, the CEQA document should contain the following parameters:

(1) The off-road equipment list (including type of equipment, horsepower, and hours of operation) assumed for the day of construction activity with maximum emissions;

(2) The maximum number of acres disturbed on the peak day;

(3) Any emission control devices added onto off-road equipment; and

(4) Specific dust suppression techniques used on the day of construction activity with maximum emissions. The CalEEMod outputs in **Appendix 4** show the equipment used for this analysis.

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the project's potential to cause an individual and cumulatively significant impact.

The LST Methodology provides Look-Up Tables with different thresholds based on the location and size of the project site and distance to the nearest sensitive receptors. The project site is located in Source Receptor Area (SRA) 22, which covers the Norco and Corona areas to the San Bernardino County and Orange County Lines.

The nearest sensitive receptors to the project site are single-family residences that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School (to the east) is a covered lunch area that is as near as 25 feet east of the project site. According to LST Methodology, any receptor located closer than 25 meters (82 feet) shall be based on the 25-meter thresholds. Based on this criterion and as calculated in ***Table 3.2*** and ***Table 3.4***, above, construction and operation of the proposed project would create a less than significant construction-related impact in regard to LSTs and that no mitigation would be required.

Toxic Air Contaminants

Toxic air contaminants (TACs) are another group of pollutants of concern. Sources of TACs include industrial processes such as petroleum refining and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. Cars and trucks release at least 40 different TACs. The most important of these TACs, in terms of health risk, are diesel particulates, benzene, formaldehyde, 1,3-butadiene, and acetaldehyde. Public exposure to TACs can result from emissions from normal operations as well as from accidental releases. Health effects of TACs include cancer, birth defects, neurological damage, and death.

The greatest potential for TAC emissions would be related to diesel particulate emissions associated with heavy equipment operations during construction of the proposed project. According to the Office of Environmental Health Hazard Assessment (OEHHA) and the SCAQMD *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis* (August 2003),[5] health effects from TACs are described in terms of individual cancer risk based on a lifetime (i.e., 30-year) resident exposure duration. Given the temporary and short-term construction schedule (approximately 29 months), the project would not result in a long-term (i.e., lifetime or 30-year) exposure as a result of project construction.

The project would comply with the CARB Air Toxics Control Measure that limits diesel-powered equipment and vehicle idling to no more than five minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle Regulation; compliance with these would minimize emissions of TACs during construction. Furthermore, construction-based particulate matter emissions (including diesel exhaust emissions) would not exceed any local or regional thresholds. Therefore, no significant short-term TAC impacts would occur during construction of the proposed project and impacts from TACs during construction would be less than significant.

Operational Impacts

Project-related air emissions may have the potential to exceed the State and federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the SCAB. The proposed project has been analyzed for the potential local carbon monoxide (CO) emission impacts from the project-generated vehicular trips and from the potential local air quality impacts from on-site operations. The following analysis addresses the vehicular CO emissions and local impacts from on-site operations per SCAQMD LST methodology.

Local CO Emission Impacts from Project-Generated Vehicular Trips

CO is the pollutant of major concern along roadways because the most notable source of CO is motor vehicles. For this reason, CO concentrations are usually indicative of the local air quality generated by a roadway network and are used as an indicator of potential local air quality impacts. Local air quality impacts can be assessed by comparing future CO levels without and with the project to the State and federal CO standards.

To determine if the proposed project could cause emission levels in excess of CO standards, a sensitivity analysis is typically conducted to determine the potential for CO "hot spots" at a number of intersections in the general project vicinity. Because of reduced speeds and vehicle

[5] Office of Environmental Health Hazard Assessment. 2015. Air Toxic Hot Spots Program Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessment. https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf. South Coast Air Quality Management District. 2003. Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis. http://www.aqmd.gov/docs/default-source/ceqa/handbook/mobilesource-toxics-analysis.doc?sfvrsn=2.

queuing, "hot spots" potentially can occur at high traffic volume intersections with a level of service E or worse.

The analysis prepared for CO attainment in the SCAB by the SCAQMD can be used to assist in evaluating the potential for CO exceedances in the SCAB. CO attainment was thoroughly analyzed as part of the SCAQMD's *2003 Air Quality Management Plan* (2003 AQMP) and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan). As discussed in the 1992 CO Plan, peak CO concentrations in the SCAB are due to unusual meteorological and topographical conditions and not due to the impact of particular intersections. Considering the region's unique meteorological conditions and the increasingly stringent CO emissions standards, CO modeling was performed as part of 1992 CO Plan and subsequent plan updates and air quality management plans. In the 1992 CO Plan, a CO hot spot analysis was conducted for four busy intersections in Los Angeles at the peak morning and afternoon time periods: South Long Beach Boulevard and Imperial Highway (Lynwood); Wilshire Boulevard and Veteran Avenue (Westwood); Sunset Boulevard and Highland Avenue (Hollywood); and La Cienega Boulevard and Century Boulevard (Inglewood). These analyses did not predict a violation of CO standards. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vehicles per day. The Los Angeles County Metropolitan Transportation Authority evaluated the level of service in the vicinity of the Wilshire Boulevard/Veteran Avenue intersection and found it to be level of service E during the morning peak hour and level of service F during the afternoon peak hour.

The project's Traffic Analysis (**Appendix 11**) showed that the project would generate a maximum of approximately 388 net new vehicle trips per day. The 1992 CO Plan showed that an intersection which has a daily traffic volume of approximately 100,000 vehicles per day would not violate the CO standard. Therefore, as the highest traffic volumes fall far short of 100,000 vehicles, no CO "hot spot" modeling was performed and no significant long-term air quality impact is anticipated to local air quality with the ongoing use of the proposed project.

3(d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?

Determination: Less Than Significant Impact.

Land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting operations, refineries, landfills, dairies, and fiberglass molding facilities.[6] The project does not include any such uses identified by SCAQMD as being associated with odors. Potential sources that may emit odors during the ongoing operations of the proposed project would include odor emissions from the intermittent diesel delivery truck emissions and trash storage areas. Due to the distance of the nearest receptors from the project site and through compliance with SCAQMD's Rule 402 regarding public nuisances, no significant impact related to odors would occur during the ongoing operations of the proposed project.

[6] South Coast Air Quality Management District. 1993. *CEQA Air Quality Handbook*.

Construction activities associated with the project may generate detectable odors from heavy-duty equipment exhaust and architectural coatings. However, construction-related odors would be short term in nature and cease upon project completion. In addition, the project would be required to comply with the California Code of Regulations, Title 13, Sections 2449(d)(3) and 2485, which minimizes the idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than five minutes. This would further reduce the detectable odors from heavy-duty equipment exhaust. The project would also comply with the SCAQMD Rule 1113, which would minimize odor impacts from reactive organic gas (ROG) emissions during architectural coating. Any impacts to existing adjacent land uses would be short term and would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

1. The following measure shall be incorporated into project plans as implementation of SCAQMD Rule 402:
    - A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
2. The following measures shall be incorporated into project plans as implementation of SCAQMD Rule 403:
    - All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour (mph) per SCAQMD guidelines in order to limit fugitive dust emissions.
    - The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project site are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
    - The contractor shall ensure that traffic speeds on unpaved roads and in project site areas are reduced to 15 mph or less.
3. The following measure shall be incorporated into project plans as implementation of SCAQMD Rule 1113:
    - In order to limit the volatile organic compound (VOC) content of architectural coatings used in the SCAB, architectural coatings shall be no more than a low VOC default level of 50 grams per liter (g/L) unless otherwise specified in the SCAQMD Table of Standards.
4. All applicable measures shall be incorporated into project plans as implementation of SCAQMD Rule 1403 if asbestos is found during the demolition of existing structures.

MITIGATION MEASURES

No mitigation is required.

4.4 BIOLOGICAL RESOURCES

Would the proposed project:					
	Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a)	Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?		X		
b)	Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?				X
c)	Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				X
d)	Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?		X		
e)	Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?				X
f)	Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan?		X		

The analysis and findings throughout this section are based on the *Biological Resources Assessment Eastvale Orange Street Residential Development Project, City of Eastvale, Riverside County, California* (Biological Resources Assessment), prepared by FirstCarbon Solutions, dated May 31, 2022, and as provided as Appendix 5 of this IS/MND.

Environmental Setting

Existing development on the project site includes a ranch-style single-family home. The property includes a large driveway and a front yard south of the main structure as well as an open-faced barn and several corrals located north of the main structure. Fenced fallow pastures dominate most of the property, presumably for grazing livestock. The vegetation found in these areas

consists of low-growing ruderal vegetation and non-native grasses. The fields show evidence of frequent disturbance from mowing, evidenced by tire tracks and vegetation that does not exceed more than a few inches in height. The project site is surrounded by urban development in all directions, including single-family residential homes located to north and west, and an elementary school and an intermediate school located to the east and south, respectively

The majority of the project site consists of ruderal fields, formerly used for pasturing livestock. The vegetation on the site shows evidence of recent mowing. Species observed on-site included redstem filaree (*Erodium cicutarium*), pineapple weed (*Matricaria discoidea*), cheeseweed (*Malva parviflora*), turkey mullein (*Croton setiger*), common horseweed, and Russian thistle. Non-native grasses observed included foxtail barley (*Hordeum jubatum*) and Mediterranean grass (*Schismus barbatus*).

Ornamental vegetation can be found within the front yard of the existing residence, including hedges, bird of paradise flower (*Strelitzia reginae*), two Italian cypress trees (*Cupressus sempervirens*), three Mexican fan palm trees (*Washingtonia robusta*), a lemon tree (*Citrus limon*), and a cherry tree (*Prunus avium*). No narrow endemic plant species were found on the project site, and such plant species are not expected to have the potential to occur on the project site. In addition, no riparian habitat or vernal pools occur on the project site, nor are there any potential jurisdictional waters or wetlands on the project site.

The project site is located within the boundaries of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) administered by the Western Riverside County Regional Conservation Authority (RCA). The City of Eastvale is a signatory to the MSHCP.

DISCUSSION

4(a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?

Determination: Less Than Significant Impact with Mitigation Incorporated.

Sensitive Plant Species

The MSHCP calls for focused studies of habitat evaluations for narrow endemic plant species. According to the Biological Resources Assessment, the disturbed state of the project site does not provide suitable habitat for any special-status species recorded in the California Natural Diversity Database (CNDDB) or California Native Plant Society (CNPS) searches due to the lack of natural vegetation communities and on-going man-made disturbance in the form of mowing. Therefore, no special-status plant species are expected to occur on the project site.

Sensitive Wildlife Species

The burrowing owl is designated as a species of special concern by the California Department of Fish and Wildlife (CDFW). The species is typically found in grassland, shrub steppe, and desert habitat types, however, can also be found in agricultural areas, ruderal fields, and pastures, as well as in urban environments such as vacant lots, flood control facilities, and open spaces.

Burrowing owls require underground burrows or other cavities for nesting, roosting and shelter. Burrows used by the owls are usually dug by other species such as California ground squirrel (*Spermophilus beecheyi*) and round-tailed ground squirrel (*Citellus tereticaudus*). As such, the presence of colonial mammal burrows is often an indication that burrowing owl may be present. Burrowing owls have also been found occupying man-made cavities, such as buried and non-functioning drainpipes, standpipes, and dry culverts.

The project site contains many small burrows all less than 3 inches in diameter, which are too small to be occupied by burrowing owl. (Burrowing owls typically require a burrow opening of at least 4 inches in diameter). However, the lack of suitably-size burrows does not preclude this species from occurring on-site, as burrowing owl may still utilize the site for foraging and are still capable of colonizing the project site. However, because the field survey was conducted outside of the burrowing owl breeding season (February 1–August 31), the possibility that burrowing owl could be present in the project vicinity cannot be entirely ruled out.

The proposed project would implement **Mitigation Measure BIO-1** to ensure potential impacts to burrowing owls are reduced to a less than significant level by requiring a pre-construction survey prior to ground-disturbing activities. With implementation of **Mitigation Measure BIO-1**, impacts to burrowing owl would be less than significant.

Birds

The Migratory Bird Treaty Act (MBTA) implements international treaties between the United States and other nations devised to protect migratory birds, their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit. The state of California has incorporated the protection of birds of prey in California Fish and Game Code (CFGC) Sections 3800, 3513, and 3503.5. All raptors and their nests are protected from take or disturbance under the MBTA (16 United States Code [USC] Section 703 et seq.) and California statute (CFGC Section 3503.5).

Direct impacts to native vegetation communities and removal of trees during project construction could result in direct impacts to bird nests, which would be considered significant absent mitigation. The project site contains several ornamental trees and bird houses present on-site that could provide suitable habitat for a variety of species of nesting birds.

Construction activities that occur during the avian nesting season (generally February 1 to August 31) could disturb nesting sites for bird species protected under the Fish and Game Code or MBTA. The removal of existing ornamental trees and bird houses during the nesting season could result in direct harm to nesting birds, while noise, light, and other man-made disturbances may cause nesting birds to abandon their nests.

Implementation of **Mitigation Measure BIO-2**, which requires a pre-construction nesting bird clearance survey to determine the presence/absence, location, and status of any active nests on or adjacent to the project site, would reduce potential impacts to nesting and migratory birds to less than significant by limiting the removal of trees, shrubs, or any other potential nesting habitat to outside the avian nesting season, which generally extends from February 1 through August 31. If the nesting bird clearance survey indicates the presence of nesting birds, **Mitigation Measure BIO-2** requires buffers to ensure that any nesting birds are protected pursuant to the

MBTA. Impacts for both sensitive wildlife species and migratory birds would be less than significant with mitigation incorporated.

4(b) Have a substantial adverse effect on riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?

Determination: No Impact.

According to the Biological Resources Assessment, no jurisdictional waters, riparian, riverine, or vernal pool areas exist on the project site. No impact would occur in this regard.

4(c) Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Determination: No Impact.

Based on the Biological Resource Assessment, no State or federally protected wetlands are located within the project site. No impact would occur in this regard.

4(d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Determination: Less Than Significant Impact with Mitigation Incorporated.

The project area does not support any bodies of water or wetlands that attract large migration stopovers or attractants for avian species. Furthermore, the project is proposed on lands that are low quality, disturbed habitats surrounded by disturbed residential uses. However, the project site does contain several ornamental trees and bird houses that could provide suitable habitat for a variety of species of nesting birds.

The MBTA governs the taking, killing, possession, transportation, and importation of migratory birds, their eggs, parts, and nests. To reduce potential impacts to nesting birds, **Mitigation Measure BIO-2** requires a pre-construction survey to determine the presence/absence, location, and status of any active nests on or adjacent to the project site. If the pre-construction survey indicates the presence of nesting birds, **Mitigation Measure BIO-2** requires buffers to ensure that any nesting birds are protected pursuant to the MBTA. With implementation of **Mitigation Measure BIO-2**, the project's potential construction-related impacts to migratory birds would be reduced to a less than significant level.

4(e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Determination: No Impact.

There are no local policies or ordinances with respect to biological resources that apply to the project site. Therefore, the project is not in conflict with local policies or ordinances. No impact would occur.

4(f) Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan?

Determination: Less Than Significant Impact with Mitigation Incorporated.

The project site is located within the boundaries of Western Riverside County MSHCP. According to the RCA MSHCP Information Map. The project site lies within a MSHCP survey area for burrowing owl and narrow endemic plants including San Diego ambrosia, Brand's phacelia, and San Miguel savory. Therefore, the proposed project is subject to the procedures outlined in the *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*. Based on the Biological Resources Assessment findings, it is recommended that pre-construction surveys be conducted prior to any ground disturbance to avoid direct take of burrowing owls, as described in **Mitigation Measure BIO-1**.

Due to the disturbed/developed state of the project site, none of the plant species listed above are likely to occur on-site and focused surveys for these species are not recommended. However, **Mitigation Measure BIO-3**, which requires the project applicant to prepare a separate MSHCP Consistency Analysis report, is required to ensure the project would not conflict with the provisions of the MSHCP. With the implementation of **Mitigation Measure BIO-3,** the proposed project would not conflict with the provisions of the MSHCP and impacts would be reduced to less than significant.

STANDARD CONDITIONS & REQUIREMENTS

1. Eastvale Municipal Code Section 4.62.100, *Payment of Fees*, states that the Western Riverside County MSHCP fee shall be paid at the time a certificate of occupancy is issued for a residential unit or development project or upon final inspection, whichever occurs first. Furthermore, no final inspection shall be made, and no certificate of occupancy shall be issued, prior to full payment of the Western Riverside County Multiple Species Habitat Conservation Plan fee. However, this section shall not be construed to prevent payment of the fee prior to the issuance of an occupancy permit or final inspection.

MITIGATION MEASURES

BIO-1 The project shall conduct focused burrowing owl pre-construction surveys as follows:

1. No more than 30 days prior to the first ground-disturbing activities, the project applicant shall retain a qualified Biologist to conduct a pre-construction survey of the project site. The survey shall establish the presence or absence of western burrowing owl and/or habitat features and evaluate use by owls in accordance

with the California Department of Fish and Wildlife (CDFW) and Western Riverside County Regional Conservation Authority (RCA) survey guidelines.

2. On the parcel where the activity is proposed, the Biologist shall survey the proposed disturbance footprint and a 500-foot radius from the perimeter of the proposed footprint to identify burrows and burrowing owl. The survey shall take place near sunrise or sunset in accordance with the CDFW and RCA guidelines. All burrows or burrowing owl shall be identified and mapped. During the breeding season (February 1–August 31), surveys shall document whether burrowing owl are nesting on or directly adjacent to disturbance areas. During the non-breeding season (September 1–January 31), surveys shall document whether burrowing owl are using habitat on or directly adjacent to any disturbance area. Survey results shall be valid only for the season during which the survey is conducted.
3. If burrowing owl are not discovered, further mitigation is not required. If burrowing owl are observed during the pre-construction surveys, the applicant shall perform the following measures to limit the impact on the burrowing owls:

    A. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone. Construction may occur during the breeding season if a qualified Biologist monitors the nest and determines that the birds have not begun egg-laying and incubation, or that the juveniles from the occupied burrows have fledged. During the non-breeding season (September 1-January 31), the project applicant shall avoid the owls and the burrows they are using, if possible. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone.

    B. If it is not possible to avoid occupied burrows, passive relocation shall be implemented. Burrowing owl shall be excluded from burrows in the immediate impact zone and within a 160-foot buffer zone by installing one-way doors in burrow entrances. These doors shall be in place for 48 hours prior to excavation. The project area shall be monitored daily for 1 week to confirm that the owl has abandoned the burrow. Whenever possible, burrows should be excavated using hand tools and refilled to prevent re-occupation. Plastic tubing or a similar structure shall be inserted in the tunnels during excavation to maintain an escape route for any burrowing owl inside the burrow.

BIO-2 The project applicant shall employ protective measures for active bird nests as follows (including pre-construction survey and implementation of avoidance buffer, if found):

1. Removal of trees shall be limited to only those necessary to construct the proposed project as reflected in the relevant project approval documents. It is recommended that a Biologist make sure the bird houses are not occupied and then block access to the bird houses for the duration of construction to avoid attracting nesting birds.

2. If construction occurs during the nesting season (February 1 to August 31), pre-construction surveys shall be conducted within 14 days prior to tree removal to determine whether or not active nests are present.
3. If an active nest is located during pre-construction surveys, a qualified Biologist shall determine an appropriately-sized avoidance buffer based on the species and anticipated disturbance level. A qualified Biologist shall delineate the avoidance buffer using Environmentally Sensitive Area fencing, pin flags, and or yellow caution tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently. No construction activities or construction foot traffic is allowed to occur within the avoidance buffer(s).
4. The qualified Biologist shall monitor the active nest during construction activities to prevent any potential impacts that may result from the construction of the proposed project, until the young have fledged.

BIO-3 Prior to the issuance of a grading permit, the project applicant shall prepare and submit a Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis report to City of Eastvale to document the project's consistency with the goals, objectives, and requirements of the MSHCP.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

With implementation of **Mitigation Measures BIO-1, BIO-2,** and **BIO-3,** as well as adherence to the standard conditions and requirements, the project would comply with the requirement of the MSHCP and the MBTA. Compliance would reduce impacts to less than significant levels.

4.5 CULTURAL RESOURCES

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?				X
b)	Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?		X		
c)	Disturb any human remains, including those interred outside of dedicated cemeteries?			X	

The analysis and findings throughout this section are based on the *Phase I Cultural Resources Assessment Orange Street Residential Development Project City of Eastvale, Riverside County, California* (Cultural Resources Assessment) prepared by FirstCarbon Solutions, dated May 31, 2022, and provided as **Appendix 6** of this IS/MND.

DISCUSSION

5(a) Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?

Determination: No Impact.

The Cultural Resources Assessment conducted for the proposed project included a pedestrian field survey and a records search to identify previously recorded prehistoric and historic cultural resources and cultural resource surveys within a 0.5-mile radius of the project area. The records search was conducted by the Eastern Information Center (EIC) of the California Historical Resources Information System at the University of California, Riverside.

Historical Resources Search Results

One linear historic resource has been recorded within a 0.5-mile radius north of the project area (P-33-016681) and no resources are located within the project boundaries. In addition, there are 12 area-specific survey reports on file with the EIC, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that portions of the project site have been previously surveyed.

The records search results also indicated that the directories checked (including the National Register of Historic Places [NRHP], California Register of Historic Resources [CRHR], California Historical Landmarks (CHL) list, the California Points of Historical Interest [CPHI] list, and the

California Built Environment Resource Directory [BERD] for Riverside County), showed that there were no listed properties within the project area.

Historical Mapping and Photographs

A review of 13 historical aerial photographs depicting the project site from 1938 to 2016 indicate that the project site and the surrounding lands remained generally undeveloped and used for agricultural purposes until approximately 1994. Between 1967 and 1994, a homestead was built within the boundaries of the project site. The images from 1938 to 2002 depict gradual residential development surrounding the project site. Sometime after 1995, the surrounding area became more urbanized with construction of the Eastvale Elementary School east of the project site and River Heights Intermediate School located south of the project site.

Pedestrian Survey Results

No archaeological resources were identified during the pedestrian survey of the project area. There is a residential property on site, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered a potential historic resource under CEQA.

Sacred Lands File Results

A Sacred Lands File search was sent to the Native American Heritage Commission (NAHC) and a response was received indicating the results of their search was positive for the presence of tribal cultural resources (TCRs). The NAHC provided a list of 22 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential tribal cultural resources that may be affected by the proposed project are addressed, a letter containing project information requesting any additional information was sent to each tribal representative on February 5, 2020. A response from the Agua Caliente Band of Cahuilla Indians tribe was received on March 10, 2021, indicating that the project is not located within the Tribe's Traditional Use Area and defer to the other tribes ethnographically associated with the project site. No other responses have been received to date.

Conclusion

No historical resources were identified as part of the Cultural Resources Assessment conducted for the project. Therefore, no impact relative to historical resources would occur.

5(b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Determination: Less Than Significant Impact with Mitigation Incorporated.

No archaeological resources were identified in the records searches or during the pedestrian survey. However, the positive results from the Sacred Lands Files search, and overall poor visibility across the project site increases the possibility that historic and prehistoric cultural resources may be encountered during the course of project construction. Based on the Cultural Resources Assessment, the potential for the proposed project to have an adverse effect on archaeological resources is considered to be moderate. As such, in accordance with the Cultural

Resources Assessment, the project would comply with the recommendation that a qualified Archaeologist who meets the Secretary of Interior's Professional Qualification Standards for Archaeology perform an inspection of the project site following grubbing, ground clearing, and demolition, and prior to any grading or project-related ground disturbance.

Based on the Cultural Resources Assessment, full-time archaeological monitoring is not recommended at this time. However, if previously undocumented cultural resources are identified during ground-disturbing activities, **Mitigation Measure CUL-1** would be implemented to reduce potential impacts to historical and archaeological resources to a less than significant level.

5(c) Disturb any human remains, including those interred outside of formal cemeteries?

Determination: Less Than Significant Impact.

Construction activities, particularly grading, could potentially disturb human remains interred outside of a formal cemetery. Thus, the potential exists that human remains may be unearthed during grading and excavation activities associated with project construction. In the event that human remains are discovered during grading or other ground-disturbing activities associated with the proposed project, all work in that area shall be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds as detailed under the Standard Conditions & Requirements below. Less than significant impacts would occur.

STANDARD CONDITIONS & REQUIREMENTS

1. If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the county coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made.

   Following discovery and during assessment of the remains, work will be diverted at least 50 feet from the burial. The discovery shall be kept confidential, and secure to prevent disturbance. If left overnight, remains will be covered with a muslin cloth and steel plate over the excavation to protect the remains. If this method of protection is not feasible, a guard will be posted.

   If the Riverside County coroner determines the remains to be of Native American origin, the NAHC must be contacted by the coroner within 24 hours of the coroner's determination. The NAHC must then immediately identify the most likely descendants(s) for purposes of receiving notification of discovery. The most likely descendant(s) shall then make recommendations within 48 hours from the time that site access is granted and engage in consultation concerning the treatment of the remains as provided in Public Resources Code Section 507.98.

MITIGATION MEASURES

CUL-1 If cultural resources are encountered during ground-disturbing activities, work in the immediate area shall cease and an archaeologist meeting the Secretary of the

Interior's Professional Qualifications Standards for Archaeology shall be contacted immediately to evaluate the find(s). If the discovery proves to be significant under the California Environment Quality Act, additional work such as data recovery excavation may be warranted and shall be reported to the City.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Implementation of **Mitigation Measure CUL-1** would ensure that any archaeological resources inadvertently discovered during project grading or construction activities would be protected consistent with the recommendations of a qualified archaeologist, thereby reducing impacts to a less than significant level.

4.6 ENERGY

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?			X	
b)	Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?			X	

The analysis and findings throughout this section are based on the *Air Quality, Energy and Greenhouse Gas Emissions Impact Analysis Magnolia Ranch Residential Project, City of Eastvale* (Air Quality, Energy and Greenhouse Gas Evaluation) prepared by Vista Environmental, dated July 26, 2022, provided as **Appendix 4** of this IS/MND.

EXISTING CONDITIONS

Electricity

Electricity would be provided to the project by SCE. SCE provides electric power to more than 15 million persons, within a service area encompassing approximately 50,000 square miles. SCE derives electricity from varied energy resources including fossil fuels, hydroelectric generators, nuclear power plants, geothermal power plants, solar power generation, and wind farms. SCE also purchases from independent power producers and utilities, including out-of-state suppliers.

Natural Gas

Natural gas would be provided to the project by SoCalGas. SoCalGas is regulated by the California Public Utilities Commission (CPUC), which regulates natural gas rates and natural gas services, including in-state transportation over the utilities' transmission and distribution pipeline systems, storage, procurement, metering and billing.

Transportation Energy Resources

The project would attract additional vehicle trips with resulting consumption of energy resources, predominantly gasoline and diesel fuel. Gasoline (and other vehicle fuels) are commercially provided commodities and would be available to the project patrons and employees via commercial outlets. The transportation sector emits 41 percent of the total GHGs in the State and about 84 percent of smog-forming oxides of nitrogen (NO_x). Petroleum comprises about 92 percent of all transportation energy use, excluding fuel consumed for aviation and most marine vessels.

DISCUSSION

6(a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Determination: Less Than Significant Impact.

Multiple energy-related regulations apply to the project including the following:

- Senate Bill (SB) 100 (Chapter 312, Statutes of 2018) requires the CPUC, California Energy Commission (CEC), California Air Resources Board (CARB), and all other State agencies to incorporate that policy into all relevant planning.
- California Assembly Bill (AB) 1493 enacted on July 22, 2002, required the California Air Resources Board (CARB) to develop and adopt regulations that reduce greenhouse gases (GHGs) emitted by passenger vehicles and light duty trucks.
- The 2019 Building Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations, Title 24, Part 6) requires the design of building shells and building components to conserve energy.
- The California Green Building Standards (CALGreen) were developed in an effort to meet the goals of California's landmark initiative Assembly Bill (AB) 32, which established a comprehensive program of cost-effective reductions of GHGs to 1990 levels by 2020.

Construction Impacts

Construction is expected to commence around December 2022 and is anticipated to last approximately 18 months. Project construction would be completed in one phase. Staging of construction vehicles and equipment would occur on-site.

The proposed project would consume energy resources during construction in three (3) general forms:

1. Petroleum-based fuels used to power off-road construction vehicles and equipment on the project site, construction worker travel to and from the project site, as well as delivery and haul truck trips (e.g. hauling of material to disposal facilities);
2. Electricity associated with the conveyance of water that would be used during project construction for dust control (supply and conveyance) and electricity to power any necessary lighting during construction, electronic equipment, or other construction activities necessitating electrical power; and,
3. Energy used in the production of construction materials, such as asphalt, steel, concrete, pipes, and manufactured or processed materials such as lumber and glass.

Construction-Related Energy

During construction, the proposed project would consume electricity to construct the proposed residences. Electricity would be supplied to the project site by SCE and would be obtained from the existing electrical lines in the vicinity of the project site. The use of electricity from existing

power lines rather than temporary diesel or gasoline powered generators would minimize impacts on fuel consumption. Electricity consumed during project construction would vary throughout the construction period based on the construction activities being performed. Various construction activities include electricity associated with the conveyance of water that would be used during project construction for dust control (supply and conveyance) and electricity to power any necessary lighting during construction, electronic equipment, or other construction activities necessitating electrical power. Such electricity demand would be temporary, nominal, and would cease upon the completion of construction. Overall, construction activities associated with the proposed project would require limited electricity consumption that would not be expected to have an adverse impact on available electricity supplies and infrastructure. Therefore, the use of electricity during project construction would not be wasteful, inefficient, or unnecessary.

Since there are currently power lines in the vicinity of the project site, it is anticipated that only nominal improvements would be required to SCE distribution lines and equipment with development of the proposed project. Compliance with City's guidelines and requirements would ensure that the proposed project fulfills its responsibilities relative to infrastructure installation, coordinates any electrical infrastructure removals or relocations, and limits any impacts associated with construction of the project. Construction of the project's electrical infrastructure is not anticipated to adversely affect the electrical infrastructure serving the surrounding uses or utility system capacity. Therefore, a less than significant impact would occur relative to construction-related energy usage.

Construction-Related Natural Gas

Construction of the proposed project typically would not involve the consumption of natural gas. Natural gas would not be supplied to support construction activities, thus there would be no demand generated by construction. Since there is currently natural gas service in the vicinity of the project site, construction of the proposed project would be limited to installation of new natural gas connections within the project site. Development of the proposed project would likely not require extensive infrastructure improvements to serve the project site. Construction-related energy usage impacts associated with the installation of natural gas connections are expected to be confined to trenching in order to place the lines below surface. In addition, prior to ground disturbance, the proposed project would notify and coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service. Therefore, construction-related impacts to natural gas supply and infrastructure would be less than significant.

Construction-Related Petroleum Fuel Use

Petroleum-based fuel usage represents the highest amount of transportation energy potentially consumed during construction, which would be utilized by both off-road equipment operating on the project site and on-road automobiles transporting workers to and from the project site and on-road trucks transporting equipment and supplies to the project site.

The off-road construction equipment fuel usage was calculated, which found that construction of the proposed project would consume 15,057 gallons of gasoline and 67,935 gallons of diesel

fuel. This equates to 0.001 percent of the gasoline and 0.05 percent of the diesel used annually in Riverside County. As such, the construction-related petroleum use would be nominal, when compared to current countywide petroleum usage rates.

Construction activities associated with the proposed project would be required to adhere to all State and SCAQMD regulations for off-road equipment and on-road trucks, which provide minimum fuel efficiency standards. As such, construction activities for the proposed project would not result in the wasteful, inefficient, and unnecessary consumption of energy resources. Impacts regarding transportation energy would be less than significant. Development of the project would not result in the need to manufacture construction materials or create new building material facilities specifically to supply the proposed project. It is difficult to measure the energy used in the production of construction materials such as asphalt, steel, and concrete, it is reasonable to assume that the production of building materials such as concrete, steel, etc., would employ all reasonable energy conservation practices in the interest of minimizing the cost of doing business. Therefore, a less than significant impact would occur relative to construction-related petroleum fuel use.

Operational Impacts

The on-going operation of the proposed project would require the use of energy resources for multiple purposes including, but not limited to, heating/ventilating/air conditioning (HVAC), refrigeration, lighting, appliances, and electronics. Energy would also be consumed during operations related to water usage, solid waste disposal, landscape equipment and vehicle trips.

Operations-Related Electricity

Operation of the proposed project would result in consumption of electricity at the project site. As discussed in the Air Quality, Energy and Greenhouse Gas Evaluation, the proposed project would consume 53,083 kilowatt-hours per year of electricity. This equates to 0.0003 percent of the electricity consumed annually in the County of Riverside. As such, the operations-related electricity use would be nominal, when compared to current electricity usage rates in the County.

It should be noted that the proposed project would be required to meet the 2019 Title 24, Part 6 building energy efficiency standards that have been developed to meet the State's goal of zero-net-energy use for new homes. The zero net energy use would be achieved through a variety of measures to make new homes more energy efficient and by also requiring installation of photovoltaic systems of adequate size to generate enough electricity to meet the zero-net energy use standard. As discussed in the Air Quality, Energy and Greenhouse Gas Evaluation, the size of the PV system required for the project pursuant to the 2019 Title 24 standards was calculated and it was concluded that the proposed project would need to install at least 112.4 Kilowatts of photovoltaic panels within the proposed project. Although, the CalEEMod model found that with implementation of the 2019 Title 24 Part 6 standards, that the proposed project would continue to utilize a nominal amount of power, it should be noted that the electricity usage and emission rates utilized by the CalEEMod model are based on regional average usage rates for existing homes, which were not all built to the most current Title 24 Part 6, standards, so the CalEEMod model provides a conservative or worst-case analysis of electricity use from the proposed project. Therefore, it is anticipated the proposed project would be designed and built to minimize

electricity use and that existing and planned electricity capacity and electricity supplies would be sufficient to support the proposed project's electricity demand. Thus, impacts with regard to electrical supply and infrastructure capacity would be less than significant.

Operations-Related Natural Gas

Operation of the proposed project would result in increased consumption of natural gas at the project site. As discussed in the Air Quality, Energy and Greenhouse Gas Evaluation, the proposed project would consume 1,160 million British thermal units (MBTU) per year of natural gas, which equates to 0.003 percent of the natural gas consumed annually in Riverside County. As such, the operations-related natural gas use would be nominal, when compared to current natural gas usage rates in the County.

It should be noted that, the proposed project would comply with all federal, State, and City requirements related to the consumption of natural gas, that includes CCR Title 24, Part 6 *Building Energy Efficiency Standards* and CCR Title 24, Part 11: *California Green Building Standards.* The CCR Title 24, Part 6 and Part 11 standards require numerous energy efficiency measures to be incorporated into the proposed warehouse, including enhanced insulation as well as use of efficient natural gas appliances and HVAC units. Therefore, it is anticipated the proposed project would be designed and built to minimize natural gas use and that existing and planned natural gas capacity and natural gas supplies would be sufficient to support the proposed project's natural gas demand. Thus, impacts with regard to natural gas supply and infrastructure capacity would be less than significant.

Operations-Related Vehicular Petroleum Fuel Usage

Operation of the proposed project would result in increased consumption of petroleum-based fuels related to vehicular travel to and from the project site. As discussed in the Air Quality, Energy and Greenhouse Gas Evaluation, the proposed project would consume 46,681 gallons of gasoline per year from vehicle travel. This equates to 0.004 percent of the gasoline consumed annually in Riverside County. As such, the operations-related petroleum use would be nominal, when compared to current county-wide petroleum usage rates.

It should be noted that, the proposed project would comply with all federal, State, and City requirements related to the consumption of transportation energy that includes California Code of Regulations Title 24, Part 10 California Green Building Standards that require that all new garages to install electrical panels of adequate size to support the installation of electric vehicle charging systems. Therefore, it is anticipated the proposed project would be designed and built to minimize transportation energy through the promotion of the use of electric-powered vehicles and it is anticipated that existing and planned capacity and supplies of transportation fuels would be sufficient to support the proposed project's demand. Thus, impacts with regard transportation energy supply and infrastructure capacity would be less than significant.

Conclusion

In conclusion, the proposed project would comply with regulatory compliance measures outlined by the State and City related to air quality, GHG emissions, transportation/circulation, and water supply. Additionally, the proposed project would be constructed in accordance with all applicable

City Building and Fire Codes. Therefore, the proposed project would not result in the wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation. Impacts would be less than significant.

6(b) Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?

Determination: Less Than Significant Impact.

The project site is located in an area that is substantially developed with an established transportation network. The proposed project's consistency with the applicable energy-related policies in the General Plan is evaluated in the Air Quality, Energy and Greenhouse Gas Evaluation, which concluded that the project would not conflict with the City's local plans for renewable energy or energy.

Access to/from the project site would occur from existing roads and, as a result, the project would not interfere with, nor otherwise obstruct, intermodal transportation plans or projects that may be proposed pursuant to the Intermodal Surface Transportation Efficiency Act (ISTEA) because SCAG is not planning for intermodal facilities in the project area.

Regarding the State's Energy Plan and Title 24 energy efficiency standards, the applicant is required to comply with the California Green Building Standard Code requirements for energy-efficient buildings and appliances as well as utility energy efficiency programs implemented by SCE and SoCalGas.

Regarding AB 1493 regulations, an individual project does not have the ability to comply or conflict with these regulations because they are intended for agencies and their adoption of procedures and protocols for reporting and certifying GHG emission reductions from mobile sources.

Regarding the State's Renewables Portfolio Standards, the project would be required to meet or exceed the energy standards established in the CalGreen Code. CalGreen standards require that new buildings reduce water consumption, employ building commissioning to increase building system efficiencies, divert construction waste from landfills, and install low pollutant-emitting finish materials.

In conclusion, the proposed project does not conflict with or obstruct a State or local plan for renewable energy or energy efficiency because the proposed project complies with the energy related policies in the General Plan, complies with applicable State laws, and does not obstruct any future plans for renewable energy or energy efficiency projects. Impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

4.7 GEOLOGY AND SOILS

Would the proposed project:						
Issues			Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:					
	i)	Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning map, issued by the State Geologist for the area or based on other substantial evidence of a known fault?			X	
	ii)	Strong seismic ground shaking?			X	
	iii)	Seismic-related ground failure, including liquefaction?			X	
	iv)	Landslides?				X
b)	Result in substantial soil erosion or the loss of topsoil?				X	
c)	Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?				X	
d)	Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?				X	
e)	Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?					X
f)	Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?				X	

The analysis and findings throughout this section are based on the *Geotechnical and Infiltration Evaluation for Proposed Single- and Multi-Family Residential Development Assessor's Parcel Number 152-040-003 Eastvale, Riverside County, California* (Geotechnical Evaluation), prepared by Geo Tek, Inc., dated January 28, 2021, and provided as **Appendix 7** of this IS/MND.

DISCUSSION

7(a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning map, issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Determination: Less Than Significant Impact.

According to the Geotechnical Evaluation, there are no known active faults traversing the site. The project site is also not located in an Earthquake Fault Zone as mapped by the California Geological Survey[7]. The closest mapped active fault that could affect the project site is the Chino-Elsinore fault, which is located approximately 5 miles to the west. Therefore, the potential for fault rupture at the site is considered low. Although no active faults traverse the project site, as a condition of issuance of building and grading permits, the project would be required to comply with the requirements of the Alquist-Priolo Earthquake Fault Zoning Act, as well as with the 2022 California Building Code (CBC), which includes specific design measures intended to maximize structural stability in the event of an earthquake. Construction of the project would also be required to comply with current seismic design parameters and all other recommendations as contained in the Geotechnical Evaluation to ensure structural integrity in the event of an earthquake. Impacts would be less than significant.

ii) Strong seismic ground shaking?

Determination: Less Than Significant Impact.

The project site is located in seismically active Southern California with numerous fault systems in the region. As such, it should be anticipated that the project site will experience moderate to strong ground shaking in the near future. However, as a condition of issuance of grading and building permits, the project would be required to comply with current CBC seismic design parameters and all other recommendations as contained in the Geotechnical Evaluation. Compliance with these parameters would require proposed residential homes to be designed and constructed to withstand expected seismic activity and associated potential hazards, thereby minimizing risk to the public and property. The project would be designed and developed consistent with the CBC and standard engineering practices and reviewed in conjunction with the City Engineer. Therefore, impacts would be less than significant.

[7] California Geological Survey *Earthquake Zones of Required Investigation* interactive web map; accessed April 12, 2022; https://maps.conservation.ca.gov/cgs/EQZApp/

iii) Seismic-related ground failure, including liquefaction?

Determination: Less Than Significant Impact.

Liquefaction

Liquefaction is the loss of soil strength or stiffness due to a buildup of pore-water pressure during severe ground shaking. Liquefaction is associated primarily with loose (low density), saturated, fine-to-medium grained, cohesionless soils. As the shaking action of an earthquake progresses, the soil grains are rearranged and the soil densifies within a short period of time. Rapid densification of the soil results in a buildup of pore-water pressure. When the pore-water pressure approaches the total overburden pressure, the soil reduces greatly in strength and temporarily behaves similarly to a fluid. Effects of liquefaction can include sand boils, settlement, and bearing capacity failures below structural foundations.

The Riverside County Map My County interactive mapping website has mapped the entire site as having a high liquefaction potential.[8] The State of California has not prepared liquefaction hazard maps for this area.

Groundwater was not encountered within the exploratory borings performed for the Geotechnical Evaluation. Based on the lack of water encountered in the borings and a review of the groundwater information contained on the State Department of Water Resources Water Data Library website, it was estimated that the depth to high groundwater at the project site is about 50 feet below grade.

Based on the presence of alluvial soils, and an estimated high groundwater depth of 50 feet and the "high" liquefaction potential for the site, an assessment of the liquefaction potential was performed for the Geotechnical Evaluation. The results of this analysis indicate that project site soils are not susceptible to liquefaction upon application of the design earthquake.

Furthermore, dry settlement potential of project site soils was also evaluated to assess the potential settlement of the unsaturated soils resulting from seismic activity. The results of the analysis indicated a seismic dry settlement estimation of less than 0.5 inch and was recommended for a seismic differential seismic settlement of 0.25 inch over a 40-foot span be considered for incorporation into design grading/compaction stage. Based on the estimated magnitude of seismic settlement, mitigation and/or special foundation design is not considered warranted. A copy of the liquefaction and seismic settlement analysis is presented in Appendix D of the Geotechnical Evaluation.

Infiltration

According to the Geotechnical Evaluation, soils from borings primarily consisted of clayey sand, silt, clay and silty sand within the 20 to 51.5-foot depth below grade

8 Riverside County Map My County interactive mapping website; accessed May 12, 2022; https://gis1.countyofriverside.us/Html5Viewer/index.html?viewer=MMC_Public

surface. The sandy soils were noted to possess a relative density ranging from dense to very dense and the silty/clayey soils generally possessed a stiff to hard consistency.

Groundwater was not encountered within exploratory borings performed for the Geotechnical Evaluation. Based on the lack of water encountered in the borings and a review of the groundwater information contained on the State Department of Water Resources Water Data Library website, it is estimated that the depth to high groundwater at the site would be at 50 feet below grade. Based on this depth to water, groundwater-related problems are not expected during or after construction.

However, it is possible that seasonal variations (temperature, rainfall, etc.) will cause fluctuations in the groundwater level. Additionally, perched water may be encountered at shallow depths following extensive rain events. If shallow perched water is encountered, the Geotechnical Evaluation thus anticipates that such an occurrence can be managed through with the installation of conventional sump pumps.

Therefore, impacts relative to seismic-related ground failure, liquefaction, and infiltration would be less than significant.

iv) Landslides?

Determination: No Impact.

The proposed project is not expected to expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death from landslides. Although the project site is in an area of high seismic activity, because of the relatively flat terrain on the site and the surrounding properties, the site is at little risk for landslide. No impact would occur.

7(b) Result in substantial soil erosion or the loss of topsoil?

Determination: Less Than Significant Impact.

Proposed construction activities would include demolition an existing residence, clearing the site of debris and/or vegetation, soil excavation, grading, asphalt paving, residential home building construction, and landscaping. Such activities would disturb site soils, exposing them to the erosive effects of wind and water. However, all construction activities related to the proposed project would be subject to implementation of Best Management Practices (BMPs) for erosion control, as required under National Pollutant Discharge Elimination System (NPDES) regulations pursuant to the federal Clean Water Act. NPDES requirements for construction projects of one acre or more in area are set forth in the Construction General Permit issued by the State Water Resources Control Board (State Water Board Order No. 2009-0009-DWQ). Furthermore, the project's demolition of the existing residence, land clearing, grading, and construction activities would be required to comply with SCAQMD Rules 403 and 403.2 regulating fugitive dust emissions, thus minimizing wind erosion from such ground-disturbing activities. Therefore, the proposed project would not generate substantial erosion. Soil erosion impacts would be less than significant.

7(c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Determination: Less Than Significant Impact.

Refer to Discussion 7a)iii and 7a)iv, above. Based on the low liquefaction and landslide potential, depth to groundwater, and flat topography, the project site is not considered to be located on a geologic unit or soil that is unstable or could become unstable as a result of the project. A less than significant impact would occur.

7(d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Determination: Less Than Significant Impact.

Expansion Index (EI) testing performed on representative samples collected from the project site and has indicated the project site soils possess a "very low" to "low" expansion potential. The results of the EI testing are included in Appendix B of the Geotechnical Evaluation. The Geotechnical Evaluation recommended for foundation elements for the proposed residential homes to composed of entirely engineered fill soils and should be designed in accordance with the CBC. Therefore, with the project conditioned to adhere to this recommendation, impacts in regard to expansive soils would be reduced to less than significant.

7(e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

Determination: No Impact.

The proposed project would be served by the municipal sewer system of the Jurupa Community Services District (JCSD) and would therefore have no need for a septic system or other alternative wastewater disposal system. There would be no impact.

7(f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Determination: Less Than Significant Impact.

The project site is located within the Inland Valley, within the Peninsular Ranges Geomorphic Province of California. The Inland Valley is situated between the San Bernardino Mountains to the northeast, the San Gabriel Mountains to the north, the Chino Hills to the southwest, and to the southeast by the hilly uplands that separate it from the San Jacinto Basin. These mountain ranges are part of the Transverse Ranges Geomorphic Province of California.

The Inland Valley is dominated by northwest-trending faults and adjacent anticlinal uplifts. The intervening deep synclinal troughs are filled with poorly consolidated Upper Pleistocene and unconsolidated Holocene sediments. Tectonism of the region is dominated by the interaction of the East Pacific Plate and the North American Plate along a transform boundary. The Inland Valley

has been filled with a variable thickness of relatively young, heterogeneous alluvial deposits. These deposits typically do not contain significant vertebrate fossils, at least within the uppermost layers.

According to the Geotechnical Evaluation, project site soils consisted primarily of clayey sand, silt, clay and silty sand within the 20 to 51.5-foot depth below grade surface. The project site is not anticipated to contain significant paleontological or geologic features. No prehistoric resources were identified during background research or field survey for the project site. As such, a less than significant impact would occur.

STANDARD CONDITIONS & REQUIREMENTS

1. The project shall comply with the California Building Code and the City of Eastvale's grading requirements in Eastvale Municipal Code Section 130.08.040, *Street Grades*, and subject to the approval of the City Engineer.
2. The project shall comply with all recommendations contained in the project-specific Geotechnical Evaluation.

MITIGATION MEASURES

None required.

4.8 GREENHOUSE GAS EMISSIONS

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			X	
b)	Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?			X	

DISCUSSION

The analysis and findings throughout this section are based on the *Air Quality, Energy and Greenhouse Gas Emissions Impact Analysis Magnolia Ranch Residential Project, City of Eastvale* (Air Quality, Energy and Greenhouse Gas Evaluation) prepared by Vista Environmental, dated July 26, 2022, provided as **Appendix 4** of this IS/MND.

Background

Global Climate Change

California is a substantial contributor of global greenhouse gases (GHGs), emitting over 420 million metric tons of carbon dioxide equivalent ($MTCO_2e$) per year.[9] Methane (CH_4) is also an important GHG that potentially contributes to global climate change. GHGs are global in their effect, which increases the earth's ability to absorb heat in the atmosphere. As primary GHGs have a long lifetime in the atmosphere, accumulate over time, and are generally well-mixed, their impact on the atmosphere is mostly independent of the point of emission. Every nation emits GHGs and as a result makes an incremental cumulative contribution to global climate change; therefore, global cooperation is required to reduce the rate of GHG emissions enough to slow or stop the human-caused increase in average global temperatures and associated changes in climatic conditions.

Due to the nature of global climate change, it is not anticipated that any single development project would have a substantial effect on global climate change. In actuality, GHG emissions from the proposed project would combine with emissions emitted across California, the United States, and the world to cumulatively contribute to global climate change.

[9] California Air Resources Board. 2019. California Greenhouse Gas Emissions for 2000 to 2017. Carbon dioxide equivalent (CO_2e) is a metric measure used to compare the emissions from various greenhouse gases based upon their global warming potential.

Regulations and Significance Criteria

Multiple regulations pertaining to GHG emissions apply to the project including the following, which are described in detail in the Air Quality and Greenhouse Gas Evaluation:

- Climate Change Action Plan: developed by the Intergovernmental Panel on Climate Change (IPCC) to address the reduction of GHGs in the United States, consisting of more than 50 voluntary programs. The IPCC concluded that a stabilization of GHGs at 400 to 450 ppm CO_2e concentration is required to keep global mean warming below two degrees Celsius (°C), which in turn is assumed to be necessary to avoid dangerous climate change.
- Executive Order S-3-05: issued in June 2005, which established the following GHG emission reduction targets:
  - 2010: Reduce GHG emissions to 2000 levels
  - 2020: Reduce GHG emissions to 1990 levels
  - 2050: Reduce GHG emissions to 80 percent below 1990 levels
- Executive Order B-30-15: Issued in April 2015, requires Statewide GHG emissions to be reduced 40 percent below 1990 levels by 2030.
- Assembly Bill 32 (California Health and Safety Code, Division 25.5 – California Global Warming Solutions Act of 2006): Adopted in 2006, focuses on reducing GHG emissions in California to 1990 levels by 2020 and defines GHGs as CO_2, CH_4, N_2O, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride and represents the first enforceable Statewide program to limit emissions of these GHGs from all major industries with penalties for noncompliance. Under HSC Division 25.5, the California Air Resources Board (CARB) has the primary responsibility for reducing GHG emissions.
- Senate Bill 32 and Assembly Bill 197: Adopted in 2016, establishes a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and includes provisions to ensure the benefits of State climate policies reach into disadvantaged communities.
- California Air Resources Board 2017 Scoping Plan: establishes a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 implementation fee to fund the program. The 2017 Scoping Plan Update identifies additional GHG reduction measures necessary to achieve the 2030 target. These measures build upon those identified in the First Update to the Scoping Plan (2013).
- City of Eastvale: The City of Eastvale is part of the Western Riverside Council of Government (WRCOG). The WRCOG adopted the WRCOG Subregional Climate Action Plan (CAP) in September 2014. The Subregional CAP sets forth a subregional emissions reduction target, emissions reduction measures, and action steps to assist each community to demonstrate consistency with California's Global Warming Solutions Act of 2006 (AB 32). The CAP consists of a community-wide emissions reduction target of 15 percent below 2010 levels by 2020, and 49 percent below 2010 levels by 2035.

In addition, the City of Eastvale General Plan Air Quality and Conservation Element includes policies related to GHGs.

8(a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Determination: Less Than Significant Impact.

Per City of Eastvale guidance, to determine whether the project's GHG emissions are significant, this analysis uses the SCAQMD screening threshold of 3,000 $MTCO_2e$ per year for all land uses.

Construction and operational activities associated with the proposed project would generate GHG emissions from area sources, energy usage, mobile sources, waste, water, and construction equipment; CalEEMod Version 2020.4.0 was used to calculate the GHG emissions from the proposed project. A summary of the results is shown in ***Table 8.1, Project-Related GHG Emissions***. As shown in ***Table 8.1***, project-related GHG emissions would total 557.29 $MTCO_2e$ per year. As stated above, according to the thresholds of significance, a cumulative global climate change impact would occur if GHG emissions created from the ongoing operations of the proposed project exceeded the SCAQMD draft threshold of 3,000 $MTCO_2e$ per year for all land uses. Therefore, the currently proposed project would not require emissions reductions. Further, the project will comply with all applicable regulations intended to reduce GHG emissions. As such, impacts would be less than significant.

Table 8.1: Project-Related GHG Emissions

Category	Greenhouse Gas Emissions (Metric Tons per Year)			
	CO_2	CH_4	N_2O	CO_2e
Area Sources	0.69	<0.01	0.00	0.71
Energy Usage	71.30	<0.01	<0.01	71.72
Mobile Sources	429.05	0.02	0.02	435.88
Solid Waste	4.87	0.29	0.00	12.07
Water and Wastewater	9.85	0.07	<0.01	12.13
Construction	24.48	<0.01	<0.01	24.78
Total Emissions	**540.25**	**0.39**	**0.02**	**557.29**
SCAQMD Draft Threshold				**3,000**
Exceed Threshold?				**No**

8(b) Conflict with an applicable plan, policy, or regulations adopted for the purpose of reducing the emissions of greenhouse gases?

Determination: Less Than Significant Impact.

The proposed project would not conflict with an applicable greenhouse gas reduction plan, policy or regulation. The applicable plan for the proposed project is the Eastvale General Plan, which provides guidance for the City's future development and includes policies related to greenhouse

gas emissions, refer to ***Table 8.2, Proposed Project Compliance with Applicable General Plan GHG Policies***, below. The proposed project would be consistent with each of the applicable policies, as demonstrated by ***Table 8.2***.

Additionally, as discussed above, the proposed project's total emissions do not exceed the SCAQMD draft threshold of 3,000 $MTCO_2e$ per year and is in compliance with overall community-wide reduction goals of the WRCOG CAP, AB 32, and SB 32. Furthermore, the project would comply with applicable CalGreen Building Standards and City of Eastvale's policies regarding sustainability (as dictated by the City's General Plan). Impacts would be less than significant.

Table 8.2: Proposed Project Compliance with Applicable General Plan GHG Policies

Policy No.	General Plan Policy	Proposed Project Implementation Actions
AQ-18	Support local, regional, and Statewide efforts to reduce emissions of greenhouse gases linked to climate change.	**Consistent.** The proposed homes are required to be designed to meet Title 24 Part 6 Energy Efficiency Standards that require all new homes to be designed to be net zero energy usage that is achieved through the installation of PV solar panels, which will minimize the usage of carbon energy sources.
AQ-19	Analyze and mitigate, to the extent feasible, potentially significant increases in greenhouse gas emissions during project review, pursuant to the California Environmental Quality Act.	**Consistent.** As detailed above in Section 4.8, Impact 8(a), the proposed project was found to create less than significant levels of GHG emissions.
AQ-20	Continue to support the planting and maintenance of trees in the community to increase carbon sequestration.	**Consistent.** The Landscape Plan for the proposed project has been designed to incorporate as many trees as possible within the proposed project.

STANDARD CONDITIONS & REQUIREMENTS

The project would be required to comply with all mandates imposed by the State of California and the South Coast Air Quality Management District intended to reduce GHG emissions. The following are applicable to the project and would assist in the reduction of GHG emissions:

- Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32) - requires CARB to adopt rules and regulations that would achieve GHG emissions equivalent to Statewide levels in 1990 by 2020
- Regional GHG Emissions Reduction Targets/Sustainable Communities Strategies (Senate Bill [SB] 375)
- California Code of Regulations, Title 24 (California Building Standards Code) – establishes energy efficiency requirements for new construction
- California Code of Regulations, Title 20, Division 2, Chapter 4 (Appliance Efficiency Regulations) – establishes energy efficiency requirements for appliances

- Senate Bill 100 (SB 1078) – requires that 100 percent of retail sales of electricity be generated from renewable or zero-carbon sources, by December 2045

MITIGATION MEASURES

None required.

4.9 HAZARDS AND HAZARDOUS MATERIALS

Would the proposed project:					
	Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a)	Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	
b)	Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			X	
c)	Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?			X	
d)	Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?				X
e)	For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles or a public airport or public use airport, result in a safety hazard for people residing or working in the project area? For a project within the vicinity of a private airstrip, result in a safety hazard for people residing or working in the project area?				X
f)	Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			X	
g)	Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				x

The analysis and findings throughout this section are based on the *Phase I Environmental Site Assessment* (Phase I ESA) prepared by Hillman Consulting LLC, dated January 27, 2021, and provided as **Appendix 8** of this IS/MND.

DISCUSSION

9(a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Determination: Less Than Significant Impact.

Exposure of the public or the environment to hazardous materials can occur through improper handling or use of hazardous materials or hazardous wastes particularly by untrained personnel, a transportation accident, environmentally unsound disposal methods, or fire, explosion, or other emergencies. The severity of potential effects varies with the activity conducted, the concentration and type of hazardous material or wastes present, and the proximity of sensitive receptors.

Project construction could expose construction workers and the public to temporary hazards related to the transport, use, and maintenance of construction materials (i.e., oil, diesel fuel, transmission fluid, etc.). These activities would be short-term, and the materials used would not be in such quantities or stored in such a manner as to pose a significant safety hazard. All project construction activities would demonstrate compliance with the applicable laws and regulations governing the use, storage, and transportation of hazardous materials, ensuring that all potentially hazardous materials are used and handled in an appropriate manner. Impacts concerning the routine transport, use, or disposal of hazardous materials during project construction would be less than significant.

9(b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Determination: Less Than Significant Impact.

Existing Conditions

One of the means through which human exposure to hazardous substance could occur is through accidental release. Incidents that result in an accidental release of hazardous substance into the environment can cause contamination of soil, surface water, and groundwater, in addition to any toxic fumes that might be generated. Human exposure of contaminated soil, soil vapor, or water can have potential health effects on a variety of factors, including the nature of the contaminant and the degree of exposure.

According to the Phase I ESA, site reconnaissance revealed no evidence of the following on the project site: hazardous substances; drums; chemical containers; underground storage tanks (USTs) or aboveground storage tanks (ASTs); interior stains or corrosion due to hazardous substance/petroleum products spills/releases; floor drains or sump pits; pits, ponds, lagoons, or standing water/pools of liquid; or onsite solid waste dumping. A septic system is present and utilized for onsite disposal of sanitary sewage, most likely located adjoining to the north of the residential structure. A pump system for a water well was observed at the southeastern portion of the project site. No visual observations indicative of a potential environmental concern were noted on the adjoining properties. In addition, a database records search of the Environmental

Data Resources (EDR) radius map revealed there are no potential historical high-risk uses at or in the vicinity of the project site.

Based on research of historical aerial photographs and topographical maps conducted for the Phase I ESA, the project site is described as being undeveloped, vacant land, with agricultural use from approximately 1931 through 1989, and residential use occurring after 1990. The project site is partially developed with one occupied single-family residence, an outbuilding, and a concrete driveway connecting the residence to Orange Street.

Construction Impacts

During project construction, there is a possibility of accidental release of hazardous substances such as petroleum-based fuels or hydraulic fluid used for construction equipment. The level of risk associated with the accidental release of hazardous substances is not considered significant due to the small volume and low concentration of hazardous materials utilized during construction. The construction contractor would be required to use standard construction controls and safety procedures that would avoid and minimize the potential for accidental release of such substances into the environment. Standard construction practices would be observed such that any materials released are appropriately contained and remediated as required by local, State, and federal law. Construction impacts in this regard would be less than significant.

Operational Impacts

The Phase I ESA revealed no evidence of recognized environmental conditions (RECs) in connection with the project site. Due to the previous agricultural uses discussed above, soil borings and samples were conducted onsite as part of the Phase I ESA due to the potential for soil contamination due to historic applications of pesticides. The samples were submitted for laboratory analysis of organo-chlorine pesticides (OCP) by U.S. Environmental Protection Agency (USEPA) Method 8081A, and analysis of Title 22 Metals by EPA Method 6010B as recommended by DTSC guidance. The results identified Heptachlor Epoxide pesticide from composite sample P17-20 at 0.027 mg/kg concentration, well below the 0.07 mg/kg screening limit for residential soils. No other OCPs were detected, as well as no elevated levels of heavy metals. Therefore, the Phase I ESA concluded that the historic usage of the project site as orchards/agricultural land is not considered to be a REC.

As discussed previously, based on the Phase I ESA conducted for the project, there is an existing onsite septic system and water well. However, prior to the proposed development, the existing onsite septic system would be removed and disposed of, and the existing onsite water well would be properly abandoned. Therefore, upon removal of the septic system and water well, potential hazardous materials impacts relative to operation of the project would be less than significant.

9(c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Determination: Less Than Significant Impact.

There are three existing schools within one-quarter mile of the proposed project site: Eastvale Elementary School at 13031 Orange Street, immediately adjacent to the east of the project site; River Heights Intermediate School at 7227 Scholar Way, immediately adjacent to the east of the project site. The nearest high school is Roosevelt High School, at 7401 Scholar Way, approximately 0.3-mile south of the project site. However, operation and maintenance of the proposed project would not produce hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste. Therefore, the proposed project would not result in impacts related to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. A less than significant impact would occur in this regard.

9(d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Determination: No Impact.

According to the Phase I ESA prepared for the proposed project, the project is not located on a known site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. No impact would occur in this regard.

9(e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles or a public airport or public use airport, result in a safety hazard for people residing or working in the project area? For a project within the vicinity of a private airstrip, result in a safety hazard for people residing or working in the project area?

Determination: No Impact.

The nearest public use airport is Chino Regional Airport, located approximately 3 miles northwest of the project site. According to Exhibit CH-6, *Compatibility Factors Map*, of the Riverside County Airport Land Use Compatibility Plan Policy Document (ALUCP), the project site is not located within the Chino Regional Airport Influence Area. Therefore, no impact would occur relative to airport safety hazards.

9(f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Determination: Less Than Significant Impact.

Activities associated with the proposed project would not impede existing emergency response plans for the project site and/or other land uses in the project vicinity. As indicated in Section 4.17, *Transportation*, the project does not propose changes to the City's circulation system, such as sharp curves or dangerous intersections, and would not introduce incompatible uses to area

roadways. Proposed off-site roadway improvements, as required by the City Public Works Department, include streetscape improvements along Schleisman Road and Orange Street. Furthermore, should partial lane closures be required as part of project construction activities, implementation of a traffic management plan would minimize congestion and ensure safe travel, including emergency access in the project vicinity; refer to the "Standard Conditions and Requirements" discussion in Section 4.17, *Transportation,* of this IS/MND. Therefore, impacts would be less than significant.

9(g) Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Determination: No Impact.

As discussed in Section 4.20, *Wildfire,* the project site is located in a developed urban area surrounded by residential and educational facility uses and is not located in a zone designated as Very High Fire Hazard by the California Department of Forestry and Fire Protection (CalFire). Urban levels of fire protection would be provided to the project area. In addition, the project would adhere to building codes and any conditions included through review by the Riverside County Fire Department (RCFD). No impact would occur in this regard.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

4.10 HYDROLOGY AND WATER QUALITY

Would the proposed project:					
	Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a)	Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?			X	
b)	Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?			X	
c)	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
	i) Result in substantial erosion or siltation on- or off-site?			X	
	ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?			X	
	iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?			X	
	iv) Impede or redirect flood flows?			X	
d)	In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?				X
e)	Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?			X	

The analysis and findings throughout this section are based on the following: *APN No. 152-04-0003 Riverside County 13175 Orange Street SFR Preliminary Drainage Report* (Hydrology Study) prepared by Allard Engineering July 12, 2023, provided as **Appendix 9A** of this IS/MND; and the *Project Specific Water Quality Management Plan* (WQMP) prepared by Allard Engineering, dated July 12, 2023, provided as **Appendix 9B** of this IS/MND.

DISCUSSION

10(a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Determination: Less Than Significant Impact.

As part of Section 402 of the Clean Water Act, the USEPA has established regulations under the NPDES program to control direct stormwater discharges. In California, the State Water Resources Control Board (SWRCB) administers the NPDES permitting program and is responsible for developing NPDES permitting requirements. The NPDES program regulates industrial pollutant discharges, which include construction activities. The SWRCB works in coordination with the Regional Water Quality Control Boards (RWQCB) to preserve, protect, enhance, and restore water quality. The project site is within the jurisdiction of the Santa Ana RWQCB.

Impacts related to water quality typically range over three different periods: 1) during the earthwork and construction phase, when the potential for erosion, siltation, and sedimentation would be the greatest; 2) following construction, prior to the establishment of ground cover, when the erosion potential may remain relatively high; and 3) following completion of the project, when impacts related to sedimentation would decrease markedly, but those associated with urban runoff would increase.

Project construction could result in short-term impacts to water quality due to the handling, storage, and disposal of construction materials, maintenance and operation of construction equipment, and earthmoving activities. These potential pollutants could damage downstream waterbodies. Dischargers whose projects disturb one or more acres of soil or whose projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the SWRCB's General Permit for Discharges of Stormwater Associated with Construction Activity Construction General Permit Order 2009-0009-DWQ (Construction General Permit). The Construction General Permit requires the project applicant to prepare and implement a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP would specify best management practices (BMPs) to be used during project construction to minimize or avoid water pollution, thereby reducing potential short-term impacts to water quality. Upon completion of the project, the project applicant would be required to submit a Notice of Termination to the SWRCB to indicate that construction has been completed.

To further minimize the potential for accidental release of pollutants during project construction, the routine transport, use, and disposal of construction materials would be required to adhere to applicable State and local standards and regulations for handling, storage, and disposal of hazardous substances; refer to Section 4.9, *Hazards and Hazardous Materials,* of this IS/MND. Compliance with such measures would prevent such substances from entering downstream water bodies via stormwater runoff and adversely affect existing water quality. Following conformance with the Construction General Permit, SWPPP, and implementation of BMPs, the project's short-term impacts to water quality and waste discharge requirements would be less than significant.

The project would be required to implement BMPs to minimize operational impacts to water quality. As detailed in the project's WQMP, potential sources of runoff pollutants include onsite storm drain inlets, landscaping/outdoor pesticide use, refuse areas, and plazas, sidewalks, and parking lots. As a result, the WQMP includes permanent and operational source control BMPs in Appendix 8, *Source Control Pollutant Sources/Source Control Checklist*, of Appendix 9B. These BMPs include, but are not limited to, the construction of on-site storm drain inlets, landscape planning and maintenance, storm drain signage, and private street sweeping. With implementation of these BMPs, the project's impacts to water quality would be less than significant.

10(b) Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level, which would not support existing land uses or planned uses for which permits have been granted)?

Determination: Less Than Significant Impact.

The project site is partially developed with one occupied single-family residence, an outbuilding, and a concrete driveway connecting the residence to Orange Street. Project development would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management. Groundwater was not encountered within the exploratory borings performed for the Geotechnical Evaluation (Appendix 7). Based on the lack of water encountered in the borings and a review of the groundwater information contained on the State Department of Water Resources Water Data Library website, the Geotechnical Investigation estimated depth to high groundwater at the site is about 50 feet below grade, therefore, the project is not expected to substantially deplete groundwater supplies or interfere substantially with groundwater recharge during or after construction.

The project site is not currently used for groundwater recharge purposes. Water for the project would be provided by JCSD and the project would connect to the existing water system. Thus, project implementation would not substantially decrease groundwater supplies nor interfere substantially with groundwater recharge. Impacts would be less than significant in this regard.

10(c)(i) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?

Determination: Less Than Significant Impact.

According to the project's *WQMP Site Map*, approximately 144,271 SF of impervious surfaces and approximately 216,406 SF of pervious surfaces would be created as a result of project development.

The project site currently contains roughly 78,200 SF of impervious concrete surfaces. Although the project would result in an increase in impervious surfaces (184 percent increase), the

proposed project overall would not substantially alter the existing drainage pattern of the site. As shown in the project's WQMP Exhibit **(Appendix 9B),** catch basins in Street A (adjacent to Lot 5) and Street D (adjacent to Lot 31) will convey runoff to underground retention/infiltration chambers in the public right-of-way to infiltrate and treat a total of 10,467 cubic feet of runoff with a drawdown rate of approximately 34-38 hours. Once the Infiltration/Retention Chamber Systems reach their capacity, the overflow will drain out using storm drain pipes from the Chamber System and will be conveyed to the frontage street (Orange Street) via the proposed 30" storm drain lateral onsite and finally conveyed to the existing City storm drain system (48" RCP) in Orange Street via 30" lateral.

As discussed in Response 4.10(a) above, the project would comply with the requirements of the Construction General Permit under the NPDES program, which would result in preparation of an SWPPP that outlines necessary BMPs to minimize erosion and water quality impacts during construction. Therefore, project development would not result in significant erosion or siltation impacts due to changes in drainage patterns and impacts would be less than significant.

10(c)(ii) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Determination: Less Than Significant Impact.

Refer to Response 4.10(c)(i) above.

10(c)(iii) Would the project create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?

Determination: Less Than Significant Impact.

Refer to Responses 4.10(c)(i) above. On-site stormwater runoff associated with the project would be engineered to be conveyed through public street improvements and onsite infiltration to dispose of stormwater. Additionally, with required implementation of a SWPPP and WQMP as discussed above, the proposed project would not generate a substantial source of polluted runoff. The project would not create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems. A less than significant impact would occur.

4(c)(iv) Would the project impede or redirect flood flows?

Determination: Less Than Significant Impact.

The project site is relatively flat. The proposed project would include the development of a storm drainage system consistent with City requirements to convey stormwater runoff to a 48-inch RCP mainline storm drain system located on Orange Street. The proposed onsite drainage system conveys runoff to the existing storm drain system south of the site which is also consistence with the existing drainage pattern. Stormwater management practices as required under Eastvale Municipal Code Title 14, *Water and Sewers,* would further reduce any impacts to a less than

significant level. In addition, proposed on-site storm drain inlets, drain lines, catch basins, underground infiltration/retention chambers, front yard typical/onsite landscaping and streetscape landscaping to Orange Street would assist in minimizing the potential for impediment or redirect flood flows. Therefore, impacts would be less than significant.

10(d) In flood hazard, tsunami, or seiche zones, would the project result in a risk release of pollutants due to project inundation?

Determination: No Impact.

According to the Federal Emergency Management Agency's (FEMA) National Flood Hazard Layer Viewer, the project site is not located within a 100-year flood hazard area.[10] As a result, no impact would occur in this regard.

A tsunami is a series of ocean waves generated in the ocean by an impulsive disturbance. The proposed project site is located approximately 30 miles inland from the Pacific Ocean. Due to this location, tsunamis are not considered a threat. No impact would occur in this regard.

A seiche is an oscillating surface wave in a restricted or enclosed body of water generated by ground motion, usually during an earthquake. Inundation from a seiche can occur if the wave overflows a containment wall or the banks of a water body. However, because the proposed project is not adjacent to any marine or inland water bodies, impacts from seiche are not expected to occur. No impact would occur in this regard.

4(e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Determination: Less Than Significant Impact.

The project site is located in the Santa Ana River Hydrologic Unit in the South Coast Hydrologic Region. The Santa Ana RWQCB oversees basin planning and water quality in the Santa Ana River Hydrologic Unit. The Santa Ana RWQCB prepares the Water Quality Control Plan for the Santa Ana River Basin (Basin Plan) to protect local surface waters and groundwater basins. The Basin Plan designates beneficial uses of waters in the region and provides objectives to maintain or improve water quality in the region.

The California Department of Water Resources (DWR) has initiated a technical process called Basin Prioritization, which utilizes the best available data and information to classify California's 515 groundwater basins into one of four categories high-, medium-, low-, or very low-priority, based on eight components that are identified in the California Water Code Section 10933(b). Each basin's priority determines which provisions of California Statewide Groundwater Elevation Monitoring (CASGEM) and the Sustainable Groundwater Management Act (SGMA) apply. SGMA requires medium- and high-priority basins to develop groundwater sustainability agencies (GSAs), develop groundwater sustainability plans (GSPs) and manage groundwater for long-term

[10] Federal Emergency Management Agency. n.d. National Flood Hazard Layer Viewer. Accessed May 13, 2022. https://www.fema.gov/national-flood-hazard-layer-nfhl.

sustainability. Based on a search of the DWR's online SGMA Basin Prioritization Dashboard, the project site is located in a groundwater basin area designated as "low and very low."[11]

As described in Response 4.10(c)(i) above, the project would install underground infiltration/retention chambers to satisfy the requirements of the NPDES permit. The proposed chambers would be designed to infiltrate, filter, and treat a total of 10,467 cubic feet of runoff with a drawdown rate of approximately 34-38 hours.

Since the NPDES permit is intended to protect water quality, compliance with the permit would ensure that the project would not impair existing or potential beneficial uses of nearby or downstream water bodies and would not conflict with or obstruct implementation of the Basin Plan. The proposed project does not propose the drilling of a well to obtain groundwater for consumption. The project would utilize an existing 8-inch potable water line in Orange Street and could utilize an existing 12-inch potable water lines in Schleisman Road if needed for pressure, and thus would not conflict with a groundwater management plan. Impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

1. The proposed project would be required to obtain coverage under the Santa Ana regional water quality control board's Statewide General Construction Permit (CGP), which requires the preparation, approval, and implementation of a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP would include Best Management Practices (BMPs) to be implemented during and after project construction to minimize erosion and sedimentation of downstream watercourses.
2. The project is subject to the Riverside County Storm Water Permit, also issued by the Santa Ana RWQCB (Order No. R8-2010-003, NPDES No. CAS 618033, as amended by R8-2013-0024, NPDES No. CAS618033) for discharges into the Municipal Separate Storm Sewer Systems (MS4S) draining the county.
3. The project applicant will be required to prepare a final WQMP for the project, with BMPs incorporated in the plan.

MITIGATION MEASURES

None required.

[11] California Department of Water Resources SGMA Basin Prioritization Dashboard. Nd. https://gis.water.ca.gov/app/bp-dashboard/final/ Accessed August 9, 2022.

4.11 LAND USE AND PLANNING

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Physically divide an established community?			X	
b)	Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?			X	

DISCUSSION

11(a) Physically divide an established community?

Determination: Less Than Significant Impact.

The physical division of an established community is typically associated with construction of a linear feature, such as a major highway or railroad tracks, or removal of a means of access, such as a local road or bridge, which would impair mobility within an existing community or between a community and an outlying area.

None of the proposed project components would constitute a barrier that would physically divide an established community. No new linear features are included in the project. Access to and movement throughout the project area and the City would not be physically impaired due to the project.

Therefore, the proposed project would not physically divide an established community. Less than significant impacts would occur.

11(b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Determination: Less Than Significant Impact.

SB 330

The City has identified the project site as being subject to SB 330 (the Housing Crisis Act of 2019). In 2021, the City adopted Chapter 120.08, *No Net Loss Program*, in the Eastvale Municipal Code in order to establish a SB 330 compliance density bonus program, in satisfaction of the "no net loss" requirements of SB 330. Projects requesting Density Bonuses through the No Net Loss Program are subject to preliminary application processing as specified in Eastvale Municipal Code Chapter 120.08, in addition to environmental analysis under CEQA.

Under the streamlining provisions of SB 330, a housing development cannot be required to rezone the property if it is consistent with the objective General Plan standards for the property.

The public agency may require the housing development to comply with the objective zoning code standards applicable to the property, but only to the extent they facilitate the development at the density allowed by the General Plan.[12]

Because the proposed project has completed both the preliminary application as required by Eastvale Municipal Code Chapter 120.08 and the environmental analysis contained in this IS/MND, the project is consistent with the provisions of SB 330 and a less than significant impact would occur.

General Plan

The project site is currently designated by the Eastvale General Plan as Medium Density Residential (MDR) and is bounded by MDR land uses on all sides. The density of the proposed project would be 4.95 du/ac, which is within the allowable density range of 2.1 to 5.0 du/ac for land with the MDR land use designation. As such, the project is consistent with the General Plan and impacts would be less than significant.

Zoning Code

The project site is zoned Heavy Agricultural (A-2). The properties to the east and south of the project site are also zoned Heavy Agricultural (A-2). The neighborhoods to the north and west are zoned One Family Dwellings (R-1). However, because the project site has a Residential land use designation and is consistent with the objective General Plan standards for the site, the project is not required to obtain approval of a Change of Zone under the provisions of SB 330, as described above.

The proposed project has been designed to meet the regulations of the Residential zoning. The project would comply with the minimum lot standards for area, width, and depth, as well as height, floor area ratio, and setback regulations. As such, the project would be consistent with the Zoning Code and impacts would be less than significant.

Conclusion

The proposed project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the General Plan, Specific Plan, Local Coastal Program, or Zoning Ordinance) adopted for the purpose of avoiding or mitigating an environmental effect. Impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

[12] Best, Best and Krieger, LLP. 2022. https://www.bbklaw.com/news-events/insights/2019/legal-alerts/10/sb-330-limits-local-laws-over-housing-developments Accessed June 21, 2022.

4.12 MINERAL RESOURCES

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the State?				X
b)	Result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan?				X

DISCUSSION

12(a) Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the State?

Determination: No Impact.

The project site has no history of use as a mineral resource recovery operation and is located in a predominantly developed area of the City. Areas identified as Mineral Resource Zone 2 (MRZ-2) are areas that contain identified mineral resources, and no areas within the project vicinity are mapped MRZ-2 by the Riverside County General Plan.[13] The project site, as with the majority of City, are mapped as Mineral Resource Zone 3 (MRZ-3) wherein the significance of mineral deposits is undetermined. As such, no mineral resources are anticipated within the project area. Thus, project implementation would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State. No impact would occur.

12(b) Result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan?

Determination: No Impact.

Refer to Response 4.12(a), above. No mineral resources are anticipated within the project area. No impact would occur.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

[13] Riverside County General Plan Update, Chapter 14, Mineral Resources, Figure 4.14.1. https://planning.rctlma.org/Portals/14/genplan/general_plan_2014/EnvironmentalImpactReport/04-14_MineralResources_2014-04-07.pdf, Accessed May 17, 2022.

4.13 NOISE

Would the proposed project result in:					
	Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a)	Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?		X		
b)	Generation of excessive groundborne vibration or groundborne noise levels?			X	
c)	For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			X	

The analysis and findings throughout this section are based on the *Magnolia Ranch Residential Project Noise Impact Analysis* (Noise Impact Analysis) prepared by Vista Environmental, dated July 26, 2022, provided as **Appendix 10** of this IS/MND. Refer to the Noise Impact Analysis for a complete discussion regarding noise metrics fundamentals.

DISCUSSION

Multiple regulations pertaining to noise apply to the project including the following, which are described in detail in the Noise Impact Analysis:

- Governor's Office of Planning and Research Noise Element Guidelines: Includes recommended exterior and interior noise level standards for local jurisdictions to identify and prevent the creation of incompatible land uses due to noise.
- City of Eastvale General Plan Noise Element contains multiple policies relative to noise impacts that are applicable to the project.
- Eastvale Municipal Code Section 8.52.020, *Exemptions;* Section 8.52.040, *General Sound Level Standards;* and Section 120.05.130, *Noise, Odor and Vibration Performance Standards*, are applicable to the project.

EXISTING CONDITIONS

Existing Ambient Noise Levels

Existing ambient noise within the proposed project area is generally characterized by vehicle traffic on Schleisman Road that is adjacent to the north side of the project site and from Orange Street that is adjacent to the south side of the project site. There is also noise created from Eastvale Elementary School, adjacent to the east side of the project site.

Noise Sensitive Receptors

Noise-sensitive land uses are generally considered to include those uses where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. Residential dwellings are of primary concern because of the potential for increased and prolonged exposure of individuals to both interior and exterior noise levels. Additional land uses such as parks, historical sites, cemeteries, and recreation areas are considered sensitive to increases in exterior noise levels. Schools, churches, hotels, libraries, and other places where low interior noise levels are essential are also considered noise-sensitive land uses.

The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Table 13.1, City of Eastvale Noise Compatibility and Land Use Designation**,** shows the City's noise compatibility associated with each specific land use designation, as presented in the General Plan.

Table 13.1: City of Eastvale Noise Compatibility and Land Use Designation

Land Use Designations	Completely Compatible	Tentatively Compatible	Normally Incompatible	Completely Incompatible
All Residential (Single- and Multi-Family)	Less than 60 dBA	60-70 dBA	70-75 dBA	Greater than 75 dBA
All Non-Residential (Commercial, Industrial & Institutional)	Less than 70 dBA	70-75 dBA	Greater than 75 dBA	To be determined as part of the project review process
Public Parks (Lands on which public parks are located or planned)	Less than 65 dBA	65-70 dBA	70-75 dBA	Greater than 75 dBA

Source: City of Eastvale General Plan, Table N-3.

Notes: All noise levels shown in this table are designated Community Noise Equivalent Level (CNEL).

dBA = A-weighted decibel

13(a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Determination: Less Than Significant Impact with Mitigation Incorporated.

Construction Impacts

The construction activities for the proposed project are anticipated to include: demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses; site preparation and grading; construction of 41 single-family homes; paving of onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site; and application of architectural coatings.

Noise impacts from construction of the proposed project have been analyzed through use of the Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM). ***Table 13.2: Construction Equipment Noise Emissions and Usage Factors,*** below, provides a list of the construction equipment anticipated to be used for each phase of construction that was obtained from the *Air Quality, Energy, and Greenhouse Gas Impact Analysis Magnolia Ranch Residential Project* (Air Quality Analysis), prepared by Vista Environmental, July 26, 2022.

Table 13.2: Construction Equipment Noise Emissions and Usage Factors

Equipment Description	Acoustical Use Factor[1]	L_{max} at 50 Feet (dBA)[2]
Demolition		
Concrete/Industrial Saw	20	90
Excavator	40	85
Rubber-Tired Dozer	40	85
Site Preparation		
Rubber-Tired Dozer	40	85
Crawler Tractor	40	84
Grading

Grader	40	85
Rubber-Tired Dozer	40	85
Scraper	40	85
Crawler Tractor	40	84
Building Construction		
Crane	16	85
Forklift (Gradall)	40	85
Generator	50	82
Crawler Tractor	40	84
Front End Loader	40	80
Backhoe	40	80
Welder	40	73
Paving		
Paver	50	85
Paving Equipment	50	85
Roller	20	85
Architectural Coating		
Air Compressor	40	80

Source: Vista Environmental. Noise Impact Analysis. July 26, 2022. Table H.
Notes: 1 = Acoustical use factor is the percentage of time each piece of equipment is operational during a typical workday
2 = Lmax = maximum noise levels; dBA = A-weighted decibel

Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 8.52.020(9) of the City's Municipal Code exempts construction noise that occurs between 6:00 AM and 6:00 PM June through September and between 7:00 AM and 6:00 PM October through May. However, General Plan Policy N-23, requires that infill development projects to prepare a Construction Noise Mitigation Plan prior to obtaining a grading permit. As such, as a standard condition, the project would require the use temporary noise barriers, designated equipment staging areas, limits on idling and the required use of mufflers on all construction equipment. Refer to the "Standard Conditions and Requirements" discussion below.

The City construction noise standards do not provide any limits to the noise levels that may be created from construction activities and even with adherence to the City standards, the resultant construction noise levels may result in a significant substantial temporary noise increase to the nearby sensitive receptors. In order to determine if the proposed construction activities would create a significant substantial temporary noise increase, Federal Transit Agency (FTA) construction noise criteria thresholds were utilized in the project's construction noise level calculations, which shows that a significant construction noise impact would occur if construction noise exceeds 80 dBA during the daytime at any of the nearby homes and school. Construction noise levels at the nearest sensitive receptor by phase are shown in ***Table 13.3, Construction Noise Levels at the Nearest Sensitive Receptor***, below. Based on the Noise Impact Analysis, and as shown in ***Table 13.3***, the greatest noise impacts would occur during the grading phase, with a noise level as high as 72 dBA L_{eq} at the school to the east and 67 dBA L_{eq} at the nearest homes to the west. ***Table 13.3*** also shows that none of the construction phases would exceed the FTA noise standard of 80 dB at the nearby homes or school. Therefore, through adherence to the allowable construction times detailed in Section 8.52.020(9) of the Municipal Code and through implementation of the standard condition and requirement that requires the preparation of a construction-related noise mitigation plan, prior to the issuance of the grading plan for the proposed project, the proposed project would not create a substantial temporary increase in ambient noise levels from construction of the proposed project. Construction-related noise impacts would be less than significant.

Table 13.3: Construction Noise Levels at the Nearest Sensitive Receptor

Construction Phase	Construction Noise Level (dBA L_{eq}) at:	
	Nearest Homes to the West[1]	Nearest School to the East[2]
Demolition	65	70
Site Preparation	66	71
Grading	67	72
Building Construction	65	70
Paving	60	65
Painting	52	57
FTA Construction Noise Threshold[3]	**80**	**80**
Exceed Threshold?	**No**	**No**

Source: Vista Environmental. Noise Impact Analysis. July 26, 2022. Table M.

Notes: 1 = The nearest homes to the west are located as near as 340 feet from the center of the project site. 5 dB of estimated shielding was included to account for the 6 to 7 foot high CMU wall on the west side of the project site.

2 = The nearest school structure to the east is located as near as 340 feet from the center of the project site.

3 = The FTA Construction noise thresholds are detailed above in Table B of the Noise Impact Analysis.

Operational Impacts

Potential noise impacts associated with the operations of the proposed project would be from project-generated vehicular traffic on the nearby roadways. In addition, the proposed development would be adjacent to Schleisman Road and adjacent to Eastvale Elementary School, which may create exterior and interior noise levels in excess of City standards at the proposed homes. Both the off-site noise impacts to nearby existing homes and the on-site noise impacts to proposed homes were analyzed separately, discussed below.

Off-Site Traffic Noise Impacts

Vehicle noise is a combination of the noise produced by the engine, exhaust and tires. The level of traffic noise depends on three primary factors (1) the volume of traffic, (2) the speed of traffic, and (3) the number of trucks in the flow of traffic. The proposed project does not propose any uses that would require a substantial number of truck trips and the proposed project would not alter the speed limit on any existing roadway; therefore, the proposed project's potential off-site noise impacts are focused on the noise impacts associated with the change of volume of traffic that would occur with development of the proposed project.

The Noise Impact Analysis analyzed the proposed project's potential off-site traffic noise impacts for the existing year, opening year 2024, and future year 2040 scenarios. The Noise Impact Analysis concluded that the proposed project's permanent roadway noise increases to the nearby homes from the generation of additional vehicular traffic would not exceed the FTA's allowable increase thresholds under any of the above scenarios. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels and a less than significant impact would occur in this regard.

On-Site Traffic Noise Impacts

The proposed development would be adjacent to Schleisman Road to the north and adjacent to Eastvale Elementary School to the east, which may create exterior and interior noise levels in excess of City standards at the proposed homes. The roadway noise impacts and non-transportation noise impacts have been analyzed separately below.

Non-Transportation Noise Impacts to Proposed Homes

The noise impacts from Eastvale Elementary School are controlled by General Plan Policy N-7 that provides the City's standards for maximum exterior non-transportation noise levels. For the proposed single-family homes, General Plan Policy N-7 provides a noise standard of 60 dBA between 7 AM to 10 PM and 50 dBA between 10 PM to 7 AM at the exterior of the proposed single-family homes.

Based on the Noise Impact Analysis, an ambient noise measurement of 56.2 dBA L_{eq} between 7 AM to 10 PM and 49.1 dBA L_{eq} between 10 PM to 7 AM is applicable to the school. As such, the noise created from the outdoor areas of the school are below the City's non-transportation exterior noise standards for single-family homes provided in General Plan Policy N-7. Therefore, the non-transportation noise impacts created from the school to the proposed homes would be within the City noise standards. Impacts would be less than significant.

Roadway Noise Impacts to Proposed Homes

The north side of the proposed development would be adjacent to Schleisman Road. General Plan Policy N-6 requires exterior noise levels for new residential uses to be mitigated to the levels shown above in ***Table 13.1*** above, that shows the "Completely Compatible" noise standard of less than 60 dBA, "Tentatively Compatible" 60 to 70 dBA, "Normally Incompatible" 70 to 75 dBA, and "Completely Incompatible" greater than 75 dBA. General Plan Policy N-11 requires developers of new residential uses where the noise exceeds the "Completely Compatible" noise standard to ensure acceptable exterior and interior noise levels. General Plan Policy N-10 details that the maximum acceptable interior noise level from roadway noise sources is 45 dBA CNEL.

It is anticipated that the primary source of noise impacts to the project site would be traffic noise from Schleisman Road that is adjacent to the north side of the project site. The proposed homes would also experience some background traffic noise impacts from the proposed project's internal roadways and from Orange Street that is adjacent to the south side of the project site. As the traffic on these local streets would consist of low traffic volumes at slower speeds, the traffic noise from these roads would not make a significant contribution to the noise environment. As such, the noise levels from these roads were not analyzed. The exterior and interior noise impacts to the proposed homes have been analyzed separately below.

Exterior Noise Impacts to Proposed Homes

The anticipated exterior noise levels have been calculated for the backyards of representative homes that are adjacent to Schleisman Road. The calculated noise levels for backyards that are adjacent to Schleisman Road are shown below in ***Table 13.4: Proposed Homes Exterior Noise Levels from Schleisman Road. Table 13.4*** shows that without a sound wall, noise levels at all of the backyards adjacent to Schleisman Road would exceed the City's residential exterior noise

standard of 60 dBA CNEL. This would be considered a significant impact. Therefore, the project would be required to implement **Mitigation Measure NOI-1**, which requires construction of a minimum 6.5-foot-high concrete masonry unit (CMU) wall on the north side of all backyards that are adjacent to Schleisman Road. As shown in ***Table 13.4***, above, with implementation of **Mitigation Measure NOI-1**, the proposed homes exterior noise levels would be within the City's 60 dBA CNEL residential exterior noise standard and impacts would be reduced to a less than significant level.

Table 13.4: Proposed Homes Exterior Noise Levels from Schleisman Road

Building Number	Exterior Noise Level Without Sound Walls (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?	Exterior Noise Level With 6.5-Foot-High Sound Wall (dBA CNEL)	Exceed City's 60 dBA CNEL Threshold?
9	68.1	Yes	59.1	No
11	68.1	Yes	59.3	No
13	68.1	Yes	59.6	No
15	68.2	Yes	60.0	No
17	68.1	Yes	59.9	No

Source: Vista Environmental. Noise Impact Analysis. July 26, 2022. Table Q.

Interior Noise Impacts to Proposed Homes

To assess the interior noise levels, the same proposed homes analyzed for the exterior private backyard analysis were also analyzed for their interior noise levels. The exterior noise level at the façade of the first and second floors were calculated and the results are shown below in ***Table 13.5, Proposed Homes Interior Noise Levels from Schleisman Road***. ***Table 13.5*** also shows the interior noise levels calculated based on 25 dB of attenuation, which is the minimum exterior to interior noise reduction rate for new homes that are constructed to meet the required California Code of Regulations Title 24, Part 6 building energy-efficiency standards that require the installation of dual-paned windows as well as enhanced insulation requirements. The anticipated noise levels have been calculated at the facades of representative proposed homes to Schleisman Road and the results are shown below in ***Table 13.5***.

Table 13.5 shows that the interior noise level of all homes adjacent to Schleisman Road would be within the City's 45 dBA CNEL interior noise standard with project implementation. Impacts would be less than significant.

Table 13.5: Proposed Homes Interior Noise Levels from Schleisman Road

Building Number	Floor	Exterior at Façade	Interior[1]	Exceed 45 dBA Interior Threshold?
9	First	58.9	33.9	No
	Second	66.9	40.4	No
11	First	58.2	33.2	No
	Second	65.4	40.4	No
13	First	58.8	33.8	No
	Second	65.7	40.7	No
15	First	60.0	35.0	No
	Second	66.9	41.9	No
27	First	58.3	33.3	No
	Second	64.3	39.3	No

Source: Vista Environmental. Noise Impact Analysis. July 26, 2022. Table R.

Notes: 1 = Based on standard dual pane windows and doors with a 26 STC rating, which are required per Title 24 energy saving requirements.

Based on the significance criteria described above, the project-related noise level increases are considered less than significant with implementation of mitigation.

13(b) Generation of excessive groundborne vibration or groundborne noise levels?

Determination: Less Than Significant Impact.

Construction activity can result in varying degrees of groundborne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that groundborne vibration from project construction activities would cause only intermittent, localized intrusion. As discussed in Impact 4.13(a) above, the construction activities for the proposed project are anticipated to include: demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses; site preparation and grading; construction of 41 single-family homes; paving of onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site; and application of architectural coatings.

Vibration impacts from construction activities associated with the proposed project would typically be created from the operation of heavy off-road equipment. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Section 120.05.130(e) of the Eastvale Municipal Code provides a vibration standard for new development of any vibration that causes discomfort or annoyance to reasonable persons of normal sensitivity. However, Section 120.05.130(e) of the Eastvale Municipal Code exempts construction activities from this standard. Since neither the Eastvale Municipal Code nor the General Plan provide a quantifiable vibration threshold for temporary construction activities,

guidance from the *Transportation and Construction-Induced Vibration Guidance Manual*, prepared by Caltrans (April 2020) has been utilized, which defines the threshold of perception from transient sources such as off-road construction equipment at 0.25 inch per second peak particle velocity (PPV).

The primary source of vibration during construction would be from the operation of a bulldozer, which would create a vibration level of 0.089 inch per second PPV at 25 feet. The vibration level at the nearest offsite homes (25 feet to west) and school structure (25 feet to east) would be below the 0.25 inch per second PPV threshold detailed above. Therefore, impacts relative to groundborne vibration would be less than significant.

13(c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Determination: Less Than Significant Impact.

The nearest public use airport is Chino Regional Airport located approximately 3 miles northwest of the project site. According to Exhibit CH-6, *Compatibility Factors Map*, of the Riverside County ALUCP Policy Document, the project site is not located within the Chino Regional Airport Influence Area, nor is the site located within any within any of the airport's noise contour areas.[14] As such, the project site would not be exposed to excessive noise levels from airport operations, and impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

1. The project will be subject to the general sound level standards of Eastvale Municipal Code Section 8.52.040, *General Sound Level Standards*.
2. Prior to the issuance of the grading permit, the project applicant shall submit a construction-related noise mitigation plan to the City for review and approval. The plan shall depict the locations of where construction equipment will operate on the project site and how the noise from the construction equipment will be mitigated during construction of the project, through use of such methods as:
    1. Temporary noise attenuation fences;
    2. Preferential location of equipment
    3. Length of equipment use and idling time; and,
    4. Use of current noise suppression technology and equipment

[14] Riverside County Airport Land Use Commission. 2008. West County Airports Background Data. Exhibit CH-6, *Compatibility Factors Map.* September 2008.

MITIGATION MEASURES

NOI-1 Prior to issuance of grading permits, the project applicant shall prepare construction documents for approval by the City Engineer which shall include plans to construct a minimum 6.5-foot-high wall on the north side of Lots 9 through 28 that are adjacent to Schleisman Road. The walls shall be constructed of concrete masonry units (CMUs) and shall be free of any decorative cutouts or openings.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

With implementation of **Mitigation Measure NOI-1**, impacts relative to noise would be reduced to a less than significant level.

4.14 POPULATION AND HOUSING

Would the proposed project:					
	Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a)	Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?			X	
b)	Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?			X	

DISCUSSION

14(a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Determination: Less Than Significant Impact.

A project could induce population growth in an area either directly, through the development of new residences or businesses, or indirectly, through the extension of roads or other infrastructure. In 2022, the California Department of Finance estimated that Eastvale had an average household size of 3.92 persons per household.[15] The most recent Regional Housing Needs Assessment (RHNA) allocation released by the Southern California Association of Governments (SCAG) for the City identifies the need for an additional 3,028 housing units in the City over the next eight years.[16] With 41 residential units as part of the proposed project, the project would generate approximately 161 residents and would accommodate approximately 1.35 percent of the City's RHNA allocation. Therefore, the project as proposed is consistent with the anticipated population growth that the City is required to plan for under its' 6th Cycle Housing Element. Impacts would be less than significant.

[15] California Department of Finance. 2022. E-5 Population and Housing Estimates for Cities, Counties, and the State, 2021-2022 with 2020 Census Benchmark. Accessed June 21, 2022. https://www.dof.ca.gov/Forecasting/Demographics/Estimates/E-5/.

[16] Southern California Association of Governments. 2022. 6th Cycle Final RHNA Allocation Plan. Accessed June 21, 2022. https://scag.ca.gov/sites/main/files/file-attachments/6th-cycle-rhna-final-allocation-plan.pdf?1616462966.

14(b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Determination: Less Than Significant Impact.

As described previously, prior to project grading and construction, the project would require the vacating and demolition of one existing residence onsite. The property owners are voluntarily selling their property and would be compensated for their property. At this time, no evictions are anticipated. It is expected that residents would have the ability to relocate based on the availability of existing housing stock in the area. In 2022, the California Department of Finance estimated that Eastvale had approximately 18,396 housing units within City limits, with a vacancy rate of 3.1 percent.[17] Therefore, substantial numbers of existing people or housing would not occur, and no replacement of housing would be needed. Impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

[17] California Department of Finance. 2022. E-5 Population and Housing Estimates for Cities, Counties, and the State, January 2021-2022 with 2020 Census Benchmark. https://www.dof.ca.gov/Forecasting/Demographics/Estimates/E-5/. Accessed June 21, 2022.

4.15 PUBLIC SERVICES

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public series:				
	i) Fire protection?			X	
	ii) Police protection?			X	
	iii) Schools?			X	
	iv) Parks?			X	
	v) Other public facilities?			X	

DISCUSSION

15(a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public series:

i) Fire protection?

Determination: Less Than Significant Impact.

The Riverside County Fire Department (RCFD) provides fire protection and safety services to the City of Eastvale. The RCFD operates two fire stations in Eastvale: Station #27 located approximately 0.6-mile east of the project site at 7067 Hamner Avenue, and Station #31 located 1.8 miles southwest of the project site at 14491 Chandler Street.

The proposed project would create an increased demand for fire protection services. However, the project would not induce significant or unplanned population growth; refer to Section 4.14, *Population and Housing*. Further, the proposed project would be conditioned to comply with the requirements of the RCFD for emergency access, fire

flow, fire protection standards, fire lanes, and other site design/building standards. The project would also be subject to the project design requirements set forth in the 2019 California Fire Code and the 2019 California Building Standards Code. The City would collect a one-time development impact fees pursuant to Eastvale Municipal Code Chapter 110.28, *Development Impact Fee Program,* which is imposed on all new development to help pay fair share of costs in upgrading the RCFD's fire facilities, as needed. Payment of these fees would offset the project's impacts to the acquisition, design, and construction of new fire facilities. Following collection of development impact fees and compliance with RCFD, California Fire Code, and CBC requirements, impacts to fire protection facilities would be less than significant.

ii) Police protection?

Determination: Less Than Significant Impact.

Police protection services are provided to the City under contract from the Riverside County Sheriff's Department. Specifically, police protection services for the project area are provided by the Jurupa Valley Sheriff's Station located at 7477 Mission Boulevard in Jurupa Valley, approximately 8.0 miles northeast of the project site.

The proposed project would create an increased demand for police protection services. However, the project would not induce significant or unplanned population growth; refer to Section 4.14, *Population and Housing.* The proposed development would be conditioned for the payment of the City's development impact fees pursuant to Eastvale Municipal Code Chapter 110.28, *Development Impact Fee Program*. The Riverside County Sheriff's Department would have the opportunity to review the project design plans and include conditions that would be required in order for the applicant to be issued development permits. As a 41-unit residential development project, the proposed project is not expected to result in any unusual circumstances that may generate high demand for police protection services. Therefore, payment of the City's development impact fees would fully mitigate any potential impact on Sheriff's Department facilities.

iii) Schools?

Determination: Less Than Significant Impact.

The proposed project site is located in the Corona-Norco Unified School District. The nearest elementary school is Eastvale Elementary School at 13031 Orange Street, immediately adjacent to the east of the project site. The nearest middle school is River Heights Intermediate School at 7227 Scholar Way, immediately adjacent to the south of the project site. The nearest high school is Roosevelt High School, at 7401 Scholar Way, approximately 0.3 miles south of the project site.

The project would not induce significant or unplanned population growth; refer to Section 4.14, *Population and Housing.* In addition, the project would be required to comply with Senate Bill (SB) 50 requirements, which allow school districts to collect

impact fees from developers of new projects. According to Section 65997 of the California Government Code, payment of statutory fees is the exclusive method of mitigating environmental effects related to the adequacy of school facilities when considering the approval or the establishment of conditions for the approval of a development project. Thus, upon payment of required fees by the project applicant consistent with existing State requirements, impacts would be less than significant.

iv) Parks?

Determination: Less Than Significant Impact.

Currently, four percent of land in Eastvale is designated for recreation. The JCSD owns and maintains 14 public parks and two community centers in the portion of Eastvale west of Hamner Avenue and the Jurupa Area Recreation and Park District (JARPD) provides four public parks in the portion of Eastvale east of Hamner Avenue. The nearest park, Harada Heritage Park, is approximately 0.3 miles north of the project, and may be utilized by residents of the project.

The proposed project would create an increased demand for parkland with the addition of new residents to the area. However, the project would not induce significant or unplanned population growth; refer to Section 4.14, *Population and Housing.* In addition, the project contains outdoor open space for use by the residents comprised of a 28,872 SF common area with a picnic seating area, lawn area, corn hole play area, trail, bench, dog station, and a 63-ft-wide paseo with a succulent garden walk. Two paseos have also been incorporated into the project's design for a total of approximately 40,724 SF. The first paseo extends along the easterly property line and will include an easement in favor of the City of Eastvale to provide a public trail connection between Schleisman Road and Orange Steet. The second paseo, located between lots 9 and 10, will provide a trail connect for resident to access a future linear park along Schleisman Road. As the project would not result in significant population growth and would provide onsite outdoor open space for use by residents, impacts to parks and recreation facilities would be less than significant.

v) Other public facilities?

Determination: Less Than Significant Impact.

The project would not induce significant or unplanned population growth; refer to Section 4.14, *Population and Housing.* The project involves the development of a 41-unit single-family residential development and does not propose new or physically altered public facilities. Thus, the proposed project would not result in an increase in the demand for other governmental services such as the economic development and other community support services commonly provided by the City. This impact would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

1. The project applicant is required to pay the established development impact fees in compliance with the Development Impact Fee Program in Chapter 110.28 of the Eastvale Municipal Code.
2. California Government Code Section 65996 indicates that payment of school impact fees is considered full mitigation for project impacts to a school district.

MITIGATION MEASURES

None required.

4.16 RECREATION

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?			X	
b)	Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?			X	

DISCUSSION

16(a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Determination: Less Than Significant Impact.

Refer to Response 4.15(a)(iv). It is not anticipated that the proposed project would generate a substantial number of new jobs or induce substantial unplanned population growth in the City. Further, the project would provide onsite outdoor open space for use by residents. Impacts would be less than significant in this regard.

16(b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Determination: Less Than Significant Impact.

Refer to Response 4.15(a)(iv). The proposed project includes amenities for use by residents but would not include the construction or expansion of any parks or recreational facilities. As described previously, the proposed project would not increase the demand for parks or other recreational facilities and would not require the construction or expansion of any such facilities. This impact would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

4.17 TRANSPORTATION

Would the proposed project:					
Issues		Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?		X		
b)	Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?			X	
c)	Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			X	
d)	Result in inadequate emergency access?			X	

The analysis and findings throughout this section are based on the *Magnolia Ranch Traffic Analysis* (Traffic Analysis) prepared by Urban Crossroads, dated August 10, 2023, provided as Appendix 11 of this IS/MND.

DISCUSSION

17(a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Determination: Less Than Significant Impact With Mitigation Incorporated.

Study Area

Based on the City-approved scoping agreement for the project, ***Table 17.1, Study Area Intersections***, shows the intersections within the City of Eastvale jurisdiction that are included in the traffic impact study area.

Relative to bicycle and pedestrian facilities, existing sidewalks are currently provided along the roadways adjacent to the project site. There are no existing bike lanes in the project area; however, future bicycle lanes are proposed for Orange Street, Sumner Avenue and Schleisman Road. Existing transit facilities provided by the Riverside Transit Agency in the project vicinity include Transit Route 3, which currently operates on 68th Street, Sumner Avenue, and Citrus Street.

Table 17.1: Study Area Intersections

Intersection Location	Jurisdiction
1. Sumner Avenue and Schleisman Road	City of Eastvale
2. Sumner Avenue and Orange Street	City of Eastvale
3. Driveway 1 and Orange Street	City of Eastvale
4. Scholar Way and Schleisman Road	City of Eastvale
5. Scholar Way and Orange Street	City of Eastvale
6. Scholar Way and Baltimore Street	City of Eastvale
7. Scholar Way and Citrus Street	City of Eastvale
8. Hamner Avenue and Schleisman Road	City of Eastvale

Methodology

CEQA Guidelines Section 15064.3 was released on December 28, 2018, to address the determination of significance for transportation impacts. The new guideline requires that the analysis is based on vehicle miles traveled (VMT) instead of congestion (such as level of service, or LOS). The change in the focus of transportation analysis is the result of legislation (SB 743) and is intended to shift the emphasis from congestion to, among other things, reducing GHG emissions, promoting a diversity of land uses, and developing multimodal transportation networks. Pursuant to CEQA Guidelines Section 15064.3(c), this change in analysis is mandated to be used beginning July 1, 2020. Refer to Response 4.17(b) below for the project impacts relative to VMT.

Projects in the City are required to complete a transportation impact study, in addition to VMT assessment, to demonstrate consistency with the General Plan. As the City has maintained its requirement to utilize LOS as the mechanism for quantifying transportation and circulation impacts of planned projects (as discussed in Chapter 4, *Circulation and Infrastructure*, of the City's General Plan), an LOS analysis was conducted for the project's Traffic Analysis and is summarized below. Refer to **Appendix 11** for the complete LOS discussion.

LOS is used to qualitatively describe the performance of a roadway facility, ranging from LOS A (free-flow conditions) to LOS F (extreme congestion and system failure). Study area intersections within the City are analyzed using the methodology in accordance with the City's *Traffic Impact Analysis Preparation Guidelines* (May 2020) (City of Eastvale TIA Guidelines). The technique used to assess the performance of an intersection is known as the intersection delay method, based on the procedures contained in the *Highway Capacity Manual* (Transportation Research Board, 6th Edition). The methodology considers the traffic volume and distribution of movements, traffic composition, geometric characteristics, and signalization details to calculate the average control delay per vehicle and corresponding LOS. Control delay is defined as the portion of delay attributed to the intersection traffic control (such as a traffic signal or stop sign) and includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay. The intersection control delay is then correlated to LOS based on the thresholds shown in ***Table 17.2, Intersection LOS Thresholds***.

Table 17.2: Intersection LOS Thresholds

Level of Service	Intersection Control Delay (Seconds / Vehicle)	
	Signalized	Unsignalized
A	≤ 10.0	≤ 10.0
B	≤ 10.0 to ≤ 20.0	≤ 10.0 to ≤ 15.0
C	≤ 20.0 to ≤ 35.0	≤ 15.0 to ≤ 25.0
D	≤ 35.0 to ≤ 55.0	≤ 25.0 to ≤ 35.0
E	≤ 55.0 to ≤ 80.0	≤ 35.0 to ≤ 50.0
F	> 80.0	> 50.0

Source: Magnolia Ranch Traffic Analysis. 2023. Table 2-1.

The City of Eastvale General Plan Policy C-10 sets a standard of LOS C with LOS D as acceptable in commercial and employment areas and at intersections of any combination of major highways, urban arterials, secondary highways, or freeway ramps. Based on this criterion, where feasible, LOS D is the minimum acceptable LOS at each of the study intersections within the City of Eastvale.

Project Trip Generation

According to the Traffic Analysis, the project is anticipated to generate a total of 388 vehicle trip-ends per day with 28 AM peak hour trips and 38 PM peak hour trips.

Analysis Scenarios and Results

The following scenarios were analyzed during typical weekday AM and PM peak hour conditions:

- Existing (2021) Conditions
- Existing Plus Project Conditions
- Opening Year Cumulative (2025) Without and With Project Conditions
- Horizon Year (2040) Without and With Project Conditions

Existing (2021) Conditions

Based on the Traffic Analysis, the study intersections currently operate within acceptable LOS (D or better), with the exception of the Sumner Avenue/Schleisman Road intersection, which is operating at an unacceptable LOS F in the AM peak hour and LOS E in the PM peak hour under Existing (2021) traffic conditions.

Existing Plus Project Conditions

Based on the Traffic Analysis, no additional intersections are anticipated to operate at an unacceptable LOS with the addition of project traffic, consistent with Existing (2021) traffic conditions. The Sumner Avenue/Schleisman Road intersection would continue to operate at an unacceptable LOS F in the AM peak hour and LOS E in the PM peak hour under Existing Plus Project conditions.

The intersection operations analysis includes the roadway improvements that would be implemented by the project. Therefore, the following roadway improvements have been identified and included as **Mitigation Measures TRA-1** and **TRA-2**:

- Install a stop sign for egress traffic from the proposed project at Driveway 1 on Orange Street, which is proposed for full access.
- Project to restripe the existing eastbound through lane to provide an eastbound shared left-through lane.
- Construct Orange Street from the western project boundary to the eastern project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.

According to the Traffic Analysis (see **Appendix 11**, *Table 5-2, Summary of Intersection Analysis for Existing Plus Project Conditions with Improvements*), the roadway improvements required under **Mitigation Measures TRA-1** and **TRA-2** would result in a reduction of delay at the Sumner Avenue/Schleisman Road intersection from 114.2 seconds to 38.8 seconds in the AM peak hour, and from 60.1 seconds to 27.0 seconds in the PM peak hour. In addition, the LOS at this intersection would improve from F to D in the AM peak hour and from E to C in the PM peak hour. Therefore, with implementation of **Mitigation Measures TRA-1** and **TRA-2,** LOS impacts under the Existing Plus Project conditions would be reduced to less than significant.

Opening Year Cumulative (2025) Without and With Project Conditions

Based on the Traffic Analysis, no additional intersections are anticipated to operate at an unacceptable LOS under both the Opening Year Cumulative (2025) Without Project and With Project conditions. The Sumner Avenue/Schleisman Road intersection would continue to operate at an unacceptable LOS F in the AM peak hour and LOS E in the PM peak hour under Opening Year Cumulative (2025) conditions.

The intersection operations analysis includes the roadway improvements that would be implemented by the project, as described in **Mitigation Measures TRA-1** and **TRA-2**, below. According to the Traffic Analysis (see **Appendix 11**, *Table 6-2, Intersection Analysis for Opening Year Cumulative (2025) Conditions with Improvements*), the roadway improvements required by **Mitigation Measures TRA-1** and **TRA-2** would result in a reduction of delay at the Sumner Avenue/Schleisman Road intersection from 161.5 seconds to 54.0 seconds in the AM peak hour, and from 78.3 seconds to 31.8 seconds in the PM peak hour. In addition, the LOS at this intersection would improve from F to D in the AM peak hour and from E to C in the PM peak hour. Therefore, with implementation of **Mitigation Measures TRA-1** and **TRA-2,** LOS impacts under the Opening Year Cumulative (2025) conditions would be reduced to a less than significant level.

Horizon Year (2040) Without and With Project Conditions

Based on the Traffic Analysis, no additional intersections are anticipated to operate at an unacceptable LOS under both the Horizon Year (2040) Without Project and With Project conditions. The Sumner Avenue/Schleisman Road intersection would continue to operate at an

unacceptable LOS F in the AM peak hour and LOS F in the PM peak hour under Horizon Year (2040) conditions.

The intersection operations analysis includes the roadway improvements that would be implemented by the project, as described in **Mitigation Measures TRA-1** and **TRA-2**, below. According to the Traffic Analysis (see **Appendix 11**, *Table 7-3, Intersection Analysis for Horizon Year (2040) Conditions with Improvements*), the roadway improvements required by **Mitigation Measures TRA-1** and **TRA-2** would result in a reduction of delay at the Sumner Avenue/Schleisman Road intersection from >200 seconds to 51.9 seconds in the AM peak hour, and from >200 seconds to 51.2 seconds in the PM peak hour. In addition, the LOS at this intersection would improve from F to D in both the AM and PM peak hours. Therefore, with implementation of **Mitigation Measures TRA-1** and **TRA-2,** LOS impacts under the Horizon Year (2040) conditions would be reduced to a less than significant level.

17(b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Determination: Less Than Significant Impact.

Changes to the CEQA Guidelines Section 15064.3 became effective July 1, 2020, which require all lead agencies to adopt VMT as a replacement for automobile delay-based LOS as the new measure for identifying transportation impacts for land use projects. On June 24, 2020, the City of Eastvale adopted Resolution No. 20-44, which establishes VMT impact thresholds for assessing consistency with CEQA Guidelines Section 15064.3, subdivision (b).

Based on the City's guidelines, land use projects that meet certain screening threshold criteria based on size, location, proximity to transit or trip-making potential may be presumed to have a less than significant transportation impact under CEQA and do not require a full detailed VMT analysis. The City utilizes three screening criteria as follows:

- Transit Priority Area (TPA): Projects located within a TPA may be presumed to have a less than significant impact absent substantial evidence to the contrary.
- Low VMT Area: Residential and office projects located within a low VMT-generating area may be presumed to have a less than significant impact absent substantial evidence to the contrary. In addition, other employment-related and mixed-use land use projects may qualify for the use of screening if there is a reasonably expectation that the project will generate VMT per service population that is similar to the existing land uses in the low VMT area.
- Project Type: Local-serving projects, including retail projects less than 50,000 SF, are presumed to have a less than significant impact absent substantial evidence to the contrary. Local serving retail generally improves the convenience of shopping close to home and has the effect of reducing vehicle travel.

The VMT evaluation of the project shows that the project meets the City's screening criteria based on the Low VMT Area criteria, and as such, a full VMT analysis is not required. Therefore, the project satisfies the project type screening criteria for a Low VMT Area and would result in a less than significant VMT impact, in accordance with VMT guidelines established by the City of Eastvale.

17(c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Determination: Less Than Significant Impact.

The project does not involve any unusual conditions, or hazardous design features, such as sharp curves or dangerous intersections, or incompatible uses. The Traffic Analysis recommended roadway improvements (**Appendix 11)** would be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of Eastvale General Plan Circulation and Infrastructure Element. The project access and project improvements (i.e., signage, buildings, and landscaping) would be designed in accordance with City standards so that adequate sight distance for drivers entering and exiting the site is maintained. On-site traffic signing and striping would be implemented in conjunction with detailed construction plans for the project site. With implementation of the recommended configuration of the driveways and frontage improvements as part of the project design, a less than significant impact would occur.

17(d) Result in inadequate emergency access?

Determination: Less Than Significant Impact.

The access and circulation features on the project site would accommodate emergency ingress and egress. As discussed above, the proposed project would provide one access point be located at Orange Street. The proposed site access improvements would ensure that access is maintained for fire trucks, police units, and ambulance/paramedic vehicles.

The project is subject to the City's design review to ensure that the project as designed does not temporarily or permanently interfere with the provision of emergency access or with evacuation routes. All emergency access features are subject to and must satisfy the City of Eastvale design requirements and be approved by the Fire Department. During periods when partial road closures are required, the project applicant would be required to implement a temporary Traffic Management Plan (TMP) to minimize temporary impacts to emergency access and evacuation routes during the construction process. Therefore, the project would not result in inadequate emergency access and impacts would be less than significant.

STANDARD CONDITIONS & REQUIREMENTS

1. Prior to the initiation of construction, the project applicant shall prepare a Traffic Management Plan (TMP) for approval by the City of Eastvale Traffic Engineer. The TMP shall comply with State standards set forth in the California Manual of Uniform Traffic Control Devices and include measures such as construction signage, limitations on timing for lane closures to avoid peak hours, temporary striping plans, and the need for a construction flag-person to direct traffic during heavy equipment use. The TMP shall specify that one lane of

travel in each direction must always be maintained for Orange Street and Schleisman Road throughout project construction. The TMP shall be incorporated into project specifications for verification prior to final plan approval.

MITIGATION MEASURES

TRA-1 **Driveway 1 & Orange Street (#4)**. Prior to ground disturbing activities, the City of Eastvale Traffic Engineer shall verify that the project plans identify a stop control for southbound exiting project traffic with a shared left-right turn lane. The City of Eastvale Traffic engineer shall also verify that project plans indicate the existing eastbound through lane is restriped to provide an eastbound shared left-through lane.

TRA-2 **Orange Street**. Prior to ground disturbing activities, the City of Eastvale Traffic Engineer shall verify that the project plans identify Orange Street from the western project boundary to the eastern project boundary at its ultimate half-section width as a 2-lane Collector (ultimate 74-foot right-of-way) in compliance with the circulation recommendations found in the City of Eastvale's General Plan.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

With implementation of **Mitigation Measures TRA-1** and **TRA-2**, impacts relative to traffic and transportation would be reduced to a less than significant level.

4.18 TRIBAL CULTURAL RESOURCES

Would the proposed project:				
Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?		X		
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.		X		

DISCUSSION

18(a)(i) *Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)? A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1?*

18(a)(ii) *A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of*

Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Determination: Less Than Significant Impact With Mitigation Incorporated.

On June 21, 2021, the City provided written notification of the project in accordance with AB 52 to all of the Native American tribes that requested to receive such notifications from the city. Staff received a request from Gabrieleno Band of Mission Indians- Kizh Nation within the 30-day period, requesting to initiate consultation. The staff consulted with representatives of Kizh Nation and **Mitigation Measure TCR-1**, below, is required to address a concern over the potential for uncovering tribal cultural recourses or other tribal-affiliated resources during construction of the project. Implementation of **Mitigation Measure TCR-1** would reduce potentially significant impacts to Tribal Cultural Resources to a less than significant level.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

TCR-1 **Treatment and Disposition of Cultural Resources**. If tribal cultural resources are inadvertently discovered during ground disturbing actives for this project. The following procedures will be carried out for treatment and disposition of the discoveries:

A. **Temporary Curation and Storage**. During the course of construction, all discovered resources shall be temporarily curated in a secure location on-site or at the offices of the project archaeologist. The removal of any artifacts from the project site will need to be thoroughly inventoried with tribal monitor oversite of the process.

B. **Treatment and Final Disposition.** The landowner(s) shall relinquish ownership of all cultural resources, including sacred items, burial goods, and all archaeological artifacts and non-human remains as part of the required mitigation for impacts to cultural resources. The applicant shall relinquish the artifacts through one or more of the following methods and provide the City Planning Department with documentation of same:

i. **Reburial On-site.** Accommodate the process for on-site reburial of the discovered items with the consulting tribes. This shall include measures and provisions to protect the future reburial area from any future impacts. Reburial shall not occur until all cataloguing and basic recordation have been completed.

ii. **Curation.** A curation agreement with an appropriate qualified repository within Riverside County that meets federal standards per 36 CFR Part 79 and therefore would be professionally curated and made available to other archaeologists or researchers for further study. The collections and

associated records shall be transferred, including title, to an appropriate curation facility within Riverside County, to be accompanied by payment of the fees necessary for permanent curation.

iii. **Disposition Dispute**. If more than one tribe is involved with the project and cannot come to a consensus as to the disposition of cultural materials, they shall be curated at the Western Science Center.

iv. **Final Report.** At the completion of grading, excavation and ground disturbing activities on the site, a Phase IV Monitoring Report shall be submitted to the City documenting monitoring activities conducted by the project archaeologist and tribal monitors within 60 days of completion of grading. This report shall:

- Document the impacts to the known resources on the property;
- Describe how each mitigation measure was fulfilled;
- Document the type of cultural resources recovered and the disposition of such resources;
- Provide evidence of the required cultural sensitivity training for the construction staff held during the required pre-grade meeting;
- In a confidential appendix, include the daily/weekly monitoring notes from the archaeologist.
- All reports produced will be submitted to the City, Eastern Information Center and consulting tribes.

SIGNIFICANCE OF IMPACT AFTER MITIGATION

Implementation of **Mitigation Measure TCR-1** would ensure that any tribal cultural and archaeological resources inadvertently discovered during project grading or construction activities would be protected consistent with the recommendations of a qualified archaeologist and the appropriate tribes, reducing impacts to less than significant.

4.19 UTILITIES AND SERVICE SYSTEMS

Would the proposed project:				
Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a) Require or result in the relocation or construction of new or expanded water, or wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?			X	
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?			X	
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?			X	
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?			X	
e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?			X	

DISCUSSION

19(a) Require or result in the relocation or construction of new or expanded water, or wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Determination: Less Than Significant Impact.

The project site is served by the following utilities:

- Electricity – Southern California Edison (SCE)
- Water – Jurupa Community Services District (JCSD)
- Sewer – JCSD
- Storm Drain – City of Eastvale

- Cable – Spectrum
- Telephone – AT&T
- Natural Gas – Southern California Gas Company (SoCalGas)

Electric Power, Natural Gas, and Telecommunications

The project site is located in a developed area of the City and is situated within close proximity to existing electric power, natural gas, and telecommunications facilities. Therefore, substantial new utility infrastructure would not be required with project implementation.

Water

The project would require water for the irrigation of landscaped areas. However, it is not expected that water demand would increase substantially with project implementation. Water for the project would be provided by JCSD and would connect to the existing water main located in Orange Street. Therefore, the expansion of off-site water facilities would not be required to serve the project.

Storm Drain

The project's stormwater needs are met by the City of Eastvale and the Riverside County Flood Control and Water Conservation District. The project site would drain to the proposed underground infiltration/retention chambers for low flow infiltration until it reaches capacity. Once the Infiltration/Retention Chamber Systems reach their capacity, the overflow will drain out using storm drain pipes from the Chamber System and will be conveyed to the frontage street (Orange Street) via the proposed 30" storm drain lateral onsite and finally conveyed to the existing City storm drain system (48" RCP) in Orange Street via 30" lateral. Therefore, the expansion of off-site storm drain facilities would not be required to serve the project.

Wastewater Treatment

The project is located within the jurisdiction of the Santa Ana RWQCB, which applies requirements to the wastewater treatment facilities owned and operated by treatment providers. Sewer service is available from an existing 10-inch diameter sewer line in Schleisman Road and an existing 8-inch diameter sewer line in Orange Street. An 8-inch sewer line would be installed throughout the project in conveying wastewater to a point of connection with the existing sewer line on Orange Street. Therefore, the expansion of off-site wastewater facilities would not be required to serve the project.

19(b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Determination: Less Than Significant Impact.

Water service would be provided to the project site by JCSD. JCSD relies predominantly on groundwater and desalinated brackish groundwater from the Chino Groundwater Basin for its

water supply,[18] as described in the City's General Plan. Through a joint powers authority, the JCSD partners with the Chino Desalter Authority, the owner and operator of two water treatment plants (desalters), to treat potable water for the JCSD service area. Each desalter has the current capacity to treat 12 million gallons per day (mgd) of water.

JCSD estimates water supply availability for normal, single-dry, and multiple-dry year scenarios from 2025 through 2045 in its 2020 Urban Water Management Plan. For all years and all scenarios, anticipated supply exceeds anticipated demand. ***Table 19.1, JCSD Normal and Single-Dry Year Supply and Demand in Acre-Feet per Year (AFY),*** summarizes supply, demand, and excess supply for the normal and single-dry year.

Table 19.1: JCSD Normal and Single-Dry Year Supply and Demand in Acre-Feet per Year (AFY)

	2025	2030	2035	2040	2045
Normal Year					
Supply	42,093	44,093	44,093	44,093	44,093

Source: Jurupa Community Services District. 2020 Urban Water Management Plan. Tables 7-2 and 7-3.

Residential peak hour demands for distribution systems serving up to 400 residential units are calculated using a formula from the JCSD Standards Manual for Water and Sewer Systems. Residential maximum day demands are calculated by dividing the peak hour demand by 1.5. For the proposed project, the peak hourly flow would be 241.9 gallons per minute (GPM) and the maximum day demand is 161.3 GPM. Using this water demand rate, the project would result in an increase in water demand of 9,936 gallons per day, equivalent to approximately 11.1 acre-feet per year (AFY).[19] This increase represents an approximately 0.026 percent increase in demand in comparison to the current existing and excess supplies. Therefore, impacts would be less than significant.

[18] City of Eastvale. 2012. General Plan. Page 7-6, Water Supply. Accessed May 19, 2022. https://www.eastvaleca.gov/home/showdocument?id=2360

[19] Jurupa Community Services District. August 2020. Standards Manual for Water and Sewer Systems.

19(c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Determination: Less Than Significant Impact.

Wastewater disposal is regulated under the federal Clean Water Act and the State Porter-Cologne Water Quality Control Act. The Santa Ana RWQCB regulates wastewater discharges in Eastvale, including the project site, and implements the Clean Water Act and the Porter-Cologne Act by administering the NPDES, issuing water discharge permits, and establishing BMPs. Development of the project site would result in wastewater flows that would be collected and treated at the Western Riverside County Regional Wastewater Authority plant, which serves Eastvale.

The proposed project would receive wastewater conveyance services from the JCSD. The JCSD discharges wastewater from this area to the Inland Empire Brine Line (IEBL), which pumps the wastewater to the Orange County Sanitation District (OCSD). The JCSD estimates that wastewater treatment plant capacity is currently 9.8 mgd with the ability to expand to 17 mgd. According to the JCSD Standards Manual,[20] single-family residential units in Eastvale are estimated to generate an average of 220 gallons per unit of wastewater per day. Therefore, the proposed project can be expected to contribute 9,020 gallons of wastewater flow to the IEBL and OCSD treatment plant daily.[21]

Since the project would only result in an increase of wastewater flows equal to 0.09 percent of current JCSD capacity,[22] adequate capacity is available to serve the proposed project. A less than significant impact would occur.

19(d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Determination: Less Than Significant Impact.

Implementation of the project is anticipated to generate additional solid waste during the temporary, short-term construction phase, as well as the operational phase, but it would not be expected to result in inadequate landfill capacity. No landfills are located in Eastvale; however, solid waste services for the City are provided by the El Sobrante Landfill near the City of Corona, approximately 13 miles southeast of the project site. According to the California Department of Resources Recycling and Recovery (CalRecycle), the landfill has a maximum throughput of 16,054 tons per day. This landfill has a maximum permitted capacity of approximately 209.9 million cubic yards, and the landfill has a remaining capacity of approximately 143.9 million cubic yards. The landfill has an expected operational life through 2051.[23]

[20] Jurupa Community Services District. August 2020. Standards Manual for Water and Sewer Systems.

[21] Based on 41 units x 220 daily gallons per unit = 9,020 gallons daily.

[22] Based on 9,020 gallons per day demand ÷ 9,800,000 gallons per day capacity= 0.09 percent.

[23] CalRecycle. N.d. SWIS Facility Detail, El Sobrante Landfill (33-AA-0217). Accessed May 19, 2022. https://www2.calrecycle.ca.gov/SolidWaste/SiteActivity/Details/2256?siteID=2402

CalRecycle's waste generation rates estimate a generation rate for 12.23 pounds of waste per household per day. Assuming 41 households, the residential portion of the project would result in 501.4 pounds of waste daily.[24] Considering the capacity of the El Sobrante Landfill, the project would not have a significant impact on local landfill capacity.

All construction activities would be subject to conformance with relevant federal, State, and local requirements related to solid waste disposal. Specifically, the project would be required to demonstrate compliance with the California Integrated Waste Management Act of 1989 (Assembly Bill [AB] 939), which requires all California cities to "reduce, recycle, and re-use solid waste generated in the State to the maximum extent feasible." The California Integrated Waste Management Act of 1989 requires that at least 50 percent of waste produced is recycled, reduced, or composted. The project would also be required to demonstrate compliance with the Green Building Code, which includes design and construction measures that act to reduce construction-related waste though material conservation measures and other construction-related efficiency measures. Compliance with these programs would ensure the project's construction-related solid waste impacts are less than significant.

19(e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?

Determination: Less Than Significant Impact.

Refer to Response 4.19(d). The project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure. As such, the project would comply with federal, State, and local management and reduction statutes and regulations related to solid waste. A less than significant impact would occur.

STANDARD CONDITIONS & REQUIREMENTS

1. The project applicant will be required to comply with the recommendations of the Riverside County Waste Management Department and all federal, State, and local statutes and regulations related to solid waste, including the Solid Waste Reuse and Recycling Access Act of 1991.
2. The project applicant, developer, or successor in interest shall provide written verification that the Jurupa Community Services District can and will provide potable water service to the project.

MITIGATION MEASURES

None required.

[24] CalRecycle. n.d. Estimated Solid Waste Generation Rates – Residential Sector Generation Rates. Accessed May 19, 2022. https://www2.calrecycle.ca.gov/wastecharacterization/general/rates

4.20 WILDFIRE

Would the proposed project:				
Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?				X
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?				X
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?				X
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?				X

DISCUSSION

20(a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Determination: No Impact.

The project site is located in a developed urban area surrounded by residential and commercial uses. According to the CalFire Fire Hazard Severity Zone Viewer,[25] and the Adopted State Responsibility Area Fire Hazard Severity Zone Maps,[26] the project site is not located in a zone designated as a Very High Fire Hazard Severity Zone. The proposed project would be required to comply with the provisions of the City of Eastvale Emergency Operations Plan, Riverside County Multi-Jurisdictional Local Hazard Mitigation Plan, and the emergency access requirements of the California Fire Code, which include but are not limited to providing access with adjoining uses

[25] CalFire. nd. Fire and Resource Assessment Program: FHSZ Viewer. Accessed May 19, 2022. https://egis.fire.ca.gov/FHSZ/

[26] CalFire. 2007. Map of CalFire's Fire Hazard Severity Zones in the Local Responsibility Area – Western Riverside County. Accessed May 19, 2022. https://osfm.fire.ca.gov/media/6754/fhszl_map60.pdf

and providing suitable access for emergency vehicles. In addition, emergency access to the site would be maintained during construction. Therefore, no impact would occur.

20(b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Determination: No Impact.

The project site is generally flat and does not support areas of steep slopes. In addition, the project site is located within an urbanized area of the city, where the risk of wildland fire is decreased. As such, the proposed project would not be located in a critical fire danger zone or adjacent to wildlands subject to wildfires. Urban levels of fire protection would be provided to the project area. In addition, the project would adhere to building codes and any conditions included through review by the RCFD. No impact would occur.

20(c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Determination: No Impact.

The project site is located in a developed area of the city and is situated within close proximity to existing electric power, natural gas, and telecommunications facilities. The proposed residential uses on-site would not include any features that would have the potential to exacerbate fire risk or result in temporary or ongoing impacts to the environment. The project would provide access to adjoining uses and suitable access for emergency vehicles. Emergency access to the site would be maintained during construction. No impact would occur.

20(d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Determination: No Impact.

The project site is relatively flat with no major changes in elevations. There are no channels or creeks running through the project site. The project site is not located within a 100-year flood hazard area. In addition, there are no known landslides at the project site, nor is the site in the path of any known or potential landslides. Therefore, the project would not expose people or structures to risks involving flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. No impact would occur.

STANDARD CONDITIONS & REQUIREMENTS

None required.

MITIGATION MEASURES

None required.

4.21 MANDATORY FINDINGS OF SIGNIFICANCE

Would the proposed project:				
Issues	**Potentially Significant Impact**	**Less Than Significant Impact with Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a) Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?		X		
b) Have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)		X		
c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?		X		

The following are mandatory findings of significance in accordance with Section 15065 of the CEQA Guidelines.

DISCUSSION

21(a) Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Determination: Less Than Significant Impact with Mitigation Incorporated.

As discussed in Section 4.4, *Biological Resources*, after implementation of **Mitigation Measures BIO-1, BIO-2**, and **BIO-3**, the proposed project would result in less than significant impacts to biological resources. Similarly, as discussed in Sections 4.5, *Cultural Resources*, and Section 4.18, *Tribal Cultural Resources*, after implementation of **Mitigation Measures CUL-1** and **TCR-1,** the proposed project would result in less than significant impacts to human remains, archaeological resources, paleontological resources, and tribal cultural resources.

21(b) Have impacts that are individually limited, but cumulatively considerable?

Determination: Less Than Significant Impact with Mitigation Incorporated.

A significant impact may occur if the project, in conjunction with related projects proposed for development in the City, would result in impacts that are less than significant when viewed separately but would be significant when viewed together. When considering the proposed project in combination with other past, present, and reasonably foreseeable future projects in the vicinity of the project site, the proposed project does not have the potential to cause impacts that are cumulatively considerable. As detailed in the above discussions, the proposed project would not result in any significant and unmitigable impacts in any environmental categories. In all cases, the impacts associated with the project are limited to the project site or are of such a negligible degree that they would not result in a significant contribution to any cumulative impacts.

21(c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Determination: Less Than Significant Impact with Mitigation Incorporated.

The proposed project does not have the potential to cause substantial adverse effects to humans, either directly or indirectly, once mitigation measures are implemented. While a number of the proposed project's impacts were identified as having the potential to significantly impact humans, with implementation of the identified mitigation measures herein, and standard requirements, these impacts would be less than significant. Therefore, the proposed project would not cause significant adverse direct or indirect impacts to humans.

- Gross Building Area: 112,384 SF (Conditioned)
- Occupancy: R-3
- Type of Construction: V-B
- Sprinkler System: NFPA 13D
- Number of Stories: 1 and 2 Stories

Development Criteria*	Provided
Minimum Lot Standards	
Lot Size	4769 SF
Lot Width	55'
Lot Depth	83'
Maximum Height	27'
Minimum Primary Building Setbacks	
Front (To Garage Face)	20'
Front (To Living Area)	10'
Side (Corner)	10'
Side (Interior)	5'
Rear	15'

* Accessory Structures shall be subject to City of Eastvale Zoning Code Section 5.12

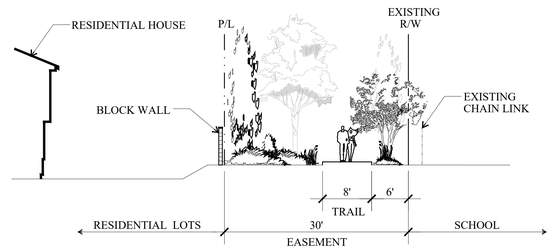
Project Summary

Gross Site Area: 10.0 Acres
Developable Area: 8.28 Acres
Total Units: 41 Homes
Density: 4.95 Units per Developable Acre

Legend
Plan 1 - (Two-Story, 2833 SF, 5 bedrooms + loft) 20 homes
Plan 2 - (Two_Story, 3153 SF, 5 bedrooms + loft) 21 homes
Total: 41 homes

Enhanced Elevation Locations

Parking Summary
- **Parking Required: 2 spaces/dwelling unit**
- **Parking Provided:**
  - **Garage: 2 spaces/dwelling unit**
  - **Driveways: 2 spaces/dwelling unit**
  - **Internal Streets: 58 spaces (parallel spaces on street)**



Open Space Summary
- **Net Site Area: 262,695 SF (excluding all streets + trail dedication)**
- **Common Area: 27,803 SF (Lot A + Lot B)**
- **Private Rear Yards: 98,012 SF**
- **Total: 125,815 SF (47.9% of net site area**

Trail Dedication
- **30' trail dedication to City**
- **Connection from Orange Ave to future Schleisman Road improvements**

Public Streets
- **56-foot right-of-way designed to County of Riverside Standards**
- **36-foot curb-to-curb section with parking on both sides**
- **5-foot sidewalk**
- **5-foot landscape area with street trees behind walk**

Amenity Space and Basin
- **63-foot wide paseo**
- **Variety of amenities including trail, bench and dog station, coffe table with seating, picnic tables, bocce ball.**
- **Maintained by Homeowners Association**

Orange Street Access & Frontage
- **Main Entry into Site**
- **Orange Street Frontage is designed to match existing frontage at subdivision to the west (attached walk, landscaping with street trees behind walk, community block wall, parallel parking on street)**
- **Existing power poles moved and replaced with metal poles to match adjacent developments**
- **Enhanced rear and side elevations where visible from public street**

LEGEND

1. Picnic Seating Area with decomposed granite , picnic tables, and specimen Magnolia shade trees
2. Succulent Garden Walk with decomposed granite, tree nooks for specimen Magnolia shade tree, citrus tree planting, and Adirondack seating.
3. Central Lawn Area for passive and active usage with real turf , bench seating, and shade trees.
4. Main project entry with specimen Magnolia trees.
5. Project signage wall feature with pin-mounted lettering.
6. Corn hole play area with real turf and shade trees
7. Four community cluster mailboxes, per USPS review and approval.
8. Proposed wall, pilaster, gate or fence, per Wall & Fence Plan.
9. Proposed tree, per Planting Plan.
10. 5' wide community natural colored concrete sidewalk, with light top cast finish and saw cut joints.
11. 4' wide unit entry natural colored concrete walk, with light top cast finish and saw cut joints.
12. Natural colored concrete driveway, with light broom finish and tooled joints.
13. Private yard area, homeowner maintained.
14. Common area landscape, builder installed and HOA maintained.
15. Community dog bag station (black in color), for pet owners.
16. Public steet R.O.W.
17. Proposed public street sidewalk, per Civil Plans.
18. Integral colored concrete.
19. Proposed AC condenser, per Architecture plans
20. Proposed curb ramp, per Civil Plans.
21. 8ft wide paseo walk connection between Schelisman Road and Orange Street.
22. Seating area with outdoor table and lounge seating.
23. Builder Installed, homeowner maintained private front yards.
24. Pedestrian connection to future linear park along Schleisman Road.
25. Enhanced landscape on both side of the community entry.
26. Enhanced Paving for Entry and Pedestrian path across.
27. Stripping at Pedestrian crossing.

NOTES:
1. Irrigations (including spray and or drip) will be provided, in the Construction Document phase, and to be installed per local California water regulations (AB1881).
2. Transformers, back-flow preventers & other above-ground utilities to be screened with landscape as permitted per local codes & regulations.
3. The plant palette listed provides a list of plant material to select from when preparing final landscape construction documents for this project. however, substitutions may be required due to availability, soils tests, or other conditions.
4. All trees within 5' of hardscape to be installed with deep root barriers.
5. Future shrub and groundcover planting proposed during Construction Documents must comply with the project's Water Quality Management Plan to ensure that the landscape layout aligns with the required Best Management Practices (BMPs) for the facilities.

1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Air Quality, Energy, and Greenhouse Gas (GHG) Emissions Impact Analysis has been completed to determine the air quality, energy, and GHG emissions impacts associated with the proposed Magnolia Ranch Residential project (proposed project). The following is provided in this report:

- A description of the proposed project;
- A description of the atmospheric setting;
- A description of the criteria pollutants and GHGs;
- A description of the air quality regulatory framework;
- A description of the energy conservation regulatory framework;
- A description of the GHG emissions regulatory framework;
- A description of the air quality, energy, and GHG emissions thresholds including the California Environmental Quality Act (CEQA) significance thresholds;
- An analysis of the conformity of the proposed project with the South Coast Air Quality Management District (SCAQMD) Air Quality Management Plan (AQMP);
- An analysis of the short-term construction related and long-term operational air quality, energy, and GHG emissions impacts; and
- An analysis of the conformity of the proposed project with all applicable energy and GHG emissions reduction plans and policies.

1.2 Site Locations and Study Area

The project site is located in the City of Eastvale (City). The approximately 10.0 gross acre project site is relatively flat and currently includes a ranch house with barn and associated fencing and facilities for livestock/horses. The project site is bounded by Schleisman Road to the north, Eastvale Elementary School to the east, Orange Street and River Heights Intermediate School to the south and single-family homes to the west. The project local study area is shown in Figure 1.

Sensitive Receptors in Project Vicinity

The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

1.3 Proposed Project Description

The proposed project would consist of a residential development on 8.28 net acres that would include 41 detached single-family homes with approximately 22,000 square feet of common open space. New sidewalks will be provided along the north side of Orange Street, a walkway will run in a north-south direction adjacent to the east property line, and a walkway will run in an east-west direction through the common open space area. The proposed project would also include development of an internal road system and road improvements to the portion of Orange Street that is adjacent to the project site. It

should be noted that the project applicant is proposing to pay TUMF fees in lieu of road improvements to the portion of Schleisman Road that is adjacent to the project site, however in order to provide a conservative analysis, it has been assumed that this area will be graded as part of the proposed project. The proposed site plan is shown in Figure 2.

1.4 Executive Summary

Standard Air Quality, Energy, and GHG Regulatory Conditions

The proposed project will be required to comply with the following regulatory conditions from the SCAQMD and State of California (State).

South Coast Air Quality Management District Rules

The following lists the SCAQMD rules that are applicable, but not limited to the proposed project.

- Rule 402 Nuisance – Controls the emissions of odors and other air contaminants;
- Rule 403 Fugitive Dust – Controls the emissions of fugitive dust;
- Rule 445 Wood Burning Devices – Controls the emissions from fire places and fire pits;
- Rules 1108 and 1108.1 Cutback and Emulsified Asphalt – Controls the VOC content in asphalt;
- Rule 1113 Architectural Coatings – Controls the VOC content in paints and solvents;
- Rule 1143 Paint Thinners – Controls the VOC content in paint thinners; and
- Rule 1403 Asbestos Removal – Provides procedures for asbestos removal from buildings.

State of California Rules

The following lists the State of California Code of Regulations (CCR) air quality emission rules that are applicable, but not limited to the proposed project.

- CCR Title 13, Article 4.8, Chapter 9, Section 2449 – In use Off-Road Diesel Vehicles;
- CCR Title 13, Section 2025 – On-Road Diesel Truck Fleets;
- CCR Title 24 Part 6 – California Building Energy Standards; and
- CCR Title 24 Part 11 – California Green Building Standards.

Summary of Analysis Results

The following is a summary of the proposed project's impacts with regard to the State CEQA Guidelines air quality, energy, and GHG emissions checklist questions.

Conflict with or obstruct implementation of the applicable air quality plan?

Less than significant impact.

Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard?

Less than significant impact.

Expose sensitive receptors to substantial pollutant concentrations?

Less than significant impact.

Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less than significant impact.

Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation;

Less than significant impact.

Conflict with or obstruct a state or local plan for renewable energy;

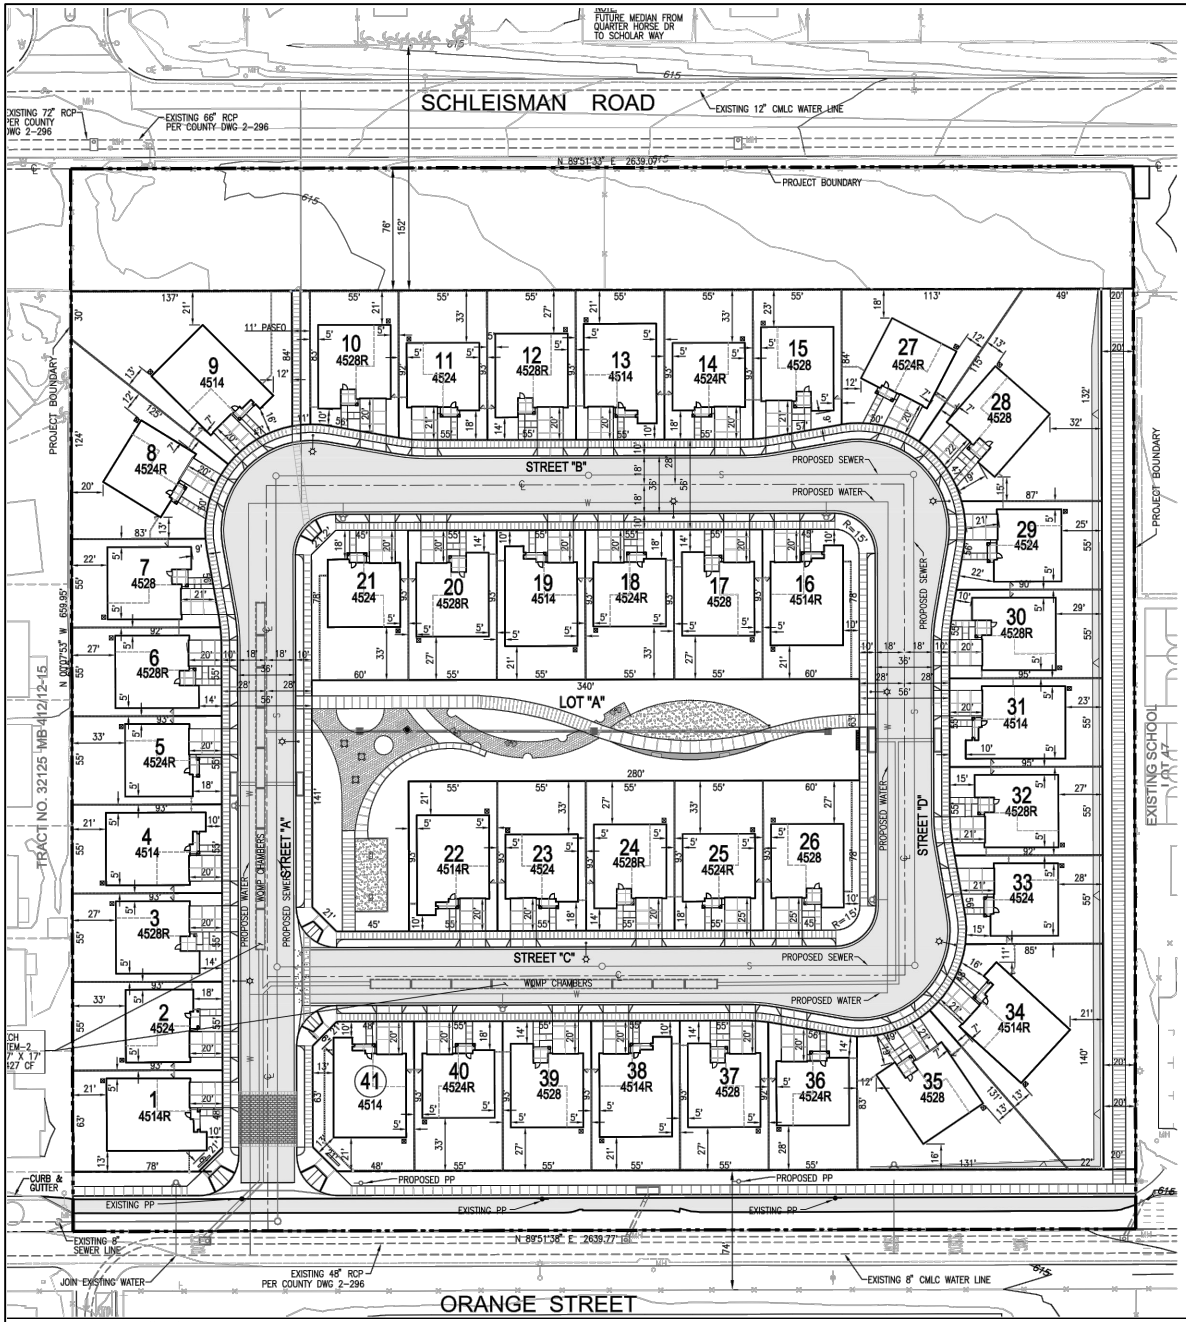
Less than significant impact.

Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

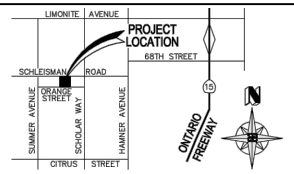
Less than significant impact.

Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs?

Less than significant impact.



1.5 Mitigation Measures for the Proposed Project



This analysis found that implementation of the State and SCAQMD air quality, energy, and GHG emissions reductions regulations were adequate to limit criteria pollutants, toxic air contaminants, odors, energy, and GHG emissions from the proposed project to less than significant levels. No mitigation measures are required for the proposed project with respect to air quality, energy, and GHG emissions.

Proposed Site Plan

2.0 AIR POLLUTANTS

Air pollutants are generally classified as either criteria pollutants or non-criteria pollutants. Federal ambient air quality standards have been established for criteria pollutants, whereas no ambient standards have been established for non-criteria pollutants. For some criteria pollutants, separate standards have been set for different periods. Most standards have been set to protect public health. For some pollutants, standards have been based on other values (such as protection of crops, protection of materials, or avoidance of nuisance conditions). A summary of federal and state ambient air quality standards is provided in the Regulatory Framework section.

2.1 Criteria Pollutants and Ozone Precursors

The criteria pollutants consist of: ozone, nitrogen oxides (NOx), CO, sulfur oxides (SOx), lead, and particulate matter (PM). The ozone precursors consist of NO_x and VOC. These pollutants can harm your health and the environment, and cause property damage. The Environmental Protection Agency (EPA) calls these pollutants "criteria" air pollutants because it regulates them by developing human health-based and/or environmentally-based criteria for setting permissible levels. The following provides descriptions of each of the criteria pollutants and ozone precursors.

Nitrogen Oxides

NOx is the generic term for a group of highly reactive gases which contain nitrogen and oxygen. While most NOx are colorless and odorless, concentrations of nitrogen dioxide (NO_2) can often be seen as a reddish-brown layer over many urban areas. NOx form when fuel is burned at high temperatures, as in a combustion process. The primary manmade sources of NO_x are motor vehicles, electric utilities, and other industrial, commercial, and residential sources that burn fuel. NOx reacts with other pollutants to form, ground-level ozone, nitrate particles, acid aerosols, as well as NO_2, which cause respiratory problems. NO_x and the pollutants formed from NO_x can be transported over long distances, following the patterns of prevailing winds. Therefore, controlling NOx is often most effective if done from a regional perspective, rather than focusing on the nearest sources.

Ozone

Ozone is not usually emitted directly into the air, instead it is created by a chemical reaction between NOx and VOC in the presence of sunlight. Motor vehicle exhaust, industrial emissions, gasoline vapors, chemical solvents as well as natural sources emit NOx and VOC that help form ozone. Ground-level ozone is the primary constituent of smog. Sunlight and hot weather cause ground-level ozone to form with the greatest concentrations usually occurring downwind from urban areas. Ozone is subsequently considered a regional pollutant. Ground-level ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Because NOx and VOC are ozone precursors, the health effects associated with ozone are also indirect health effects associated with significant levels of NOx and VOC emissions.

Carbon Monoxide

Carbon monoxide (CO) is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes approximately 56 percent of all CO emissions nationwide. In cities, 85 to 95 percent of all CO emissions may come from motor vehicle exhaust. Other sources of CO emissions include industrial processes (such as metals processing and chemical manufacturing), residential wood burning, and natural sources such as forest fires. Woodstoves,

gas stoves, cigarette smoke, and unvented gas and kerosene space heaters are indoor sources of CO. The highest levels of CO in the outside air typically occur during the colder months of the year when inversion conditions are more frequent. The air pollution becomes trapped near the ground beneath a layer of warm air. CO is described as having only a local influence because it dissipates quickly. Since CO concentrations are strongly associated with motor vehicle emissions, high CO concentrations generally occur in the immediate vicinity of roadways with high traffic volumes and traffic congestion, active parking lots, and in automobile tunnels. Areas adjacent to heavily traveled and congested intersections are particularly susceptible to high CO concentrations.

CO is a public health concern because it combines readily with hemoglobin and thus reduces the amount of oxygen transported in the bloodstream. The health threat from lower levels of CO is most serious for those who suffer from heart disease such as angina, clogged arteries, or congestive heart failure. For a person with heart disease, a single exposure to CO at low levels may cause chest pain and reduce that person's ability to exercise; repeated exposures may contribute to other cardiovascular effects. High levels of CO can affect even healthy people. People who breathe high levels of CO can develop vision problems, reduced ability to work or learn, reduced manual dexterity, and difficulty performing complex tasks. At extremely high levels, CO is poisonous and can cause death.

Sulfur Oxides

SOx gases are formed when fuel containing sulfur, such as coal and oil is burned, as well as from the refining of gasoline. SOx dissolves easily in water vapor to form acid and interacts with other gases and particles in the air to form sulfates and other products that can be harmful to people and the environment.

Lead

Lead is a metal found naturally in the environment as well as manufactured products. The major sources of lead emissions have historically been motor vehicles and industrial sources. Due to the phase out of leaded gasoline, metal processing is now the primary source of lead emissions to the air. High levels of lead in the air are typically only found near lead smelters, waste incinerators, utilities, and lead-acid battery manufacturers. Exposure of fetuses, infants and children to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

Particulate Matter

PM is the term for a mixture of solid particles and liquid droplets found in the air. PM is made up of a number of components including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to their potential for causing health problems. Particles that are less than 10 micrometers in diameter (PM10) that are also known as *Respirable Particulate Matter* are the particles that generally pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects. Particles that are less than 2.5 micrometers in diameter (PM2.5) that are also known as *Fine Particulate Matter* have been designated as a subset of PM10 due to their increased negative health impacts and its ability to remain suspended in the air longer and travel further.

Volatile Organic Compounds

Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of ozone are referred to and regulated as VOCs (also

referred to as reactive organic gases). Combustion engine exhaust, oil refineries, and fossil-fueled power plants are the sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

VOC is not classified as a criteria pollutant, since VOCs by themselves are not a known source of adverse health effects. The primary health effects of VOCs result from the formation of ozone and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate health standards for VOCs as a group.

2.2 Other Pollutants of Concern

Toxic Air Contaminants

In addition to the above-listed criteria pollutants, TACs are another group of pollutants of concern. TACs is a term that is defined under the California Clean Air Act and consists of the same substances that are defined as Hazardous Air Pollutants (HAPs) in the Federal Clean Air Act. There are over 700 hundred different types of TACs with varying degrees of toxicity. Sources of TACs include industrial processes such as petroleum refining and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. Cars and trucks release at least 40 different toxic air contaminants. The most important of these TACs, in terms of health risk, are diesel particulates, benzene, formaldehyde, 1,3-butadiene, and acetaldehyde. Public exposure to TACs can result from emissions from normal operations as well as from accidental releases. Health effects of TACs include cancer, birth defects, neurological damage, and death.

TACs are less pervasive in the urban atmosphere than criteria air pollutants, however they are linked to short-term (acute) or long-term (chronic or carcinogenic) adverse human health effects. There are hundreds of different types of TACs with varying degrees of toxicity. Sources of TACs include industrial processes, commercial operations (e.g., gasoline stations and dry cleaners), and motor vehicle exhaust.

According to *The California Almanac of Emissions and Air Quality 2013 Edition*, the majority of the estimated health risk from TACs can be attributed to relatively few compounds, the most important of which is diesel particulate matter (DPM). DPM is a subset of PM2.5 because the size of diesel particles are typically 2.5 microns and smaller. The identification of DPM as a TAC in 1998 led the California Air Resources Board (CARB) to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles in September 2000. The plan's goals are a 75-percent reduction in DPM by 2010 and an 85-percent reduction by 2020 from the 2000 baseline. Diesel engines emit a complex mixture of air pollutants, composed of gaseous and solid material. The visible emissions in diesel exhaust are known as particulate matter or PM, which includes carbon particles or "soot." Diesel exhaust also contains a variety of harmful gases and over 40 other cancer-causing substances. California's identification of DPM as a toxic air contaminant was based on its potential to cause cancer, premature deaths, and other health problems. Exposure to DPM is a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Overall, diesel engine emissions are responsible for the majority of California's potential airborne cancer risk from combustion sources.

Asbestos

Asbestos is listed as a TAC by CARB and as a HAP by the EPA. Asbestos occurs naturally in mineral formations and crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma. The nearest likely locations of naturally occurring asbestos, as identified in the *General Location Guide for Ultramafic Rocks in California*, prepared by the California Division of Mines and Geology, is located in Santa Barbara County. The nearest historic asbestos mine to the project site, as identified in the *Reported Historic Asbestos Mines, Historic Asbestos Prospects, and Other Natural Occurrences of Asbestos in California,* prepared by U.S. Geological Survey, is located at Asbestos Mountain, which is approximately 40 miles southeast of the project site in the San Jacinto Mountains. Due to the distance to the nearest natural occurrences of asbestos, the project site is not likely to contain asbestos.

In addition to naturally occurring asbestos, asbestos was used extensively in building construction from the early 1940s through the 1970s as highly-effective and inexpensive fire-retardant material and thermal and acoustic insulator. Asbestos is most commonly found as thermal insulation on pipes, but also may be found in certain types of floor and ceiling tiles. There are two types of asbestos: “friable” and "non-friable.” Friable asbestos generally contains more than 1 percent asbestos by weight or area, and can be crumbled, pulverized, or reduced to powder by the pressure of an ordinary human hand, which releases fibers. Non friable asbestos generally contains more than 1 percent asbestos but cannot be pulverized under hand pressure and generally does not release asbestos fibers. The analysis of asbestos from demolition of the existing structures is provided below in Section 10.4.

3.0 GREENHOUSE GASES

3.1 Greenhouse Gases

Constituent gases of the Earth's atmosphere, called atmospheric GHGs, play a critical role in the Earth's radiation amount by trapping infrared radiation from the Earth's surface, which otherwise would have escaped to space. Prominent greenhouse gases contributing to this process include carbon dioxide (CO_2), methane (CH_4), ozone, water vapor, nitrous oxide (N_2O), and chlorofluorocarbons (CFCs). This phenomenon, known as the Greenhouse Effect, is responsible for maintaining a habitable climate. Anthropogenic (caused or produced by humans) emissions of these greenhouse gases in excess of natural ambient concentrations are responsible for the enhancement of the Greenhouse Effect and have led to a trend of unnatural warming of the Earth's natural climate, known as global warming or climate change. Emissions of gases that induce global warming are attributable to human activities associated with industrial/manufacturing, agriculture, utilities, transportation, and residential land uses. Emissions of CO_2 and N_2O are byproducts of fossil fuel combustion. Methane, a potent greenhouse gas, results from off-gassing associated with agricultural practices and landfills. Sinks of CO_2, where CO_2 is stored outside of the atmosphere, include uptake by vegetation and dissolution into the ocean. The following provides a description of each of the greenhouse gases and their global warming potential.

Water Vapor

Water vapor is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. The feedback loop in which water is involved is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to "hold" more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop." The extent to which this positive feedback loop will continue is unknown as there is also dynamics that put the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually also condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the Earth's surface and heat it up).

Carbon Dioxide

The natural production and absorption of CO_2 is achieved through the terrestrial biosphere and the ocean. However, humankind has altered the natural carbon cycle by burning coal, oil, natural gas, and wood. Since the industrial revolution began in the mid-1700s, each of these activities has increased in scale and distribution. CO_2 was the first GHG demonstrated to be increasing in atmospheric concentration with the first conclusive measurements being made in the last half of the 20th century. Prior to the industrial revolution, concentrations were fairly stable at 280 parts per million (ppm). The International Panel on Climate Change (IPCC) indicates that concentrations were 379 ppm in 2005, an increase of more than 30 percent. Left unchecked, the IPCC projects that concentration of carbon dioxide in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources. This

could result in an average global temperature rise of at least two degrees Celsius or 3.6 degrees Fahrenheit.

Methane

CH_4 is an extremely effective absorber of radiation, although its atmospheric concentration is less than that of CO_2. Its lifetime in the atmosphere is brief (10 to 12 years), compared to some other GHGs (such as CO_2, N_2O, and CFCs). CH_4 has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of methane. Other anthropocentric sources include fossil-fuel combustion and biomass burning.

Nitrous Oxide

Concentrations of N_2O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration of this GHG was documented at 314 parts per billion (ppb). N_2O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. N_2O is also commonly used as an aerosol spray propellant (i.e., in whipped cream bottles, in potato chip bags to keep chips fresh, and in rocket engines and race cars).

Chlorofluorocarbons

CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the Earth's surface). CFCs have no natural source, but were first synthesized in 1928. They were used for refrigerants, aerosol propellants, and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and in 1989 the European Community agreed to ban CFCs by 2000 and subsequent treaties banned CFCs worldwide by 2010. This effort was extremely successful, and the levels of the major CFCs are now remaining level or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.

Hydrofluorocarbons

Hydrofluorocarbons (HFCs) are synthetic man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential. The HFCs with the largest measured atmospheric abundances are (in order), HFC-23 (CHF_3), HFC-134a (CF_3CH_2F), and HFC-152a (CH_3CHF_2). Prior to 1990, the only significant emissions were HFC-23. HFC-134a use is increasing due to its use as a refrigerant. Concentrations of HFC-23 and HFC-134a in the atmosphere are now about 10 parts per trillion (ppt) each. Concentrations of HFC-152a are about 1 ppt. HFCs are manmade for applications such as automobile air conditioners and refrigerants.

Perfluorocarbons

Perfluorocarbons (PFCs) have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF_4) and hexafluoroethane (C_2F_6).

Concentrations of CF_4 in the atmosphere are over 70 ppt. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing.

Sulfur Hexafluoride

Sulfur Hexafluoride (SF_6) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF_6 has the highest global warming potential of any gas evaluated; 23,900 times that of CO_2. Concentrations in the 1990s were about 4 ppt. Sulfur hexafluoride is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Aerosols

Aerosols are particles emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols. Sulfate aerosols are emitted when fuel containing sulfur is burned. Black carbon (or soot) is emitted during biomass burning due to the incomplete combustion of fossil fuels. Particulate matter regulation has been lowering aerosol concentrations in the United States; however, global concentrations are likely increasing.

3.2 Global Warming Potential

GHGs have varying global warming potential (GWP). The GWP is the potential of a gas or aerosol to trap heat in the atmosphere; it is the cumulative radiative forcing effects of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to the reference gas, CO_2. The GHGs listed by the IPCC and the CEQA Guidelines are discussed in this section in order of abundance in the atmosphere. Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic (human-made) sources. To simplify reporting and analysis, GHGs are commonly defined in terms of their GWP. The IPCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of CO_2 equivalent (CO_2e). As such, the GWP of CO_2 is equal to 1. The GWP values used in this analysis are based on the 2007 IPCC Fourth Assessment Report, which are used in CARB's 2014 Scoping Plan Update and the CalEEMod Model Version 2020.4.0 and are detailed in Table A. The IPCC has updated the Global Warming Potentials of some gases in their Fifth Assessment Report, however the new values have not yet been incorporated into the CalEEMod model that has been utilized in this analysis.

Table A – Global Warming Potentials, Atmospheric Lifetimes and Abundances of GHGs

Gas	Atmospheric Lifetime (years)[1]	Global Warming Potential (100 Year Horizon)[2]	Atmospheric Abundance
Carbon Dioxide (CO_2)	50-200	1	379 ppm
Methane (CH_4)	9-15	25	1,774 ppb
Nitrous Oxide (N_2O)	114	298	319 ppb
HFC-23	270	14,800	18 ppt
HFC-134a	14	1,430	35 ppt
HFC-152a	1.4	124	3.9 ppt
PFC: Tetrafluoromethane (CF_4)	50,000	7,390	74 ppt
PFC: Hexafluoroethane (C_2F_6)	10,000	12,200	2.9 ppt
Sulfur Hexafluoride (SF_6)	3,200	22,800	5.6 ppt

Notes:

[1] Defined as the half-life of the gas.
[2] Compared to the same quantity of CO_2 emissions and is based on the Intergovernmental Panel On Climate Change (IPCC) 2007 standard, which is utilized in CalEEMod (Version 2020.4.0),that is used in this report (CalEEMod User Guide, May 2021).
Definitions: ppm = parts per million; ppb = parts per billion; ppt = parts per trillion

3.3 Greenhouse Gas Emissions Inventory

According to the Carbon Dioxide Information Analysis Center[1], 9,855 million metric tons (MMT) of CO_2e emissions were created globally in the year 2014. According to the Environmental Protection Agency (EPA), the breakdown of global GHG emissions by sector consists of: 25 percent from electricity and heat production; 21 percent from industry; 24 percent from agriculture, forestry and other land use activities; 14 percent from transportation; 6 percent from building energy use; and 10 percent from all other sources of energy use[2].

According to *Inventory of U.S. Greenhouse Gas Emissions and Sinks 1990-2019,* prepared by EPA, in 2019 total U.S. GHG emissions were 6,558 million metric tons (MMT) of CO_2e emissions. Total U.S. emissions have increased by 4 percent between 1990 and 2016 and GHG emissions decreased by 13 percent between 2005 and 2019. The recent decrease in GHG emissions was a result of multiple factors, including population, economic growth, energy markets, and technological changes the include energy efficiency and energy fuel choices. Between 2018 and 2019, GHG emissions decreased by almost 2 percent due to multiple factors, including a one percent decrease in total energy use.

According to *California Greenhouse Gas Emissions for 2000 to 2019 Trends of Emissions and Other Indicators*, prepared by CARB, July 28, 2021, the State of California created 418.2 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) in 2019. The 2019 emissions were 7.2 $MMTCO_2e$ lower than 2018 levels and almost 13 $MMTCO_2e$ below the State adopted year 2020 GHG limit of 431 $MMTCO_2e$. The breakdown of California GHG emissions by sector consists of: 39.7 percent from transportation; 21.1 percent from industrial; 14.1 percent from electricity generation; 7.6 percent from agriculture; 10.5 percent from residential and commercial buildings; 4.9 percent from high global warming potential sources, and 2.1 percent from waste.

4.0 AIR QUALITY MANAGEMENT

The project site is located within the South Coast Air Basin (Air Basin). The air quality at the project site is addressed through the efforts of various federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for improving the air quality are discussed below.

4.1 Federal – United States Environmental Protection Agency

The Clean Air Act, first passed in 1963 with major amendments in 1970, 1977 and 1990, is the overarching legislation covering regulation of air pollution in the United States. The Clean Air Act has established the mandate for requiring regulation of both mobile and stationary sources of air pollution at the state and federal level. The EPA was created in 1970 in order to consolidate research, monitoring, standard-setting and enforcement authority into a single agency.

The EPA is responsible for setting and enforcing the National Ambient Air Quality Standards (NAAQS) for atmospheric pollutants. It regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain locomotives. NAAQS pollutants were identified using medical evidence and are shown below in Table B.

Table B – State and Federal Criteria Pollutant Standards

Air Pollutant	Concentration / Averaging Time		Most Relevant Effects
	California Standards	Federal Primary Standards	
Ozone (O_3)	0.09 ppm / 1-hour 0.07 ppm / 8-hour	0.070 ppm, / 8-hour	a) Pulmonary function decrements and localized lung injury in humans and animals; (b) asthma exacerbation; (c) chronic obstructive pulmonary disease (COPD) exacerbation; (d) respiratory infection; (e) increased school absences, and hospital admissions and emergency department (ED) visits for combined respiratory diseases; (e) increased mortality; (f) possible metabolic effects. Vegetation damage; property damage
Carbon Monoxide (CO)	20.0 ppm / 1-hour 9.0 ppm / 8-hour	35.0 ppm / 1-hour 9.0 ppm / 8-hour	Visibility reduction (a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) possible impairment of central nervous system functions; (d) possible increased risk to fetuses; (f) possible increased risk of pulmonary disease; (g) possible emergency department visits for respiratory diseases overall and visits for asthma.
Nitrogen Dioxide (NO_2)	0.18 ppm / 1-hour 0.030 ppm / annual	100 ppb / 1-hour 0.053 ppm / annual	Short-term (a) asthma exacerbations (“asthma attacks”) Long-term (a) asthma development; (b) higher risk of all-cause, cardiovascular, and respiratory mortality. Both short and long term NO2 exposure is also associated with chronic obstructive pulmonary disease (COPD) risk. Potential impacts on cardiovascular health, mortality and cancer, aggravate chronic respiratory disease. Contribution to atmospheric discoloration

Air Pollutant	Concentration / Averaging Time		Most Relevant Effects
	California Standards	Federal Primary Standards	
Sulfur Dioxide (SO_2)	0.25 ppm / 1-hour 0.04 ppm / 24-hour	75 ppb / 1-hour	Respiratory symptoms (bronchoconstriction, possible wheezing or shortness of breath) during exercise or physical activity in persons with asthma. Possible allergic sensitization, airway inflammation, asthma development.
Respirable Particulate Matter (PM_{10})	50 µg/m^3 / 24-hour 20 µg/m^3 / annual	150 µg/m^3 / 24-hour	Short -term (a) increase in mortality rates; (b) increase in respiratory infections; (c) increase in number and severity of asthma attacks; (d) COPD exacerbation; (e) increase in combined respiratory-diseases and number of hospital admissions; (f) increased mortality due to cardiovascular or respiratory diseases; (g) increase in hospital admissions for acute respiratory conditions; (h) increase in school absences; (i) increase in lost work days; (j) decrease in respiratory function in children; (k) increase medication use in children and adults with asthma.
Suspended Particulate Matter ($PM_{2.5}$)	12 µg/m^3 / annual	35 µg/m^3 / 24-hour 12 µg/m^3 / annual	Long-term (a) reduced lung function growth in children; (b) changes in lung development; (c) development of asthma in children; (d) increased risk of cardiovascular diseases; (e) increased total mortality from lung cancer; (f) increased risk of premature death. Possible link to metabolic, nervous system, and reproductive and developmental effects for short-term and long-term exposure to PM2.5.
Sulfates	25 µg/m^3 / 24-hour	No Federal Standards	(a) Decrease in lung function; (b) aggravation of asthmatic symptoms; (c) vegetation damage; (d) Degradation of visibility; (e) property damage
Lead	1.5 µg/m^3 / 30-day	0.15 µg/m^3 /3-month rolling	(a) Learning disabilities; (b) impairment of blood formation and nerve function; (c) cardiovascular effects, including coronary heart disease and hypertension Possible male reproductive system effects
Hydrogen Sulfide	0.03 ppm / 1-hour	No Federal Standards	Exposure to lower ambient concentrations above the standard may result in objectionable odor and may be accompanied by symptoms such as headaches, nausea, dizziness, nasal irritation, cough, and shortness of breath

Source: Draft 2022 AQMP, SCAQMD, 2022.

As part of its enforcement responsibilities, the EPA requires each state with federal nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the national standards. The SIP must integrate federal, state, and local components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the timeframe identified in the SIP. The CARB defines attainment as the category given to an area with no violations in the past three years. As indicated below in Table C, the Air Basin has been designated by EPA for the national standards as a non-attainment area for ozone and PM2.5 and partial non-attainment for lead. Currently, the Air Basin is in attainment with the national ambient air quality standards for CO, PM10, SO_2, and NO_2.

Table C – National Air Quality Standards Attainment Status – South Coast Air Basin

Criteria Pollutant	Averaging Time	Designation[a]	Attainment Date[b]
Ozone	1979 1-Hour (0.12 ppm)	Nonattainment (Extreme)	2/6/2023 (revised deadline)
	2015 8-Hour (0.07 ppm)[d]	Nonattainment (Extreme)	8/3/2038
	2008 8-Hour (0.075 ppm)[d]	Nonattainment (Extreme)	7/20/2032
	1997 8-Hour (0.08 ppm)[d]	Nonattainment (Extreme)	6/15/2024
PM2.5[e]	2006 24-Hour (35 µg/m^3)	Nonattainment (Serious)	12/31/2019
	2012 Annual (12 µg/m^3)	Nonattainment (Serious)	12/31/2021
	1997 Annual (15 µg/m^3)	Attainment (final determination pending)	4/5/2015 (attained 2013)
PM10[f]	1987 24-Hour (150 µg/m^3)	Attainment (Maintenance)	7/26/2013 (attained)
Lead[g]	2008 3-Months Rolling (0.15 µg/m^3)	Nonattainment (Partial) (Attainment determination requested)	12/31/2015
CO	1971 1-Hour (35 ppm)	Attainment (Maintenance)	6/11/2007
	1971 8-Hour (9 ppm)	Attainment (Maintenance)	6/11/2007
NO_2[h]	2010 1-Hour (100 ppb)	Unclassifiable/Attainment	N/A (attained)
	1971 Annual (0.053 ppm)	Attainment (Maintenance)	9/22/1998 (attained)
SO_2[i]	2010 1-Hour (75 ppb)	Unclassifiable/Attainment	1/9/2018
	1971 24-Hour (0.14 ppm)	Unclassifiable/Attainment	3/19/1979

Source: SCAQMD, May 2022

Notes:

a) U.S. EPA often only declares Nonattainment areas; everywhere else is listed as Unclassifiable/Attainment or Unclassifiable.

b) A design value below the NAAQS for data through the full year or smog season prior to the attainment date is typically required for attainment demonstration.

c) The 1979 1-hour ozone NAAQS (0.12 ppm) was revoked, effective June 15, 2005; however, the Basin has not attained this standard and therefore has some continuing obligations with respect to the revoked standard; original attainment date was 11/15/2010; the revised attainment date is 2/6/2023.

d) The 2008 8-hour ozone NAAQS (0.075 ppm) was revised to 0.070 ppm, effective 12/28/20115 with classifications and implementation goals to be finalized by 10/1/2017; the 1997 8-hour ozone NAAQS (0.08 ppm) was revoked in the 2008 ozone implementation rule, effective 4/6/2015; there are continuing obligations under the revoked 1997 and revised 2008 ozone NAAQS until they are attained.

e) The attainment deadline for the 2006 24-Hour PM2.5 NAAQS was 12/31/15 for the former "moderate" classification; the EPA approved reclassification to "serious", effective 2/12/16 with an attainment deadline of 12/31/2019; the 2012 (proposal year) annual PM2.5 NAAQS was revised on 1/15/2013, effective 3/18/2013, from 15 to 12 µg/m^3; new annual designations were final 1/15/2015, effective 4/15/2015; on 7/25/2016 the EPA finalized a determination that the Basin attained the 1997 annual (15.0 µg/m^3) and 24-hour PM2.5 (65 µg/m^3) NAAQS, effective 8/24/2016.

f) The annual PM10 standard was revoked, effective 12/18/2006; the 24-hour PM10 NAAQS deadline was 12/31/2006; the Basin's Attainment Re-designation Request and PM10 Maintenance Plan was approved by the EPA on 6/26/2103, effective 7/26/2013.

g) Partial Nonattainment designation – Los Angeles County portion of the Basin only for near-source monitors; expect to remain in attainment based on current monitoring data; attainment re-designation request pending.

h) New 1-hour NO_2 NAAQS became effective 8/2/2010, with attainment designations 1/20/2012; annual NO_2 NAAQS retained.

i) The 1971 annual and 24-hour SO_2 NAAQS were revoked, effective 8/23/2010.

Despite substantial improvements in air quality over the past few decades, some air monitoring stations in the Air Basin still exceed the NAAQS and frequently record the highest ozone levels in the United States. In 2020, monitoring stations in the Air Basin exceeded the most current federal standards on a total of 181 days (49 percent of the year), including: 8-hour ozone (157 days over the 2015 ozone NAAQS), 24-hour PM2.5 (39 days), PM10 (3 days), and NO_2 (1 day). Nine of the top 10 stations in the nation most frequently exceeding the 2015 8-hour ozone NAAQS in 2020 were located within the Air Basin, including stations in San Bernardino, Riverside, and Los Angeles Counties (SCAQMD, 2022).

PM2.5 levels in the Air Basin have improved significantly in recent years. Since 2015, none of the monitoring stations in the Air Basin have recorded violations of the former 1997 annual PM2.5 NAAQS (15.0 µg/m^3). On July 25, 2016 the U.S. EPA finalized a determination that the Air Basin attained the 1997 annual (15.0 µg/m^3) and 24-hour PM2.5 (65 µg/m^3) NAAQS, effective August 24, 2016. However, the Air Basin does not meet the 2012 annual PM2.5 NAAQS (12.0 µg/m^3), with six monitoring stations having design values above the standard for the 2018-2020 period (SCAQMD, 2022).

4.2 State – California Air Resources Board

The CARB, which is a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, the CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the SIP. The CAAQS for criteria pollutants in the Air Basin are shown in Table D. In addition, the CARB establishes emission standards for motor vehicles sold in California, consumer products (e.g. hairspray, aerosol paints, and barbeque lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

Table D – California Ambient Air Quality Standards Attainment Status – South Coast Air Basin

Criteria Pollutant	Averaging Time	Level[a]	Designation[b]
Ozone	1-Hour	0.09 ppm	Nonattainment
	8-Hour	0.070 ppm	Nonattainment
PM2.5	Annual	12 µg/m^3	Nonattainment
PM10	24-Hour	50 µg/m^3	Nonattainment
	Annual	20 µg/m^3	Nonattainment
Lead	30-Day Average	1.5 µg/m^3	Attainment
CO	1-Hour	20 ppm	Attainment
	8-Hour	9.0 ppm	Attainment
NO_2	1-Hour	0.18 ppm	Attainment
	Annual	0.030	Nonattainment[c] (CA 60 Near-road portion of San Bernardino, Riverside and Los Angeles Counties) Attainment (remainder of Basin)
SO_2	1-Hour	0.25 ppm	Attainment
	24-Hour	0.04 ppm	Attainment
Sulfates	24-Hour	25 µg/m^3	Attainment
Hydrogen Sulfide	1-Hour	0.03 ppm	Unclassified

Source: SCAQMD, May 2022

Notes:

a) CA State standards, or CAAQS, for ozone, SO_2, NO_2, PM10 and PM2.5 are values not to be exceeded; lead, sulfates and H_2S standards are values not to be equaled or exceeded; CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

b) CA State designations shown were updated by CARB in 2019, based on the 2016-2018 3-year period; stated designations are based on a 3-year data period after consideration of outliers and exceptional events.

c) While this region is currently in Nonattainment, the CARB approved a redesignation to attainment to attainment based on 2018-2020 data on February 24, 2022.

As shown in Table D, the Air Basin has been designated by the CARB as a non-attainment area for ozone, PM10 and PM2.5 and partial nonattainment for NO_2. Currently, the Air Basin is in attainment with the ambient air quality standards for lead, CO, SO_2 and sulfates, and is unclassified for Hydrogen Sulfide.

The following lists the State of California Code of Regulations (CCR) air quality emission rules that are applicable, but not limited to all warehouse projects in the State.

Assembly Bill 2588

The Air Toxics "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588, 1987, Connelly) was enacted in 1987 as a means to establish a formal air toxics emission inventory risk quantification program. AB 2588, as amended, establishes a process that requires stationary sources to report the type and quantities of certain substances their facilities routinely release in California. The data is ranked by high, intermediate, and low categories, which are determined by: the potency, toxicity, quantity, volume, and proximity of the facility to nearby receptors.

CARB Regulation for In-Use Off-Road Diesel Vehicles

On July 26, 2007, the CARB adopted California Code of Regulations Title 13, Article 4.8, Chapter 9, Section 2449 to reduce DPM and NOx emissions from in-use off-road heavy-duty diesel vehicles in California. Such vehicles are used in construction, mining, and industrial operations. The regulation limits idling to no more than five consecutive minutes, requires reporting and labeling, and requires disclosure of the regulation upon vehicle sale. Performance requirements of the rule are based on a fleet's average NOx emissions, which can be met by replacing older vehicles with newer, cleaner vehicles or by applying exhaust retrofits. The regulation was amended in 2010 to delay the original timeline of the performance requirement making the first compliance deadline January 1, 2014 for large fleets (over 5,000 horsepower), 2017 for medium fleets (2,501-5,000 horsepower), and 2019 for small fleets (2,500 horsepower or less). Currently, no commercial operation in California may add any equipment to their fleet that has a Tier 0 or Tier 1 engine. By January 1, 2018 medium and large fleets will be restricted from adding Tier 2 engines to their fleets and by January 2023, no commercial operation will be allowed to add Tier 2 engines to their fleets. It should be noted that commercial fleets may continue to use their existing Tier 0 and 1 equipment, if they can demonstrate that the average emissions from their entire fleet emissions meet the NOx emissions targets.

CARB Resolution 08-43 for On-Road Diesel Truck Fleets

On December 12, 2008 the CARB adopted Resolution 08-43, which limits NOx, PM10 and PM2.5 emissions from on-road diesel truck fleets that operate in California. On October 12, 2009 Executive Order R-09-010 was adopted that codified Resolution 08-43 into Section 2025, title 13 of the California Code of Regulations. This regulation requires that by the year 2023 all commercial diesel trucks that operate in California shall meet model year 2010 (Tier 4 Final) or latter emission standards. In the interim period, this regulation provides annual interim targets for fleet owners to meet. By January 1, 2014, 50 percent of a truck fleet is required to have installed Best Available Control Technology (BACT) for NOx emissions and 100 percent of a truck fleet installed BACT for PM10 emissions. This regulation also provides a few exemptions including a onetime per year 3-day pass for trucks registered outside of California. All on-road diesel trucks utilized during construction of the proposed project will be required to comply with Resolution 08-43.

4.3 Regional – Southern California

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the South Coast Air Basin. To that end, as a regional agency, the SCAQMD works directly with the Southern California Association of Governments (SCAG), county transportation commissions, and local governments and cooperates actively with all federal and state agencies.

South Coast Air Quality Management District

SCAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emission sources, and enforces such measures through educational programs or fines, when necessary. SCAQMD is directly responsible for reducing emissions from stationary, mobile, and indirect sources. It has responded to this requirement by preparing a sequence of AQMPs. The *Final 2016 Air Quality Management Plan* (2016 AQMP) was adopted by the SCAQMD Board on March 3, 2016 and was adopted by CARB on March 23, 2017 for inclusion into the SIP. The 2016 AQMP was prepared in order to meet the following standards:

- 8-hour Ozone (75 ppb) by 2032
- Annual PM2.5 (12 µg/m3) by 2021-2025
- 8-hour Ozone (80 ppb) by 2024 (updated from the 2007 and 2012 AQMPs)
- 1-hour Ozone (120 ppb) by 2023 (updated from the 2012 AQMP)
- 24-hour PM2.5 (35 µg/m^3) by 2019 (updated from the 2012 AQMP)

In addition to meeting the above standards, the 2016 AQMP also includes revisions to the attainment demonstrations for the 1997 8-hour ozone NAAQS and the 1979 1-hour ozone NAAQS. The prior 2012 AQMP was prepared in order to demonstrate attainment with the 24-hour PM2.5 standard by 2014 through adoption of all feasible measures. The prior 2007 AQMP demonstrated attainment with the 1997 8-hour ozone (80 ppb) standard by 2023, through implementation of future improvements in control techniques and technologies. These "black box" emissions reductions represent 65 percent of the remaining NOx emission reductions by 2023 in order to show attainment with the 1997 8-hour ozone NAAQS. Given the magnitude of these needed emissions reductions, additional NOx control measures have been provided in the 2012 AQMP even though the primary purpose was to show compliance with 24-hour PM2.5 emissions standards.

The 2016 AQMP provides a new approach that focuses on available, proven and cost effective alternatives to traditional strategies, while seeking to achieve multiple goals in partnership with other entities to promote reductions in GHG emissions and TAC emissions as well as efficiencies in energy use, transportation, and goods movement. The 2016 AQMP recognizes the critical importance of working with other agencies to develop funding and other incentives that encourage the accelerated transition of vehicles, buildings and industrial facilities to cleaner technologies in a manner that benefits not only air quality, but also local businesses and the regional economy.

Although SCAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate air quality issues associated with plans and new development projects throughout the Air Basin. Instead, this is controlled through local jurisdictions in accordance to CEQA. In order to assist local jurisdictions with air quality compliance issues the *CEQA Air Quality Handbook* (SCAQMD CEQA Handbook), prepared by SCAQMD, 1993, with the most current updates found at http://www.aqmd.gov/ceqa/hdbk.html, was developed in accordance with the projections and programs detailed in the AQMPs. The purpose of the SCAQMD CEQA Handbook is to assist Lead Agencies, as well as consultants, project proponents, and other interested parties in evaluating a proposed project's potential air quality impacts. Specifically, the SCAQMD CEQA Handbook explains the procedures that SCAQMD recommends be followed for the environmental review process required by CEQA. The SCAQMD CEQA Handbook provides direction on how to evaluate potential air quality impacts, how to determine whether these impacts are significant, and how to mitigate these impacts. The SCAQMD

intends that by providing this guidance, the air quality impacts of plans and development proposals will be analyzed accurately and consistently throughout the Air Basin, and adverse impacts will be minimized.

The following lists the SCAQMD rules that are applicable but not limited to residential development projects in the Air Basin.

Rule 402 - Nuisance

Rule 402 prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. Compliance with Rule 402 will reduce local air quality and odor impacts to nearby sensitive receptors.

Rule 403- Fugitive Dust

Rule 403 governs emissions of fugitive dust during construction activities and requires that no person shall cause or allow the emissions of fugitive dust such that dust remains visible in the atmosphere beyond the property line or the dust emission exceeds 20 percent opacity, if the dust is from the operation of a motorized vehicle. Compliance with this rule is achieved through application of standard Best Available Control Measures, which include but are not limited to the measures below. Compliance with these rules would reduce local air quality impacts to nearby sensitive receptors.

- Utilize either a pad of washed gravel 50 feet long, 100 feet of paved surface, a wheel shaker, or a wheel washing device to remove material from vehicle tires and undercarriages before leaving project site.
- Do not allow any track out of material to extend more than 25 feet onto a public roadway and remove all track out at the end of each workday.
- Water all exposed areas on active sites at least three times per day and pre-water all areas prior to clearing and soil moving activities.
- Apply nontoxic chemical stabilizers according to manufacturer specifications to all construction areas that will remain inactive for 10 days or longer.
- Pre-water all material to be exported prior to loading, and either cover all loads or maintain at least 2 feet of freeboard in accordance with the requirements of California Vehicle Code Section 23114.
- Replant all disturbed area as soon as practical.
- Suspend all grading activities when wind speeds (including wind gusts) exceed 25 miles per hour.
- Restrict traffic speeds on all unpaved roads to 15 miles per hour or less.

Rule 445- Fireplaces

Rule 445 governs emissions from fireplaces. This rule restricts the installation of wood-burning fireplaces into any new development and only allows the installation of dedicated gaseous-fueled fireplaces.

Rules 1108 and 1108.1 – Cutback and Emulsified Asphalt

Rules 1108 and 1108.1 govern the sale, use, and manufacturing of asphalt and limits the VOC content in asphalt. This rule regulates the VOC contents of asphalt used during construction as well as any on-going maintenance during operations. Therefore, all asphalt used during construction and operation of the proposed project must comply with SCAQMD Rules 1108 and 1108.1.

Rule 1113 – Architectural Coatings

Rule 1113 governs the sale, use, and manufacturing of architectural coatings and limits the VOC content in sealers, coatings, paints and solvents. This rule regulates the VOC contents of paints available during construction. Therefore, all paints and solvents used during construction and operation of the proposed project must comply with SCAQMD Rule 1113.

Rule 1143 – Paint Thinners

Rule 1143 governs the sale, use, and manufacturing of paint thinners and multi-purpose solvents that are used in thinning of coating materials, cleaning of coating application equipment, and other solvent cleaning operations. This rule regulates the VOC content of solvents used during construction. Solvents used during construction and operation of the proposed project must comply with SCAQMD Rule 1143.

Rule 1403 – Asbestos Removal

Rule 1403 governs asbestos emissions from demolition and renovation activities. The existing structures on the project site shall be surveyed for asbestos prior to demolition activities. If asbestos is found within the existing structures, the asbestos shall be removed through utilization of the removal procedures detailed in Rule 1403.

Southern California Association of Governments

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG is the federally designated Metropolitan Planning Organization (MPO) for the majority of the southern California region and is the largest MPO in the nation. With respect to air quality planning, SCAG has prepared the *2020-2045 Regional Transportation Plan/Sustainable Communities Strategy* (Connect SoCal), adopted September 3, 2020and the *2019 Federal Transportation Improvement* Program (2019 FTIP), adopted September 2018, which addresses regional development and growth forecasts. Although the Connect SoCal and 2019 FTIP are primarily planning documents for future transportation projects a key component of these plans are to integrate land use planning with transportation planning that promotes higher density infill development in close proximity to existing transit service. These plans form the basis for the land use and transportation components of the AQMP, which are utilized in the preparation of air quality forecasts and in the consistency analysis included in the AQMP. The Connect SoCal, 2019 FTIP, and AQMP are based on projections originating within the City and County General Plans.

4.4 Local – City of Eastvale

Local jurisdictions, such as the City of Eastvale, have the authority and responsibility to reduce air pollution through its police power and decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City is also responsible for the implementation of transportation control measures as outlined in the AQMPs.

Examples of such measures include bus turnouts, energy-efficient streetlights, and synchronized traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation.

In accordance with the CEQA requirements, the City does not, however, have the expertise to develop plans, programs, procedures, and methodologies to ensure that air quality within the County and region will meet federal and state standards. Instead, the City relies on the expertise of the SCAQMD and utilizes the SCAQMD CEQA Handbook as the guidance document for the environmental review of plans and development proposals within its jurisdiction.

The *City of Eastvale General Plan* (General Plan), adopted June 13, 2012, provides the following air quality-related goals and policies that are applicable to the proposed project.

Goal AQ-1: Air quality that meets or exceeds all state and federal standards.

Policies

AQ-5: Sensitive receptors should be separated and protected from polluting point sources to the greatest extent possible.

AQ-6: Require site plan designs to protect people and land uses sensitive to air pollution.

AQ-7: The City encourages the use of pollution control measures such as landscaping, vegetation, and other materials, which trap particulate matter or control pollution.

AQ-8: The City encourages the planting of urban trees to remove pollutants from the air, provide shade, and decrease the negative impacts of heat on the air.

AQ-13: The City encourages the use of building materials and methods which reduce emissions and energy use.

AQ-14: The City encourages the use of energy-efficient heating equipment and other appliances, such as water heaters, swimming pool heaters, cooking equipment, refrigerators, furnaces, and boiler units.

AQ-17: To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, the Environmental Protection Agency, and the California Air Resources Board.

5.0 ENERGY CONSERVATION MANAGEMENT

The regulatory setting related to energy conservation is primarily addressed through State and City regulations, which are discussed below.

5.1 State

Energy conservation management in the State was initiated by the 1974 Warren-Alquist State Energy Resources Conservation and Development Act that created the California Energy Resource Conservation and Development Commission (currently named California Energy Commission [CEC]), which was originally tasked with certifying new electric generating plants based on the need for the plant and the suitability of the site of the plant. In 1976 the Warren-Alquist Act was expanded to include new restrictions on nuclear generating plants, that effectively resulted in a moratorium of any new nuclear generating plants in the State. The following details specific regulations adopted by the State in order to reduce the consumption of energy.

California Code of Regulations (CCR) Title 20

On November 3, 1976 the CEC adopted the *Regulations for Appliance Efficiency Standards Relating to Refrigerators, Refrigerator-Freezers and Freezers and Air Conditioners,* which were the first energy-efficiency standards for appliances. The appliance efficiency regulations have been updated several times by the Commission and the most current version is the *2016 Appliance Efficiency Regulations*, adopted January 2017 and now includes almost all types of appliances and lamps that use electricity, natural gas as well as plumbing fixtures. The authority for the CEC to control the energy-efficiency of appliances is detailed in California Code of Regulations (CCR), Title 20, Division 2, Chapter 4, Article 4, Sections 1601-1609.

California Code of Regulations (CCR) Title 24, Part 6

The CEC is also responsible for implementing the CCR Title 24, Part 6: *California's Energy Efficiency Standards for Residential and Nonresidential Buildings* (Title 24 Part 6) that were first established in 1978 in response to a legislative mandate to reduce California's energy consumption. In 2008 the State set an energy-use reduction goal of zero-net-energy use of all new homes by 2020 and the CEC was mandated to meet this goal through revisions to the Title 24, Part 6 regulations.

The Title 24 standards are updated on a three-year schedule and since 2008 the standards have been incrementally moving to the 2020 goal of the zero-net-energy use. Currently the 2019 Title 24 standards are in effect and have been designed so that the average new home built in California will now use zero-net-energy. The 2019 standards require that all single-family homes to have rooftop solar photovoltaic systems and when the solar systems are factored in, homes built under the 2019 standards will use about 53 percent less energy than homes built under the prior 2016 standards. In addition to requiring rooftop solar systems, the 2019 standards also encourage the use of battery storage and heat pump water heaters, require the more widespread use of LED lighting, as well as improve the building's thermal envelope through high performance attics, walls and windows. The 2019 standards also require improvements to ventilation systems by requiring highly efficient air filters to trap hazardous air particulates as well as improvements to kitchen ventilation systems.

California Code of Regulations (CCR) Title 24, Part 11

CCR Title 24, Part 11: *California Green Building Standards* (CalGreen) was developed in response to continued efforts to reduce GHG emissions associated with energy consumption. The CalGreen Building Standards are also updated every three years and the current version is the 2019 California Green Building Standard Code that become effective on January 1, 2020.

The CALGreen Code contains requirements for construction site selection; storm water control during construction; construction waste reduction; indoor water use reduction; material selection; natural resource conservation; site irrigation conservation; and more. The code provides for design options allowing the designer to determine how best to achieve compliance for a given site or building condition. The code also requires building commissioning, which is a process for verifying that all building systems (e.g., heating and cooling equipment and lighting systems) are functioning at their maximum efficiency.

The CALGreen Code provides standards for bicycle parking, carpool/vanpool/electric vehicle spaces, light and glare reduction, grading and paving, energy efficient appliances, renewable energy, graywater systems, water efficient plumbing fixtures, recycling and recycled materials, pollutant controls (including moisture control and indoor air quality), acoustical controls, storm water management, building design, insulation, flooring, and framing, among others. Implementation of the CALGreen Code measures reduces energy consumption and vehicle trips and encourages the use of alternative-fuel vehicles, which reduces pollutant emissions.

Some of the notable changes in the 2019 CALGreen Code over the prior 2016 CALGreen Code include: an alignment of building code engineering requirements with the national standards that include anchorage requirements for solar panels, provides design requirements for buildings in tsunami zones, increases Minimum Efficiency Reporting Value (MERV) for air filters from 8 to 13, increased electric vehicle charging requirements in parking areas, and sets minimum requirements for use of shade trees.

Executive Order N-79-20

The California Governor issued Executive Order N-79-20 on September 23, 2020 that requires all new passenger cars and trucks and commercial drayage trucks sold in California to be zero-emissions by the year 2035 and all medium- heavy-duty vehicles (commercial trucks) sold in the state to be zero-emission by 2045 for all operations where feasible. Executive Order N-79-20 also requires all off-road vehicles and equipment to transition to 100 percent zero-emission equipment, where feasible by 2035.

Senate Bill 100

Senate Bill 100 (SB 100) was adopted September 2018 and requires that by December 1, 2045 that 100 percent of retail sales of electricity to be generated from renewable or zero-carbon emission sources of electricity. SB 100 supersedes the renewable energy requirements set by SB 350, SB 1078, SB 107, and SB X1-2. SB 100 codified the interim renewable energy thresholds from the prior Bills of: 33 percent by 2020, 40 percent by December 31, 2024, 45 percent by December 31, 2027, and 50 percent by December 31, 2030.

Executive Order B-48-18 and Assembly Bill 2127

The California Governor issued Executive Order B-48-18 on January 26, 2018 that orders all state entities to work with the private sector to put at least five million zero-emission vehicles on California roads by 2030 and to install 200 hydrogen fueling stations and 250,000 electric vehicle chargers by 2025. Currently there are approximately 350,000 electric vehicles operating in California, which represents approximately

1.5 percent of the 24 million vehicles total currently operating in California. Implementation of Executive Order B-48-18 would result in approximately 20 percent of all vehicles in California to be zero emission electric vehicles. Assembly Bill 2127 (AB 2127) was codified into statute on September 13, 2018 and requires that the CEC working with CARB prepare biannual assessments of the statewide electric vehicle charging infrastructure needed to support the levels of zero emission vehicle adoption required for the State to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030.

Assembly Bill 1109

California Assembly Bill 1109 (AB 1109) was adopted October 2007, also known as the Lighting Efficiency and Toxics Reduction Act, prohibits the manufacturing of lights after January 1, 2010 that contain levels of hazardous substances prohibited by the European Union pursuant to the RoHS Directive. AB 1109 also requires reductions in energy usage for lighting and is structured to reduce lighting electrical consumption by: (1) At least 50 percent reduction from 2007 levels for indoor residential lighting; and (2) At least 25 percent reduction from 2007 levels for indoor commercial and all outdoor lighting by 2018. AB 1109 would reduce GHG emissions through reducing the amount of electricity required to be generated by fossil fuels in California.

Assembly Bill 1493

California Assembly Bill 1493 (also known as the Pavley Bill, in reference to its author Fran Pavley) was enacted on July 22, 2002 and required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. In 2004, CARB approved the "Pavley I" regulations limiting the amount of GHGs that may be released from new passenger automobiles that are being phased in between model years 2009 through 2016. These regulations will reduce GHG emissions by 30 percent from 2002 levels by 2016. In June 2009, the EPA granted California the authority to implement GHG emission reduction standards for light duty vehicles, in September 2009, amendments to the Pavley I regulations were adopted by CARB and implementation of the "Pavley I" regulations started in 2009.

The second set of regulations "Pavley II" was developed in 2010, and is being phased in between model years 2017 through 2025 with the goal of reducing GHG emissions by 45 percent by the year 2020 as compared to the 2002 fleet. The Pavley II standards were developed by linking the GHG emissions and formerly separate toxic tailpipe emissions standards previously known as the "LEV III" (third stage of the Low Emission Vehicle standards) into a single regulatory framework. The new rules reduce emissions from gasoline-powered cars as well as promote zero-emissions auto technologies such as electricity and hydrogen, and through increasing the infrastructure for fueling hydrogen vehicles. In 2009, the U.S. EPA granted California the authority to implement the GHG standards for passenger cars, pickup trucks and sport utility vehicles and these GHG emissions standards are currently being implemented nationwide.

The EPA has performed a midterm evaluation of the longer-term standards for model years 2022-2025, and based on the findings of this midterm evaluation, the EPA proposed The Safer Affordable Fuel Efficient (SAFE) Vehicles Proposed Rule for Model Years 2021-2026 that amends the corporate average fuel economy (CAFE) and GHG emissions standards for light vehicles for model years 2021 through 2026. The SAFE Vehicles Rule was published on April 30, 2020 and made effective on June 29, 2020.

5.2 Local – City of Eastvale

The applicable energy plan for the proposed project is the General Plan. The energy-related goals and policies in the General Plan that are applicable for the proposed project are shown below.

Goal AQ-4: Safe and reliable energy including energy from renewable sources to meet Eastvale's needs and enable continued economic growth.

Policies

AQ-26: Permit and encourage the use of passive solar devices and other state-of-the-art energy conservation measures.

AQ-27: Support and encourage voluntary efforts to provide active and passive solar access opportunities in new development.

AQ-28: The City encourages energy-efficient materials and systems, including shade design technologies, for buildings.

AQ-31: The City encourages urban design measures that support alternatives to private automobile use.

AQ-32: Utilize source reduction, recycling, and other appropriate measures to reduce the amount of solid waste disposed of in landfills.

AQ-33: The City encourages the incorporation of energy-efficient design elements beyond code requirements, including appropriate site orientation and the use of shade and windbreak trees to reduce fuel consumption for heating and cooling.

AQ-34: The City shall review all development proposals to ensure that all services and utilities can be provided in an energy-efficient and effective manner.

AQ-36: The City shall support the inclusion of energy-efficient design and renewable energy technologies in public and private projects.

6.0 GLOBAL CLIMATE CHANGE MANAGEMENT

The regulatory setting related to global climate change is addressed through the efforts of various international, federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to reduce GHG emissions through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for global climate change regulations are discussed below.

6.1 International

In 1988, the United Nations established the IPCC to evaluate the impacts of global climate change and to develop strategies that nations could implement to curtail global climate change. In 1992, the United States joined other countries around the world in signing the United Nations' Framework Convention on Climate Change (UNFCCC) agreement with the goal of controlling GHG emissions. The parties of the UNFCCC adopted the Kyoto Protocol, which set binding GHG reduction targets for 37 industrialized countries, the objective of reducing their collective GHG emissions by five percent below 1990 levels by 2012. The Kyoto Protocol has been ratified by 182 countries, but has not been ratified by the United States. It should be noted that Japan and Canada opted out of the Kyoto Protocol and the remaining developed countries that ratified the Kyoto Protocol have not met their Kyoto targets. The Kyoto Protocol expired in 2012 and the amendment for the second commitment period from 2013 to 2020 has not yet entered into legal force. The Parties to the Kyoto Protocol negotiated the Paris Agreement in December 2015, agreeing to set a goal of limiting global warming to less than 2 degrees Celsius compared with pre-industrial levels. The Paris Agreement has been adopted by 195 nations with 147 ratifying it, including the United States by President Obama, who ratified it by Executive Order on September 3, 2016. On June 1, 2017, President Trump announced that the United States is withdrawing from the Paris Agreement and on January 21, 2021 President Biden signed an executive order rejoining the Paris Agreement.

Additionally, the Montreal Protocol was originally signed in 1987 and substantially amended in 1990 and 1992. The Montreal Protocol stipulates that the production and consumption of compounds that deplete ozone in the stratosphere—CFCs, halons, carbon tetrachloride, and methyl chloroform—were to be phased out, with the first three by the year 2000 and methyl chloroform by 2005.

6.2 Federal – United States Environmental Protection Agency

The United States Environmental Protection Agency (EPA) is responsible for implementing federal policy to address global climate change. The Federal government administers a wide array of public-private partnerships to reduce U.S. GHG intensity. These programs focus on energy efficiency, renewable energy, methane, and other non-CO_2 gases, agricultural practices and implementation of technologies to achieve GHG reductions. EPA implements several voluntary programs that substantially contribute to the reduction of GHG emissions.

In Massachusetts v. Environmental Protection Agency (Docket No. 05–1120), argued November 29, 2006 and decided April 2, 2007, the U.S. Supreme Court held that not only did the EPA have authority to regulate greenhouse gases, but the EPA's reasons for not regulating this area did not fit the statutory requirements. As such, the U.S. Supreme Court ruled that the EPA should be required to regulate CO2 and other greenhouse gases as pollutants under the federal Clean Air Act (CAA).

In response to the FY2008 Consolidations Appropriations Act (H.R. 2764; Public Law 110-161), EPA proposed a rule on March 10, 2009 that requires mandatory reporting of GHG emissions from large sources in the United States. On September 22, 2009, the Final Mandatory Reporting of GHG Rule was signed and published in the Federal Register on October 30, 2009. The rule became effective on December 29, 2009. This rule requires suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to EPA.

On December 7, 2009, the EPA Administrator signed two distinct findings under section 202(a) of the Clean Air Act. One is an endangerment finding that finds concentrations of the six GHGs in the atmosphere threaten the public health and welfare of current and future generations. The other is a cause or contribute finding, that finds emissions from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare. These actions did not impose any requirements on industry or other entities, however, since 2009 the EPA has been providing GHG emission standards for vehicles and other stationary sources of GHG emissions that are regulated by the EPA. On September 13, 2013 the EPA Administrator signed 40 CFR Part 60, that limits emissions from new sources to 1,100 pounds of CO_2 per mega-watt hour (MWh) for fossil fuel-fired utility boilers and 1,000 pounds of CO_2 per MWh for large natural gas-fired combustion units.

On August 3, 2015, the EPA announced the Clean Power Plan, emissions guidelines for U.S. states to follow in developing plans to reduce GHG emissions from existing fossil fuel-fired power plants (Federal Register Vol. 80, No. 205, October 23 2015). On October 11, 2017, the EPA issued a formal proposal to repeal the Clean Power Plan and on June 19, 2019 the EPA replaced the Clean Power Plan with the Affordable Clean Energy rule that is anticipated to lower power sector GHG emissions by 11 million tons by the year 2030.

On April 30, 2020, the EPA and the National Highway Safety Administration published the Final Rule for the *Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks* (SAFE Vehicles Rule). Part One of the Rule revokes California's authority to set its own GHG emissions standards and zero-emission vehicle mandates in California, which results in one emission standard to be used nationally for all passenger cars and light trucks that is set by the EPA.

6.3 State

The CARB has the primary responsible for implementing state policy to address global climate change, however there are State regulations related to global climate change that affect a variety of State agencies. CARB, which is a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both the federal and state air pollution control programs within California. In this capacity, the CARB conducts research, sets California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the SIP. In addition, the CARB establishes emission standards for motor vehicles sold in California, consumer products (e.g. hairspray, aerosol paints, and barbeque lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

In 2008, CARB approved a Climate Change Scoping Plan that proposes a "comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve our environment, reduce our dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health" (CARB 2008). The Climate Change Scoping Plan has a range of GHG reduction actions which include direct

regulations; alternative compliance mechanisms; monetary and non-monetary incentives; voluntary actions; market-based mechanisms such as a cap-and-trade system. In 2014, CARB approved the First Update to the Climate Change Scoping Plan (CARB, 2014) that identifies additional strategies moving beyond the 2020 targets to the year 2050. On December 14, 2017 CARB adopted the California's 2017 Climate Change Scoping Plan, November 2017 (CARB, 2017) that provides specific statewide policies and measures to achieve the 2030 GHG reduction target of 40 percent below 1990 levels by 2030 and the aspirational 2050 GHG reduction target of 80 percent below 1990 levels by 2050. In addition, the State has passed the following laws directing CARB to develop actions to reduce GHG emissions, which are listed below in chronological order, with the most current first.

Executive Order N-79-20

EO N-79-20 establish targets for when all new vehicles and equipment are zero-emission and is described in more detail above in Section 5.1 under Energy Conservation Management.

California Code of Regulations (CCR) Title 24, Part 6

The Title 24 Part 6 standards have been developed by the CEC primarily for energy conservation and is described in more detail above in Section 5.1 under Energy Conservation Management. It should be noted that implementation of the Title 24 Part 6 building standards would also reduce GHG emissions, since as detailed above in Section 3.3 Greenhouse Gas Emissions Inventory, energy use for residential and commercial buildings creates 9.7 percent of the GHG emissions in the State.

California Code of Regulations (CCR) Title 24, Part 11

The CalGreen Building standards have been developed by the CEC primarily for energy conservation and is described in more detail above in Section 5.1 under Energy Conservation Management. It should be noted that implementation of the CalGreen Building standards would also reduce GHG emissions, since as detailed above under Title 24, Part 6, energy usage from buildings creates 9.7 percent of GHG emissions in the State.

Senate Bill 100

SB 100 requires that by December 1, 2045 that 100 percent of retail sales of electricity to be generated from renewable or zero-carbon emission sources of electricity and is described in more detail above in Section 5.1 under Energy Conservation Management.

Executive Order B-48-18 and Assembly Bill 2127

Executive Order B-48-18 and AB 2127 provides measures to put at least five million zero-emission vehicles on California roads by 2030 and to install 200 hydrogen fueling stations and 250,000 electric vehicle chargers by 2025 and is described in more detail above in Section 5.1 under Energy Conservation Management.

Executive Order B-30-15, Senate Bill 32 and Assembly Bill 197

The California Governor issued Executive Order B-30-15 on April 29, 2015 that aims to reduce California's GHG emissions 40 percent below 1990 levels by 2030. This executive order aligns California's GHG reduction targets with those of other international governments, such as the European Union that set the same target for 2030 in October, 2014. This target will make it possible to reach the ultimate goal of reducing GHG emissions 80 percent under 1990 levels by 2050 that is based on scientifically established levels needed in the U.S.A to limit global warming below 2 degrees Celsius – the warming threshold at

which scientists say there will likely be major climate disruptions such as super droughts and rising sea levels. Assembly Bill 197 (AB 197) (September 8, 2016) and Senate Bill 32 (SB 32) (September 8, 2016) codified into statute the GHG emissions reduction targets of at least 40 percent below 1990 levels by 2030 as detailed in Executive Order B-30-15. AB 197 also requires additional GHG emissions reporting that is broken down to sub-county levels and requires CARB to consider the social costs of emissions impacting disadvantaged communities.

Executive Order B-29-15

The California Governor issued Executive Order B-29-15 on April 1, 2015 and directed the State Water Resources Control Board to impose restrictions to achieve a statewide 25% reduction in urban water usage and directed the Department of Water Resources to replace 50 million square feet of lawn with drought tolerant landscaping through an update to the State's Model Water Efficient Landscape Ordinance. The Ordinance also requires installation of more efficient irrigation systems, promotion of greywater usage and onsite stormwater capture, and limits the turf planted in new residential landscapes to 25 percent of the total area and restricts turf from being planted in median strips or in parkways unless the parkway is next to a parking strip and a flat surface is required to enter and exit vehicles. Executive Order B-29-15 would reduce GHG emissions associated with the energy used to transport and filter water.

Assembly Bill 341 and Senate Bills 939 and 1374

Senate Bill 939 (SB 939) requires that each jurisdiction in California to divert at least 50 percent of its waste away from landfills, whether through waste reduction, recycling or other means. Senate Bill 1374 (SB 1374) requires the California Integrated Waste Management Board to adopt a model ordinance by March 1, 2004 suitable for adoption by any local agency to require 50 to 75 percent diversion of construction and demolition of waste materials from landfills. Assembly Bill 341 (AB 341) was adopted in 2011 and builds upon the waste reduction measures of SB 939 and 1374, and set a new target of a 75 percent reduction in solid waste generated by the year 2020.

Senate Bill 375

Senate Bill 375 (SB 375) was adopted September 2008 in order to support the State's climate action goals to reduce GHG emissions from transportation sources through coordinated regional transportation planning efforts, regional GHG emission reduction targets, and land use and housing allocation. SB 375 requires CARB to set regional targets for GHG emissions reductions from passenger vehicle use. In 2010, CARB established targets for 2020 and 2035 for each Metropolitan Planning Organizations (MPO) within the State. It was up to each MPO to adopt a sustainable communities strategy (SCS) that will prescribe land use allocation in that MPOs Regional Transportation Plan (RTP) to meet CARB's 2020 and 2035 GHG emission reduction targets. These reduction targets are required to be updated every eight years and the most current targets are detailed at: https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets, which provides GHG emissions reduction targets for SCAG of 8 percent by 2020 and 19 percent by 2035.

The Connect SoCal (SCAG, 2020) provides a 2035 GHG emission reduction target of 19 percent reduction over the 2005 per capita emissions levels. The Connect SoCal include new initiatives of land use, transportation and technology to meet the 19 percent GHG emission reduction target for 2035. CARB is also charged with reviewing SCAG's RTP/SCS for consistency with its assigned targets.

City and County land use policies, including General Plans, are not required to be consistent with the RTP and associated SCS. However, new provisions of CEQA incentivize, through streamlining and other

provisions, qualified projects that are consistent with an approved SCS and categorized as "transit priority projects."

Assembly Bill 1109

AB 1109 requires reductions in energy usage for lighting and is described in more detail above in Section 5.1 under Energy Conservation Management.

Executive Order S-1-07

Executive Order S-1-07 was issued in 2007 and proclaims that the transportation sector is the main source of GHG emissions in the State, since it generates more than 40 percent of the State's GHG emissions. It establishes a goal to reduce the carbon intensity of transportation fuels sold in the State by at least ten percent by 2020. This Executive Order also directs CARB to determine whether this Low Carbon Fuel Standard (LCFS) could be adopted as a discrete early-action measure as part of the effort to meet the mandates in AB 32.

In 2009 CARB approved the proposed regulation to implement the LCFS. The standard was challenged in the courts, but has been in effect since 2011 and was re-approved by the CARB in 2015. The LCFS is anticipated to reduce GHG emissions by about 16 MMT per year by 2020. The LCFS is designed to provide a framework that uses market mechanisms to spur the steady introduction of lower carbon fuels. The framework establishes performance standards that fuel producers and importers must meet annually. Reformulated gasoline mixed with corn-derived ethanol and low-sulfur diesel fuel represent the baseline fuels. Lower carbon fuels may be ethanol, biodiesel, renewable diesel, or blends of these fuels with gasoline or diesel. Compressed natural gas and liquefied natural gas also may be low-carbon fuels. Hydrogen and electricity, when used in fuel cells or electric vehicles, are also considered as low-carbon fuels.

Senate Bill 97

Senate Bill 97 (SB 97) was adopted August 2007 and acknowledges that climate change is a prominent environmental issue that requires analysis under CEQA. SB 97 directed the Governor's Office of Planning and Research (OPR), which is part of the State Natural Resources Agency, to prepare, develop, and transmit to CARB guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, by July 1, 2009. The Natural Resources Agency was required to certify and adopt those guidelines by January 1, 2010.

Pursuant to the requirements of SB 97 as stated above, on December 30, 2009 the Natural Resources Agency adopted amendments to the State CEQA guidelines that addresses GHG emissions. The CEQA Guidelines Amendments changed 14 sections of the CEQA Guidelines and incorporated GHG language throughout the Guidelines. However, no GHG emissions thresholds of significance were provided and no specific mitigation measures were identified. The GHG emission reduction amendments went into effect on March 18, 2010 and are summarized below:

- Climate Action Plans and other greenhouse gas reduction plans can be used to determine whether a project has significant impacts, based upon its compliance with the plan.
- Local governments are encouraged to quantify the GHG emissions of proposed projects, noting that they have the freedom to select the models and methodologies that best meet their needs and circumstances. The section also recommends consideration of several qualitative factors that may be used in the determination of significance, such as the extent to which the given project

complies with state, regional, or local GHG reduction plans and policies. OPR does not set or dictate specific thresholds of significance. Consistent with existing CEQA Guidelines, OPR encourages local governments to develop and publish their own thresholds of significance for GHG impacts assessment.

- When creating their own thresholds of significance, local governments may consider the thresholds of significance adopted or recommended by other public agencies, or recommended by experts.
- New amendments include guidelines for determining methods to mitigate the effects of GHG emissions in Appendix F of the CEQA Guidelines.
- OPR is clear to state that "to qualify as mitigation, specific measures from an existing plan must be identified and incorporated into the project; general compliance with a plan, by itself, is not mitigation."
- OPR's emphasizes the advantages of analyzing GHG impacts on an institutional, programmatic level. OPR therefore approves tiering of environmental analyses and highlights some benefits of such an approach.
- Environmental impact reports must specifically consider a project's energy use and energy efficiency potential.

Assembly Bill 32

In 2006, the California State Legislature adopted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires CARB, to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020 through an enforceable statewide emission cap which will be phased in starting in 2012. Emission reductions shall include carbon sequestration projects that would remove carbon from the atmosphere and utilize best management practices that are technologically feasible and cost effective.

In 2007 CARB released the calculated Year 1990 GHG emissions of 431 $MMTCO_2e$. The 2020 target of 431 $MMTCO_2e$ requires the reduction of 78 $MMTCO_2e$, or approximately 16 percent from the State's projected 2020 business as usual emissions of 509 $MMTCO_2e$ (CARB, 2014). Under AB 32, CARB was required to adopt regulations by January 1, 2011 to achieve reductions in GHGs to meet the 1990 cap by 2020. Early measures CARB took to lower GHG emissions included requiring operators of the largest industrial facilities that emit 25,000 metric tons of CO_2 in a calendar year to submit verification of GHG emissions by December 1, 2010. The CARB Board also approved nine discrete early action measures that include regulations affecting landfills, motor vehicle fuels, refrigerants in cars, port operations and other sources, all of which became enforceable on or before January 1, 2010.

CARB's Scoping Plan that was adopted in 2009, proposes a variety of measures including: strengthening energy efficiency and building standards; targeted fees on water and energy use; a market-based cap-and-trade system; achieving a 33 percent renewable energy mix; and a fee regulation to fund the program. The 2014 update to the Scoping Plan identifies strategies moving beyond the 2020 targets to the year 2050.

The Cap-and-Trade Program established under the Scoping Plan sets a statewide limit on sources responsible for 85 percent of California's GHG emissions, and has established a market for long-term investment in energy efficiency and cleaner fuels since 2012.

Executive Order S-3-05

In 2005 the California Governor issued Executive Order S 3-05, GHG Emission, which established the following reduction targets:

- 2010: Reduce greenhouse gas emissions to 2000 levels;
- 2020: Reduce greenhouse gas emissions to 1990 levels;
- 2050: Reduce greenhouse gas emissions to 80 percent below 1990 levels.

The Executive Order directed the secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce GHG emissions to the target levels. To comply with the Executive Order, the secretary of CalEPA created the California Climate Action Team (CAT), made up of members from various state agencies and commissions. The team released its first report in March 2006. The report proposed to achieve the targets by building on the voluntary actions of businesses, local governments, and communities and through State incentive and regulatory programs. The State achieved its first goal of reducing GHG emissions to 2000 levels by 2010.

Assembly Bill 1493

AB 1493 or the Pavley Bill sets tailpipe GHG emissions limits for passenger vehicles in California as well as fuel economy standards and is described in more detail above in Section 5.1 under Energy Conservation Management.

6.4 Regional – Southern California

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the Air Basin. To that end, as a regional agency, the SCAQMD works directly with SCAG, county transportation commissions, and local governments and cooperates actively with all federal and state agencies.

South Coast Air Quality Management District

SCAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emission sources, and enforces such measures through educational programs or fines, when necessary. SCAQMD is directly responsible for reducing emissions from stationary, mobile, and indirect sources. The SCAQMD is also responsible for GHG emissions for projects where it is the lead agency. However, for other projects in the Air Basin where it is not the lead agency, it is limited to providing resources to other lead agencies in order to assist them in determining GHG emission thresholds and GHG reduction measures. In order to assist local agencies with direction on GHG emissions, the SCAQMD organized a Working Group, which is described below.

<u>SCAQMD Working Group</u>

Since neither CARB nor the OPR has developed GHG emissions threshold, the SCAQMD formed a Working Group to develop significance thresholds related to GHG emissions. At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that either provides a quantitative annual thresholds of 3,500 $MTCO_2e$ for residential uses, 1,400 $MTCO_2e$ for commercial uses, 3,000 $MTCO_2e$ for mixed uses, and 10,000 $MTCO_2e$ for industrial uses.

Southern California Association of Governments

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG is the federally designated Metropolitan Planning Organization (MPO) for the majority of the southern California region and is the largest MPO in the nation. With respect to air quality planning, SCAG has prepared the Connect SoCal and 2019 FTIP addresses regional development and growth forecasts. Although the Connect SoCal and 2019 FTIP are primarily planning documents for future transportation projects a key component of these plans are to integrate land use planning with transportation planning that promotes higher density infill development in close proximity to existing transit service. These plans form the basis for the land use and transportation components of the AQMP, which are utilized in the preparation of air quality forecasts and in the consistency analysis included in the AQMP. The Connect SoCal, 2019 FTIP, and AQMP are based on projections originating within the City and County General Plans.

6.5 Local – City of Eastvale

Local jurisdictions, such as the City of Eastvale, have the authority and responsibility to reduce GHG emissions through their police power and decision-making authority. Specifically, the City is responsible for the assessment and mitigation of GHG emissions resulting from its land use decisions. In accordance with CEQA requirements and the CEQA review process, the City assesses the global climate change potential of new development projects, requires mitigation of potentially significant global climate change impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation.

The General Plan provides the following GHG-related goals and policies that are applicable to the proposed project.

Goal AQ-2: Meet or exceed all current and future state-mandated targets for reducing emissions of greenhouse gases.

Policies

AQ-18: Support local, regional, and statewide efforts to reduce emissions of greenhouse gases linked to climate change.

AQ-19: Analyze and mitigate, to the extent feasible, potentially significant increases in greenhouse gas emissions during project review, pursuant to the California Environmental Quality Act.

AQ-20: Continue to support the planting and maintenance of trees in the community to increase carbon sequestration.

7.0 ATMOSPHERIC SETTING

7.1 South Coast Air Basin

The project site is located in the northwestern corner of Riverside County, which is part of the South Coast Air Basin (Air Basin) that includes the non-desert portions of Riverside, San Bernardino, and Los Angeles Counties and all of Orange County. The Air Basin is located on a coastal plain with connecting broad valleys and low hills to the east. Regionally, the Air Basin is bounded by the Pacific Ocean to the southwest and high mountains to the east forming the inland perimeter.

7.2 Local Climate

The climate of western Riverside County, technically called an interior valley subclimate of the Southern California's Mediterranean-type climate, is characterized by hot dry summers, mild moist winters with infrequent rainfall, moderate afternoon breezes, and generally fair weather. Occasional periods of strong Santa Ana winds and winter storms interrupt the otherwise mild weather pattern. The clouds and fog that form along the area's coastline rarely extend as far inland as western Riverside County. When morning clouds and fog form, they typically burn off quickly after sunrise. The most important weather pattern from an air quality perspective is associated with the warm season airflow across the densely populated areas located west of the project site. This airflow brings polluted air into western Riverside County late in the afternoon. This transport pattern creates unhealthful air quality that may extend to the project site particularly during the summer months.

Winds are an important parameter in characterizing the air quality environment of a project site because they both determine the regional pattern of air pollution transport and control the rate of dispersion near a source. Daytime winds in western Riverside County are usually light breezes from off the coast as air moves regionally onshore from the cool Pacific Ocean to the warm Mojave Desert interior of Southern California. These winds allow for good local mixing, but as discussed above, these coastal winds carry significant amounts of industrial and automobile air pollutants from the densely urbanized western portion of the Air Basin into the interior valleys which become trapped by the mountains that border the eastern and northern edges of the Air Basin.

In the summer, strong temperature inversions may occur that limit the vertical depth through which air pollution can be dispersed. Air pollutants concentrate because they cannot rise through the inversion layer and disperse. These inversions are more common and persistent during the summer months. Over time, sunlight produces photochemical reactions within this inversion layer that creates ozone, a particularly harmful air pollutant. Occasionally, strong thermal convections occur which allows the air pollutants to rise high enough to pass over the mountains and ultimately dilute the smog cloud.

In the winter, light nocturnal winds result mainly from the drainage of cool air off of the mountains toward the valley floor while the air aloft over the valley remains warm. This forms a type of inversion known as a radiation inversion. Such winds are characterized by stagnation and poor local mixing and trap pollutants such as automobile exhaust near their source. While these inversions may lead to air pollution "hot spots" in heavily developed coastal areas of the Air Basin, there is not enough traffic in inland valleys to cause any winter air pollution problems. Despite light wind conditions, especially at night and in the early morning, winter is generally a period of good air quality in the project vicinity.

The temperature and precipitation levels for the Corona COOP Monitoring Station, which is the nearest weather station to the project site with historical data are shown below in Table E. Table E shows that July is typically the warmest month and January is typically the coolest month. Rainfall in the project area varies considerably in both time and space. Almost all the annual rainfall comes from the fringes of mid-latitude storms from late November to early April, with summers being almost completely dry.

Table E – Monthly Climate Data

Month	Average Maximum Temperature (°F)	Average Minimum Temperature (°F)	Average Total Precipitation (inches)
January	65.3	39.7	2.61
February	67.7	41.2	2.62
March	70.5	42.8	2.00
April	74.9	45.7	0.98
May	79.3	49.9	0.26
June	85.5	53.7	0.04
July	92.3	57.7	0.02
August	92.2	58.3	0.09
September	89.1	55.6	0.25
October	81.6	50.2	0.55
November	73.5	44.3	1.14
December	66.8	40.4	2.15
Annual	**78.2**	**48.3**	**12.71**

7.3 Monitored Local Air Quality

The air quality at any site is dependent on the regional air quality and local pollutant sources. Regional air quality is determined by the release of pollutants throughout the Air Basin. Estimates of the existing emissions in the Air Basin provided in the 2012 AQMP, indicate that collectively, mobile sources account for 59 percent of the VOC, 88 percent of the NOx emissions and 40 percent of directly emitted PM2.5, with another 10 percent of PM2.5 from road dust. The 2016 AQMP found that since 2012 AQMP projections were made stationary source VOC emissions have decreased by approximately 12 percent, but mobile VOC emissions have increased by 5 percent. The percentage of NOx emissions remain unchanged between the 2012 and 2016 projections.

SCAQMD has divided the Air Basin into 38 air-monitoring areas. The project site is located in Air Monitoring Area 22, which is located in the northwestern portion of Riverside County and covers the Norco and Corona areas to the San Bernardino County and Orange County Lines. The nearest air monitoring station to the project site is the Mira Loma Van Buren Monitoring Station (Mira Loma Station), which is located approximately five miles northeast of the project site at 5130 Poinsettia Place, Jurupa Valley. However, it should be noted that due to the air monitoring station's distance from the project site, recorded air pollution levels at the Rubidoux Station reflect with varying degrees of accuracy, local air quality conditions at the project site. Table F shows that ozone and particulate matter (PM10 and PM2.5) are the air pollutants of primary concern in the project area, which are detailed below:

Table F – Local Area Air Quality Monitoring Summary

Pollutant (Standard)	Year[1] 2018	2019	2020
Ozone[1]:			
Maximum 1-Hour Concentration (ppm)	0.129	0.131	0.140
Days > CAAQS (0.09 ppm)	**21**	**26**	**51**
Maximum 8-Hour Concentration (ppm)	0.107	0.099	0.117
Days > NAAQS (0.070 ppm)	**57**	**64**	**89**
Days > CAAQs (0.070 ppm)	**57**	**65**	**96**
Nitrogen Dioxide[2]:			
Maximum 1-Hour Concentration (ppb)	54.5	56.0	58.1
Days > NAAQS (100 ppb)	0	0	0
Days > CAAQS (180 ppb)	0	0	0
Inhalable Particulates (PM10) [1]:			
Maximum 24-Hour National Measurement (ug/m^3)	98.9	118.8	162.5
Days > NAAQS (150 ug/m^3)	0	0	**1**
Days > CAAQS (50 ug/m^3)	**22**	**14**	**16**
Annual Arithmetic Mean (AAM) (ug/m^3)	44.5	37.7	52.2
Annual > NAAQS (50 ug/m^3)	No	No	**Yes**
Annual > CAAQS (20 ug/m^3)	**Yes**	**Yes**	**Yes**
Ultra-Fine Particulates (PM2.5) [2]:			
Maximum 24-Hour National Measurement (ug/m^3)	86.0	54.7	60.9
Days > NAAQS (35 ug/m^3)	**6**	**10**	**12**
Annual Arithmetic Mean (AAM) (ug/m^3)	14.1	12.6	14.7
Annual > NAAQS and CAAQS (12 ug/m^3)	**Yes**	**Yes**	**Yes**

Notes: Exceedances are listed in **bold.** CAAQS = California Ambient Air Quality Standard; NAAQS = National Ambient Air Quality Standard; ppm = parts per million; ppb = parts per billion; ND = no data available.
[1] Data obtained from the Mira Loma Station.
Source: http://www.arb.ca.gov/adam/

Ozone

The State 1-hour concentration standard for ozone has been exceeded between 21 and 26 days each year over the past three years at the Mira Loma Station. The State 8-hour ozone standard has been exceeded between 57 and 96 days each year over the past three years at the Mira Loma Station. The Federal 8-hour ozone standard has been exceeded between 57 and 89 days each year over the past three years at the Mira Loma Station.

Ozone is a secondary pollutant as it is not directly emitted. Ozone is the result of chemical reactions between other pollutants, most importantly hydrocarbons and NO_2, which occur only in the presence of bright sunlight. Pollutants emitted from upwind cities react during transport downwind to produce the oxidant concentrations experienced in the area. Many areas of Southern California contribute to the

ozone levels experienced at this monitoring station, with the more significant areas being those directly upwind.

Nitrogen Dioxide

The Mira Loma Station did not record an exceedance of either the Federal or State 1-hour NO_2 standards for the last three years.

Particulate Matter

The State 24-hour concentration standard for PM10 has been exceeded between 14and 22 days each year over the past three years at the Mira Loma Station. Over the past three years the Federal 24-hour standard for PM10 has only been exceeded for one day in 2020 at the Mira Loma Station. The annual PM10 concentration at the Mira Loma Station has exceeded the State standard for the past three years and has exceeded the Federal standard for one of the past three years.

The Federal 24-hour concentration standard for PM2.5 has been exceeded between 6 and 12 days each year over the past three years at the Mira Loma Station. The annual PM2.5 concentration exceeded both the State and Federal standard for two of the past three years at the Loma Linda Station. Particulate levels in the area are due to natural sources, grading operations, and motor vehicles.

According to the EPA, some people are much more sensitive than others to breathing fine particles (PM10 and PM2.5). People with influenza, chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death due to breathing these fine particles. People with bronchitis can expect aggravated symptoms from breathing in fine particles. Children may experience decline in lung function due to breathing in PM10 and PM2.5. Other groups considered sensitive are smokers and people who cannot breathe well through their noses. Exercising athletes are also considered sensitive, because many breathe through their mouths during exercise.

7.4 Toxic Air Contaminant Levels in the Air Basin

In order to determine the Air Basin-wide risks associated with major airborne carcinogens, the SCAQMD conducted the Multiple Air Toxics Exposure Study (MATES) studies. According to the MATES V study (SCAQMD, 2021), the project site has an estimated cancer risk of 406 per million persons chance of cancer in the vicinity of the project site. In comparison, the average cancer risk for the Air Basin is 455 per million persons. The MATES V study that monitored air toxins between May 1, 2018 to April 30, 2019 found that cancer risk from air toxics has declined significantly in the Air Basin with a 40 percent decrease in cancer risk since the monitoring for the MATES IV study that occurred between July 1, 2012 and June 30, 2013 and an 84 percent decrease in cancer risk since the monitoring for the MATES II study that occurred between April 1, 1998 and March 31, 1999.

The MATES V study also analyzed impacts specific to the communities experiencing environmental injustices (EJ communities) that were evaluated using the Senate Bill 535 definition of disadvantaged communities, which found that between MATES IV and MATES V, the cancer risk from air toxics decreased by 57 percent in EJ communities overall, compared to a 53 percent reduction in non-EJ communities.

In order to provide a perspective of risk, it is often estimated that the incidence in cancer over a lifetime for the U.S. population ranges between 1 in 3 to 4 and 1 in 3, or a risk of about 300,000 per million persons. The MATES-III study referenced a Harvard Report on Cancer Prevention, which estimated that of cancers associated with known risk factors, about 30 percent were related to tobacco, about 30 percent were

related to diet and obesity, and about 2 percent were associated with environmental pollution related exposures that includes hazardous air pollutants.

8.0 MODELING PARAMETERS AND ASSUMPTIONS

8.1 CalEEMod Model Input Parameters

The criteria air pollution and year 2030 GHG emissions impacts created by the proposed project have been analyzed through use of CalEEMod Version 2020.4.0. CalEEMod is a computer model published by the SCAQMD for estimating air pollutant emissions. The CalEEMod program uses the EMFAC2017 computer program to calculate the emission rates specific for the South Coast Air Basin portion of Riverside County for employee, vendor and haul truck vehicle trips and the OFFROAD2011 computer program to calculate emission rates for heavy equipment operations. EMFAC2017 and OFFROAD2011 are computer programs generated by CARB that calculates composite emission rates for vehicles. Emission rates are reported by the program in grams per trip and grams per mile or grams per running hour.

The project characteristics in the CalEEMod model were set to a project location of the South Coast Air Basin portion of Riverside County, a Climate Zone of 10, utility company of Southern California Edison and a project opening year of 2024. In addition, the EMFAC off-model adjustment factors for gasoline light duty vehicles was selected.

Land Use Parameters

The proposed project would consist of a residential development that would include 41 detached single-family homes (136,598 square feet of building space). The proposed project would include approximately 22,000 square feet of common open space that will include pathways throughout the development and a detention basin. Development of the proposed project will also include paving of the onsite roadway system, as well as road improvements to the portion of Orange Street that is adjacent to the project site that were also analyzed in the CalEEMod model. The proposed project's land use parameters that were entered into the CalEEMod model are shown in Table G.

Table G – CalEEMod Land Use Parameters

Proposed Land Use	Land Use Subtype in CalEEMod	Land Use Size[1]	Lot Acreage[2]	Building/Paving[3] (square feet)
Single-Family Homes	Single-Family Housing	41 DU	6.27	136,598
Common Open Space	City Park	0.51 AC	0.51	22,216
Onsite Roads and Improvements to Orange Street Road	Other Asphalt Surfaces	2.11 AC	2.11	91,912
Schleisman Road Dedication Area	Other Non-Asphalt Surfaces	1.11 AC	1.11	48,352

Notes:
[1] DU = Dwelling Unit; AC = Acres.
[2] Lot acreage calculated based on the total project site of 10 gross acres.
[3] Building/Paving square feet represent area where architectural coatings will be applied. Paved area based on CalEEMod default values.

Construction Parameters

Construction of the proposed project is anticipated to start around December 2022 and would be completed in 18 months, which is based on the CalEEMod default timing for a project of this size. The construction-related GHG emissions were based on a 30-year amortization rate as recommended in the SCAQMD GHG Working Group meeting on November 19, 2009. The phases of construction activities that have been analyzed are detailed below and include: 1) Demolition, 2) Site Preparation; 3) Grading, 4) Building construction, 5) Paving; and 6) Application of architectural coatings.

The CalEEMod model provides the selection of "mitigation" to account for project conditions that would result in less emissions than a project without these conditions, however it should be noted that this "mitigation" may represent regulatory requirements. This includes the required to adherence to SCAQMD Rule 403, which requires that the Best Available Control Measures be utilized to reduce fugitive dust emissions.

Demolition

The demolition phase would consist of demolishing the existing ranch house with barn and associated fencing and facilities for livestock/horses that total approximately 6,700 square feet of building space. In addition, the existing driveways and walkways on the project site would also be demolished, which covers approximately 8,000 square feet of the project site. The pavement was assumed to be an average of 4-inches thick and weigh 145 pounds per square foot, which results in 193 tons of pavement that would be removed from the project site. For the existing structures, CalEEMod utilizes a factor of 0.046 tons of debris of building material per building square foot. This results in 308 tons of debris that would be generated from demolition of the 6,700 square feet of existing building space. Therefore, the combined demolition of the structures and pavement area would require the removal of 502 tons of debris that would be exported from the site and would require a total of 50 haul truck trips (average 2.5 haul truck trips per day over duration of demolition phase).

The demolition phase has been modeled as starting in December 2022 and occurring over four weeks, which is based on the CalEEMod default timing. The demolition activities would generate 15 worker trips per day. In order to account for water truck emissions, six vendor truck emissions were added to the demolition phase. The onsite equipment would consist of one concrete/industrial saw, three excavators, and two rubber-tired dozers, which is based on the CalEEMod default equipment mix. The mitigation of "water all exposed areas three times per day" and "replace ground cover of area disturbed" were chosen in order to account for the fugitive dust reduction that would occur through adhering to SCAQMD Rule 403, which requires that the Best Available Control Measures be utilized to reduce fugitive dust emissions.

Site Preparation

The site preparation phase would consist of removing any vegetation, tree stumps, and stones onsite prior to grading. The site preparation phase would occur after completion of the demolition phase and was modeled as occurring over two weeks, which is based on the CalEEMod default timing. The site preparation activities would require 18 worker trips per day. In order to account for water truck emissions, six vendor truck emissions were added to the site preparation phase. The onsite equipment would consist of three rubber-tired dozers, and four crawler tractors, which replaced the CalEEMod default value of four of either tractors, loaders, or backhoes, in order to provide a more conservative analysis. The mitigation of "water all exposed areas three times per day" and "replace ground cover of area disturbed" were chosen in order to account for the fugitive dust reduction that would occur through adhering to SCAQMD Rule 403, which requires that the Best Available Control Measures be utilized to reduce fugitive dust emissions.

Grading

The grading phase would occur after completion of the site preparation phase and was modeled as occurring over six weeks, which is based on the CalEEMod default timing. The preliminary earthwork quantities for the proposed project show that 4,200 cubic yards of dirt will need to be imported to the project site. It is likely that the final earthwork quantities, will result in a balanced site with no dirt being

imported to the project site, however the import of 5,000 cubic yards of dirt to the project site was analyzed in CalEEMod, in order to provide a worst-case analysis. The import of 5,000 cubic yards of dirt would require a total of 625 haul truck trips (average 20.8 haul truck trips per day over duration of grading phase).

The onsite equipment would consist of two excavators, one grader, one rubber-tired dozer, two scrapers, and two crawler tractors, which replaced the CalEEMod default value of two of either tractors, loaders, or backhoes, in order to provide a more conservative analysis. The grading phase would generate 20 worker trips per day. In order to account for water truck emissions, six vendor truck emissions were added to the grading phase. The mitigation of "water all exposed areas three times per day" and "replace ground cover of area disturbed" were chosen in order to account for the fugitive dust reduction that would occur through adhering to SCAQMD Rule 403, which requires that the Best Available Control Measures be utilized to reduce fugitive dust emissions.

Building Construction

The building construction would occur after the completion of the grading phase and was modeled as occurring over 14 months, which is based on the CalEEMod default timing. The building construction phase would generate 83 worker trips and 31 vendor trips per day. The onsite equipment would consist of the simultaneous operation of one crane, three forklifts, one generator, one welder, and three of either tractors, loaders, or backhoes, which is based on the CalEEMod default equipment mix.

Paving

The paving phase would consist of paving the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site. The paving phase would occur after the completion of the building construction phase and was modeled as occurring over four weeks, which is based on the CalEEMod default timing. The paving phase would generate 15 worker trips per day. The onsite equipment would consist of the simultaneous operation of two pavers, two paving equipment, and two rollers, which is based on the CalEEMod default equipment mix.

Architectural Coating

The application of architectural coatings would occur after the completion of the paving phase and was modeled as occurring over four weeks, which is based on the CalEEMod default timing. The architectural coating phase was modeled based on covering 276,611 square feet of residential interior area, 92,204 square feet of residential exterior area, and 8,416 square feet of roadway area. The architectural coating phase would generate 17 worker trips per day. The onsite equipment would consist of one air compressor, which is based on the CalEEMod default equipment mix.

Operational Emissions Modeling

The operations-related criteria air pollutant emissions and GHG emissions created by the proposed project have been analyzed through use of the CalEEMod model. The proposed project was analyzed in the CalEEMod model based on the land use parameters provided above and the parameters entered for each operational emission source is described below.

Mobile Sources

Mobile sources include emissions the additional vehicle miles generated from the proposed project. The weekday daily vehicle trip rates associated with the proposed project have been set to match the 388

project generated daily trips from the *Project Scoping Agreement for Land Use Project – PLN22-20024* (Traffic Scoping Agreement), prepared by Urban Crossroads, June 27, 2022. Since the Traffic Analysis did not provide Saturday or Sunday daily trip rates for the proposed project, the default CalEEMod daily trip generation rates of: 9.54 per single-family home on Saturdays; and 8.55 per single-family home on Sundays were utilized. Since the proposed open space area would be primarily utilized by the residents of the project and would not encourage people to drive to this open space area, the trip generation rate for the open space area was set to zero.

The CalEEMod model provides the selection of "mitigation" to account for project conditions that would result in less emissions than a project without these conditions, however it should be noted that this "mitigation" may represent current conditions, such as development that is in close proximity to existing sidewalks, where a project built at such location would create less vehicle trips and associated emissions than a project that was not built in close proximity to existing sidewalks. The mobile source emissions analysis for the project included the CalEEMod "mitigation" of "improved pedestrian network on project site and connecting offsite".

Area Sources

Area sources include emissions from consumer products, landscape equipment, hearths and architectural coatings. The area source emissions were based on the on-going use of the proposed project in the CalEEMod model. According to the proposed project plans, no fireplaces or woodstoves would be installed into the proposed homes. As such, the number of woodstoves and fireplaces was set to zero in CalEEMod. No other changes were made to the default area source parameters in the CalEEMod model.

Energy Usage

Energy usage includes emissions from electricity and natural gas used onsite. The energy usage was based on the ongoing use of the proposed 41 single-family homes in the CalEEMod Model. No changes were made to the default energy usage parameters in the CalEEMod model.

The 2019 Title 24, Part 6 building energy efficiency standards went into effect January 1, 2020 and have been developed so that the average new home built in California will have zero-net-energy use. The 2019 Title 24 Part 6 standards also now require all new homes to install rooftop photovoltaic systems based on Section 150.1-C from: https://www.energy.ca.gov/2018publications/CEC-400-2018-020/CEC-400-2018-020-CMF.pdf

It should be noted that the Title 24 Report for the proposed project has not yet been prepared so the exact number of solar panels to be installed on the project site has not yet been calculated. However, Exception 3 to Section 150.1-c states that all two story homes shall provide a minimum of 1.0 Watt DC of solar panels per square foot of conditioned floor area. According to the Architectural Plans, the proposed project would have 112,384 square feet of conditioned floor area, which would result in the installation of 112.4 kilowatts of photovoltaic solar panels. Since the CalEEMod model requires that the total kilowatt-hours per year generated by the solar panels be entered into the model, the 112.4 kilowatts of solar panels was multiplied by 8 hours, to provide a conservative average hours per day of sunlight that the solar panels will generate electricity and then divided by 1.2 to account for the loss associated with converting the direct current (DC) power from the solar panels to the alternating current (AC) power on the electrical grid and then multiplying by 365 days, which resulted in the proposed solar panels generating 273,468 kilowatt-hours per year that was entered into the CalEEMod model

Solid Waste

Waste includes the GHG emissions associated with the processing of waste from the proposed project as well as the GHG emissions from the waste once it is interred into a landfill. The analysis was based on the default CalEEMod waste generation rate of 48 tons of solid waste per year from the proposed project. No changes were made to the default solid waste parameters or mitigation measures in the CalEEMod model.

The CalEEMod mitigation of a 50 percent reduction in landfill waste was selected to account for implementation of AB 341 that provides strategies to reduce, recycle or compost solid waste by 75 percent by 2020. Only 50 percent was selected, since AB 341 builds upon the waste reduction measures of SB 939 and 1374 and therefore, it was assumed approximately 25 percent of the waste reduction target has already been accounted for in the CalEEMod model.

Water and Wastewater

Water includes the water used for the interior of the buildings as well as for landscaping and is based on the GHG emissions associated with the energy used to transport and filter the water. The analysis was based on the default CalEEMod water usage rate of 2,671,320 gallons per year of indoor water use and 2,291,745 gallons per year of outdoor water use. No changes were made to the default water and wastewater parameters in the CalEEMod model.

The CalEEMod "mitigation" of the use of low flow faucets, showers and toilets and use of smart irrigation system controllers were selected to account for the implementation of the 2019 CCR Title 24 Part 11 (CalGreen) requirements, which lowered the calculated water use for the proposed project to 2,137,050 gallons per year of indoor water use and 2,151,949 gallons per year of outdoor water use.

8.2 Energy Use Calculations

The proposed project is anticipated to consume energy during both construction and operation of the proposed project and the parameters utilized to calculate energy use from construction and operation of the proposed project are detailed separately below.

Construction-Related Energy Use

Construction of the proposed project is anticipated to use energy in the forms of petroleum fuel for both off-road equipment as well as from the transport of workers and materials to and from the project site and the calculations for each source are described below.

Off-Road Construction Equipment

The off-road construction equipment fuel usage was calculated through use of the CalEEMod model's default off-road equipment assumptions detailed above in Section 8.1. For each piece of off-road equipment, the fuel usage was calculated through use of the *2017 Off-road Diesel Emission Factors* spreadsheet, prepared by CARB (https://ww3.arb.ca.gov/msei/ordiesel.htm). The Spreadsheet provides the following formula to calculate fuel usage from off-road equipment:

Fuel Used = Load Factor x Horsepower x Total Operational Hours x BSFC / Unit Conversion

Where:

Load Factor - Obtained from CalEEMod default values

Horsepower – Obtained from CalEEMod default values

Total Operational Hours – Calculated by multiplying CalEEMod default daily hours by CalEEMod default number of working days for each phase of construction

BSFC – Brake Specific Fuel Consumption (pounds per horsepower-hour) – If less than 100 Horsepower = 0.408, if greater than 100 Horsepower = 0.367

Unit Conversion – Converts pounds to gallons = 7.109

Table H shows the off-road construction equipment fuel calculations based on the above formula. Table H shows that the off-road equipment utilized during construction of the proposed project would consume 58,190 gallons of diesel fuel.

Table H – Off-Road Equipment and Fuel Consumption from Construction of the Proposed Project

Equipment Type	Equipment Quantity	Horse-power	Load Factor	Operating Hours per Day	Total Operational Hours[1]	Fuel Used (gallons)
Demolition						
Concrete/Industrial Saws	1	81	0.73	8	160	543
Excavators	3	158	0.38	8	480	1,488
Rubber Tired Dozers	2	247	0.40	8	320	1,632
Site Preparation						
Rubber Tired Dozers	3	247	0.40	8	240	1,224
Crawler Tractors	4	212	0.43	8	320	1,506
Grading						
Excavators	2	158	0.38	8	480	1,488
Grader	1	187	0.41	8	240	950
Rubber Tired Dozer	1	247	0.40	8	240	1,224
Scrapers	2	367	0.48	8	480	4,356
Crawler Tractors	2	212	0.43	8	480	2,259
Building Construction						
Crane	1	231	0.29	7	2,100	7,263
Forklifts	3	89	0.20	8	7,200	7,355
Generator Set	1	84	0.74	8	2,400	8,562
Tractors/Loaders/Backhoes	3	97	0.37	7	6,300	12,977
Welder	1	46	0.45	8	2,400	2,851
Paving						
Pavers	2	130	0.42	8	320	902
Paving Equipment	2	132	0.36	8	320	785
Rollers	2	80	0.38	8	320	558
Architectural Coating						
Air Compressor	1	78	0.48	6	120	258
Total Off-Road Equipment Diesel Fuel Used during Construction (gallons)						**58,190**

Notes:
[1] Based on: 20 days for demolition, 10 days for Site Preparation, 30 days for Grading; 300 days for Building Construction; 20 days for Paving; and 20 days for Architectural Coating.
Source: CalEEMod Version 2020.4.0 (see Appendix A); CARB, 2017.

On-Road Construction-Related Vehicle Trips

The on-road construction-related vehicle trips fuel usage was calculated through use of the construction vehicle trip assumptions from the CalEEMod model run as detailed above in Section 8.1. The calculated total construction miles were then divided by the fleet average for the South Coast Air Basin miles per gallon rates for the year 2022 calculated through use of the EMFAC2017 model (https://www.arb.ca.gov/emfac/2017/) and the EMFAC2017 model printouts are shown in Appendix B. The worker trips were based on the entire fleet average miles per gallon rate for gasoline powered vehicles and the vendor trips were based on the Heavy-Heavy Duty Truck (HHDT), Medium Duty Vehicle (MDV), and Medium Heavy-Duty Vehicle (MHDV) fleet average miles per gallon rate for diesel-powered vehicles. Table I shows the on-road construction vehicle trips modeled in CalEEMod and the fuel usage calculations.

Table I – On-Road Vehicle Trips and Fuel Consumption from Construction of the Proposed Project

Vehicle Trip Types / Fuel Type	Daily Trips	Trip Length (miles)	Total Miles per Day	Total Miles per Phase[1]	Fleet Average Miles per Gallon[2]	Fuel Used (gallons)
Demolition						
Worker (Gasoline)	15	14.7	221	4,410	26.0	170
Haul Truck (Diesel)	2.5	20.0	50	1,000	8.2	122
Vendor Truck (Diesel)	6	6.9	41	828	8.2	101
Site Preparation						
Worker (Gasoline)	18	14.7	265	2,646	26.0	102
Vendor Truck (Diesel)	6	6.9	41	414	8.2	50
Grading						
Worker (Gasoline)	20	14.7	294	8,820	26.0	339
Haul Truck (Diesel)	20.8	20.0	417	12,500	8.2	1,520
Vendor Truck (Diesel)	6	6.9	41	1,242	8.2	151
Building Construction						
Worker (Gasoline)	83	14.7	1,220	366,030	26.0	14,084
Vendor Truck (Diesel)	31	6.9	214	64,170	8.2	7,802
Paving						
Worker (Gasoline)	15	14.7	221	4,410	26.0	170
Architectural Coating						
Worker (Gasoline)	17	14.7	250	4,998	26.0	192
	Total Gasoline Fuel Used from On-Road Construction Vehicles (gallons)					**15,057**
	Total Diesel Fuel Used from On-Road Construction Vehicles (gallons)					**9,745**

Notes:
[1] Based on: 20 days for demolition, 10 days for Site Preparation, 30 days for Grading; 300 days for Building Construction; 20 days for Paving; and 20 days for Architectural Coating.
[2] From EMFAC 2017 model (see Appendix B). Worker Trips based on entire fleet of gasoline vehicles and Vendor Trips based on only truck fleet of diesel vehicles.
Source: CalEEMod Version 2020.4.0; CARB, 2018.

Table I shows that the on-road construction-related vehicle trips would consume 15,057 gallons of gasoline and 9,745 gallons of diesel fuel. As detailed above in Table H shows that the off-road construction equipment would consume 58,190 gallons of diesel fuel. This would result in the total consumption of 15,057 gallons of gasoline and 67,935 gallons of diesel fuel from construction of the proposed project.

Operations-Related Energy Use

The operation of the proposed project is anticipated to use energy in the forms of petroleum fuel, electricity, and natural gas, and the calculations for each source are described below.

Operational Petroleum Fuel

The on-road operations-related vehicle trips fuel usage was calculated through use of the total annual vehicle miles traveled assumptions from the CalEEMod model run as detailed above in Section 8.1, which found that operation of the proposed project would generate 1,282,589 vehicle miles traveled per year. The calculated total operational miles were then divided by the South Coast Air Basin average rates of 27.5 miles per gallon, which was calculated through use of the EMFAC2017 model and based on year 2024. The EMFAC2017 model printouts are shown in Appendix B. Based on the above calculation methodology, the operation of the proposed project would consume 46,681 gallons of gasoline per year.

Operational Electricity Use

The operations-related electricity usage was calculated in the CalEEMod model run that is detailed above in Section 8.1 that found the proposed project will use 53,083 kilowatt hours (kWh) per year with implementation of Title 24 Part 6 requirements that require the implementation of building energy efficiency standards that include the installation of photovoltaic systems on the rooftops of the proposed homes.

Operational Natural Gas Use

The operations-related natural gas usage was calculated in the CalEEMod model run that is detailed above in Section 8.1 that found the proposed project will use 1,160,000 kilo British Thermal Units (kBTU) per year, which is equivalent to 1,160 mega-British Thermal units (MBTU) per year of natural gas.

9.0 THRESHOLDS OF SIGNIFICANCE

9.1 Regional Air Quality

Many air quality impacts that derive from dispersed mobile sources, which are the dominate pollution generators in the Air Basin, often occurs hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual project is generally very small and difficult to measure. Therefore, SCAQMD has developed significance thresholds based on the volume of pollution emitted rather than on actual ambient air quality because the direct air quality impact of a project is not quantifiable on a regional scale. The SCAQMD CEQA Handbook states that any project in the Air Basin with daily emissions that exceed any of the identified significance thresholds should be considered as having an individually and cumulatively significant air quality impact. For the purposes to this air quality impact analysis, a regional air quality impact would be considered significant if emissions exceed the SCAQMD significance thresholds identified in Table J.

Table J – SCAQMD Regional Criteria Pollutant Emission Thresholds of Significance

	Pollutant Emissions (pounds/day)						
	VOC	**NOx**	**CO**	**SOx**	**PM10**	**PM2.5**	**Lead**
Construction	75	100	550	150	150	55	3
Operation	55	55	550	150	150	55	3

Source: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2

9.2 Local Air Quality

Project-related construction air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the Air Basin. In order to assess local air quality impacts the SCAQMD has developed Localized Significant Thresholds (LSTs) to assess the project-related air emissions in the project vicinity. SCAQMD has also provided *Final Localized Significance Threshold Methodology* (LST Methodology), July 2008, which details the methodology to analyze local air emission impacts. The LST Methodology found that the primary emissions of concern are NO_2, CO, PM10, and PM2.5.

The LST Methodology provides Look-Up Tables with different thresholds based on the location and size of the project site and distance to the nearest sensitive receptors. As detailed above in Section 7.3, the project site is located in Monitoring Area 22, which covers the Norco and Corona areas to the San Bernardino County and Orange County Lines.

The Look-Up Tables include site acreage sizes of 1-acre, 2-acres and 5-acres. The *Fact Sheet for Applying CalEEMod to Localized Significance Thresholds*, prepared by SCAQMD, 2015, provides guidance on how to determine the appropriate site acreage size to utilize for a project. The Fact Sheet details the site acreage should be based on the maximum number of acres disturbed on the peak day of construction that is calculated on the construction equipment list utilized in the CalEEMod model, where crawler tractors, graders, and rubber-tired dozers are all assumed to disturb 0.5-acre in an 8-hour day and scrapers are assumed to disturb 1.0-acre in an 8-hour day. It should be noted that the methodology in the Fact Sheet was developed from the CalEEMod User Guide Appendix A, page 9, where the same acres disturbed per

equipment type is detailed and is utilized in the CalEEMod model in order to determine the acres per day disturbed during site preparation and grading phases.

Table K lists all of the construction equipment modeled in CalEEMod and utilizes the methodology in the Fact Sheet to calculate the acres disturbed per day. As shown in Table K, the maximum disturbed per day would occur during the grading phase when 4.0-acres would be disturbed. As such, the 2-acre and 5-acre project sites shown in the Look-Up Tables were interpolated in order to calculate the 4.0-acre threshold that has been utilized in this analysis.

Table K – Construction Equipment Modeled in CalEEMod and Acres Disturbed per Day

Construction Activity	Equipment Type	Equipment Quantity	Acres Disturbed per piece of Equipment per Day[1]	Operating Hours per Day	Acres Disturbed per Day
Demolition	Concrete/Industrial Saws	1	0	8	0
	Excavators	3	0	8	0
	Rubber Tired Dozers	2	0.5	8	1.0
		Total Acres Disturbed per Day During Demolition			1.0
Site Preparation	Rubber Tired Dozers	3	0.5	8	1.5
	Crawler Tractors	4	0.5	8	2.0
		Total Acres Disturbed per Day During Site Preparation			3.5
Grading	Graders	1	0.5	8	0.5
	Excavators	2	0	8	0
	Rubber Tired Dozers	1	0.5	8	0.5
	Scrapers	2	1.0	8	2.0
	Crawler Tractors	2	0.5	8	1.0
		Total Acres Disturbed per Day During Grading			4.0
Building Construction	Cranes	1	0	7	0
	Forklifts	3	0	8	0
	Generator Sets	1	0	8	0
	Tractors/Loaders/Backhoes	3	0	7	0
	Welders	1	0	8	0
		Total Acres Disturbed per Day During Building Construction			0
Paving	Pavers	2	0	8	0
	Paving Equipment	2	0	8	0
	Rollers	2	0	8	0
		Total Acres Disturbed per Day During Paving			0
Architectural Coating	Air Compressor	1	0	6	0
		Total Acres Disturbed per Day During Architectural Coating			0
		Maximum Acres Disturbed during All Construction Activities			**4.0**

Notes:
[1] Based on the Fact Sheet for Applying CalEEMod to Localized Significance Thresholds where crawler tractors, graders, and rubber-tired dozers disturb 0.5-acre in an 8-hour day and scrapers disturb 1.0-acre in an 8-hour day. All other equipment disturbs 0 acres per 8-hour day.
Source: CalEEMod Version 2020.4.0; SCAQMD, 2015.

The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet (8 meters) west of the project site. According to LST Methodology, any receptor located closer

than 25 meters (82 feet) shall be based on the 25-meter thresholds. Table L below shows the LSTs for NO_2, PM10 and PM2.5 for both construction and operational activities.

Table L – SCAQMD Local Air Quality Thresholds of Significance

Activity	Allowable Emissions (pounds/day)[1]			
	NOx	CO	PM10	PM2.5
Construction	237	1,469	10	7
Operation	237	1,469	3	2

Notes:
[1] The nearest sensitive receptors to the project site are single-family homes located as near as 25 feet (8 meters) west of the project site. According to SCAQMD methodology, all receptors closer than 25 meters are based on the 25-meter threshold.
Source: Calculated from SCAQMD's Mass Rate Look-up Tables for two and five acres in Air Monitoring Area 22, Norco/Corona.

9.3 Toxic Air Contaminants

According to the SCAQMD CEQA Handbook, any project that has the potential to expose the public to toxic air contaminants in excess of the following thresholds would be considered to have a significant air quality impact:

- If the Maximum Incremental Cancer Risk is 10 in one million or greater; or
- Toxic air contaminants from the proposed project would result in a Hazard Index increase of 1 or greater.

In order to determine if the proposed project may have a significant impact related to toxic air contaminants (TACs), the *Health Risk Assessment Guidance for analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*, (Diesel Analysis) prepared by SCAQMD, August 2003, recommends that if the proposed project is anticipated to create TACs through stationary sources or regular operations of diesel trucks on the project site, then the proximity of the nearest receptors to the source of the TAC and the toxicity of the HAP should be analyzed through a comprehensive facility-wide health risk assessment (HRA).

9.4 Odor Impacts

The SCAQMD CEQA Handbook states that an odor impact would occur if the proposed project creates an odor nuisance pursuant to SCAQMD Rule 402, which states:

> "A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
>
> The provisions of this rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals."

If the proposed project results in a violation of Rule 402 with regards to odor impacts, then the proposed project would create a significant odor impact.

9.5 Energy Conservation

The *2020 CEQA California Environmental Quality Act Statutes & Guidelines* (2020 CEQA Guideline) now include an Energy Section that analyzes the proposed project's energy consumption in order to avoid or reduce inefficient, wasteful or unnecessary consumption of energy. Appendix F of the 2020 CEQA Statute and Guidelines, states the following:

> The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include:
>
> (1) Decreasing overall per capita energy consumption,
>
> (2) Decreasing reliance on fossil fuels such as coal, natural gas and oil, and
>
> (3) Increasing reliance on renewable energy sources.

Since the Energy Section was recently added, no state or local agencies have adopted specific criteria or thresholds to be utilized in an energy impact analysis. However, Appendix F, Subsection II.C of the 2018 CEQA Guidelines provides the following criteria for determining significance.

1. The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project life cycle including construction, operation, maintenance and/or removal. If appropriate, the energy intensiveness of materials may be discussed.
2. The effects of the project on local and regional energy supplies and on requirement for additional capacity.
3. The effects of the project on peak and base period demands for electricity and other forms of energy.
4. The degree to which the project complies with existing energy standards.
5. The effects of the project on energy resources.
6. The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

If the proposed project creates inefficient, wasteful or unnecessary consumption of energy during construction or operation activities or conflicts with a state or local plan for renewable energy or energy efficiency, then the proposed project would create a significant energy impact.

9.6 Greenhouse Gas Emissions

The proposed project is located within the jurisdiction of the SCAQMD. In order to identify significance criteria under CEQA for development projects, SCAQMD initiated a Working Group, which provided detailed methodology for evaluating significance under CEQA. At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that provides a quantitative annual threshold of 3,000 $MTCO_2e$ for all land use projects. Although the SCAQMD provided substantial evidence supporting the use of the above threshold, as of November 2017, the SCAQMD Board has not yet considered or approved the Working Group's thresholds.

It should be noted that SCAQMD's Working Group's thresholds were prepared prior to the issuance of Executive Order B-30-15 on April 29, 2015 that provided a reduction goal of 40 percent below 1990 levels by 2030. This target was codified into statute through passage of AB 197 and SB 32 in September 2016. However, to date no air district or local agency within California has provided guidance on how to address

AB 197 and SB 32 with relation to land use projects. In addition, the California Supreme Court's ruling on *Cleveland National Forest Foundation v. San Diego Association of Governments* (Cleveland v. SANDAG), Filed July 13, 2017 stated:

> SANDAG did not abuse its discretion in declining to adopt the 2050 goal as a measure of significance in light of the fact that the Executive Order does not specify any plan or implementation measures to achieve its goal. In its response to comments, the EIR said: "It is uncertain what role regional land use and transportation strategies can or should play in achieving the EO's 2050 emissions reduction target. A recent California Energy Commission report concludes, however, that the primary strategies to achieve this target should be major 'decarbonization' of electricity supplies and fuels, and major improvements in energy efficiency [citation].

Although, the above court case was referencing California's GHG emission targets for the year 2050, at this time it is also unclear what role land use strategies can or should play in achieving the AB 197 and SB 32 reduction goal of 40 percent below 1990 levels by 2030. As such this analysis has relied on the SCAQMD Working Group's recommended thresholds. Therefore, the proposed project would be considered to create a significant cumulative GHG impact if the proposed project would exceed the annual threshold of 3,000 $MTCO_2e$.

The GHG emissions analysis for both construction and operation of the proposed project can be found below in Sections 10.8 and 10.9.

10.0 IMPACT ANALYSIS

10.1 CEQA Thresholds of Significance

Consistent with CEQA and the State CEQA Guidelines, a significant impact related to air quality, energy, and GHG emissions would occur if the proposed project is determined to:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard;
- Expose sensitive receptors to substantial pollutant concentrations;
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people;
- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation;
- Conflict with or obstruct a state or local plan for renewable energy;
- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

10.2 Air Quality Compliance

The proposed project would not conflict with or obstruct implementation of the SCAQMD Air Quality Management Plan (AQMP). The following section discusses the proposed project's consistency with the SCAQMD AQMP.

SCAQMD Air Quality Management Plan

The California Environmental Quality Act (CEQA) requires a discussion of any inconsistencies between a proposed project and applicable General Plans and regional plans (CEQA Guidelines Section 15125). The regional plan that applies to the proposed project includes the SCAQMD AQMP. Therefore, this section discusses any potential inconsistencies of the proposed project with the AQMP.

The purpose of this discussion is to set forth the issues regarding consistency with the assumptions and objectives of the AQMP and discuss whether the proposed project would interfere with the region's ability to comply with Federal and State air quality standards. If the decision-makers determine that the proposed project is inconsistent, the lead agency may consider project modifications or inclusion of mitigation to eliminate the inconsistency.

The SCAQMD CEQA Handbook states that "New or amended GP Elements (including land use zoning and density amendments), Specific Plans, and significant projects must be analyzed for consistency with the AQMP." Strict consistency with all aspects of the plan is usually not required. A proposed project should be considered to be consistent with the AQMP if it furthers one or more policies and does not obstruct other policies. The SCAQMD CEQA Handbook identifies two key indicators of consistency:

(1) Whether the project will result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.

(2) Whether the project will exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

Both of these criteria are evaluated in the following sections.

Criterion 1 - Increase in the Frequency or Severity of Violations?

Based on the air quality modeling analysis contained in this report, short-term regional construction air emissions would not result in significant impacts based on SCAQMD regional thresholds of significance discussed above in Section 9.1 or local thresholds of significance discussed above in Section 9.2. The ongoing operation of the proposed project would generate air pollutant emissions that are inconsequential on a regional basis and would not result in significant impacts based on SCAQMD thresholds of significance discussed above in Section 9.1. The analysis for long-term local air quality impacts showed that local pollutant concentrations would not exceed the air quality standards. Therefore, a less than significant long-term impact would occur and no mitigation would be required.

Therefore, based on the information provided above, the proposed project would be consistent with the first criterion.

Criterion 2 - Exceed Assumptions in the AQMP?

Consistency with the AQMP assumptions is determined by performing an analysis of the proposed project with the assumptions in the AQMP. The emphasis of this criterion is to ensure that the analyses conducted for the proposed project are based on the same forecasts as the AQMP. The AQMP is developed through use of the planning forecasts provided in the Connect SoCal and 2019 FTIP. The Connect SoCal is a major planning document for the regional transportation and land use network within Southern California. The Connect SoCal is a long-range plan that is required by federal and state requirements placed on SCAG and is updated every four years. The 2019 FTIP provides long-range planning for future transportation improvement projects that are constructed with state and/or federal funds within Southern California. Local governments are required to use these plans as the basis of their plans for the purpose of consistency with applicable regional plans under CEQA. For this project, the City of Eastvale General Plan's Land Use Plan Land Use Plan defines the assumptions that are represented in AQMP.

The project site is currently designated as Medium Density Residential in the General Plan Land Use Plan. The proposed residential project is an allowed use under the Medium Density Residential designation. Therefore, the proposed project would not result in an inconsistency with the current land use designations with respect to the regional forecasts utilized by the AQMPs. As such, the proposed project is not anticipated to exceed the AQMP assumptions for the project site and is found to be consistent with the AQMP for the second criterion.

Based on the above, the proposed project will not result in an inconsistency with the SCAQMD AQMP. Therefore, a less than significant impact will occur in relation to implementation of the AQMP.

Level of Significance

Less than significant impact.

10.3 Cumulative Net Increase in Non-Attainment Pollution

The proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard.

The SCAQMD has published a report on how to address cumulative impacts from air pollution: White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution (http://www.aqmd.gov/docs/default-source/Agendas/Environmental-Justice/cumulative-impacts-working-group/cumulative-impacts-white-paper.pdf). In this report the AQMD clearly states (Page D-3):

> *"…the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or Environmental Impact Report (EIR). The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for TAC emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility- wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts. Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."*

Therefore, this analysis assumes that individual projects that do not generate operational or construction emissions that exceed the SCAQMD's recommended daily thresholds for project- specific impacts would also not cause a cumulatively considerable increase in emissions for those pollutants for which the Basin is in nonattainment, and, therefore, would not be considered to have a significant, adverse air quality impact. Alternatively, individual project-related construction and operational emissions that exceed SCAQMD thresholds for project-specific impacts would be considered cumulatively considerable. The following section calculates the potential air emissions associated with the construction and operations of the proposed project and compares the emissions to the SCAQMD standards.

Construction Emissions

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings. The construction emissions have been analyzed for both regional and local air quality impacts.

Construction-Related Regional Impacts

The CalEEMod model has been utilized to calculate the construction-related regional emissions from the proposed project and the input parameters utilized in this analysis have been detailed in Section 8.1. The worst-case summer or winter daily construction-related criteria pollutant emissions from the proposed project for each phase of construction activities are shown below in Table M and the CalEEMod daily

printouts are shown in Appendix A. Since it is possible that building construction, paving, and architectural coating activities may occur concurrently towards the end of the building construction phase, Table M also shows the combined regional criteria pollutant emissions from building construction (year 2023), paving and architectural coating phases of construction.

Table M – Construction-Related Regional Criteria Pollutant Emissions

Activity	Pollutant Emissions (pounds/day)					
	VOC	NOx	CO	SO_2	PM10	PM2.5
Demolition (Year 2022)[1]						
Onsite[2]	2.64	25.72	20.59	0.04	1.43	1.18
Offsite[3]	0.08	0.64	0.76	<0.01	0.26	0.08
Total	**2.72**	**26.36**	**21.35**	**0.04**	**1.69**	**1.26**
Site Preparation (Year 2023)[1]

Total	**3.90**	**42.13**	**19.03**	**0.06**	**9.47**	**5.23**
Grading (Year 2023)[1]						
Onsite[2]	3.91	41.69	28.08	0.07	5.20	2.83
Offsite[3]	0.13	2.46	1.39	0.01	0.65	0.20
Total	**4.03**	**44.15**	**29.46**	**0.09**	**5.85**	**3.03**
Building Construction (Year 2023)						
Onsite	1.57	14.38	16.24	0.03	0.70	0.66
Offsite	0.34	1.27	3.46	0.01	1.14	0.32
Total	**1.91**	**15.65**	**19.71**	**0.04**	**1.84**	**0.97**
Combined Year 2024 Building Construction, Paving, and Architectural Coatings						
Onsite	47.60	24.19	32.60	0.05	1.14	1.07
Offsite	0.43	1.31	4.36	0.02	1.50	0.41
Total	**48.03**	**25.50**	**36.96**	**0.07**	**2.64**	**1.48**
Maximum Daily Construction Emissions	**48.03**	**44.15**	**36.96**	**0.09**	**9.47**	**5.23**
SCQAMD Thresholds	**75**	**100**	**550**	**150**	**150**	**55**
Exceeds Threshold?	No	No	No	No	No	No

Notes:
[1] Demolition, Site Preparation and Grading based on adherence to fugitive dust suppression requirements from SCAQMD Rule 403.
[2] Onsite emissions from equipment not operated on public roads.
[3] Offsite emissions from vehicles operating on public roads.
Source: CalEEMod Version 2020.4.0.

Table M shows that none of the analyzed criteria pollutants would exceed the regional emissions thresholds during either demolition, site preparation, grading, or the combined building construction, paving and architectural coatings phases. Therefore, a less than significant regional air quality impact would occur from construction of the proposed project.

Construction-Related Local Impacts

Construction-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the Air Basin.

The local air quality emissions from construction were analyzed through utilizing the methodology described in *Localized Significance Threshold Methodology* (LST Methodology), prepared by SCAQMD, revised October 2009. The LST Methodology found the primary criteria pollutant emissions of concern are NOx, CO, PM10, and PM2.5. In order to determine if any of these pollutants require a detailed analysis of the local air quality impacts, each phase of construction was screened using the SCAQMD's Mass Rate LST Look-up Tables. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily onsite emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality.

Table N shows the onsite emissions from the CalEEMod model for the different construction phases and the calculated localized emissions thresholds that have been detailed above in Section 9.2. Since it is possible that building construction, paving, and architectural coating activities may occur concurrently towards the end of the building construction phase, Table N also shows the combined local criteria pollutant emissions from year 2024 building construction, paving and architectural coating phases of construction.

Table N – Construction-Related Local Criteria Pollutant Emissions

Construction Phase	Pollutant Emissions (pounds/day)[1]			
	NOx	CO	PM10	PM2.5
Demolition[2]	25.80	20.69	1.46	1.19
Site Preparation[2]	41.91	18.39	9.26	5.17
Grading[2]	42.00	28.25	5.28	2.86
Building Construction (Year 2023)	14.54	16.68	0.84	0.70
Combined Building Construction (Year 2024), Paving and Architectural Coatings	24.35	33.15	1.33	1.12
Maximum Daily Construction Emissions	**42.00**	**33.15**	**9.26**	**5.17**
SCAQMD Local Construction Thresholds[3]	**237**	**1,469**	**10**	**7**
Exceeds Threshold?	No	No	No	No

Notes:
[1] The Pollutant Emissions include 100% of the On-Site emissions (off-road equipment and fugitive dust) and 1/8 of the Off-Site emissions (on road trucks and worker vehicles), in order to account for the on-road emissions that occur within a ¼ mile of the project site.
[2] Demolition, Site Preparation and Grading phases based on adherence to fugitive dust suppression requirements from SCAQMD Rule 403.
[3] The nearest offsite sensitive receptors to the project site are single-family homes located as near as 25 feet (8 meters) west of the project site. According to SCAQMD methodology, all receptors closer than 25 meters are based on the 25-meter threshold.
Source: Calculated from SCAQMD's Mass Rate Look-up Tables for two and five acres in Air Monitoring Area 22, Norco/Corona.

The data provided in Table N shows that none of the analyzed criteria pollutants would exceed the local emissions thresholds during either demolition, site preparation, grading, or the combined building construction, paving, and architectural coatings phases. Therefore, a less than significant local air quality impact would occur from construction of the proposed project.

Operational Emissions

The on-going operation of the proposed project would result in a long-term increase in air quality emissions. This increase would be due to emissions from the project-generated vehicle trips, emissions from energy usage, onsite area source emissions, and off-road equipment created from the on-going use of the proposed project. The following section provides an analysis of potential long-term air quality impacts due to regional air quality and local air quality impacts with the on-going operations of the proposed project.

Operations-Related Regional Criteria Pollutant Analysis

The operations-related regional criteria air quality impacts created by the proposed project have been analyzed through use of the CalEEMod model and the input parameters utilized in this analysis have been detailed in Section 8.1. The worst-case summer or winter VOC, NOx, CO, SO_2, PM10, and PM2.5 daily emissions created from the proposed project's long-term operations have been calculated and are summarized below in Table O and the CalEEMod daily emissions printouts are shown in Appendix A.

Table O – Operational Regional Criteria Pollutant Emissions

	Pollutant Emissions (pounds/day)					
Activity	**VOC**	**NOx**	**CO**	**SO_2**	**PM10**	**PM2.5**
Area Sources[1]	3.10	0.04	3.38	<0.01	0.02	0.02
Energy Usage[2]	0.03	0.29	0.12	<0.01	0.02	0.02
Mobile Sources[3]	1.21	1.66	11.78	0.03	2.79	0.76
Total Emissions	**4.35**	**1.99**	**15.28**	**0.03**	**2.83**	**0.80**
SCQAMD Operational Thresholds	**55**	**55**	**550**	**150**	**150**	**55**
Exceeds Threshold?	No	No	No	No	No	No

Notes:
[1] Area sources consist of emissions from consumer products, architectural coatings, hearths (no hearths included in project) and landscaping equipment.
[2] Energy usage consist of emissions from natural gas usage.
[3] Mobile sources consist of emissions from vehicles and road dust.
Source: Calculated from CalEEMod Version 2020.4.0.

The data provided in Table O shows that none of the analyzed criteria pollutants would exceed the regional emissions thresholds. Therefore, a less than significant regional air quality impact would occur from operation of the proposed project.

Friant Ranch Case

The operations-related regional criteria air quality impacts In *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502 (also referred to as "*Friant Ranch*"), the California Supreme Court held that when an EIR concluded that when a project would have significant impacts to air quality impacts, an EIR should "make a reasonable effort to substantively connect a project's air quality impacts to likely health consequences." In order to determine compliance with this Case, the Court developed a multi-part test that includes the following:

1) The air quality discussion shall describe the specific health risks created from each criteria pollutant, including diesel particulate matter.

This Analysis details the specific health risks created from each criteria pollutant above in Section 4.1 and specifically in Table B. In addition, the specific health risks created from diesel particulate matter is detailed above in Section 2.2 of this analysis. As such, this analysis meets the part 1 requirements of the Friant Ranch Case.

2) The analysis shall identify the magnitude of the health risks created from the Project. The Ruling details how to identify the magnitude of the health risks. Specifically, on page 24 of the ruling it states "The Court of Appeal identified several ways in which the EIR could have framed the analysis so as to adequately inform the public and decision makers of possible adverse health

effects. The County could have, for example, identified the Project's impact on the days of nonattainment per year."

The Friant Ranch Case found that an EIR's air quality analysis must meaningfully connect the identified air quality impacts to the human health consequences of those impacts, or meaningfully explain why that analysis cannot be provided. As noted in the Brief of Amicus Curiae by the SCAQMD in the Friant Ranch case (https://www.courts.ca.gov/documents/9-s219783-ac-south-coast-air-quality-mgt-dist-041315.pdf) (Brief), SCAQMD has among the most sophisticated air quality modeling and health impact evaluation capability of any of the air districts in the State, and thus it is uniquely situated to express an opinion on how lead agencies should correlate air quality impacts with specific health outcomes. The SCAQMD discusses that it may be infeasible to quantify health risks caused by projects similar to the proposed Project, due to many factors. It is necessary to have data regarding the sources and types of air toxic contaminants, location of emission points, velocity of emissions, the meteorology and topography of the area, and the location of receptors (worker and residence). The Brief states that it may not be feasible to perform a health risk assessment for airborne toxics that will be emitted by a generic industrial building that was built on "speculation" (i.e., without knowing the future tenant(s)). Even where a health risk assessment can be prepared, however, the resulting maximum health risk value is only a calculation of risk, it does not necessarily mean anyone will contract cancer as a result of the Project. The Brief also cites the author of the CARB methodology, which reported that a PM2.5 methodology is not suited for small projects and may yield unreliable results. Similarly, SCAQMD staff does not currently know of a way to accurately quantify ozone-related health impacts caused by NOX or VOC emissions from relatively small projects, due to photochemistry and regional model limitations. The Brief concludes, with respect to the Friant Ranch EIR, that although it may have been technically possible to plug the data into a methodology, the results would not have been reliable or meaningful.

On the other hand, for extremely large regional projects (unlike the proposed project), the SCAQMD states that it has been able to correlate potential health outcomes for very large emissions sources – as part of their rulemaking activity, specifically 6,620 pounds per day of NOx and 89,180 pounds per day of VOC were expected to result in approximately 20 premature deaths per year and 89,947 school absences due to ozone. As shown above in Table M, project-related construction activities would generate a maximum of 48.03 pounds per day of VOC and 44.15 pounds per day of NOx and as shown above in Table O, operation of the proposed project would generate 4.35 pounds per day of VOC and 1.99 pounds per day NOx. The proposed project would not generate anywhere near these levels of 6,620 pounds per day of NOx or 89,190 pounds per day of VOC emissions. Therefore, the proposed project's emissions are not sufficiently high enough to use a regional modeling program to correlate health effects on a basin-wide level.

Notwithstanding, this analysis does evaluate the proposed project's localized impact to air quality for emissions of CO, NOX, PM10, and PM2.5 by comparing the proposed project's onsite emissions to the SCAQMD's applicable LST thresholds. As evaluated in this analysis, the proposed project would not result in emissions that exceeded the SCAQMD's LSTs. Therefore, the proposed project would not be expected to exceed the most stringent applicable federal or state ambient air quality standards for emissions of CO, NOX, PM10, and PM2.5.

Operations-Related Local Air Quality Impacts

Project-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a

regional impact to the Air Basin. The proposed project has been analyzed for the potential local CO emission impacts from the project-generated vehicular trips and from the potential local air quality impacts from on-site operations. The following analyzes the vehicular CO emissions and local impacts from on-site operations.

Local CO Hotspot Impacts from Project-Generated Vehicular Trips

CO is the pollutant of major concern along roadways because the most notable source of CO is motor vehicles. For this reason, CO concentrations are usually indicative of the local air quality generated by a roadway network and are used as an indicator of potential local air quality impacts. Local air quality impacts can be assessed by comparing future without and with project CO levels to the State and Federal CO standards of 20 ppm over one hour or 9 ppm over eight hours.

At the time of the 1993 Handbook, the Air Basin was designated nonattainment under the CAAQS and NAAQS for CO. With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations in the Air Basin and in the state have steadily declined. In 2007, the Air Basin was designated in attainment for CO under both the CAAQS and NAAQS. SCAQMD conducted a CO hot spot analysis for attainment at the busiest intersections in Los Angeles during the peak morning and afternoon periods and did not predict a violation of CO standards[3]. Since the nearby intersections to the proposed project are much smaller with less traffic than what was analyzed by the SCAQMD, no local CO Hotspot are anticipated to be created from the proposed project and no CO Hotspot modeling was performed. Therefore, a less than significant long-term air quality impact is anticipated to local air quality with the on-going use of the proposed project.

Local Criteria Pollutant Impacts from Onsite Operations

Project-related air emissions from onsite sources such as architectural coatings, landscaping equipment, and onsite usage of natural gas appliances may have the potential to create emissions areas that exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the Air Basin.

The local air quality emissions from onsite operations were analyzed using the SCAQMD's Mass Rate LST Look-up Tables and the methodology described in LST Methodology. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality. Table P shows the onsite emissions from the CalEEMod model that includes area sources, energy usage, onsite off-road equipment, and vehicles operating in the immediate vicinity of the project site and the calculated emissions thresholds.

[3] The four intersections analyzed by the SCAQMD were: Long Beach Boulevard and Imperial Highway; Wilshire Boulevard and Veteran Avenue; Sunset Boulevard and Highland Avenue; and La Cienega Boulevard and Century Boulevard. The busiest intersection evaluated (Wilshire and Veteran) had a daily traffic volume of approximately 100,000 vehicles per day with LOS E in the morning and LOS F in the evening peak hour.

Table P – Operations-Related Local Criteria Pollutant Emissions

Onsite Emission Source	Pollutant Emissions (pounds/day)			
	NOx	CO	PM10	PM2.5
Area Sources	0.04	3.38	0.02	0.02
Energy Usage	0.29	0.12	0.02	0.02
Mobile Sources[1]	0.21	1.47	0.35	0.09
Total Emissions	**0.54**	**4.98**	**0.39**	**0.14**
SCAQMD Local Operational Thresholds[2]	**237**	**1,469**	**3**	**2**
Exceeds Threshold?	No	No	No	No

Notes:
[3] Mobile sources based on 1/8 of the gross vehicular emissions, which is the estimated portion of vehicle emissions occurring within a quarter mile of the project site.
[2] The nearest sensitive receptors to the project site are single-family homes located as near as 25 feet (8 meters) west of the project site. According to SCAQMD methodology, all receptors closer than 25 meters are based on the 25-meter threshold.
Source: Calculated from SCAQMD's Mass Rate Look-up Tables for two and five acres in Air Monitoring Area 22, Norco/Corona.

The data provided in Table P shows that the on-going operations of the proposed project would not exceed the local NOx, CO, PM10 and PM2.5 thresholds of significance discussed above in Section 9.2. Therefore, the on-going operations of the proposed project would create a less than significant operations-related impact to local air quality due to onsite emissions and no mitigation would be required.

Therefore, the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant.

Level of Significance

Less than significant impact.

10.4 Sensitive Receptors

The proposed project would not expose sensitive receptors to substantial pollutant concentrations. The local concentrations of criteria pollutant emissions produced in the nearby vicinity of the proposed project, which may expose sensitive receptors to substantial concentrations have been calculated above in Section 10.3 for both construction and operations, which are discussed separately below. The discussion below also includes an analysis of the potential impacts from local criteria pollutant and toxic air contaminant emissions. The nearest sensitive receptors to the project site are the single-family homes that are located as near as 25 feet west of the project site. The nearest structure at Eastvale Elementary School is a covered lunch area that is as near as 25 feet east of the project site.

Construction-Related Sensitive Receptor Impacts

Construction activities may expose sensitive receptors to substantial pollutant concentrations of localized criteria pollutant concentrations and from toxic air contaminant emissions created from onsite construction equipment, which are described below.

Local Criteria Pollutant Impacts from Construction

The local air quality impacts from construction of the proposed project have been analyzed above in Section 10.3 and found that the construction of the proposed project would not exceed the local NOx, CO, PM10 and PM2.5 thresholds of significance discussed above in Section 9.2. Therefore, construction of the

proposed project would create a less than significant construction-related impact to local air quality and no mitigation would be required.

Toxic Air Contaminants Impacts from Construction

Construction activities associated with the proposed project are anticipated to generate TAC emissions from DPM associated with the operation of trucks and off-road equipment and from possible asbestos in the structures to be demolished.

Diesel Particulate Matter Emissions

The greatest potential for toxic air contaminant emissions would be related to DPM emissions associated with heavy equipment operations during construction of the proposed project. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of "individual cancer risk". "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. It should be noted that the most current cancer risk assessment methodology recommends analyzing a 30 year exposure period for the nearby sensitive receptors (OEHHA, 2015).

Given the relatively limited number of heavy-duty construction equipment, the varying distances that construction equipment would operate to the nearby sensitive receptors, and the short-term construction schedule, the proposed project would not result in a long-term (i.e., 30 or 70 years) substantial source of toxic air contaminant emissions and corresponding individual cancer risk. In addition, California Code of Regulations Title 13, Article 4.8, Chapter 9, Section 2449 regulates emissions from off-road diesel equipment in California. This regulation limits idling of equipment to no more than five minutes, requires equipment operators to label each piece of equipment and provide annual reports to CARB of their fleet's usage and emissions. This regulation also requires systematic upgrading of the emission Tier level of each fleet, and currently no commercial operator is allowed to purchase Tier 0 or Tier 1 equipment and by January 2023 no commercial operator is allowed to purchase Tier 2 equipment. In addition to the purchase restrictions, equipment operators need to meet fleet average emissions targets that become more stringent each year between years 2014 and 2023. As of January, 2019, 25 percent or more of all contractors' equipment fleets must be Tier 2 or higher. Therefore, no significant short-term toxic air contaminant impacts from DPM emissions would occur during construction of the proposed project.

Asbestos Emissions

It is possible that the existing onsite structures to be demolished contains asbestos. According to SCAQMD Rule 1403 requirements, prior to the start of demolition activities, the existing structures located onsite shall be thoroughly surveyed for the presence of asbestos by a person that is certified by Cal/OSHA for asbestos surveys. Rule 1403 requires that the SCAQMD be notified a minimum of 10 days before any demolition activities begin with specific details of all asbestos to be removed, start and completion dates of demolition, work practices and engineering controls to be used to contain the asbestos emissions, estimates on the amount of asbestos to be removed, the name of the waste disposal site where the asbestos will be taken, and names and addresses of all contractors and transporters that will be involved in the asbestos removal process. Therefore, through adherence to the asbestos removal requirements, detailed in SCAQMD Rule 1403, a less than significant asbestos impact would occur during construction of the proposed project

As such, construction of the proposed project would result in a less than significant exposure of sensitive receptors to substantial pollutant concentrations.

Operations-Related Sensitive Receptor Impacts

The on-going operations of the proposed project may expose sensitive receptors to substantial pollutant concentrations of local CO emission impacts from the project-generated vehicular trips and from the potential local air quality impacts from onsite operations. The following analyzes the vehicular CO emissions. Local criteria pollutant impacts from onsite operations, and toxic air contaminant impacts.

Local CO Hotspot Impacts from Project-Generated Vehicle Trips

CO is the pollutant of major concern along roadways because the most notable source of CO is motor vehicles. For this reason, CO concentrations are usually indicative of the local air quality generated by a roadway network and are used as an indicator of potential impacts to sensitive receptors. The analysis provided above in Section 10.3 shows that no local CO Hotspots are anticipated to be created at any nearby intersections from the vehicle traffic generated by the proposed project. Therefore, operation of the proposed project would result in a less than significant exposure of offsite sensitive receptors to substantial pollutant concentrations.

Local Criteria Pollutant Impacts from Onsite Operations

The local air quality impacts from the operation of the proposed project would occur from onsite sources such as architectural coatings, landscaping equipment, and onsite usage of natural gas appliances. The analysis provided above in Section 9.3 found that the operation of the proposed project would not exceed the local NOx, CO, PM10 and PM2.5 thresholds of significance discussed above in Section 9.2. Therefore, the on-going operations of the proposed project would create a less than significant operations-related impact to local air quality due to on-site emissions and no mitigation would be required.

Operations-Related Toxic Air Contaminant Impacts

Particulate matter (PM) from diesel exhaust is the predominant TAC in most areas and according to *The California Almanac of Emissions and Air Quality 2013 Edition*, prepared by CARB, about 80 percent of the outdoor TAC cancer risk is from diesel exhaust. Some chemicals in diesel exhaust, such as benzene and formaldehyde have been listed as carcinogens by State Proposition 65 and the Federal Hazardous Air Pollutants program. Due to the nominal number of diesel truck trips that are anticipated to be generated by the on-going operation of the proposed residential project, a less than significant TAC impact would occur during the on-going operations of the proposed project and no mitigation would be required.

Therefore, operation of the proposed project would result in a less than significant exposure of sensitive receptors to substantial pollutant concentrations.

Level of Significance

Less than significant impact.

10.5 Odor Emissions

The proposed project would not result in other emissions, such as those leading to odors that would adversely affect a substantial number of people. The local concentrations of criteria pollutant emissions, TAC emissions, and CO concentrations that may adversely impact a substantial number of people have been analyzed above in Section 10.4 for both construction and operations, which found that these types of emissions would create less than significant impacts. As such, the following analysis is limited to odors that would have the potential to adversely affect a substantial number of people.

Individual responses to odors are highly variable and can result in a variety of effects. Generally, the impact of an odor results from a variety of factors such as frequency, duration, offensiveness, location, and sensory perception. The frequency is a measure of how often an individual is exposed to an odor in the ambient environment. The intensity refers to an individual's or group's perception of the odor strength or concentration. The duration of an odor refers to the elapsed time over which an odor is experienced. The offensiveness of the odor is the subjective rating of the pleasantness or unpleasantness of an odor. The location accounts for the type of area in which a potentially affected person lives, works, or visits; the type of activity in which he or she is engaged; and the sensitivity of the impacted receptor.

Sensory perception has four major components: detectability, intensity, character, and hedonic tone. The detection (or threshold) of an odor is based on a panel of responses to the odor. There are two types of thresholds: the odor detection threshold and the recognition threshold. The detection threshold is the lowest concentration of an odor that will elicit a response in a percentage of the people that live and work in the immediate vicinity of the project site and is typically presented as the mean (or 50 percent of the population). The recognition threshold is the minimum concentration that is recognized as having a characteristic odor quality, this is typically represented by recognition by 50 percent of the population. The intensity refers to the perceived strength of the odor. The odor character is what the substance smells like. The hedonic tone is a judgment of the pleasantness or unpleasantness of the odor. The hedonic tone varies in subjective experience, frequency, odor character, odor intensity, and duration. Potential odor impacts have been analyzed separately for construction and operations below.

Construction-Related Odor Impacts

Potential sources that may emit odors during construction activities include the application of coatings such as asphalt pavement, paints and solvents and from emissions from diesel equipment. Standard construction requirements that limit the time of day when construction may occur as well as SCAQMD Rule 1108 that limits VOC content in asphalt and Rule 1113 that limits the VOC content in paints and solvents would minimize odor impacts from construction. As such, the objectionable odors that may be produced during the construction process would be temporary and would not likely be noticeable for extended periods of time beyond the project site's boundaries. Through compliance with the applicable regulations that reduce odors and due to the transitory nature of construction odors, a less than significant odor impact would occur and no mitigation would be required.

Operations-Related Odor Impacts

The proposed project would consist of a residential development. Potential sources that may emit odors during the on-going operations of the proposed project would primarily occur from the trash storage areas. Pursuant to City regulations, permanent trash enclosures that protect trash bins from rain as well as limit air circulation would be required for the trash storage areas. Due to the distance of the nearest receptors from the project site and through compliance with SCAQMD's Rule 402 and City trash storage regulations, no significant impact related to odors would occur during the on-going operations of the proposed project. Therefore, a less than significant odor impact would occur and no mitigation would be required.

Level of Significance

Less than significant impact

10.6 Energy Consumption

The proposed project would impact energy resources during construction and operation. Energy resources that would be potentially impacted include electricity, natural gas, and petroleum based fuel supplies and distribution systems. This analysis includes a discussion of the potential energy impacts of the proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. A general definition of each of these energy resources are provided below.

Electricity, a consumptive utility, is a man-made resource. The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into energy. The delivery of electricity involves a number of system components, including substations and transformers that lower transmission line power (voltage) to a level appropriate for on-site distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid. Conveyance of electricity through transmission lines is typically responsive to market demands. In 2020, Riverside County consumed 16,858 Gigawatt-hours per year of electricity[4].

Natural gas is a combustible mixture of simple hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas consumed in California is obtained from naturally occurring reservoirs, mainly located outside the State, and delivered through high-pressure transmission pipelines. The natural gas transportation system is a nationwide network and, therefore, resource availability is typically not an issue. Natural gas satisfies almost one-third of the State's total energy requirements and is used in electricity generation, space heating, cooking, water heating, industrial processes, and as a transportation fuel. Natural gas is measured in terms of cubic feet. In 2020, Riverside County consumed 436.94 Million Therms of natural gas[5].

Petroleum-based fuels currently account for a majority of the California's transportation energy sources and primarily consist of diesel and gasoline types of fuels. However, the state has been working on developing strategies to reduce petroleum use. Over the last decade California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and GHG emissions from the transportation sector, and reduce vehicle miles traveled (VMT). Accordingly, petroleum-based fuel consumption in California has declined. In 2017, 1,052 million gallons of gasoline and 148 million gallons of diesel was sold in Riverside County[6].

The following section calculates the potential energy consumption associated with the construction and operations of the proposed project and provides a determination if any energy utilized by the proposed project is wasteful, inefficient, or unnecessary consumption of energy resources.

Construction Energy

The construction activities for the proposed project are anticipated to include demolition of the existing ranch house with barn and associated fencing and facilities for livestock/horses, site preparation and grading of the 10.0 gross acre project site, building construction of the 41 single-family homes, paving of

4 Obtained from: http://www.ecdms.energy.ca.gov/elecbycounty.aspx
5 Obtained from: http://www.ecdms.energy.ca.gov/gasbycounty.aspx
6 Obtained from: https://ww2.energy.ca.gov/almanac/transportation_data/gasoline/

the onsite roads and road improvements to the portion of Orange Street that is adjacent to the project site, and application of architectural coatings.

The proposed project would consume energy resources during construction in three (3) general forms:

1. Petroleum-based fuels used to power off-road construction vehicles and equipment on the project site, construction worker travel to and from the project site, as well as delivery and haul truck trips (e.g. hauling of material to disposal facilities);
2. Electricity associated with the conveyance of water that would be used during project construction for dust control (supply and conveyance) and electricity to power any necessary lighting during construction, electronic equipment, or other construction activities necessitating electrical power; and,
3. Energy used in the production of construction materials, such as asphalt, steel, concrete, pipes, and manufactured or processed materials such as lumber and glass.

Construction-Related Electricity

During construction the proposed project would consume electricity to construct the proposed warehouse and infrastructure. Electricity would be supplied to the project site by Southern California Edison and would be obtained from the existing electrical lines in the vicinity of the project site. The use of electricity from existing power lines rather than temporary diesel or gasoline powered generators would minimize impacts on fuel consumption. Electricity consumed during project construction would vary throughout the construction period based on the construction activities being performed. Various construction activities include electricity associated with the conveyance of water that would be used during project construction for dust control (supply and conveyance) and electricity to power any necessary lighting during construction, electronic equipment, or other construction activities necessitating electrical power. Such electricity demand would be temporary, nominal, and would cease upon the completion of construction. Overall, construction activities associated with the proposed project would require limited electricity consumption that would not be expected to have an adverse impact on available electricity supplies and infrastructure. Therefore, the use of electricity during project construction would not be wasteful, inefficient, or unnecessary.

Since there are currently power lines in the vicinity of the project site, it is anticipated that only nominal improvements would be required to Southern California Edison Utility distribution lines and equipment with development of the proposed project. Compliance with City's guidelines and requirements would ensure that the proposed project fulfills its responsibilities relative to infrastructure installation, coordinates any electrical infrastructure removals or relocations, and limits any impacts associated with construction of the project. Construction of the project's electrical infrastructure is not anticipated to adversely affect the electrical infrastructure serving the surrounding uses or utility system capacity.

Construction-Related Natural Gas

Construction of the proposed project typically would not involve the consumption of natural gas. Natural gas would not be supplied to support construction activities, thus there would be no demand generated by construction. Since there is currently natural gas service in the vicinity of the project site, construction of the proposed project would be limited to installation of new natural gas connections within the project site. Development of the proposed project would likely not require extensive infrastructure improvements to serve the project site. Construction-related energy usage impacts associated with the installation of natural gas connections are expected to be confined to trenching in order to place the lines

below surface. In addition, prior to ground disturbance, the proposed project would notify and coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service. Therefore, construction-related impacts to natural gas supply and infrastructure would be less than significant.

Construction-Related Petroleum Fuel Use

Petroleum-based fuel usage represents the highest amount of transportation energy potentially consumed during construction, which would be utilized by both off-road equipment operating on the project site and on-road automobiles transporting workers to and from the project site and on-road trucks transporting equipment and supplies to the project site.

The off-road construction equipment fuel usage was calculated through use of the off-road equipment assumptions and fuel use assumptions shown above in Section 8.2, which found that construction of the proposed project would consume 15,057 gallons of gasoline and 67,935 gallons of diesel fuel. This equates to 0.001 percent of the gasoline and 0.05 percent of the diesel used annually in Riverside County. As such, the construction-related petroleum use would be nominal, when compared to current county-wide petroleum usage rates.

Construction activities associated with the proposed project would be required to adhere to all State and SCAQMD regulations for off-road equipment and on-road trucks, which provide minimum fuel efficiency standards. As such, construction activities for the proposed project would not result in the wasteful, inefficient, and unnecessary consumption of energy resources. Impacts regarding transportation energy would be less than significant. Development of the project would not result in the need to manufacture construction materials or create new building material facilities specifically to supply the proposed project. It is difficult to measure the energy used in the production of construction materials such as asphalt, steel, and concrete, it is reasonable to assume that the production of building materials such as concrete, steel, etc., would employ all reasonable energy conservation practices in the interest of minimizing the cost of doing business.

Operational Energy

The on-going operation of the proposed project would require the use of energy resources for multiple purposes including, but not limited to, heating/ventilating/air conditioning (HVAC), refrigeration, lighting, appliances, and electronics. Energy would also be consumed during operations related to water usage, solid waste disposal, landscape equipment and vehicle trips.

Operations-Related Electricity

Operation of the proposed project would result in consumption of electricity at the project site. As detailed above in Section 8.2 the proposed project would consume 53,083 kilowatt-hours per year of electricity. This equates to 0.0003 percent of the electricity consumed annually in the County of Riverside. As such, the operations-related electricity use would be nominal, when compared to current electricity usage rates in the County.

It should be noted that the proposed project will be required to meet the 2019 Title 24, Part 6 building energy efficiency standards that have been developed to meet the State's goal of zero-net-energy use for new homes. The zero net energy use will be achieved through a variety of measures to make new homes more energy efficient and by also requiring installation of photovoltaic systems of adequate size to generate enough electricity to meet the zero-net energy use standard. The size of the PV system required

for the project pursuant to the 2019 Title 24 standards was calculated above in Section 8.1, which found that the proposed project would need to install at least 112.4 Kilowatts of photovoltaic panels within the proposed project. Although, the CalEEMod model found that with implementation of the 2019 Title 24 Part 6 standards, that the proposed project would continue to utilize a nominal amount of power, it should be noted that the electricity usage and emission rates utilized by the CalEEMod model are based on regional average usage rates for existing homes, which were not all built to the most current Title 24 Part 6, standards, so the CalEEMod model provides a conservative or worst-case analysis of electricity use from the proposed project. Therefore, it is anticipated the proposed project will be designed and built to minimize electricity use and that existing and planned electricity capacity and electricity supplies would be sufficient to support the proposed project's electricity demand. Thus, impacts with regard to electrical supply and infrastructure capacity would be less than significant and no mitigation measures would be required.

Operations-Related Natural Gas

Operation of the proposed project would result in increased consumption of natural gas at the project site. As detailed above in Section 8.2 the proposed project would consume 1,160 MBTU per year of natural gas. This equates to 0.003 percent of the natural gas consumed annually in Riverside County. As such, the operations-related natural gas use would be nominal, when compared to current natural gas usage rates in the County.

It should be noted that, the proposed project would comply with all Federal, State, and City requirements related to the consumption of natural gas, that includes CCR Title 24, Part 6 *Building Energy Efficiency Standards* and CCR Title 24, Part 11: *California Green Building Standards.* The CCR Title 24, Part 6 and Part 11 standards require numerous energy efficiency measures to be incorporated into the proposed warehouse, including enhanced insulation as well as use of efficient natural gas appliances and HVAC units. Therefore, it is anticipated the proposed project will be designed and built to minimize natural gas use and that existing and planned natural gas capacity and natural gas supplies would be sufficient to support the proposed project's natural gas demand. Thus, impacts with regard to natural gas supply and infrastructure capacity would be less than significant and no mitigation measures would be required

Operations-Related Vehicular Petroleum Fuel Usage

Operation of the proposed project would result in increased consumption of petroleum-based fuels related to vehicular travel to and from the project site. As detailed above in Section 8.2 the proposed project would consume 46,681 gallons of gasoline per year from vehicle travel. This equates to 0.004 percent of the gasoline consumed annually in Riverside County. As such, the operations-related petroleum use would be nominal, when compared to current county-wide petroleum usage rates.

It should be noted that, the proposed project would comply with all Federal, State, and City requirements related to the consumption of transportation energy that includes California Code of Regulations Title 24, Part 10 California Green Building Standards that require that all new garages to install electrical panels of adequate size to support the installation of electric vehicle charging systems. Therefore, it is anticipated the proposed project will be designed and built to minimize transportation energy through the promotion of the use of electric-powered vehicles and it is anticipated that existing and planned capacity and supplies of transportation fuels would be sufficient to support the proposed project's demand. Thus, impacts with regard transportation energy supply and infrastructure capacity would be less than significant and no mitigation measures would be required.

In conclusion, the proposed project would comply with regulatory compliance measures outlined by the State and City related to Air Quality, GHG Emissions, Transportation/Circulation, and Water Supply. Additionally, the proposed project would be constructed in accordance with all applicable City Building and Fire Codes. Therefore, the proposed project would not result in the wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation. Impacts would be less than significant.

Level of Significance

Less than significant impact.

10.7 Energy Plan Consistency

The proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. The applicable energy plan for the proposed project is the General Plan (City of Eastvale, 2012). The proposed project's consistency with the applicable energy-related policies in the General Plan are shown in Table Q.

Table Q – Proposed Project Compliance with Applicable General Plan Energy Policies

Policy No.	General Plan Policy	Proposed Project Implementation Actions
AQ-26	Permit and encourage the use of passive solar devices and other state-of-the-art energy conservation measures.	**Consistent.** The proposed homes are required to be designed to meet Title 24 Part 6 Energy Efficiency Standards that require all new homes to be designed to be net zero energy usage that is achieved through the installation of rooftop PV solar panels, which is a type of passive solar.
AQ-27	Support and encourage voluntary efforts to provide active and passive solar access opportunities in new development.	**Consistent.** As detailed above, the proposed homes will include rooftop PV solar panels.
AQ-28	The City encourages energy-efficient materials and systems, including shade design technologies, for buildings.	**Consistent.** The Landscape Plan for the proposed project has been designed to place trees to provide shade on the buildings and parking areas.
AQ-31	The City encourages urban design measures that support alternatives to private automobile use.	**Consistent.** The proposed project has been designed with a sidewalk system that connects to the existing sidewalks on Orange Street, in order to promote a walkable community.
AQ-32	Utilize source reduction, recycling, and other appropriate measures to reduce the amount of solid waste disposed of in landfills.	**Consistent.** Trash service provided for the proposed project will be required to meet the recycling requirements detailed in AB 341 that requires 75 percent of waste diverted from landfills. Specifically, each home will be provided separate bins for trash and recycling.
AQ-33	The City encourages the incorporation of energy-efficient design elements beyond code requirements, including appropriate site orientation and the use of shade and windbreak trees to reduce fuel consumption for heating and cooling.	**Consistent.** As detailed above, the proposed project will be designed to incorporate shade trees and rooftop PV solar panels. The proposed project will exceed the Title 24 Part 6 minimum requirements.
AQ-34	The City shall review all development proposals to ensure that all services and utilities can be	**Consistent.** The proposed project is required to obtain "will serve" letters from all utility providers in

Policy No.	General Plan Policy	Proposed Project Implementation Actions
	provided in an energy-efficient and effective manner.	order to ensure that the utilities can be provided in an effective manner.
AQ-36	The City shall support the inclusion of energy-efficient design and renewable energy technologies in public and private projects.	**Consistent.** As detailed above, the proposed homes will include rooftop PV solar systems and will be designed to meet the most current Title 24 Part 6 Energy Efficiency Standards.

Source: City of Eastvale, 2012.

As shown in Table Q, the proposed project would be consistent with all applicable energy-related policies from the General Plan. Therefore, the proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Impacts would be less than significant.

Level of Significance

Less than significant impact.

10.8 Generation of Greenhouse Gas Emissions

The proposed project would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. The proposed project would consist of the development of a residential development with 41 single-family homes. The proposed project is anticipated to generate GHG emissions from area sources, energy usage, mobile sources, waste disposal, water usage, and construction equipment. The project's GHG emissions have been calculated with the CalEEMod model based on the construction and operational parameters detailed in Section 7.1 above. A summary of the results is shown below in Table R and the CalEEMod model run annual printouts are provided in Appendix F.

Table R – Project Related Greenhouse Gas Annual Emissions

	Greenhouse Gas Emissions (Metric Tons per Year)			
Category	**CO_2**	**CH_4**	**N_2O**	**CO_2e**
Area Sources[1]	0.69	<0.01	0.00	0.71
Energy Usage[2]	71.30	<0.01	<0.01	71.72
Mobile Sources[3]	429.05	0.02	0.02	435.88
Solid Waste[4]	4.87	0.29	0.00	12.07
Water and Wastewater[5]	9.85	0.07	<0.01	12.13
Construction[6]	24.48	<0.01	<0.01	24.78
Total Emissions	540.25	0.39	0.02	**557.29**
SCAQMD Draft Threshold				**3,000**
Exceed Threshold?				**No**

Notes:
[1] Area sources consist of GHG emissions from consumer products, architectural coatings, and landscaping equipment.
[2] Energy usage consists of GHG emissions from electricity and natural gas usage.
[3] Mobile sources consist of GHG emissions from vehicles.
[4] Waste includes the CO_2 and CH_4 emissions created from the solid waste placed in landfills.
[5] Water includes GHG emissions from electricity used for transport of water and processing of wastewater.
[6] Construction emissions amortized over 30 years as recommended in the SCAQMD GHG Working Group on November 19, 2009.
Source: CalEEMod Version 2020.4.0.

The data provided in Table R shows that the proposed project would create 557.29 $MTCO_2e$ per year. According to the SCAQMD draft threshold of significance detailed above in Section 9.5, a cumulative global climate change impact would occur if the GHG emissions created from the on-going operations would exceed 3,000 $MTCO_2e$ per year. Therefore, a less than significant generation of greenhouse gas emissions would occur from development of the proposed project. Impacts would be less than significant.

Level of Significance

Less than significant impact.

10.9 Greenhouse Gas Plan Consistency

The proposed project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing GHG emissions. The applicable plan for the proposed project is the General Plan (City of Eastvale, 2012). The proposed project's consistency with the applicable GHG-related policies in the General Plan are shown in Table S.

Table S – Proposed Project Compliance with Applicable General Plan GHG Policies

Policy No.	General Plan Policy	Proposed Project Implementation Actions
AQ-18	Support local, regional, and statewide efforts to reduce emissions of greenhouse gases linked to climate change.	**Consistent.** The proposed homes are required to be designed to meet Title 24 Part 6 Energy Efficiency Standards that require all new homes to be designed to be net zero energy usage that is achieved through the installation of rooftop PV solar panels, which will minimize the usage of carbon energy sources.
AQ-19	Analyze and mitigate, to the extent feasible, potentially significant increases in greenhouse gas emissions during project review, pursuant to the California Environmental Quality Act.	**Consistent.** As detailed above in Section 10.8, the proposed project was found to create less than significant levels of GHG emissions.
AQ-20	Continue to support the planting and maintenance of trees in the community to increase carbon sequestration.	**Consistent.** The Landscape Plan for the proposed project has been designed to incorporate as many trees as possible within the proposed project.

Source: City of Eastvale, 2012.

As shown in Table S, the proposed project would be consistent with all applicable GHG-related policies from the General Plan. In addition, as detailed above Section 10.8, the proposed project is anticipated to create 557.29 $MTCO_2e$ per year, which is well below the SCAQMD draft threshold of significance of 3,000 $MTCO_2e$ per year. The SCAQMD developed this threshold through a Working Group, which also developed detailed methodology for evaluating significance under CEQA. At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that provides a quantitative annual threshold of 3,000 $MTCO_2e$ for all land use type projects, which was based on substantial evidence supporting the use of the recommended thresholds. Therefore, the proposed project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases

Level of Significance

Less than significant impact.

APPENDIX A

CalEEMod Model Daily Printouts

Magnolia Ranch Residential - Riverside-South Coast County, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Magnolia Ranch Residential

Riverside-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	2.11	Acre	2.11	91,911.60	0
Other Non-Asphalt Surfaces	1.11	Acre	1.11	48,351.60	0
City Park	0.51	Acre	0.51	22,215.60	0
Single Family Housing	41.00	Dwelling Unit	6.27	136,598.00	117

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	390.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Site = 10 gross acres

Construction Phase -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Grading: 2 Excavators, 1 Grader, 1 Rubber Tired Dozer, 2 Scrapers & 2 Crawler Tractors

Off-road Equipment -

Off-road Equipment - Site Preparation: 3 Rubber Tired Dozers & 4 Crawler Tractors

Trips and VMT - 6 vendor trips added to Demo, Site Prep and Grading phases to account for water truck emissions

Magnolia Ranch Residential - Riverside-South Coast County, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Demolition - Demo - 6,700 sq ft of Building = 308 tons + 8,000 sq ft of pavement = 193 tons. Total 502 tons of demo.

Grading - Grading - Import of 5,000 cu yds of dirt

Vehicle Trips - Weekday trip rate set to match TIA of 388 daily trips. City Park set to zero.

Woodstoves - No woodstoves or fireplaces

Construction Off-road Equipment Mitigation - Water Exposed Area 3x per day and Replace Ground Cover selected to account for SCAQMD Rule 403 Minimum requirements

Mobile Land Use Mitigation - Improve Pedestrian Network onsite and connecting offsite.

Energy Mitigation - 273,468 kWh generated from solar PV panels

Water Mitigation - Install low-flow fixtures and use water-efficient irrigation selected to account for Title 24 Part 11 min requirements

Waste Mitigation - 50% reduction in waste selected to account for AB 341

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	2.11	Acre	2.11	91,911.60	0
Other Non-Asphalt Surfaces	1.11	Acre	1.11	48,351.60	0
City Park	0.51	Acre	0.51	22,215.60	0
Single Family Housing	41.00	Dwelling Unit	6.27	136,598.00	117

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	390.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Site = 10 gross acres

Construction Phase -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Grading: 2 Excavators, 1 Grader, 1 Rubber Tired Dozer, 2 Scrapers & 2 Crawler Tractors

Off-road Equipment -

Off-road Equipment - Site Preparation: 3 Rubber Tired Dozers & 4 Crawler Tractors

Trips and VMT - 6 vendor trips added to Demo, Site Prep and Grading phases to account for water truck emissions

Magnolia Ranch Residential - Riverside-South Coast County, Winter

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Demolition - Demo - 6,700 sq ft of Building = 308 tons + 8,000 sq ft of pavement = 193 tons. Total 502 tons of demo.

Grading - Grading - Import of 5,000 cu yds of dirt

Vehicle Trips - Weekday trip rate set to match TIA of 388 daily trips. City Park set to zero.

Woodstoves - No woodstoves or fireplaces

Construction Off-road Equipment Mitigation - Water Exposed Area 3x per day and Replace Ground Cover selected to account for SCAQMD Rule 403 Minimum requirements

Mobile Land Use Mitigation - Improve Pedestrian Network onsite and connecting offsite.

Energy Mitigation - 273,468 kWh generated from solar PV panels

Water Mitigation - Install low-flow fixtures and use water-efficient irrigation selected to account for Title 24 Part 11 min requirements

Waste Mitigation - 50% reduction in waste selected to account for AB 341

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2024
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	390.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Site = 10 gross acres

Construction Phase -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - Grading: 2 Excavators, 1 Grader, 1 Rubber Tired Dozer, 2 Scrapers & 2 Crawler Tractors

Off-road Equipment -

Off-road Equipment - Site Preparation: 3 Rubber Tired Dozers & 4 Crawler Tractors

Trips and VMT - 6 vendor trips added to Demo, Site Prep and Grading phases to account for water truck emissions

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Demolition - Demo - 6,700 sq ft of Building = 308 tons + 8,000 sq ft of pavement = 193 tons. Total 502 tons of demo.

Grading - Grading - Import of 5,000 cu yds of dirt

Vehicle Trips - Weekday trip rate set to match TIA of 388 daily trips. City Park set to zero.

Woodstoves - No woodstoves or fireplaces

Construction Off-road Equipment Mitigation - Water Exposed Area 3x per day and Replace Ground Cover selected to account for SCAQMD Rule 403 Minimum requirements

Mobile Land Use Mitigation - Improve Pedestrian Network onsite and connecting offsite.

Energy Mitigation - 273,468 kWh generated from solar PV panels

Water Mitigation - Install low-flow fixtures and use water-efficient irrigation selected to account for Title 24 Part 11 min requirements

Waste Mitigation - 50% reduction in waste selected to account for AB 341

SECTION 1: INTRODUCTION

FirstCarbon Solutions (FCS) prepared this Biological Resources Assessment (BRA) for the Eastvale Orange Street Residential Development Project (proposed project). The purpose of the BRA is to (1) document existing and potentially occurring biological resources on the project site and adjacent areas; (2) analyze potential project-related impacts on regulated biological resources; (3) summarize relevant local, State, and federal regulations; and (4) recommend appropriate measures to mitigate potential impacts on biological resources to less-than-significant levels.

1.1 - Project Location

The proposed project site is 10 gross acres (8.28 net acres) in size and located at 13175 Orange Street, in the City of Eastvale, in Riverside County, California (Exhibit 1). The project site is located south of Schleisman Road, approximately 1.25 miles west of Interstate 15 (I-15), and approximately 1.5 miles north of the Santa Ana River (Exhibit 2). Regional access to the project parcel is provided by I-15, which is located approximately 1.22 miles east of the project site, and local access is provided by Schleisman Road and Orange Street. The site consists of Assessor's Parcel Number (APN) 152-040-003, and is located within the *Corona North, California* United States Geological Survey (USGS) 7.5-minute Topographic Quadrangle Map.

1.2 - Project Description

MLC Holdings Inc. (Client) is proposing to develop a residential development community, consisting of 41 single-family detached homes on 8.28 acres for a density of 4.95 dwelling units per acre (du/acre). The homes would range from 2,054 square feet to 3,153 square feet in size and consist of 11 one-story homes with four bedrooms and 30 two-story homes with five bedrooms and a loft. The proposed project would include vehicular access from Schleisman Road and secondary access from Orange Street. The proposed project would provide two garage spaces and two driveway spaces per dwelling unit, for a total of 164 spaces, as well as an additional 59 parallel street parking spaces. A 45-foot-wide paseo would be located in the center of the community that would consist of a trail, bench, and dog station that would be maintained by the Homeowner's Association (HOA).

SECTION 2: REGULATORY SETTING

2.1 - Federal

2.1.1 - Endangered Species Act

The United States Fish and Wildlife Service (USFWS) has jurisdiction over species listed as threatened or endangered under the Federal Endangered Species Act (FESA). Section 9 of FESA protects listed species from "take," which is broadly defined as actions taken to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." FESA protects threatened and endangered plants and animals and their critical habitat. Candidate species are those proposed for listing; these species are usually treated by resource agencies as if they were actually listed during the environmental review process.

2.1.2 - Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) implements international treaties between the United States and other nations devised to protect migratory birds, their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit. All migratory birds and their nests are protected from take and other impacts under the MBTA (16 United States Code [USC] § 703, *et seq*.).

2.1.3 - Bald and Golden Eagle Protection Act

The golden eagle (*Aquila chrysaetos*) and bald eagle (*Haliaeetus leucocephalus*) are afforded additional protection under the Eagle Protection Act, amended in 1973 (16 USC § 669, *et seq*.) and the Bald and Golden Eagle Protection Act (16 USC §§ 668–668d).

2.1.4 - Clean Water Act

Section 404

The United States Army Corps of Engineers (USACE) administers Section 404 of the federal Clean Water Act (CWA), which regulates the discharge of dredge and fill material into waters of the United States. The USACE has established a series of nationwide permits that authorize certain activities in waters of the United States if a proposed activity can demonstrate compliance with standard conditions. Normally, the USACE requires an individual permit for an activity that will affect an area equal to or greater than 0.5 acre or greater than 0.5 acre of waters of the United States. A project that results in impacts to less than 0.5 acre of waters of the United States can normally be conducted pursuant to one of the nationwide permits if it is consistent with the standard permit conditions. The USACE also has discretionary authority to require an Environmental Impact Statement for projects that result in impacts to between 0.1 and 0.5 acre. Use of any nationwide permit is contingent on the activities having no impacts on endangered species.

Section 401

As stated in Section 401 of the CWA, "any applicant for a federal permit for activities that involve a discharge to waters of the State, shall provide the federal permitting agency a certification from the State in which the discharge is proposed that states that the discharge will comply with the applicable provisions under the Federal Clean Water Act." Therefore, before the USACE will issue a Section 404 permit, applicants must apply for and receive a Section 401 Water Quality Certification from the Regional Water Quality Control Board (RWQCB).

2.2 - State

2.2.1 - CEQA Guidelines

The following California Environmental Quality Act (CEQA) Guidelines Appendix G checklist questions serve as thresholds of significance when evaluating the potential impacts of a proposed project on biological resources. Impacts are considered significant if a project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as being a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or USFWS.
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the CDFW or USFWS.
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan.

2.2.2 - California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to FESA but pertains to State-listed endangered and threatened species. CESA requires State agencies to consult with the CDFW when preparing CEQA documents to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code [FGC] § 2080). CESA directs agencies to consult with the CDFW on projects or actions that could affect listed species, directs the CDFW to determine whether jeopardy would occur, and allows the CDFW to identify

"reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows the CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (FGC § 2081).

2.2.3 - California Fish and Game Code

Under CESA, the CDFW has the responsibility for maintaining a list of endangered and threatened species (FGC § 2070). Fish and Game Code Sections 2050 through 2098 outline the protection provided to California's rare, endangered, and threatened species. Fish and Game Code Section 2080 prohibits the taking of plants and animals listed under the CESA. Fish and Game Code Section 2081 established an incidental take permit program for state-listed species. The CDFW maintains a list of "candidate species," which it formally notices as being under review for addition to the list of endangered or threatened species.

In addition, the Native Plant Protection Act of 1977 (NPPA) (FGC § 1900, *et seq*.) prohibits the taking, possessing, or sale within the State of any plants with a State designation of rare, threatened, or endangered (as defined by the CDFW). An exception to this prohibition in the NPPA allows landowners, under specified circumstances, to take listed plant species, provided that the owners first notify CDFW and give the agency at least 10 days to come and retrieve (and presumably replant) the plants before they are plowed under or otherwise destroyed. Fish and Game Code Section 1913 exempts from "take" prohibition "the removal of endangered or rare native plants from a canal, lateral ditch, building site, or road, or other right of way." Project impacts to these species are not considered significant unless the species are known to have a high potential to occur within the area of disturbance associated with construction of the proposed project.

In addition to formal listing under FESA and CESA, some species receive additional consideration by the CDFW and local lead agencies during the CEQA process. Species that may be considered for review are those listed as a "Species of Special Concern." The CDFW maintains lists of "Species of Special Concern" that serve as species "watch lists." Species with this status may have limited distributions or limited populations, and/or the extent of their habitats has been reduced substantially, such that their populations may be threatened. Thus, their populations are monitored, and they may receive special attention during environmental review. While they do not have statutory protection, they may be considered rare under CEQA and specific protection measures may be warranted. In addition to Species of Special Concern, the CDFW Special Animals List identifies animals that are tracked by the California Natural Diversity Database (CNDDB) and may be potentially vulnerable but warrant no federal interest and no legal protection.

Sensitive species that would qualify for listing but are not currently listed are afforded protection under CEQA. CEQA Guidelines Section 15065 (Mandatory Findings of Significance) requires that a substantial reduction in numbers of a rare or endangered species be considered a significant effect. CEQA Guidelines Section 15380 (Rare or Endangered Species) provides for the assessment of unlisted species as rare or endangered under CEQA if the species can be shown to meet the criteria for listing. Unlisted plant species on the California Native Plant Society (CNPS) List ranked 1A, 1B, and 2 would typically require evaluation under CEQA.

Fish and Game Code Sections 3500 to 5500 outline protection for fully protected species of mammals, birds, reptiles, amphibians, and fish. Species that are fully protected by these sections may not be taken or possessed at any time. The CDFW cannot issue permits or licenses that authorize the take of any fully protected species, except under certain circumstances such as scientific research and live capture and relocation of such species pursuant to a permit for the protection of livestock.

Under Fish and Game Code Section 3503.5, it is unlawful to take, possess, or destroy any birds in the orders of *Falconiformes* or *Strigiformes* (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto. To comply with the requirements of CESA, an agency reviewing a proposed project within its jurisdiction must determine whether any state-listed endangered or threatened species may be present in the project study area and determine whether the proposed project will have a potentially significant impact on such species. In addition, the CDFW encourages informal consultation on any proposed project that may impact a candidate species.

Project-related impacts to species on the CESA endangered or threatened list would be considered significant. State-listed species are fully protected under the mandates of CESA. "Take" of protected species incidental to otherwise lawful management activities may be authorized under Fish and Game Code Section 206.591. Authorization from the CDFW would be in the form of an Incidental Take Permit.

Fish and Game Code Section 1602 requires any entity to notify the CDFW before beginning any activity that "may substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of any river, stream, or lake" or "deposit debris, waste, or other materials that could pass into any river, stream, or lake." "River, stream, or lake" includes waters that are episodic and perennial and ephemeral streams, desert washes, and watercourses with a subsurface flow. A Lake or Streambed Alteration Agreement will be required if the CDFW determines that project activities may substantially adversely affect fish or wildlife resources through alterations to a covered body of water.

2.2.4 - California Porter-Cologne Water Quality Control Act

The RWQCB regulates actions that would involve "discharging waste, or proposing to discharge waste, within any region that could affect the water of the State" (Water Code § 13260(a)), pursuant to provisions of the Porter-Cologne Water Quality Act. "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the State" (Water Code § 13050(e)).

2.2.5 - California Native Plant Society

The CNPS maintains a rank of plant species that are native to California and that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Vascular Plants of California. Following are the definitions of the CNPS ranks:

- **Rank 1A:** Plants presumed Extinct in California
- **Rank 1B:** Plants Rare, Threatened, or Endangered in California and elsewhere
- **Rank 2A:** Plants presumed extirpated in California but common elsewhere
- **Rank 2B:** Plants rare, threatened, or endangered in California but more common elsewhere
- **Rank 3:** Plants about which we need more information—A Review List
- **Rank 4:** Plants of limited distribution—A Watch List

Potential impacts to populations of CNPS ranked plants receive consideration under CEQA review. All plants appearing on the CNPS List ranked 1 or 2 are considered to meet the CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, potential impacts to these species or their habitats should be analyzed during the preparation of environmental documents pursuant to CEQA, as they may meet the definition of Rare or Endangered under the CEQA Guidelines Section 15380 criteria.

2.2.6 - Regional and Local

Western Riverside County Multiple Species Habitat Conservation Plan

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is a comprehensive, multi-jurisdictional HCP focusing on conservation of species and their associated habitats in Western Riverside County. The MSHCP Plan Area encompasses approximately 1.26 million acres (1,966 square miles); it includes all unincorporated Riverside County land west of the crest of the San Jacinto Mountains to the Orange County line, as well as the jurisdictional areas of the cities of Temecula, Murrieta, Lake Elsinore, Canyon Lake, Norco, Corona, Riverside, Moreno Valley, Banning, Beaumont, Calimesa, Perris, Hemet, and San Jacinto. The MSHCP serves as an HCP pursuant to Section 10(a)(1)(B) of FESA, as well as a Natural Community Conservation Plan (NCCP) under the NCCP Act of 2001. The MSHCP allows the participating jurisdictions to authorize "take" of plant and wildlife species identified within the Plan Area. The USFWS and CDFW have authority to regulate the take of Threatened, Endangered, and rare Species. Under the MSHCP, these agencies may grant "Take Authorization" for otherwise lawful actions–such as public and private development that may incidentally take or harm individual species or their habitat outside of the MSHCP Conservation Area–in exchange for the assembly and management of a coordinated MSHCP Conservation Area.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 3: METHODS

3.1 - Literature Review

This literature review provides a baseline from which to evaluate project impacts on biological resources potentially occurring on the project site and in the surrounding area.

3.1.1 - Existing Documentation

This report was based on the result of a previous due diligence memorandum prepared for the project site on February 10, 2021, by FCS. As part of the literature review, an FCS Biologist also examined existing environmental documentation for the project site and vicinity including literature pertaining to the habitat requirements of special-status species with the potential to occur in the project vicinity; and federal register listings, protocols, and species data provided by the USFWS and CDFW.

3.1.2 - Topographic Maps and Aerial Photographs

An FCS Biologist reviewed current USGS 7.5-minute topographic quadrangle map(s)and aerial photographs as a preliminary analysis of the existing conditions within the project site and immediate vicinity.[1] Information obtained from the topographic maps included elevation, general watershed information, and potential drainage feature locations using Google Earth in conjunction with the United States Environmental Protection Agency (EPA) Watershed Assessment, Tracking, and Environmental Results System (WATERS).[2] Aerial photographs provided a perspective of the current site conditions relative to on-site and off-site land use, plant community locations, and potential locations of wildlife movement corridors.

3.1.3 - Soil Surveys

The United States Department of Agriculture (USDA) has published soil surveys that describe the soil series (i.e., group of soils with similar profiles) occurring within a particular area.[3] These profiles include major horizons with similar thickness, arrangement, and other important characteristics. These series are further subdivided into soil mapping units that provide specific information regarding soil characteristics. Many special-status plant species have a limited distribution based exclusively on soil type. Therefore, pertinent USDA soil survey maps were reviewed to determine the existing soil mapping units within the project site and to establish whether the soil conditions on-site are suitable for any special-status plant species.

3.1.4 - Special-status Species Database Search

An FCS Biologist compiled a list of threatened, endangered, and otherwise special-status species previously recorded within the project vicinity based on a search of the CNDDB and the CNPS Electronic Inventory (CNPSEI) of Rare and Endangered Vascular Plants of California for the *Corona North, California,* USGS 7.5-minute Topographic Quadrangle Map and the eight surrounding quadrangles.[4,5]

The CNDDB Biogeographic Information and Observation System (BIOS 5) database was used to determine the distance between the known occurrences of special-status species and the project site.[6]

3.1.5 - Trees

Prior to conducting the reconnaissance-level field survey, an FCS Biologist reviewed applicable City and County ordinances pertaining to tree preservation and protection and ascertained whether tree replacement measures or permits for the removal of protected trees are required.

3.1.6 - Jurisdictional Waters and Wetlands

Prior to conducting the reconnaissance-level survey, an FCS Biologist reviewed EPA WATERS and aerial photography to identify potential natural drainage features and water bodies.[7] In general, all surface drainage features identified as blue-line streams on USGS maps and linear patches of vegetation are expected to exhibit evidence of flows and considered potentially subject to state and federal regulatory authority as waters of the United States and/or State. A preliminary assessment was conducted to determine the location of any existing drainages and limits of project-related grading activities, to aid in determining whether a formal delineation of waters of the United States or State is necessary.

3.1.7 - Western Riverside County Multiple Species Habitat Conservation Plan

Prior to conducting the reconnaissance-level survey, an FCS Biologist reviewed the Western Riverside County Regional Riverside Conservation Authority (RCA) MSHCP Information Map in order to determine what biological constraints are applicable to the proposed project.[8]

3.2 - Field Survey

An FCS Biologist conducted a reconnaissance-level field survey of the field site, and took notes on general site conditions, vegetation, and suitability of habitat for various special-status elements. Site photographs are provided in Appendix A. A preliminary assessment was conducted to determine the location of any existing drainages and the limits of project-related grading activities, to aid in determining whether a formal delineation of waters of the United States or State is necessary.

3.2.1 - Vegetation

An FCS Biologist identified common plant species observed during the reconnaissance-level survey based on visual characteristics and morphology and recorded their observations in a field notebook. Uncommon and fewer familiar plants were identified with the use of taxonomical guides, including Jepson eFlora and Calflora.[9,10] Taxonomic nomenclature used in this study follows The Jepson Manual: Vascular Plants of California.[11] Common plant names, when not available from The Jepson Manual, were taken from other regionally specific references. Vegetation types and boundaries were noted on aerial photos, verified through field observation, and digitized using ESRI ArcGIS software® ArcMap 10.8. By incorporating collected field data and interpreting aerial photography, a map of habitat types, land cover types, and other biological resources within the project site was prepared. Vegetation community and land cover types used to help classify habitat types are based on the Manual of California Vegetation (MCV) and cross-referenced with the CDFW Natural Communities List.[12,13]

3.2.2 - Wildlife

Wildlife species detected during the reconnaissance-level survey by sight, calls, tracks, scat, or other signs were recorded. Notations were made regarding suitable habitat for those special-status species determined to have the potential to occur within the project site.[14] Appropriate field guides were used to assist in species identification during surveys, such as Peterson, Reid, and Stebbins.[15,16,17] Online resources such as eBird and California Herps were also consulted, as necessary. 3.2.3 - Wildlife Movement Corridors

Wildlife movement corridors link areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. Urbanization and the resulting fragmentation of open space areas create isolated “islands” of wildlife habitat, forming separated populations. Corridors act as an effective link between populations.

The project site was evaluated for evidence of a wildlife movement corridor during the reconnaissance-level survey. The scope of the biological resource assessment did not include a formal wildlife movement corridor study utilizing track plates, camera stations, scent stations, or snares. Rather, the focus of this study was to determine whether a change in land use at the project site could have significant impacts on the regional movement of wildlife. Conclusions are based on the information compiled during the literature review, including aerial photographs, USGS topographic maps and resource maps for the vicinity; the field survey; and professional experience with the desired topography, habitat, and resource requirements of the special-status species potentially utilizing the project site and vicinity.

SECTION 4: RESULTS

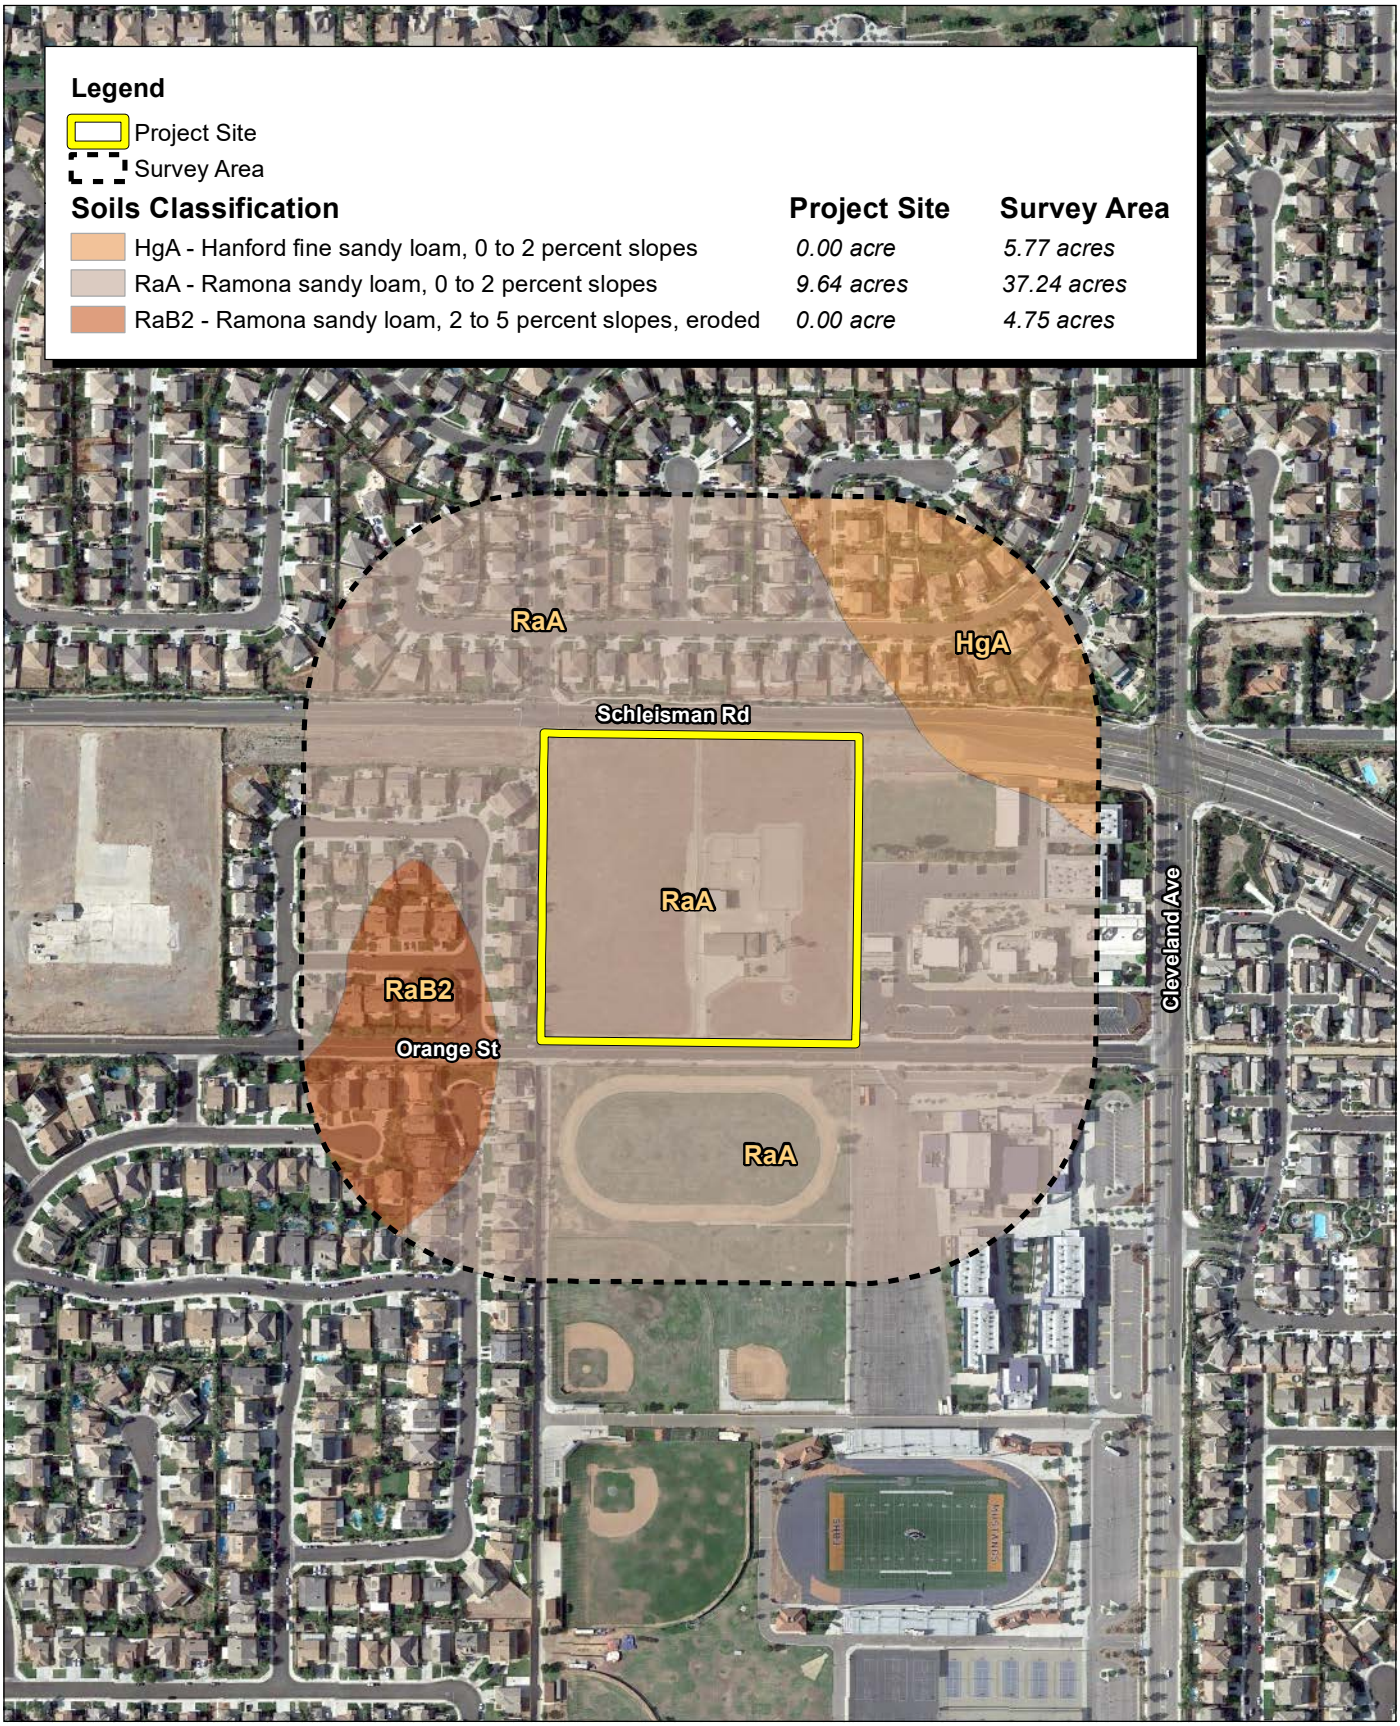
This section summarizes the results of the literature search, database review, as well as three consecutive botanical and wildlife field surveys conducted by FCS Biologist, Alec Villanueva, on January 19, 2021. Weather conditions during the field survey were sunny and clear, with an approximate temperature of 62°F (degrees Fahrenheit). Wind speeds averaged 22 miles per hour (mph).

4.1 - Environmental Setting

Existing development on the project site includes a ranch-style single-family home. The property includes a large driveway and a front yard south of the main structure as well as an open-faced barn and several corrals located north of the main structure. Fenced fallow pastures dominate most of the property, presumably for grazing livestock. The vegetation found in these areas consists of low-growing ruderal vegetation and non-native grasses. The fields show evidence of frequent disturbance from mowing, evidenced by tire tracks and vegetation that does not exceed more than a few inches in height. The project site is surrounded by urban development in all directions, including single-family residential homes located to north and west, and an elementary school and an intermediate school located to the east and south, respectively (Exhibit 2; Attachment A).

4.1.1 - Topography

Topography within the study area is generally flat and ranges in elevation from approximately 610 to 620 feet above mean sea level, with the high point in the northeast corner generally sloping toward the southwest corner.



4.1.2 - Soils

Soils on the site are mapped by the NRCS as Ramona sandy loam (Exhibit 4).[20] Ramona Series soils can be found mostly in the interior valleys of Central California and the western part of Southern California. Ramona Series soils are formed in alluvium derived mostly from granitic and related rock sources. Ramona Series soils are typically well-drained with moderately-slow permeability and are also slightly acidic. This soil type is used mostly for the production of grain, grain-hay, pasture, irrigated citrus, olives, truck crops, and deciduous fruits. Uncultivated areas often have a cover of annual grasses, forbs, chamise, or chaparral vegetation.[21]

4.2 - Vegetation Communities and Land Cover

4.2.1 - Ruderal/Disturbed–8.10 Acres

Ruderal/Disturbed habitat is classified as areas that have been physically disturbed by previous legal human activity, and which are no longer recognizable as a native or naturalized vegetation association, but which continue to retain a soil substrate. Vegetation, if present, is typically composed of non-native plant species such as ornamentals or ruderal exotic species that take advantage of disturbance, or show signs of past or present animal usage that precludes them from providing viable natural habitat for uses other than dispersal.

Examples of disturbed land include areas that have been graded or repeatedly cleared for fuel management purposes, as well as areas that have experienced repeated use that prevents natural revegetation (i.e., dirt parking lots, trails that have been present for several decades), recently graded firebreaks, graded construction pads, construction staging areas, off-road vehicle trails, and old home-sites. Common species typically associated with the ruderal/disturbed vegetation community include Russian thistle (*Salsola tragus*), telegraph weed (*Heterotheca grandiflora*), sow thistle (*Sonchus oleraceus*), common horseweed (*Conyza canadensis*), and a sub-dominance of non-native grasses.

The majority of the project site consists of ruderal fields, formerly used for pasturing livestock. The vegetation on the site shows evidence of recent mowing. Species observed on-site included redstem filaree (*Erodium cicutarium*), pineapple weed (*Matricaria discoidea*), cheeseweed (*Malva parviflora*), turkey mullein (*Croton setiger*), common horseweed, and Russian thistle. Non-native grasses observed included foxtail barley (*Hordeum jubatum*) and Mediterranean grass (*Schismus barbatus*) (Exhibit 5; Attachment A).

4.2.2 - Urban/Developed–1.55 Acres

Developed land is characterized by permanent or semi-permanent structures, pavement, or hardscape, and landscaped areas that often require irrigation. The urban/developed vegetation community includes land that has been constructed upon or otherwise covered with a permanent man-made surface. Areas where no natural land is evident, or because large amounts of debris or other materials have been placed upon it, may also be considered. Vegetation within the urban/developed land consists of ornamental landscape vegetation with little to no native species observed.

The center of the project site contains a driveway, a residential home, a shed, and several corrals (Exhibit 2). Ornamental vegetation can be found within the front yard of the residence, including hedges, bird of paradise flower (*Strelitzia reginae*), two Italian cypress trees (*Cupressus sempervirens*), three Mexican fan palm trees (*Washingtonia robusta*), a lemon tree (*Citrus* × *limon*), and a cherry tree (*Prunus avium*). Ruderal species including those listed above can also be between cracks in the pavement and growing in some of the corrals.

Feet

Exhibit 4
Vegetation and Land Cover Map

THIS PAGE INTENTIONALLY LEFT BLANK

4.3 - Wildlife

The vegetation community and land cover types discussed above, may provide habitat for generalist and opportunistic wildlife species that are able to tolerate high levels of habitat disturbance and human-modified environments. Wildlife activity during the field survey was low and consisted exclusively of avian species, likely as a result of the high winds during the field survey.

4.3.1 - Birds

Bird species observed on-site during the field survey included mourning dove (*Zenaida macroura*), house finch (*Haemorhous mexicanus*), and western meadowlark (*Sturnella neglecta*). The project site contains several ornamental palms (*Washingtonia robusta*) and Italian cypress trees that could provide suitable habitat for migratory or resident nesting birds. Four birdhouses in usable condition were observed on-site. Additionally, a remnant of a bird nest was observed in the corner of the on-site shed (Appendix A–Photograph 16).

4.3.2 - Mammals

Several small burrows less than 3 inches in diameter were observed throughout the ruderal vegetation that covers a majority of the project site. Such burrows could be constructed by small rodents such as Botta's pocket gopher (*Thomomys bottae*). Evidence of domesticated cat (*Felis catus*) in the form of scat was also observed on-site. No signs of bat roosts were observed during the field survey.

4.3.3 - Reptiles

The project site may also provide suitable habitat for reptiles adapted to human-modified environments including western fence lizard (*Sceloporus occidentalis*) and western side-blotched Lizard (*Uta stansburiana elegans*).

4.3.4 - Species Likely Absent

No amphibian or fish species were observed on-site during the field survey due to the lack of suitable aquatic habitat. Additionally, the project site does not contain suitable or foraging habitat for most amphibian species and dispersal to the project site is limited by the surrounding land use.

4.4 - Wildlife Movement Corridors

The project site was evaluated generally for evidence of wildlife movement corridors during the field survey; the scope of the survey did not include a formal wildlife movement corridor study utilizing track plates, camera stations, scent stations, or snares. The project site is entirely developed and is surrounded on all sides by urban development and roadways and other man-made structures that serve as barriers to wildlife movement; therefore, the project site does not function as a wildlife movement corridor.

The nearest known wildlife corridor is the Santa Ana River, located approximately a mile south of the project site.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 5: SENSITIVE BIOLOGICAL RESOURCES

The following section discusses the existing site conditions and potential for sensitive biological resources to occur within the project site.

5.1 - Sensitive Natural Communities

The CDFW maintains a list of natural communities which attempts to classify vegetation types found within the State of California and rank them based on rarity. Communities ranked S1-S3 are considered sensitive natural communities. Wetlands and riparian habitats are also typically considered sensitive natural communities and are addressed in the environmental review process.

The project site does not contain any sensitive natural communities.

5.2 - Special-status Plants

Fifty-five special-status plant species and CNPS sensitive species have been recorded within the *Corona North, California,* Topographic Quadrangle Map and the eight surrounding quadrangles by the CNDDB and CNPSEI.[22,23,24] The Special-status Plant Species Table (Appendix B, Table 1) lists 8 special-status plants have been recorded within a 5-mile radius of the project site.[25] The table also includes the species' status, required habitat, and potential to occur within the project site. Special-status plant species that were determined to have no potential to occur on-site are included in the table, along with the justification for their exclusion from further discussion. The following species were analyzed:

1. Chaparral sand-verbena (*Abronia villosa* var. *aurita*)
2. Lucky morning-glory (*Calystegia felix*)
3. Smooth tarplant (*Centromadia pungens* ssp. *laevis*)
4. Many-stemmed dudleya (*Dudleya multicaulis*)
5. Santa Ana River woollystar (*Eriastrum densifolium* ssp. *sanctorum*)
6. Jokerst's monardella (*Monardella australis* ssp. *jokerstii*)
7. Salt spring checkerbloom (*Sidalcea neomexicana*)
8. San Bernardino aster (*Symphyotrichum defoliatum*

The recorded species require specific habitat conditions associated with specific vegetation communities such as coastal sage scrub, riparian scrub, chaparral, grassland, cismontane woodlands, or wet meadows and playas; none of which are present on the project site. The disturbed state of

[22] United States Geological Survey (USGS). 2021. National Geospatial Program. Website: https://www.usgs.gov/core-science-systems/national-geospatial-program/us-topo-maps-america?qt-science_support_page_related_con=4#qt-science_support_page_related_con

[23] California Department of Fish and Wildlife (CDFW). 2021. CNDDB RareFind 5 California Natural Diversity Database Query for Special-Status Species. Website: https://map.dfg.ca.gov/rarefind/view/RareFind.aspx. Accessed January 18, 2021.

[24] California Native Plant Society (CNPS). 2021. California Native Plant Society Rare and Endangered Plant Inventory. Website: http://www.rareplants.cnps.org/. Accessed January 18, 2021.

[25] California Department of Fish and Wildlife (CDFW). 2021. Biogeographic Information and Observation System (BIOS 5). Website: https://map.dfg.ca.gov/bios/. Accessed January 18, 2021.

the project site does not provide suitable habitat for any special-status species recorded in the CNDDB or CNPS searches due to the lack of natural vegetation communities and on-going man-made disturbance in the form of mowing. Therefore, no special-status plant species are expected to occur on the project site.

5.3 - Special-status Wildlife

Fifty-three federal and State-listed threatened and/or endangered wildlife species and State Species of Special Concern that have been recorded within the *Corona North, California,* Topographic Quadrangle Map. The Special-status Wildlife Species Table (Appendix B, Table 2) identifies 28 special-status wildlife species have been recorded within a 5-mile radius of the project site.[26] The table includes the species' status, required habitat types and features, and potential to occur within the project site. Appendix B, Table 2, includes all special-status wildlife species that have been determined unlikely to occur on-site, primarily based on the absence of suitable habitat and the lack of recorded occurrence in the project vicinity, along with the justification for their exclusion from further discussion.

5.3.1 - Burrowing Owl

Burrowing owl (*Athene cunicularia*) occurs in open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. This species utilizes, modifies, and nests in burrows created by other species, most notably the California ground squirrel (*Otospermophilus beecheyi*).

The project site contains many small burrows all less than 3 inches in diameter, which are too small to be occupied by burrowing owl. (Burrowing owls typically require a burrow opening of at least 4 inches in diameter).[27] However, the lack of suitably-size burrows does not preclude this species from occurring on-site, as burrowing owl may still utilize the site for foraging and are still capable of colonizing the project site. As of the date of this report, the CNDDB shows 26 records of burrowing owl within 5 miles of the project site.[28]

5.3.2 - Nesting Birds

The project site contains a few ornamental trees of sufficient size to provide suitable nesting locations for migratory or resident nesting birds. A total of four birdhouses are also present on-site that could provide suitable nesting locations for smaller birds.

[26] California Department of Fish and Wildlife (CDFW). 2021. Biogeographic Information and Observation System (BIOS 5). Website: https://map.dfg.ca.gov/bios/. Accessed January 18, 2021.

[28] California Department of Fish and Wildlife (CDFW). 2021. Biogeographic Information and Observation System (BIOS 5). Website: https://map.dfg.ca.gov/bios/. Accessed January 20, 2021.

5.4 - Jurisdictional Waters and Wetlands

No wetlands or other hydrological features that meet the criteria as waters of the United States or waters of the State were observed within the proposed project site during the reconnaissance-level survey.

5.5 - Protected Trees

The Eastvale Municipal Code was reviewed regarding any applicable ordinances regarding tree preservation.[29] The project site does not contain any trees that would be regulated under the City of Eastvale Tree Ordinance as the code is only applicable to "street trees."

5.6 - Western Riverside County Multiple Species Habitat Conservation Plan

The project is located within the boundaries of Western Riverside County MSHCP. According to the Western Riverside County RCA MSHCP Information Map, the project site is located within a MSHCP survey area for burrowing owl and narrow endemic plants including San Diego ambrosia (*Ambrosia pumila*), Brand's phacelia (*Phacelia stellaris*), and San Miguel savory (*Clinopodium chandleri*).[30] Due to the disturbed/developed state of the project site, none of these plant species are likely to occur on-site; however, as stated above, marginally suitable habitat for burrowing owl is present on-site. No other MSHCP covered species or biological resource was observed on-site during the field survey.

SECTION 6: IMPACT ANALYSIS AND RECOMMENDATIONS

The following discussion addresses potential project impacts on regulated biological resources, including special-status species, and recommends measures to avoid and/or mitigate impacts to a less-than-significant level under CEQA.

6.1 - Impacts to Special-status Wildlife

6.1.1 - Burrowing Owl

Burrowing owl, a California Species of Special Concern, was assessed as having a moderate potential to occur on the project site. Though they are not expected to breed or nest on the project site, they may use the site for short periods during migratory movements through the area. Because FCS conducted the field survey outside of the burrowing owl breeding season (February 1–August 31), the possibility that burrowing owl could be present in the project vicinity cannot be entirely ruled out. Therefore, the construction and operation of the proposed project still has potential (albeit low potential) to impact to burrowing owl habitat or burrowing owl.

The proposed project is located within a MSHCP survey area for burrowing owl and contains marginally suitable habitat for this species.[31] In accordance with the *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*, it is recommended that the applicant commission a focused burrow survey (Step II, Part A) and pre-construction surveys to avoid direct take of burrowing owl.[32]

To avoid potential project impacts on burrowing owl that may temporarily utilize the project site and to ensure impacts to burrowing owls are less than significant under CEQA, it is recommended the project applicant implement the following Mitigation Measures (MMs):

MM BIO-1 Burrowing Owl Pre-Construction Surveys

1. No more than 30 days prior to the first ground-disturbing activities, the project applicant shall retain a qualified Biologist to conduct a pre-construction survey of the project site. The survey shall establish the presence or absence of western burrowing owl and/or habitat features and evaluate use by owls in accordance with the California Department of Fish and Wildlife (CDFW) and Western Riverside County Regional Riverside Conservation Authority (RCA) survey guidelines.
2. On the parcel where the activity is proposed, the Biologist shall survey the proposed disturbance footprint and a 500-foot radius from the perimeter of the proposed footprint to identify burrows and burrowing owl. The survey shall take

[31] Western Riverside County Regional Conservation Authority (RCA). 2021. MSHCP Information Map. Website: https://wrcrca.maps.arcgis.com/apps/webappviewer/index.html?id=a73e69d2a64d41c29ebd3acd67467abd. Accessed January 18, 2021.

[32] Western Riverside County Regional Conservation Authority (RCA). 2005. Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area. November 7.

place near sunrise or sunset in accordance with the CDFW and RCA guidelines. All burrows or burrowing owl shall be identified and mapped. During the breeding season (February 1–August 31), surveys shall document whether burrowing owl are nesting on or directly adjacent to disturbance areas. During the non-breeding season (September 1–January 31), surveys shall document whether burrowing owl are using habitat on or directly adjacent to any disturbance area. Survey results shall be valid only for the season during which the survey is conducted.

3. If burrowing owl are not discovered, further mitigation is not required. If burrowing owl are observed during the pre-construction surveys, the applicant shall perform the following measures to limit the impact on the burrowing owls:
4. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone. Construction may occur during the breeding season if a qualified Biologist monitors the nest and determines that the birds have not begun egg-laying and incubation, or that the juveniles from the occupied burrows have fledged. During the non-breeding season (September 1-January 31), the project applicant shall avoid the owls and the burrows they are using, if possible. Avoidance shall include the establishment of a 160-foot non-disturbance buffer zone.
5. If it is not possible to avoid occupied burrows, passive relocation shall be implemented. Burrowing owl shall be excluded from burrows in the immediate impact zone and within a 160-foot buffer zone by installing one-way doors in burrow entrances. These doors shall be in place for 48 hours prior to excavation. The project area shall be monitored daily for 1 week to confirm that the owl has abandoned the burrow. Whenever possible, burrows should be excavated using hand tools and refilled to prevent re-occupation. Plastic tubing or a similar structure shall be inserted in the tunnels during excavation to maintain an escape route for any burrowing owl inside the burrow.

6.1.2 - Nesting Birds

The several ornamental trees and bird houses present on-site could provide suitable habitat for a variety of species of nesting birds. Construction activities that occur during the avian nesting season (generally February 1 to August 31) could disturb nesting sites for bird species protected under the Fish and Game Code or MBTA. The removal of trees during the nesting season could result in direct harm to nesting birds, while noise, light, and other man-made disturbances may cause nesting birds to abandon their nests.

The project applicant shall implement the following avoidance and minimization measures to ensure that project impacts on nesting birds are less than significant:

MM BIO-2 Protection of Active Bird Nests (includes pre-construction survey and implementation of avoidance buffer, if found).

1. Removal of trees shall be limited to only those necessary to construct the proposed project as reflected in the relevant project approval documents. It is recommended that a Biologist make sure the bird houses are not occupied and then block access to the bird houses for the duration of construction to avoid attracting nesting birds.
2. If construction occurs during the nesting season (February 1 to August 31), pre-construction surveys shall be conducted within 14 days prior to tree removal to determine whether or not active nests are present.
3. If an active nest is located during pre-construction surveys, a qualified Biologist shall determine an appropriately-sized avoidance buffer based on the species and anticipated disturbance level. A qualified Biologist shall delineate the avoidance buffer using Environmentally Sensitive Area fencing, pin flags, and or yellow caution tape. The buffer zone shall be maintained around the active nest site(s) until the young have fledged and are foraging independently. No construction activities or construction foot traffic is allowed to occur within the avoidance buffer(s).
4. The qualified Biologist shall monitor the active nest during construction activities to prevent any potential impacts that may result from the construction of the proposed project, until the young have fledged.

6.2 - Compliance with Western Riverside County Multiple Species Habitat Conservation Plan

The project site is located within the boundaries of Western Riverside County MSHCP. According to the RCA MSHCP Information Map. The project site lies within a MSHCP survey area for burrowing owl and narrow endemic plants including San Diego ambrosia, Brand's phacelia, and San Miguel savory.[33] Therefore, the proposed project shall follow the procedures outlined *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*. [34] Step I of these procedures requires a habitat assessment that can be satisfied by the same due diligence field survey that this report summarizes. Based on the findings of this report, it is recommended that pre-construction surveys be conducted prior to any ground disturbance to avoid direct take of burrowing owls, as described in MM BIO-1.

Due to the disturbed/developed state of the project site, none of the plant species listed above are likely to occur on-site and focused surveys for these species are not recommended. The project applicant shall prepare a separate MSHCP Consistency Analysis report to summarize and analyze any MSHCP requirements and biological constraints that apply to potential development within the

[33] Western Riverside County Regional Conservation Authority (RCA). 2021. MSHCP Information Map. Website: https://wrcrca.maps.arcgis.com/apps/webappviewer/index.html?id=a73e69d2a64d41c29ebd3acd67467abd. Accessed January 18, 2021.

[34] Western Riverside County Regional Conservation Authority (RCA). 2005. Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area. November 7.

proposed project area and to document the project's consistency with the goals, objectives, and requirements of the MSHCP. With the implementation of these measures the proposed project would be in compliance with the provisions of the MSHCP.

MM BIO-3 Western Riverside County MSHCP Compliance

Prior to the issuance of a grading permit, the project applicant shall prepare and submit a Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis report to City of Eastvale to document the project's consistency with the goals, objectives, and requirements of the MSHCP.

Appendix B:
Special-status Species Tables

THIS PAGE INTENTIONALLY LEFT BLANK

Table 1: Special-status Plant Species Evaluated

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale
	USFWS[1]	CDFW[2]	CNPS[3]		
Abronia villosa var. *aurita* chaparral sand-verbena	—	—	1B.1	Chaparral, coastal scrub, desert dunes. Areas with sandy soils. Elevation: -60-1570 m. Bloom period:	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Calystegia felix lucky morning-glory	—	—	1B.1	Meadows and seeps, riparian scrub. Sometimes occurs where alkaline and alluvial soils are present. Elevation: 9 – 205 m. Bloom period:	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Centromadia pungens ssp. laevis smooth tarplant	—	—	1B.1	Occurs in valley and foothill grassland, chenopod scrub, meadows, playas, and riparian woodland. Prefers alkali meadows, alkali scrub. May also occur in disturbed places. Elevation: 0 – 640 m. Bloom period: April – September	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Dudleya multicaulis many-stemmed dudleya	—	—	1B.2	Chaparral, coastal scrub, valley and foothill grassland. Grows in heavy, often clayey soils or grassy slopes. Elevation: 1 – 910 m. Bloom period:	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Eriastrum densifolium ssp. *sanctorum* Santa Ana River woollystar	FE	SE	1B.1	Can be found in chaparral and coastal scrub habitat. Prefers sandy soils on river floodplains or terraced fluvial deposits at elevations between Elevation: 180 – 700 m. Bloom period: May – September	**None.** The project site does not contain suitable floodplain/fluvial deposits to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Monardella australis ssp. *jokerstii* Jokerst's monardella	—	—	1B.1	Occurs in lower montane coniferous forest, chapparal. Often found growing on steep scree or talus slopes between breccia. May also occur on alluvial benches along drainages and washes. Elevation: 210 – 1740 m. Bloom period:	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.

Scientific Name Common Name	Status			Habitat Description[4]	Potential to Occur and Rationale
	USFWS[1]	CDFW[2]	CNPS[3]		
Sidalcea neomexicana salt spring checkerbloom	—	—	2B.2	Found in playas, chaparral, coastal scrub, lower montane coniferous forest, Mojave desert scrub, alkali springs and marshes. Elevation: 0 – 1,530 m. Bloom period: March – June	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Symphyotrichum defoliatum San Bernardino aster	—	—	1B.2	Found in meadows and seeps, marshes and swamps, coastal scrub, cismontane woodland, lower montane coniferous forest, grassland. Prefers vernally mesic grassland or near ditches, streams, and springs; especially disturbed areas. Elevation: 2 – 2,040 m. Bloom period: July – November	**None.** The project site does not contain suitable vegetation communities or soils conditions to support this species. Previous anthropogenic disturbances further preclude this species from occurring.

Table 2: Special-status Wildlife Species Evaluated

Scientific Name Common Name	Status		Habitat Description[3]	Potential to Occur and Rationale[4]
	USFWS[1]	CDFW[2]		
Birds				
Agelaius tricolor tricolored blackbird	— MBTA	ST SSC	Forages in open habitats such as farm fields, pastures, cattle pens, large lawns. Highly colonial species, most numerous in Central Valley & vicinity. Largely endemic to California. Breeds in large freshwater marshes, dense stands of hydrophytic vegetation (cattails, bulrushes, etc.)	**None.** The project parcel does contain suitable foraging habitat nor suitable freshwater marsh to support this species.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	— MBTA	— WL	Resident in southern California coastal sage scrub and sparse mixed chaparral. Frequents relatively steep, often rocky hillsides with grass and forb patches.	**None.** The project site does not contain suitable vegetation communities or rocky hillsides to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Aquila chrysaetos golden eagle	— MBTA	— FP WL	Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.	**None.** The project site does not contain suitable nesting habitat or prey base to support this species. Previous anthropogenic disturbances further preclude this species from occurring.
Athene cunicularia burrowing owl	— MBTA	— SSC CFG	Found in open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. A subterranean nester, dependent upon burrowing mammals, most notably the California ground squirrel.	**Low.** The project parcel does contain ruderal habitat suitable for foraging. However, no burrows suitable for nesting were observed. Multiple occurrences recorded are located within 5 miles surrounding the project parcel.
Buteo swainsoni Swainson's hawk	— MBTA	ST SSC CFG	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	**None.** The project site does not contain suitable nesting habitat or prey base to support this species. Previous anthropogenic disturbances further preclude this species from occurring. Species is believed to be locally extirpated.
Coccyzus americanus occidentalis western yellow-billed cuckoo	FT MBTA	SE	Found in riparian forest along the broad lower flood-bottoms of larger river systems. Nests in riparian jungles of willow, often mixed with cottonwoods; understory consists of blackberry, nettles, and wild grape.	**None.** The project parcel does contain suitable riparian habitat to support this species.

Scientific Name Common Name	Status		Habitat Description[3]	Potential to Occur and Rationale[4]
	USFWS[1]	CDFW[2]		
Coturnicops noveboracensis yellow rail	— MBTA	— SSC	Grassy marshes, meadows. In summer, favors large wet meadows or shallow marshes dominated by sedges and grasses. Typically in fresh or brackish marsh with water no more than a foot deep. In winter mostly in coastal salt marsh, especially drier areas with dense stands of spartina; also rice fields, damp meadows near coast.	**None.** The project parcel does not contain suitable freshwater marsh habitat to support this species.
Elanus leucurus white-tailed kite	— MBTA	— FP	Often found near foothills and valley margins with scattered oaks & river bottomlands or marshes next to deciduous woodland or isolated dense-topped trees for nesting and perching. Forages in open grasslands, meadows, or marshes.	**Low.** The project parcel does contain ruderal habitat which may be suitable for foraging. However, the project site lacks suitable nesting habitat. Nearest recorded BIOS occurrences are located approximately 4.7 miles southwest of the project parcel near Prado Regional Park.
Empidonax traillii extimus southwestern willow flycatcher	FE MBTA	SE	Riparian woodlands in Southern California.	**None.** The project parcel does contain suitable riparian habitat to support this species.
Icteria virens yellow-breasted chat	— MBTA	— SSC	Summer resident of Southern California. Inhabits riparian thickets of willow and other brushy tangles near watercourses. Nests in low, dense riparian, consisting of willow, blackberry, wild grape; forages and nests within 10 ft. of ground.	**None.** The project parcel does not contain suitable riparian vegetation to support this species.
Laterallus jamaicensis coturniculus California black rail	— MBTA	ST FP	Inhabits freshwater marshes, wet meadows, and shallow margins of saltwater marshes bordering larger bays. Requires water depth of about 1 inch that does not fluctuate during the year, and dense vegetation for nesting.	**None.** The project parcel does not contain suitable freshwater marsh habitat to support this species.
Polioptila californica californica coastal California gnatcatcher	FT MBTA	— SSC	An obligate, permanent resident of coastal sage scrub below 2,500 feet in Southern California. May also be found in arid washes, on mesas, and slopes.	**None.** The project parcel does not contain suitable sage scrub vegetation to support this species.
Setophaga petechia yellow warbler	— MBTA	— SSC	Occurs riparian habitats in close proximity to water. Frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash, and alders. May also nests in montane shrubbery in open conifer forests in Cascades and Sierra Nevada.	**None.** The project parcel does not contain suitable riparian vegetation to support this species.

Scientific Name Common Name	Status USFWS[1]	 CDFW[2]	Habitat Description[3]	Potential to Occur and Rationale[4]
Vireo bellii pusillus least Bell's vireo	FE MBTA	SE	A summer resident of Southern California. Nests in low riparian habitat in the vicinity of water or in dry river bottoms. Nests placed along margins of bushes or in twigs projecting into pathways, usually willows, coyote bush, mule fat, or mesquite. Occurs below 2,000 feet.	**None.** The project parcel does not contain suitable riparian vegetation to support this species.
Fish				
Catostomus santaanae Santa Ana sucker	FT	—	Endemic to Los Angeles basin south coastal streams. Are habitat generalists, but prefer sand-rubble-boulder bottoms, cool, clear water, and algae.	**None.** There are no streams or rivers present within the project to support this species. Nearest occurrence is approximately a mile south of the project site within the Santa Ana River.
Gila orcuttii arroyo chub	—	— SSC	Native to the streams and rivers of the Los Angeles plain in Southern California. Arroyo chub are adapted to survive in streams that fluctuate between large winter storm flows, and low summer flows, and the low dissolved oxygen and wide temperature fluctuations. Feeds on plants such as algae and water fern, as well as insects and mollusks.	**None.** There are no streams or rivers present within the project site to support this species. Nearest occurrence is approximately a mile south of the project site within the Santa Ana River.
Oncorhynchus mykiss irideus (pop. 10) steelhead (southern California DPS)	FE	—	Habitat needs vary depending on the time in the life cycle. In the freshwater phase, freely flowing, cool, clean, highly oxygenated water is essential. In Southern California there is a winter run occurring January through March. Eggs are hatched in streams with gravel bottoms. Juvenile fish prefer pools with protective debris and a variety of hiding areas. Juveniles ultimately make their way to estuarine waters and to the ocean where they reach maturity.	**None.** There are no streams or rivers present within the project site to support this species. Nearest occurrence is a mile south of the project site within the Santa Ana River. This species is believed to be largely extirpated from Santa Ana watershed.
Insects				
Rhaphiomidas terminatus abdominalis Delhi Sands flower-loving fly	FE	—	Found only in small parts of San Bernardino and Riverside counties, in areas of fine sandy soil, known as Delhi series sands. While formerly widespread, this habitat has been intensively developed in the past century, primarily for agriculture, though more recently for industry and housing. Only an estimated 2-3 percent of the original habitat remains undeveloped.	**None.** No suitable habitat is present within the project site due to lack of Delhi series soils and its associated vegetation communities. Nearest known population is located in the Jurupa Hills, approximately 6 miles northeast of the project site.
Mammals				
Dipodomys stephensi *Stephens' kangaroo rat*	FE	ST	Primarily annual & perennial grasslands, but also occurs in coastal scrub & sagebrush with sparse canopy cover. Prefers buckwheat, chamise, brome grass and filaree. Will burrow into firm soil.	**None.** The project site does not contain suitable vegetation communities to support this species. Previous anthropogenic disturbances and man-made barriers further preclude this species from occurring.

Scientific Name Common Name	Status		Habitat Description[3]	Potential to Occur and Rationale[4]
	USFWS[1]	CDFW[2]		
Eumops perotis californicus *western mastiff bat*	—	— SSC	Found in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	**None.** The project site does not contain suitable roosting habitat in the form of cliffs, high buildings, dense trees or tunnels.
Lasiurus xanthinus *western yellow bat*	—	— SSC	Prefers open habitats or habitat mosaics, with access to trees for cover, and open areas or habitat edges for feeding. Roosts in dense foliage of medium-to-large trees. Feeds primarily on moths. Requires a water source nearby.	**None.** The project site does not contain suitable roosting habitat due to the lack of trees with dense foliage.
Nyctinomops femorosaccus *pocketed free-tailed bat*	—	— SSC	Found in a variety of arid areas in Southern California; pine-juniper woodlands, desert scrub, palm oasis, desert wash, or desert riparian habitat. Prefers rocky areas with high cliffs.	**None.** The project site does not contain suitable roosting habitat in the form of cliffs and other rocky areas.
Reptiles				
Anniella stebbinsi Southern California legless lizard	—	— SSC	Found in a variety of habitats. Generally found in areas of sparse vegetation where sandy or loose loamy soils with a high moisture content are present. The range of this species extends generally south of the Transverse Range, extending to northwestern Baja California. Disjunct populations in the Tehachapi and Piute Mountains in Kern County also exist.	**None.** The project parcel does not contain suitable soils or vegetation communities to support this species. Moisture is essential for this species. The project parcel is highly arid, and no typical habitat is present.
Arizona elegans occidentalis California glossy snake	—	— SSC	Inhabits arid scrub, rocky washes, grasslands, chaparral preferably open areas with loose soil for easy burrowing.	**None.** The project site does not contain suitable vegetation communities and rocky habitats to support this species. Previous anthropogenic disturbances and man-made barriers further preclude this species from occurring.
Aspidoscelis hyperythra orange-throated whiptail	—	— WL	Inhabits low-elevation coastal scrub, chaparral, and valley-foothill hardwood habitats. Prefers washes and other sandy areas with patches of brush and rocks. Perennial plants necessary for its primary food: termites.	**None.** The project site does not contain suitable vegetation communities and termite colonies to support this species. Previous anthropogenic disturbances and man-made barriers further preclude this species from occurring.
Coleonyx variegatus abbotti San Diego banded gecko	—	— SSC	Prefers rocky areas in coastal sage and chaparral.	**None.** The project site does not contain suitable vegetation communities and rocky habitats to support this species. Previous anthropogenic disturbances and man-made barriers further preclude this species from occurring.
Crotalus ruber red-diamond rattlesnake	—	— SSC	Found in chaparral, woodland, grassland, and desert areas from coastal San Diego County to the eastern slopes of the mountains. Occurs in rocky areas with dense vegetation. Requires rodent burrows, cracks in rocks, or surface cover objects. Often found in disturbed areas.	**None.** The project site does not contain suitable vegetation communities and rocky habitats to support this species. Previous anthropogenic disturbances and man-made barriers further preclude this species from occurring.

Scientific Name Common Name	Status USFWS[1]	Status CDFW[2]	Habitat Description[3]	Potential to Occur and Rationale[4]
Emys marmorata western pond turtle	—	— SSC	Occurs in ponds, marshes, rivers, streams and irrigation ditches, usually with aquatic vegetation, below 6000 ft elevation. Needs basking sites and suitable (sandy banks or grassy open fields) upland habitat up to 0.5 km from water for egg-laying.	**None.** The project parcel does not contain suitable aquatic habitat to support this species.

ESU	= Evolutionary Significant Unit is a distinctive population.	**SE**	= Listed as endangered under the CESA.
FE	= Listed as endangered under the FESA.	**ST**	= Listed as threatened under the CESA.
FT	= Listed as threatened under the FESA.	**SSC**	= Species of Special Concern as identified by the CDFW.
FC	= Candidate for listing (threatened or endangered) under FESA.	**FP**	= Listed as fully protected under FGC.
FD	= Delisted in accordance with the FESA.	**CFG**	= FGC =protected by FGC 3503.5
FPD	= Federally Proposed to be Delisted.	**CE**	= Candidate endangered under the CESA.
MBTA	= protected by the Migratory Bird Treaty Act	**—**	= Not state listed
—	= Not federally listed		

[3] **Habitat Description**: Habitat description adapted from CNDDB[3] or other specified source*.
[4] **Potential to Occur and Rationale**: Location of recorded species occurrences determined by geospatial information from BIOS 5[4] or other specified source*.

Scientific Name	Common Name	Family	Lifeform	Federal Listing Status	State Listing Status	CA Rare Plant Rank	Habitats	Lowest Elevation	Highest Elevation	Blooming Period
Abronia villosa var. aurita	chaparral sand-verbena	Nyctaginaceae	annual herb			1B.1	• Chaparral • Coastal scrub • Desert dunes	75 m	1600 m	(Jan)Mar-Sep
Allium munzii	Munz's onion	Alliaceae	perennial bulbiferous herb	FE	CT	1B.1	• Chaparral • Cismontane woodland • Coastal scrub • Pinyon and juniper woodland • Valley and foothill grassland	297 m	1070 m	Mar-May
Ambrosia pumila	San Diego ambrosia	Asteraceae	perennial rhizomatous herb	FE		1B.1	• Chaparral • Coastal scrub • Valley and foothill grassland • Vernal pools	20 m	415 m	Apr-Oct
Astragalus brauntonii	Braunton's milk-vetch	Fabaceae	perennial herb	FE		1B.1	• Chaparral • Coastal scrub • Valley and foothill grassland	4 m	640 m	Jan-Aug
Atriplex coulteri	Coulter's saltbush	Chenopodiaceae	perennial herb			1B.2	• Coastal bluff scrub • Coastal dunes • Coastal scrub	3 m	460 m	Mar-Oct

							• Valley and foothill grassland			
Baccharis malibuensis	Malibu baccharis	Asteraceae	perennial deciduous shrub			1B.1	• Chaparral • Cismontane woodland • Coastal scrub • Riparian woodland	150 m	305 m	Aug
Berberis nevinii	Nevin's barberry	Berberidaceae	perennial evergreen shrub	FE	CE	1B.1	• Chaparral • Cismontane woodland • Coastal scrub • Riparian scrub	70 m	825 m	(Feb)Mar-Jun
Calandrinia breweri	Brewer's calandrinia	Montiaceae	annual herb			4.2	• Chaparral • Coastal scrub	10 m	1220 m	(Jan)Mar-Jun
Calochortus catalinae	Catalina mariposa lily	Liliaceae	perennial bulbiferous herb			4.2	• Chaparral • Cismontane woodland • Coastal scrub • Valley and foothill grassland	15 m	700 m	(Feb)Mar-Jun
Calochortus plummerae	Plummer's mariposa lily	Liliaceae	perennial bulbiferous herb			4.2	• Chaparral • Cismontane woodland • Coastal scrub • Lower montane coniferous forest • Valley and foothill grassland	100 m	1700 m	May-Jul
Calochortus weedii var. intermedius	intermediate mariposa lily	Liliaceae	perennial bulbiferous herb			1B.2	• Chaparral • Coastal scrub • Valley and foothill grassland	105 m	855 m	May-Jul
Calystegia felix	lucky morning-glory	Convolvulaceae	annual rhizomatous herb			1B.1	• Meadows and seeps (sometimes alkaline) • Riparian scrub (alluvial)	30 m	215 m	Mar-Sep
Camissoniopsis lewisii	Lewis' evening-primrose	Onagraceae	annual herb			3	• Coastal bluff scrub • Cismontane woodland • Coastal dunes • Coastal scrub	0 m	300 m	Mar-May(Jun)

							• Valley and foothill grassland			
Caulanthus simulans	Payson's jewelflower	Brassicaceae	annual herb			4.2	• Chaparral • Coastal scrub	90 m	2200 m	(Feb)Mar-May(Jun)
Centromadia pungens ssp. laevis	smooth tarplant	Asteraceae	annual herb			1B.1	• Chenopod scrub • Meadows and seeps • Playas • Riparian woodland • Valley and foothill grassland	0 m	640 m	Apr-Sep
Chorizanthe leptotheca	Peninsular spineflower	Polygonaceae	annual herb			4.2	• Chaparral • Coastal scrub • Lower montane coniferous forest	300 m	1900 m	May-Aug
Chorizanthe parryi var. fernandina	San Fernando Valley spineflower	Polygonaceae	annual herb	FC	CE	1B.1	• Coastal scrub (sandy) • Valley and foothill grassland	150 m	1220 m	Apr-Jul
Chorizanthe parryi var. parryi	Parry's spineflower	Polygonaceae	annual herb			1B.1	• Chaparral • Cismontane woodland • Coastal scrub • Valley and foothill grassland	275 m	1220 m	Apr-Jun
Chorizanthe polygonoides var. longispina	long-spined spineflower	Polygonaceae	annual herb			1B.2	• Chaparral • Coastal scrub • Meadows and seeps • Valley and foothill grassland • Vernal pools	30 m	1530 m	Apr-Jul
Chorizanthe xanti var. leucotheca	white-bracted spineflower	Polygonaceae	annual herb			1B.2	• Coastal scrub (alluvial fans) • Mojavean desert scrub • Pinyon and juniper woodland	300 m	1200 m	Apr-Jun
Cladium californicum	California sawgrass	Cyperaceae	perennial rhizomatous herb			2B.2	• Meadows and seeps • Marshes and swamps Alkaline or Freshwater	60 m	1600 m	Jun-Sep
Convolvulus simulans	small-flowered	Convolvulaceae	annual herb			4.2	• Chaparral (openings)	30 m	740 m	Mar-Jul

	morning-glory						• Coastal scrub • Valley and foothill grassland			
Deinandra paniculata	paniculate tarplant	Asteraceae	annual herb			4.2	• Coastal scrub • Valley and foothill grassland • Vernal pools	25 m	940 m	(Mar)Apr-Nov(Dec)
Dodecahema leptoceras	slender-horned spineflower	Polygonaceae	annual herb	FE	CE	1B.1	• Chaparral • Cismontane woodland • Coastal scrub (alluvial fan)	200 m	760 m	Apr-Jun
Dudleya multicaulis	many-stemmed dudleya	Crassulaceae	perennial herb			1B.2	• Chaparral • Coastal scrub • Valley and foothill grassland	15 m	790 m	Apr-Jul
Eriastrum densifolium ssp. sanctorum	Santa Ana River woollystar	Polemoniaceae	perennial herb	FE	CE	1B.1	• Chaparral • Coastal scrub (alluvial fan)	91 m	610 m	Apr-Sep
Erythranthe diffusa	Palomar monkeyflower	Phrymaceae	annual herb			4.3	• Chaparral • Lower montane coniferous forest	1220 m	1830 m	Apr-Jun
Harpagonella palmeri	Palmer's grapplinghook	Boraginaceae	annual herb			4.2	• Chaparral • Coastal scrub • Valley and foothill grassland	20 m	955 m	Mar-May
Hesperocyparis forbesii	Tecate cypress	Cupressaceae	perennial evergreen tree			1B.1	• Closed-cone coniferous forest • Chaparral	80 m	1500 m	
Hordeum intercedens	vernal barley	Poaceae	annual herb			3.2	• Coastal dunes • Coastal scrub • Valley and foothill grassland (saline flats and depressions) • Vernal pools	5 m	1000 m	Mar-Jun
Horkelia cuneata var. puberula	mesa horkelia	Rosaceae	perennial herb			1B.1	• Chaparral (maritime) • Cismontane woodland • Coastal scrub	70 m	810 m	Feb-Jul(Sep)
Juglans californica	Southern	Juglandaceae	perennial			4.2	• Chaparral	50 m	900 m	Mar-Aug

	California black walnut		deciduous tree		• Cismontane woodland • Coastal scrub • Riparian woodland			
Lasthenia glabrata ssp. coulteri	Coulter's goldfields	Asteraceae	annual herb	1B.1	• Marshes and swamps (coastal salt) • Playas • Vernal pools	1 m	1220 m	Feb-Jun
Lepechinia cardiophylla	heart-leaved pitcher sage	Lamiaceae	perennial shrub	1B.2	• Closed-cone coniferous forest • Chaparral • Cismontane woodland	520 m	1370 m	Apr-Jul
Lepidium virginicum var. robinsonii	Robinson's pepper-grass	Brassicaceae	annual herb	4.3	• Chaparral • Coastal scrub	1 m	885 m	Jan-Jul
Lilium humboldtii ssp. ocellatum	ocellated Humboldt lily	Liliaceae	perennial bulbiferous herb	4.2	• Chaparral • Cismontane woodland • Coastal scrub • Lower montane coniferous forest • Riparian woodland	30 m	1800 m	Mar-Jul(Aug)
Microseris douglasii ssp. platycarpha	small-flowered microseris	Asteraceae	annual herb	4.2	• Cismontane woodland • Coastal scrub • Valley and foothill grassland • Vernal pools	15 m	1070 m	Mar-May
Monardella australis ssp. jokerstii	Jokerst's monardella	Lamiaceae	perennial rhizomatous herb	1B.1	• Chaparral • Lower montane coniferous forest	1350 m	1750 m	Jul-Sep
Monardella hypoleuca ssp. intermedia	intermediate monardella	Lamiaceae	perennial rhizomatous herb	1B.3	• Chaparral • Cismontane woodland • Lower montane coniferous forest (sometimes)	400 m	1250 m	Apr-Sep
Monardella pringlei	Pringle's monardella	Lamiaceae	annual herb	1A	• Coastal scrub (sandy)	300 m	400 m	May-Jun
Muhlenbergia californica	California muhly	Poaceae	perennial rhizomatous	4.3	• Chaparral • Coastal	100 m	2000 m	Jun-Sep

			herb		scrub • Lower montane coniferous forest • Meadows and seeps			
Navarretia prostrata	prostrate vernal pool navarretia	Polemoniaceae	annual herb	1B.1	• Coastal scrub • Meadows and seeps • Valley and foothill grassland (alkaline) • Vernal pools	3 m	1210 m	Apr-Jul
Nolina cismontana	chaparral nolina	Ruscaceae	perennial evergreen shrub	1B.2	• Chaparral • Coastal scrub	140 m	1275 m	(Mar)May-Jul
Penstemon californicus	California beardtongue	Plantaginaceae	perennial herb	1B.2	• Chaparral • Lower montane coniferous forest • Pinyon and juniper woodland	1170 m	2300 m	May-Jun(Aug)
Pentachaeta aurea ssp. allenii	Allen's pentachaeta	Asteraceae	annual herb	1B.1	• Coastal scrub (openings) • Valley and foothill grassland	75 m	520 m	Mar-Jun
Phacelia keckii	Santiago Peak phacelia	Hydrophyllaceae	annual herb	1B.3	• Closed-cone coniferous forest • Chaparral	545 m	1600 m	May-Jun
Phacelia stellaris	Brand's star phacelia	Hydrophyllaceae	annual herb	1B.1	• Coastal dunes • Coastal scrub	1 m	400 m	Mar-Jun
Pickeringia montana var. tomentosa	woolly chaparral-pea	Fabaceae	evergreen shrub	4.3	• Chaparral	0 m	1700 m	May-Aug
Polygala cornuta var. fishiae	Fish's milkwort	Polygalaceae	perennial deciduous shrub	4.3	• Chaparral • Cismontane woodland • Riparian woodland	100 m	1000 m	May-Aug
Pseudognaphalium leucocephalum	white rabbit-tobacco	Asteraceae	perennial herb	2B.2	• Chaparral • Cismontane woodland • Coastal scrub • Riparian woodland	0 m	2100 m	(Jul)Aug-Nov(Dec)

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Riverside County, California

Local office

Carlsbad Fish And Wildlife Office

(760) 431-9440
(760) 431-5901

2177 Salk Avenue - Suite 250
Carlsbad, CA 92008-7385

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

NOT FOR CONSULTATION

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS

Stephens' Kangaroo Rat Dipodomys stephensi (incl. D. cascus) Endangered
Wherever found
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/3495

Birds

NAME	STATUS

Coastal California Gnatcatcher Polioptila californica californica Threatened
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
https://ecos.fws.gov/ecp/species/8178

Least Bell's Vireo Vireo bellii pusillus Endangered
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
https://ecos.fws.gov/ecp/species/5945

Southwestern Willow Flycatcher Empidonax traillii extimus Endangered
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
https://ecos.fws.gov/ecp/species/6749

Fishes

NAME	STATUS

Santa Ana Sucker Catostomus santaanae Threatened
There is **final** critical habitat for this species. The location of the critical habitat is not available.
https://ecos.fws.gov/ecp/species/3785

Insects

NAME	STATUS

Delhi Sands Flower-loving Fly Rhaphiomidas terminatus abdominalis Endangered
Wherever found
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/1540

Flowering Plants

NAME	STATUS

NOT FOR CONSULTATION

San Diego Ambrosia Ambrosia pumila — Endangered
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
https://ecos.fws.gov/ecp/species/8287

Santa Ana River Woolly-star Eriastrum densifolium ssp. sanctorum — Endangered
Wherever found
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/6575

Thread-leaved Brodiaea Brodiaea filifolia — Threatened
Wherever found
There is **final** critical habitat for this species. The location of the critical habitat is not available.
https://ecos.fws.gov/ecp/species/6087

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php

- Nationwide conservation measures for birds
  http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31

Burrowing Owl Athene cunicularia — Breeds Mar 15 to Aug 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9737

Clark's Grebe Aechmophorus clarkii — Breeds Jan 1 to Dec 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Long-billed Curlew Numenius americanus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/5511

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Rufous Hummingbird selasphorus rufus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8002

NOT FOR CONSULTATION

Short-billed Dowitcher Limnodromus griseus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9480	Breeds elsewhere
Song Sparrow Melospiza melodia This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds Feb 20 to Sep 5
Spotted Towhee Pipilo maculatus clementae This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/4243	Breeds Apr 15 to Jul 20
Tricolored Blackbird Agelaius tricolor This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/3910	Breeds Mar 15 to Aug 10
Whimbrel Numenius phaeopus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9483	Breeds elsewhere
Willet Tringa semipalmata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Wrentit Chamaea fasciata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 15 to Aug 10

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

NOT FOR CONSULTATION

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

THERE ARE NO KNOWN WETLANDS AT THIS LOCATION.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

MANAGEMENT SUMMARY

At the request of the MLC, Holdings Inc. (Client), FirstCarbon Solutions (FCS) conducted a Phase I Cultural Resource Assessment (Phase I CRA) Orange Street Residential Development Project (proposed project) located in the City of Eastvale, in Riverside County, California. The purpose of the assessment was to identify the presence or absence of potentially significant cultural resources within the project area, and if impacted by the proposed development, propose recommendations for mitigation. Completion of this investigation fulfills the requirements of the California Environmental Quality Act (CEQA) under Section 15064.5. This report follows the California Office of Historic Preservation (OHP) procedures for cultural resource surveys and the OHP Archaeological Resource Management Report (ARMR) format for archaeological reports.

On February 25, 2021, a records search was conducted at the Eastern Information Center (EIC) located at University of California, Riverside, for the project site and a 0.5-mile radius area beyond the project boundaries. To identify additional historic properties or resources, the search also included current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), the California Historical Landmarks (CHL) list, the California Points of Historical Interest (CPHI) list, and the California Built Environment Resource Directory (BERD) for Riverside County. The results of the records search indicate that only one linear historic resource has been recorded north of the project site within the 0.5-mile search radius, and no historic or prehistoric resources have been recorded within the project boundaries. In addition, there are 12 area-specific survey reports on file with the EIC, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that portions of the project site have been previously surveyed.

On January 15, 2021, FCS sent a request to the Native American Heritage Commission (NAHC) in an effort to determine if any sacred sites are listed on its Sacred Lands File for the project site. A response was received on February 1, 2021, indicating that the Sacred Lands File was positive for the presence of Native American cultural resources in the immediate project area. The NAHC included a list of 22 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential Tribal Cultural Resources (TRCs) that may be affected by the proposed project are addressed, a letter containing project information requesting any additional information was sent to each tribal representative on February 4, 2020. A response from the Agua Caliente Band of Cahuilla Indians Tribe was received on March 10, 2021, indicating that the proposed project is not located within the Tribe's Traditional Use Area and defer to the other tribes ethnographically associated with the project site. No other responses have been received to date. Correspondence with the NAHC can be found in Appendix C.

On April 2, 2021, FCS Staff Archaeologists, Natalie Adame and Kweku Williams, MA, conducted a pedestrian survey for unrecorded cultural resources within the project boundaries of the proposed project site. The survey had to split into a western and eastern side due to home and livestock stables positioned in the middle of the project site. The survey began on the westside of the project site, along the southeast border, and moved west, using north-south transects, spaced at 15-meter

intervals whenever possible. Soil visibility was poor across the project site, raging >5 percent due to the heavy vegetation and tall grasses. Areas of exposed soil consisted of light brown sandy loam with gravel inclusions. There is a residential property on site, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered a potential historic resources under CEQA.

Survey conditions were documented using digital photographs and field notes. During the survey, Mr. Williams and Ms. Adame examined all areas of the exposed ground surface for prehistoric artifacts (e.g., fire-affected rock, milling tools, flaked stone tools, tool-making debris, ceramics), soil discoloration and depressions that might indicate the presence of a cultural midden, faunal and human osteological remains, and features indicative of the former presence of structures or buildings (e.g., postholes, standing exterior walls, foundations) or historic debris (e.g., glass, metal, ceramics. No additional resources were encountered.

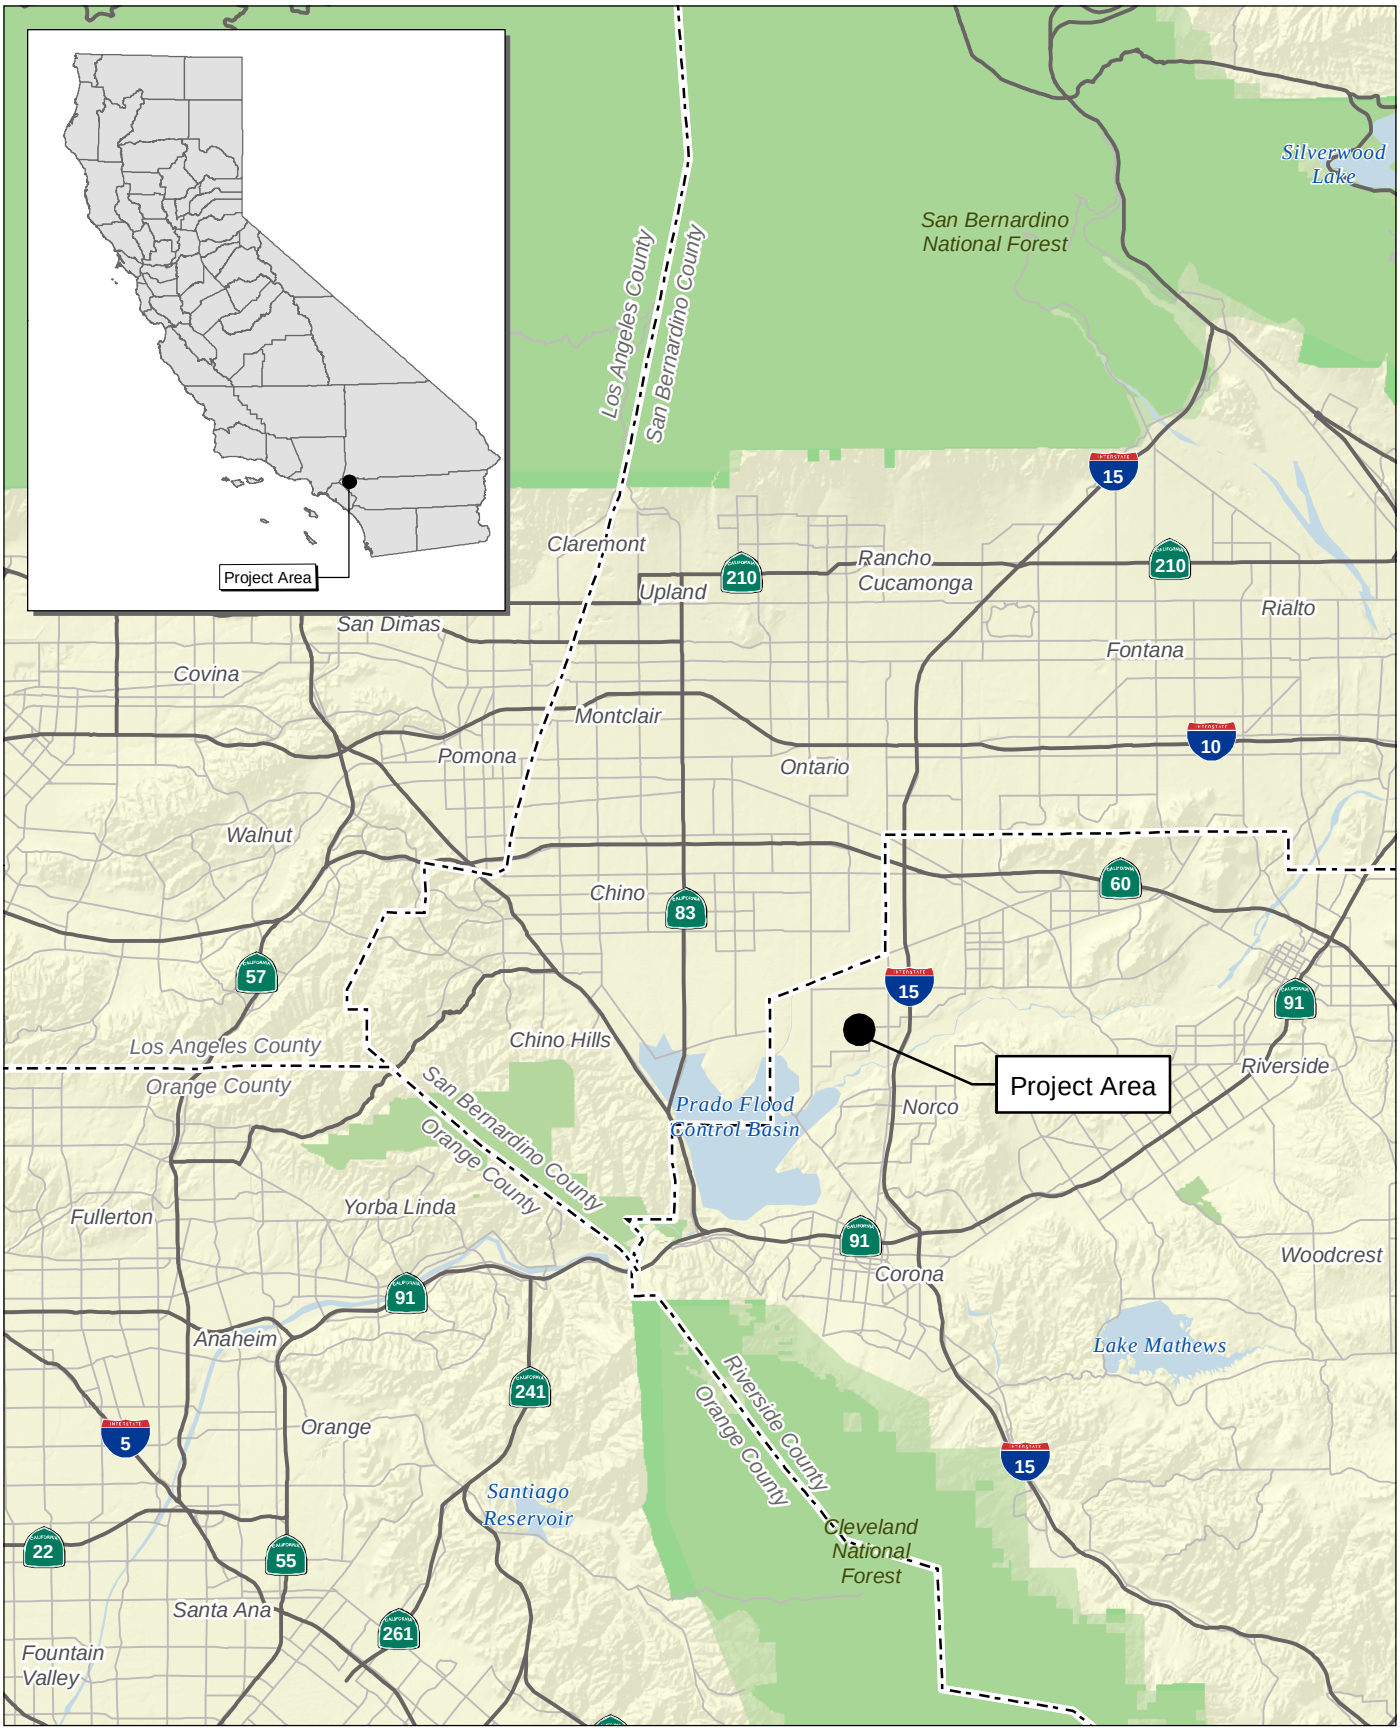
Based on the results of the records searches, archival research, tribal correspondence, and pedestrian survey, FCS considers the potential for the proposed project to have an adverse effect on cultural resources to be moderate. No prehistoric or historic resources were identified during the pedestrian survey, however the positive results from the NAHC and lack of soil visibility during the pedestrian survey increases the probability that potential resources may be encountered during project subsurface construction activities and demolition.

FCS therefore recommends that a qualified Archaeologist who meets the Secretary of Interior's Professional Qualification Standards for Archaeology perform an inspection of the site following grubbing, ground clearing, and demolition, and prior to any grading or project related ground disturbance. In the event exposed soils indicate cultural materials may be present, this may be followed by regular or periodic archaeological monitoring as determined by the Archaeologist, but full-time archaeological monitoring is not recommended at this time. Additional recommended procedures for the inadvertent discovery of archaeological resources or human remains are included in this report.

SECTION 1: INTRODUCTION

1.1 - Project Location

The project site is 10 gross acres (8.28 net acres) in size and located at 13175 Orange Street, in the City of Eastvale, in Riverside County, California (Exhibit 1). The project site is located within the Jurupa (Stearns) Land Grant of the *Corona North, California* United States Geological Survey (USGS) 7.5-minute Quadrangle Topographic Map (Exhibit 2). The project is bounded by Orange Street to the south, Schleisman Road to the north, residential neighborhood to the west and Eastvale Elementary School to the east, and encompasses Assessor's Parcel Numbers (APNs) 152-040-003 (Exhibit 3).



1.2 - Project Description

MLC Holdings Inc. (Client) is proposing to develop a residential development community, consisting of 41 single-family detached homes on 8.28 acres for a density of 4.95 dwelling units per acre (du/acre). The homes would range from 2,054 square feet to 3,153 square feet in size and consist of 11 one-story homes with four bedrooms and 30 two-story homes with five bedrooms and a loft. The proposed project would include vehicular access from Schleisman Road and secondary access from Orange Street. The proposed project would provide two garage spaces and two driveway spaces per dwelling unit, for a total of 164 spaces, as well as an additional 59 parallel street parking spaces. A 45-foot-wide paseo would be located in the center of the community that would consist of a trail, bench, and dog station that would be maintained by the Homeowner's Association (HOA).

1.3 - Assessment Team

FCS Staff Archaeologists, Natalie Adame and Kweku Williams MA, conducted the pedestrian survey and Ms. Adame authored this report. Dr. Dana DePietro, RPA, provided senior review and served as principal investigator. Ms. Adame, Mr. Williams, and Dr. DePietro exceed the professional standards set for their respective roles by the Secretary of the Interior. Professional qualifications for Ms. Adame, Mr. Williams, and Dr. DePietro can be found in Appendix A.

SECTION 2: CULTURAL SETTING

Following is a brief overview of the prehistory, ethnography, and historic background, providing context in which to understand the background and relevance of sites found in the general project area. This section is not intended to be a comprehensive review of the current resources available; rather, it serves as a general overview.

Further details can be found in ethnographic studies, mission records, and major published sources, including Beardsley (1948), Bennyhoff (1950), Fredrickson (1973), Kroeber (1925), Chartkoff and Chartkoff (1984), and Moratto (1984).

2.1 - Prehistoric Background

Fagan (2003), Moratto (1984), and Chartkoff and Chartkoff (1984) provide recent overviews of California archaeology and historical reviews of the inland Southern California among other locales. An early and widely used regional chronology for coastal Southern California is Wallace's four-part Horizon format (1955), which was later updated and revised by Warren (1968) and more recently by Chartkoff and Chartkoff (1984), and King (1990 and 2000). The sequence provides a framework that relates societal change to change in material culture; the advantages and weaknesses of Southern California chronological sequences are reviewed by Warren (in Moratto 1984), Chartkoff and Chartkoff (1984), and Heizer (ed. 1978).

2.1.1 - Paeloamericans

In North America, radiocarbon dates from existing samples of archaeological materials demonstrate human presence as early as 15,000 years Before Present (BP) (Waters et al. 2018). The lithics from the earliest (14,000 to 15,000 BP) documented sites in North America include cores, flakes and flake tools (e.g., 5 blades, 14 bladelets, 12 bifaces, one discoidal flake core, 23 edge-modified tools that includes scrapers and gravers from the Debra L. Friedkin site in, Texas) with an absence of projectile points (Waters et al. 2011, 2018). The first known projectile points in North America are from 13,000 years BP, with lanceolate fluted points (Clovis Complex) in sites from central and eastern North America, and stemmed projectile points from sites in areas of western North America that were not glaciated (Jenkins et al. 2012; Beck and Jones 2010). Glennan (1972) provides an early study of the hypothesis of Pre-Clovis in Southern California. The oldest California radiocarbon date as of 2007 from archaeological materials confirms a human presence in the northeastern part of the State (from site CA-SIS-218) as early as 13,500 years BP (Jones and Klar 2007). The radiocarbon date corresponds to the period of fluted points and fluted points have been found throughout California (Rondeau et al. 2007; Rondeau 2009) although projectile points and other chronologically and culturally informative materials are absent from the SIS-218 sample.

2.1.2 - Millingstone Complex or Early Period

During the early post glacial period after 8,500 BP the Southern California climate became warmer and drier (Fagan 2003). Groundstone artifacts that include manos and metates correspond to the Early Period. The Early period in Southern California begins as early or earlier than 8,000 BP and ends

by about 2,800 BP (King 1990). The Early period corresponds to the earliest known sites in Southern California with year-round habitation and cemeteries. Manos and metates consist of a variety of types. Mano and metates of the Early period in Southern California, correspond to types from studies in the U.S. southwest that efficiently grind small, oily annual and biennial wild seeds (Adams 1999; Ciolek-Torello 1995; Gilman 1988; Lancaster 1984; Whittlesey 1995). Most annual and biennial wild seed plant types in Southern California are best adapted for warm and dry environments (e.g., Hemizonia fasciculata, which is a summer seed source). Annual and biennial seed crops are highly reliable, nutritious, and productive. Annual and biennial seed producers are also, diverse and afford reliable seed production throughout the year. Compared to later periods, utilitarian artifacts are most frequently found with Early Period burials.

Manos and metates are “kitchen tools” and concentrate within residential areas of Early period habitation sites in Southern California (King and Merrill 2002; Merrill 2015). Other kinds of lithics that correspond to the Early period include many kinds of core tools (e.g., hammers, choppers, and scraper planes), knives, bifaces, scrapers (many types), gravers, burins, dart points, and compound bone fishhooks. Sedentism apparently increased in areas with abundant resources that were available for longer periods. Arid inland regions and offshore desert islands (e.g., San Nicolas Island) provided less opportunity for long term residence without trade and possibly for more mobile subsistence. The Early period ends about 2,800 BP (King 1990).

2.1.3 - Middle Period

The Middle Period lasted from about 2,800 BP to 750 BP (King 1990). Excavated assemblages retain many attributes of the Early Period but with more diverse artifact types. Middle Period sites can contain large-stemmed or notched small projectile points suggestive of bow and arrow use, especially near the end of the Period, and the use of portable grinding tools continued. Intensive use of mortar and pestles signaled processing of acorns as the primary vegetative staple as opposed to a mixed diet of seeds and acorns. Because of a general lack of data, neither the settlement and subsistence systems nor the cultural evolution of this Period are well understood, but it is very likely that the nomadic ways continued. It has been proposed that sedentism increased with the exploitation of storable food resources, such as acorns, but coastal sites from the Period exhibit higher fishing activity than in previous periods. The first permanently occupied villages make their appearance in this Period (Chartkoff and Chartkoff 1984).

2.1.4 - Late Prehistoric

Extending from 750 BP to Spanish Contact in 1769, the Late Prehistoric includes changes in trade networks and political and secular economic subsystems. There was also a differentiation of types of political economies. Exploitation of marine resources continued to intensify. Assemblages characteristically contain projectile points, and toward the end of the Period the size of the points decreased and notched and stemmed bases appeared, which implies the use of the bow and arrow. Use of personal ornaments such as shell beads, were widely distributed east of the coast, suggesting well-organized and codified trade networks. Additional assemblages in this Period included steatite bowls, asphaltum, grave goods, and elaborate shell ornaments. The use of bedrock milling stations was widespread during this horizon. Increased hunting efficiency and widespread exploitation of acorns provided reliable and storable food resources. Village size increased during this time, and

some of these villages may have held 1,500 or more residents (Chartkoff and Chartkoff 1984). Analyses of skeletons showed that the first signs of malnutrition appeared in this Period, signaling greater competition for food resources (Fagan 2003).

The earliest part of this Period may have seen an incursion of Cupan-Takic speakers from the Great Basin (the "Shoshonean wedge" of Kroeber 1925) may have replaced the Hokan speakers in the area. At the time of Spanish conquest, Cupan-Takic speakers were distributed throughout Orange County, western Riverside County, and the Los Angeles Basin (Gabrieliño, Juaneño, and Cahuilla peoples). Serran-Takic speakers are now represented by the Serranos in the San Bernardino Mountains. Recent work (O'Neil 2002) suggests that the "Shoshonean wedge" is misnamed—the original Los Angeles inhabitants replaced by the incoming Takic-speakers may have actually been Yuman speakers (similar to those in the California Delta region of the Colorado River) and not Hokan Salinan-Seri (Chumash) speakers as was suggested by Kroeber.

At the time of Spanish conquest, local indigenous groups were composed of constantly moving and shifting clans and cultures. Early ethnographers applied the concept of territorial boundaries to local indigenous groups purely as a conceptualization device, and the data was based on fragmented information provided to them from second-hand sources. At least three Native American groups, the Cahuilla, Serrano, and Gabrieliño are known to have occupied or utilized resources within the vicinity of the project site at different points in history. A brief overview of these three tribal groups follows.

2.2 - Native American Background

2.2.1 - The Tongva (Gabrieliño)

Ethnographic accounts of Native Americans indicate that the Tongva (or Gabrieliño) once occupied the region that encompasses the project area. At the time of contact with Europeans, the Tongva were the main occupants of the southern Channel Islands, the Los Angeles basin, much of Orange County, and extended as far east as the western San Bernardino Valley. The term "Gabrieliño" came from the tribe's association with Mission San Gabriel Arcangel, established in 1771. However, today the tribe prefers to be known by their ancestral name, Tongva. The Tongva are believed to have been one of the most populous and wealthy Native American tribes in Southern California prior to European contact, second only to the Chumash (Bean and Smith 1978; McCawley 1996; Moratto 1984).

The Tongva occupied numerous villages with populations ranging from 50 to 200 inhabitants. Residential structures within the villages were domed, circular, and made from thatched tule or other available wood. Tongva society was organized by kinship groups, with each group composed of several related families who together owned hunting and gathering territories. Settlement patterns varied according to the availability of floral and faunal resources (Bean and Smith 1978; McCawley 1996; Miller 1991). Vegetable staples consisted of acorns, chia, seeds, piñon nuts, sage, cacti, roots, and bulbs. Animals hunted included deer, antelope, coyote, rabbits, squirrels, rodents, birds, snakes, and the Tongva also fished (Bean and Smith 1978; McCawley 1996; Miller 1991).

By the late 18th Century, Tongva population had significantly dwindled due to the introduction of diseases and dietary deficiencies. Tongva communities near the missions disintegrated as individuals succumbed to Spanish control, fled the region, or died. Later, many of the Tongva fell into indentured

servitude to Anglo-Americans. By the early 1900s, few Tongva people had survived and much of their culture had been lost (Bean and Smith 1978; McCawley 1996; Miller 1991). However, in the 1970s, a revival of the Tongva culture began which continues to this day with growing interest and support.

2.2.2 - The Cahuilla

The project area is located in the region known to have been occupied by the Cahuilla Indians. Cahuilla territory was bounded on the north by the San Bernardino Mountains, on the east by the Orocopia Mountains, on the west by the Santa Ana River, the San Jacinto Plain and the eastern slope of the Palomar Mountains, and on the south by Borrego Springs and the Chocolate Mountains (Bean 1978).

The diversity of the territory provided the Cahuilla with a variety of foods. It has been estimated that the Cahuilla exploited more than 500 native and non-native plants (Bean and Saubel 1972). Acorns, mesquite, screw beans, piñon nuts, and various types of cacti were used. A variety of seeds, wild fruits and berries, tubers, roots, and greens were also a part of the Cahuilla diet. A marginal agricultural existence provided corn, beans, squashes, and melons. Rabbits and small animals were also hunted to supplement the diet. During high stands of Ancient Lake Cahuilla, fish, migratory birds, and marshland vegetation were also taken for sustenance and utilitarian purposes (Bean 1978).

Structures within permanent villages ranged from small brush shelters to dome-shaped or rectangular dwellings. Villages were situated near water sources, in the canyons near springs, or on alluvial fans at man-made walk-in wells (Bean 1972). Mortuary practices entailed cremation of the dead. Upon a person's death, the body was bound or put inside a net and then taken to a place where the body would be cremated. Secondary interments also occurred. A mourning ceremony took place about a year after a person's death. During this ceremony, an image of the deceased was burned along with other goods (Lando and Modesto 1977; Strong 1929).

Precontact Cahuilla population has been estimated as low as 2,500 to as high as 10,000. At the time of first contact with Europeans, around 1774, the Cahuilla numbered approximately 6,000. Although they were the first to come into contact with the Cahuilla, the Spanish had little to do with those of the desert region. Some of the Cahuilla who lived in the plains and valleys west of the desert and mountains, however, were missionized through the asistencia located near present day San Bernardino. Cahuilla political, economic, and religious autonomy was maintained until 1877 when the United States government established Indian reservations in the region. Protestant missionaries came into the area to convert and civilize the Native American population. During this era, traditional cultural practices, such as cremation of the dead, were prohibited. Today, the Cahuilla reside on eight separate reservations in southern California, located from Banning in the north to Warner Springs in the south and from Hemet in the west to Thermal in the east (Bean 1978).

2.3 - Regional Historic Background

2.3.1 - The Spanish Period (1769–1821)

The first Europeans to traverse the territory that constitutes modern Riverside County were Spanish soldier Pedro Fages and Father Francisco Garcés. This expedition to locate deserting soldiers eventually brought the group through the foothills of the San Jacinto Mountains, along Coyote Canyon, on the southern edge of Riverside County. They then continued into the Anza Valley, the San Jacinto Valley, Riverside and eventually into San Bernardino and the Cajon Pass. Later, in 1774, Captain Juan Bautista de Anza would also utilize Coyote Canyon and enter the confines of modern Riverside County as his expedition searched for an overland route from Sonora to coastal Southern California. These expeditions sparked an influx of non-natives to Southern California, and the first of these groups were the Spanish. Associated with the Spanish migration is the establishment of missions and military presidios along the coast of California. Although neither the missions nor presidios were ever located within the confines of modern Riverside County, their influence was far reaching. Land belonging to Mission San Gabriel extended to inland Southern California, east of the periphery of the Coachella Valley. Mission officials then converted portions of these holdings into ranchos during the Mexican period. Several ranchos were located in modern Riverside County, and the project area is located in the Jurupa Rancho.

2.3.2 - The Mexican Period (1821–1848)

Administration of the Southern California ranchos shifted to Mexican hands about 1824, but effective control did not occur until the early 1830s. Once the ranchos were secularized, the Mexican administrators began granting vast tracts of the original Mission properties to members of prominent families who had helped cut ties from the Spanish system. In 1838, title to the Mission San Gabriel's outpost in this area, the Jurupa Rancho, was granted to Juan Bandini, the appointed administrator of the Mission San Gabriel. This land grant was the first officially recognized Mexican land grant within modern Riverside County. The Jurupa Rancho consisted of roughly 30,000 acres, bounded by the Jurupa Hills to the north, the Santa Ana River to the south and east, and the Chino Rancho to the west.

During the period of the Mexican ranchos, rancho owners were constantly harassed by thieves and native groups from the Mojave region. Groups whose intent was to steal horses and cattle often attacked the northern part of the Rancho San Bernardino, so that Juan Bandini donated the very northeastern portion of the Jurupa Rancho for resettlement in 1842. By 1843, Bandini further fragmented the Jurupa Rancho, selling a sizable portion to Benjamin D. Wilson, who then sold the property known as Jurupa (Rubidoux) Rancho to Louis Rubidoux in 1847. The Rancho would be further divided within the upcoming decade.

2.3.3 - Riverside County

Riverside County is the 4th largest county in California in both size and population. It is 7,206 square miles and is home to 4,470,546 people. It is bordered by Orange County to the west, San Bernardino County to the north, San Diego County to the south, and Arizona to the east. Riverside County was

formed in 1893 from a small portion of San Bernardino County and a larger part of San Diego County and received its name from the already established City of Riverside (County of Riverside 2020).

The majority of Riverside County was part of Rancho San Jacinto Viejo, which was given to Don José Antonio Estudillo; Sierra (Yorba) Rancho, and Rincon Grant, which were given to Bernardo Yorba through land grants that were given to prominent Spanish families by the Spanish Government. Following the establishment of the community of Riverside, it maintained the same agricultural business practices that brought commerce to the region; however, the success in fruit growing and export of good, the profitable land, proximity to a water source, the arrival of several investors and the acquisition of irrigation rights, leading to the formation of the Riverside Land and Irrigation Company, Riverside was rapidly becoming an attractive destination to settle in. The addition of the Southern Pacific Railroad in the region further facilitated the distribution of goods and travelers, bringing financial prosperity and more business to Riverside. Rapid growth meant that institutions needed to be formed to meet the needs of the growing population, and in 1891 the first attempt to form a new county was held (Brown and Boyd 1922; Guinn 1902).

Riverside continues to be one of the fastest growing counites in California with a population of 2,470,546 people (United States Census Bureau 2020). It's ecological diversity, with rivers, deserts, mountains and beaches, affordable housing, the Wine Country near Temecula and renowned UC Riverside are key factors in the continued appeal of the County.

2.3.4 - City of Eastvale

The City of Eastvale was originally part of the Riverside School District that formed in 1893. The name Eastvale may have come given that the majority of the new school district was located east of the Milton Vale Ranch, *east* of the *Vale* Ranch. Likewise, from a suggestion of the Fuller Family, whose land housed the new elementary school, which was located *eas*t of the previous *Valley School*. The Fuller Family was one of the prominent Eastvale families, residing in Eastvale from 1889 to the mid-1950's. The Fuller's ventured in several business, having found success in cattle and racehorse breeding and transportation, establishing the Pioneer Truck and Transfer Company in the early 1900's and successfully transitioning from horse drawn carriages to motor vehicles, thus playing a pivotal role in the bringing business to the small community. Following the creation of Riverside County and the Eastvale School District in 1893, the community of Eastvale continued to gradually grow, attracting agricultural and dairy farmers, maintaining its rural identity until the 2000's. Beginning in 2007, citizens of Eastvale began the process of giving cityhood to Eastvale, establishing the Eastvale Incorporation Committee, officially incorporating Eastvale on October 1, 2010. Today, Eastvale continues to grow at a rapid pace, attracting future residents with its delicately planned residential neighborhoods and opportunities with the ever growing business and commerce expansion (eastvale.gov; Meissner & Johnson 2013)

SECTION 3: RESULTS

3.1 - Records Search

3.1.1 - Eastern Information Center

On February 25, 2021, a records search for the project site and a 0.5-mile radius beyond the project boundaries was conducted at the EIC located at University of California, Riverside. To identify additional historic properties or resources, the current inventories of the NRHP, CRHR, CHL list, CPHI list, and the BERD for Riverside County were reviewed to determine the existence of previously documented historic and prehistoric resources.

The results of the records search indicate that only one historic linear historic resource north of the project site has been recorded within the 0.5-mile search radius, and no resources are located within the project boundary (Table 1). In addition, 12 area-specific survey reports (Table 2) are on file with the EIC, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that portions of the project site have been previously surveyed (Table 2). Complete EIC records search results may be found in Appendix B.

3.1.2 - Historic Aerials

A review of 13 historical aerial photographs depicting the project site from 1938 to 2016 indicate that the project site and the surrounding lands remained generally undeveloped and used for agricultural purposes until approximately 1994. Between 1967 and 1994 a homestead was built within the boundaries of the project site. The images from 1938 to 2002 depict gradual residential

development surrounding the project site. Sometime after 1995 the surrounding area became more urbanized with construction of the Eastvale Elementary School east of the project site and River Heights Intermediate School located south of the project site (Historic Aerials 2020).

3.1.3 - Native American Heritage Commission

On January 15, 2021, FCS sent a request to the NAHC in an effort to determine if any sacred sites are listed on its Sacred Lands File for the project site. A response was received on February 1, 2021, indicating the results of their search was positive for the presence of TCRs. The NAHC provided a list of 22 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential tribal cultural resources that may be affected by the proposed project are addressed, a letter containing project information requesting any additional information was sent to each tribal representative on February 5, 2020. A response from the Agua Caliente Band of Cahuilla Indians tribe was received on March 10, 2021, indicating that the project is not located within the Tribe's Traditional Use Area and defer to the other tribes ethnographically associated with the project site. No other responses have been received to date. No other responses have been received to date. Correspondence related to the NAHC letters and tribal representatives can be found in Appendix C.

3.2 - Pedestrian Survey

On April 2, 2021, FCS Staff Archaeologist's Natalie Adame and Kweku Williams, MA, conducted a pedestrian survey for unrecorded cultural resources within the project boundaries of the proposed project site. The survey had to split in a western and eastern side due to home and -livestock stables positioned in the middle of the project site. The survey began on the westside of the project site, along the southeast border, and moved west, using north-south transects, spaced at 15-meter intervals whenever possible. Soil visibility was poor, throughout the project site, raging >5 percent due to the heavy vegetation and tall grasses. Areas of exposed soil consisted of light brown sandy loam with gravel inclusions. There is a residential property on site, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered potential historic resources under CEQA.

Survey conditions were documented using digital photographs and field notes. During the survey, Mr. Williams and Ms. Adame examined all areas of the exposed ground surface for prehistoric artifacts (e.g., fire-affected rock, milling tools, flaked stone tools, tool-making debris, ceramics), soil discoloration and depressions that might indicate the presence of a cultural midden, faunal and human osteological remains, and features indicative of the former presence of structures or buildings (e.g., postholes, standing exterior walls, foundations) or historic debris (e.g., glass, metal, ceramics).

To the extent possible, all areas of the project site were inspected for culturally modified soils or other indicators of potential historic or prehistoric resources. No historic or prehistoric cultural resources or raw materials commonly used in the manufacture of tools (e.g., obsidian, Franciscan chert, etc.) were found within the project site. Pedestrian Survey photos can be found in Appendix D.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 4: SUMMARY AND RECOMMENDATIONS

4.1 - Summary

In accordance with CEQA Guidelines, FCS assessed the potential impacts of the proposed project for known and potential cultural resources at the project site. Results from the EIC indicate that there are no cultural resources within the project site, and only a single historic resource has been recorded within the 0.5 mile radius. In addition, 12 area-specific survey reports are on file with the EIC for the project site and its 0.5-mile, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that the project site has been previously surveyed. The results of the pedestrian field survey failed to identify additional unrecorded cultural resources within the project site, however grasses and ground cover greatly reduced the visibility of native soils.

The NAHC Sacred Lands File search contained positive results, but subsequent correspondence with Native American representatives did not identify any TCRs that may be adversely affected by the proposed project. Although the pedestrian survey failed to locate any cultural resources, the pedestrian survey did confirm the presence of a residential property, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered potential a historic resources under CEQA

4.2 - Recommendations

4.2.1 - Cultural Resources Recommendations

Based on the results of the records searches, archival research, tribal correspondence, and pedestrian survey, FCS considers the potential for the proposed project to have an adverse effect on cultural resources to be moderate. No archaeological resources were identified in the records searches or during the pedestrian survey; however, the positive results from the Sacred Lands Files search, and overall poor visibility across the project site increases the possibility that historic and prehistoric cultural resources may be encountered during the course of project construction.

FCS therefore recommends that a qualified Archaeologist who meets the Secretary of Interior's Professional Qualification Standards for Archaeology perform an inspection of the site following grubbing, ground clearing, and demolition, and prior to any grading or project related ground disturbance. In the event exposed soils indicate cultural materials may be present, this may be followed by regular or periodic archaeological monitoring as determined by the Archaeologist, but full-time archaeological monitoring is not recommended at this time.

The following section recommends measures that would result in avoidance or minimization of potential project-related impacts to cultural resources on-site, and recommended procedures to be followed in the event cultural resources are encountered during project construction:

4.3 - Inadvertent Discovery Procedures

4.3.1 - Inadvertent Discovery of Human Remains

There is always the possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. Should this occur, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed.

In the event of an accidental discovery or recognition of any human remains, Public Resource Code Section 5097.98 shall be followed. In this instance, once project-related earthmoving begins and if there is inadvertent discovery or recognition of any human remains, the following steps shall be taken:

1. There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the County Coroner is contacted to determine if the remains are Native American and if an investigation of the cause of death is required. If the coroner determines the remains to be Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the "most likely descendant" of the deceased Native American. The most likely descendant may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resources Code Section 5097.98, or
2. Where the following conditions occur, the landowner or his/her authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the most likely descendent or on the project site in a location not subject to further subsurface disturbance:
   - The NAHC is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 48 hours after being notified by the Commission;
   - The descendent identified fails to make a recommendation; or
   - The landowner or his authorized representative rejects the recommendation of the descendent, and the mediation by the NAHC fails to provide measures acceptable to the landowner.

4.3.2 - Inadvertent Discovery of Cultural Resources

It is always possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources. If buried cultural resources are discovered during construction, operations shall stop in the immediate vicinity of the find and a qualified Archaeologist shall be consulted to determine whether the resource requires further study. The qualified Archeologist shall make recommendations to the Lead Agency on the measures that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with Section 15064.5 of the CEQA Guidelines. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area should be recorded on appropriate DPR forms and evaluated for significance in terms of CEQA criteria.

If the resources are determined to be unique historic resources as defined under Section 15064.5 of the CEQA Guidelines, mitigation measures shall be identified by the Archaeological Monitor and recommended to the Lead Agency. Appropriate mitigation measures for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.

No further grading shall occur in the area of the discovery until the Lead Agency approves the measures to protect these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the Lead Agency where they would be afforded long-term preservation to allow future scientific study.

FIRSTCARBON SOLUTIONS™

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

OVERVIEW

- More than 15 Years' Experience in Archaeology and Cultural Resources

Education

- Ph.D., Near Eastern Art and Archaeology, University of California at Berkeley, 2012
- M.A., Near Eastern Art and Archaeology, University of California at Berkeley, 2005
- B.A., Archaeology and History (double major), University of California at San Diego, 2002

Fellowships and Awards

- Albright Institute Educational and Cultural Affairs Fellowship (2015)
- Katherine Davis Foundation Projects for Peace Prize (2012)
- International House Gateway Fellowship (2011-2012)
- The George Franklin Dales Foundation Fellowship for Archaeological Research (2011)
- CAORC Multi-Country Dissertation Research Fellowship (2010)

Dana DePietro, Ph.D. is a Registered Professional Archaeologist who meets the Secretary of Interior's standards for historic preservation programs in archaeology. Dr. DePietro has over 15 years of experience in all aspects of cultural resource management, including prehistoric and historic archaeology, paleontology, materials conservation, history of art and architecture, and community engagement. He has experience in compliance with the National Environmental Policy Act (NEPA), the California Environment Quality Act (CEQA), the National Historic Preservation Act (NHPA), and the Archaeological Resources Protection Act (ARAP). Dr. DePietro has completed cultural resource projects that have involved agency, client, Native American, and subcontractor coordination; treatment plans and research design development; archival research; field reconnaissance; site testing; data recovery excavation; construction monitoring; site recordation; site protection/preservation, mapping/ cartography; spatial analysis/GIS; laboratory analysis; materials conservation; artifact curation and exhibition; and report production. He has completed projects in California within the jurisdiction of the Bureau of Land Management (BLM) and other federal agencies requiring compliance with Section 106 of the NHPA. He has also completed projects throughout California under CEQA for state and local governments and municipalities, including the California Department of Transportation (Caltrans) and has worked with clients to insure deliverables meet and exceed the standards set by the State Historic Preservation Office (SHPO).

RELATED EXPERIENCE AND CLIENT SUMMARY

FirstCarbon Solutions

As the Lead Archaeologist/Cultural Resource Specialist for FCS, Dr. DePietro conducts evaluations and performs field documentation of historic and prehistoric cultural resources; prepares environmental impact reports (EIRs), cultural resources assessments (CRAs), DPR forms and Section 106 reports; conducts mapping, GIS analysis, and state and county record searches; leads archaeological surveys and field monitoring efforts; and coordinates with state, federal and tribal officials and institutions for a variety of FCS projects, including the following:

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

- Atherton Baptist Homes Master Plan/Phase II, City of Alhambra, Los Angeles County
- Biological and Cultural Resources Assistance 140-Acre Project Site Woodcrest, Riverside County, CA

Other Relevant Experience

The Society for Humanitarian Archaeological Research and Exploration

Dr. DePietro is the Founder and Executive Director of The Society for Humanitarian Archaeological Research and Exploration. He manages the projects, staff, and the daily operation of this not-for-profit organization. Dr. DePietro likewise establishes relationships with partner universities and institutions, writes grant proposals, supervises fundraising projects, and maintains accounts, financial records, and the organization's online presence.

University of California at Berkeley

Dr. DePietro was a lecturer at the University of California, Berkeley from August 2003 to January 2015. During his tenure, he prepared University-level source and lectures in the history of the modern and ancient Middle East, performed student advising and evaluation, and university administrative duties. Dr. DePietro provided resources and opportunities that empower people to critically engage with other cultures as well as with their own communities.

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

Penn State University—Tel Akko Total Archaeology Project

Dr. DePietro was the Director of Community Engagement from 2013 to 2014 at the Penn State University for the Tel Akko Total Archaeology Project. He developed and executed a community engagement program, supervised staff and community participants, taught excavation and conservation techniques to groups of young people in Akko, and performed outreach, dialogue, and program developments in partnership[with community leaders.

Harvard University—Leon Levy Expedition to Ashkelon, Israel

Dr. De Pietro was the excavation supervisor during the summers of 2007-2013 for the Harvard University—Leon Levy Expedition to Ashkelon, Israel. He supervised the excavation and stratagraphic interpretation and instructed students in excavation techniques, data collection, photography, analysis, and publication.

Early Iron Age Cemetery Excavation—Dhamar, Yemen

Dr. De Pietro was the Area Supervisor during the summer of 2004 for the Early Iron Age Cemetery Excavation in Dhamar, Yemen. He supervised the excavation and stratagraphic interpretation, taught excavation techniques, strategy and implementation, field conservation, surveying techniques, data collection and analysis, and site management.

Journal of Associated Graduates in Near Eastern Studies (JAGNES)

Dr. DePietro was the Associate Editor from August 2003 to May 2012 for the Journal of Associated Graduates in Near Eastern Studiers (JAGNES). He solicited and proofread submissions, fundraising, and advertisements.

"Travel Today: Egypt" Magazine

Dr. De Pietro was an Archaeological Correspondent from December 2002 to February 2005. He wrote magazine articles, conducted relevant interviews and research, and procured photos and images to compliment articles.

- Superior Exhibit Award for *Trowels and Fair Trade: Revealing the Underground Railroad and Contemporary Slavery* exhibit, Anthropology Museum, Northern Illinois University, Illinois Association of Museums, IL, 2013
- Rhoten A. Smith Fellowship, Northern Illinois University, DeKalb, IL, 2012–2014
- Anthropology Foundation Fund Award, Northern Illinois University, DeKalb, IL, 2012

Kweku Williams, MA, RPA, is a Registered Professional Archaeologist (License No. 17953) with more than 12 years of experience specializing in archaeology and physical anthropology. He possesses knowledge on excavation practices, artifact analysis, and osteology. Mr. Williams has worked on the field in sites around the US and parts of Europe, as well as in the academe where he served as Adjunct Professor in Anthropology at Berkeley City College, Berkeley, California, and Las Positas College, Livermore, California.

RELATED EXPERIENCE AND CLIENT SUMMARY

FirstCarbon Solutions

Tulocay Cemetery Project for Holman Teague Roche Anglin, LLP Archaeological Monitoring, City of Napa, CA

FCS provided archaeological monitoring for excavations during boundary determination testing at Tulocay Cemetery. Mr. Williams served as Archaeological Monitor.

KWEKU WILLIAMS, MA, RPA—ARCHAEOLOGICAL MONITOR

Ritz-Carlton Napa Valley Resort Hotel Project Data Recovery of CA-NAP-928, City of Napa, CA

FCS is currently assisting the US Army Corps of Engineers (USACE) with the data recovery of CA-NAP-928. FCS is implementing the Memorandum of Agreement (MOA) and Historic Properties Treatment Plan (HPTP) for the Ritz-Carlton Napa Valley Resort Project, which was determined to have an adverse effect on the prehistoric site CA-NAP-928. The project proponent is a private developer whose application for the hotel site (which included a wetland) prompted Section 106 review by the USACE, San Francisco District. The project would result in the complete displacement of CA-NAP-928, which was determined eligible for listing in the National Register of Historic Places under criterion D for its data potential. To address this adverse effect, the USACE and the California State Historic Preservation Officer executed an MOA calling for the implementation of the HPTP. Treatment includes data recovery of the large, complex, multi-period site, involving the analysis of macrobotanical remains, lithics, fire-affected rock, obsidian hydration analysis, C-14 dating, and the treatment and recovery of faunal and human osteological remains. FCS is also working closely with Scott Gabaldon, the Chairperson of the Mishewal Wappo Tribe of Alexander Valley, who has assigned one Native American monitor to be present at the site during all ground-disturbing activities. Mr. Williams is providing archaeological testing and monitoring services for the project.

Previous Field Experience

Applied EarthWorks, Inc. and Cogstone Resource Management, Inc., Crowder Canyon, San Bernardino County, CA

Mr. Williams worked with Applied EarthWorks, Inc. and Cogstone Resource Management as a Field Technician on the Project State Route Realignment—Crowder Canyon Data Recovery Project for California Department of Transportation (Caltrans).

Schoharie Valley Field School, State University of New York, Albany, NY

Mr. Williams received training in archaeological techniques in surveying, excavation, and artifact analysis and preservation from Dr. Christina Rieth.

Cultural Resources Survey Program, New York State Museum, New York, NY

Under the supervision of Dr. Christina Rieth, Mr. Williams served as Archaeological Field Technician and conducted archaeological surveys and excavation for the New York State Museum.

Far Western Anthropological Research Group, Multiple Locations

As Field Technician, Mr. Williams' work included excavation and osteological recovery in compliance with the Native American Graves Protection and Repatriation Act with the Enterprise people; excavation testing for infrastructure development in Camp Pendleton for the Department of Defense; excavation and teaching demonstration in archaeological practices at Camp Tawonga, California; excavation and boundary site testing for a known archaeological site in Aliso Creek for the USACE; test excavation at Mariposa Leach Field for the US Forest Service (USFS); artifact processing for the Feather River West Levy project of the USACE and the Enterprise Tribal Group; the Moke 3700-Acre Survey in Pioneer, California for the USFS; the Onyx Ranch Survey in Mojave, California, for the Bureau of Land Management; Goleta Data Recovery for the Caltrans; archaeological field surveys, monitoring, and

excavation/burial recovery for the Feather River West Levee Project in Live Oak, California; and archaeological field surveys and excavation in Mariposa Grove at the Yosemite National Park.

Ka'Kabish Field School, Orange Walk, Belize

Through Trent University, Canada, Mr. Williams worked with Dr. Helen Haines as Crew Chief and Field Manager at the Ka'Kabish Field School in the province of Orange Walk, Belize.

Archaeological Field School in Salemi, Sicily, Italy

Through Northern Illinois University's Archaeological Field School, Mr. Williams collected data for his Master's thesis and received further training in archaeological techniques in surveying, excavation, and artifact analysis and preservation from Dr. Michael Kolb.

Hydro-archaeology Project, Universidad de Granada, Andalusia, Spain

Mr. Williams assisted Dr. José Maria Cervantes in mapping waterways in Andalusia, Spain.

Academic Positions

Berkeley City College, Berkeley, CA

Mr. Williams served as Adjunct Professor in Anthropology, teaching Introduction to Physical Anthropology, Introduction to Cultural Anthropology, and Introduction to Archaeology.

Las Positas College, Livermore, CA

Mr. Williams served as Adjunct Professor in Anthropology teaching Introduction to Physical Anthropology, Introduction to Cultural Anthropology, Introduction to Forensic Anthropology, and Introduction to Archaeology.

Archaeology Camp, College of Liberal Arts and Science, Northern Illinois University, DeKalb, IL

Mr. Williams served as Co-coordinator and Counselor for the Archaeology Camp of the College of Liberal Arts and Science in Northern Illinois University, DeKalb.

Anthropology Museum, Northern Illinois University, DeKalb, IL

Mr. Williams served as Graduate Assistant in Northern Illinois University, DeKalb's Anthropology Museum, where he coordinated the exhibit development team, provided tours and lectures on the content of exhibits, and fostered appreciation for education and cultural diversity. He also assisted in the development and installation of the *Fast Food Nation: 10,000 B.C.* and *Trowels and Fair Trade: Revealing the Underground Railroad and Contemporary Slavery* exhibits.

Department of Anthropology, Northern Illinois University, DeKalb, IL

As Teaching Assistant, Mr. Williams taught Introduction to Physical Anthropology, where he discussed The Life History and Social Behavior of the Mountain Gorilla, and Exploratory Archaeology, where he discussed The Rise of the City States of Mesopotamia, The Bronze Age in the Western Mediterranean, and Classic Period of the Maya Lowlands.

KWEKU WILLIAMS, MA, RPA—ARCHAEOLOGICAL MONITOR

Ka'Kabish Field School, Orange Walk, Belize

Through Trent University, Canada, Mr. Williams served as Field School Instructor where he provided students with the essentials for archaeological studies, such as laying out units, mapping (plan view and profile), calculating elevations and stadia metric distances, the essentials of logistical management of unit forms, proper notetaking in field journals, and the collection and labeling of artifact bags.

Academic Events and Speaking Engagements

- Learning Community Revolutionary Scholars First Year Experience, Berkeley City College, Berkeley, CA, Fall 2017
- Panelist on the Islamophobia Open Talk, Muslim Student Association and Peace and Social Justice Student Association, Las Positas College, Livermore, CA, Fall 2016
- Panelist on the African-American Science, Technology, Engineering, and Math Panel, Black Student Union, Las Positas College, Livermore, CA, Spring 2016
- Midwestern Mesoamerican Archaeological Conference, Northern Illinois University, DeKalb, IL, Spring 2014

Community Service

Mr. Williams participated in Northern Illinois University Cares Day where he participated in the beautification of DeKalb historical landmarks and public parks.

Publications

Williams, K.A. (2014). *Space and Specialization: Understanding the Medieval Economic Behavior through Ceramics in Salemi, Sicily* (master's thesis). Northern Illinois University, Illinois, United States.

FIRSTCARBON SOLUTIONS™

NATALIE ADAME—ARCHAEOLOGICAL MONITOR

OVERVIEW

- More than 2 years of experience

Education

- Bachelor of Arts, Biological Anthropology, Minor in Geology, California State University, East Bay, Hayward, CA, 2016
- Associate of Arts, Geology, Mt. San Antonio College, Walnut, CA, 2011

Skill

- Esri Aeronautical Reconnaissance Coverage Geographic Information System (ArcGIS)

Natalie Adame has more than 2 years of experience in archaeology, which she gained from extensive fieldwork and museum experience. Ms. Adame has established excellent research skills exemplified by her ability to prepare comprehensive reports and presentations. Her experience includes performing land use analyses and preparing Initial Studies and EIRs for various development projects. As an Archaeological Monitor/Field Technician, Ms. Adame implements Worker Environmental Awareness Programs (WEAP) 'tailgate' training sessions and coordinates with construction staff and Native American Monitors, construction monitoring, and the salvage and recordation of archaeological resources.

RELATED EXPERIENCE AND CLIENT SUMMARY

Biological, Archaeological, and Paleontological Monitoring and Reporting Services, Los Angeles Regional Interoperable Communications System, Los Angeles County, CA

FCS is providing monitoring and reporting services during the construction of more than 150 land mobile radio (LMR) facilities at sites located primarily in Los Angeles County. The LMR sites contain the infrastructure and equipment necessary to provide voice communications coverage throughout the County for emergency responders. These locations are widely dispersed across the County in both urban (intensively developed) and rural (less developed) settings and include coastal locations, sites in downtown Los Angeles, remote mountain peaks across the County, and the northern high desert. FCS is conducting the biological, archaeological, and paleontological pre-construction and construction monitoring and reporting services in accordance with the Construction Management Requirements outlined in the NEPA Environmental Assessment that FCS prepared for the project. Ms. Adame is a Field Archaeological Monitor on the project.

Barton Road Logistics Facility Project EIR, Technical Studies, and Peer Review, City of Colton, CA

FCS is providing CEQA documentation and peer review services for the Barton Road Logistics Facility Project in the City of Colton, in San Bernardino County. The proposed project includes the demolition of four industrial buildings, an office building, and parking lot. The proposed project would construct two state-of-the-art speculative concrete tilt-up industrial warehouse logistics facilities with a total square footage of 960,040 square feet. The project will develop Best-in-Class industrial facilities in the City of Colton that are designed to meet contemporary industry standards, can easily accommodate a wide

variety of warehouse and distribution uses, and are economically competitive with similar warehouse facilities in the local Inland Empire marketplace. FCS is preparing an EIR with supporting stand-alone Air Quality and Greenhouse Gas (GHG) Emissions Analysis with Health Risk Assessment, Biological Resources Assessment, Phase I Cultural Resources Assessment (CRA), Noise Impact Analysis, and Traffic Impact Analysis. Our team will also peer review the Geotechnical Report. The Phase I Cultural Resources Assessment will provide an evaluation and recommendations regarding potential construction related impacts to cultural resources. Ms. Adame is a Field Archaeological Monitor on the project.

Library/Learning Resource Center Building Project Biological and Cultural Construction Monitoring Services for the Solano Community College District, Fairfield, CA

FCS prepared the IS/MND and provided the subsequent biological and cultural construction monitoring services for the construction of a new 59,252-gross-square-foot, 2-story Library/Learning Resources Center building on the Fairfield Campus of the Solano Community College Campus. The building would be constructed on an open quad in the center of campus, replacing an open lawn. FCS conducted AB 52 consultation in coordination with the District and tribal representatives from the Yocha Dehe Wintun Nation to address concerns about tribal cultural resources in the immediate vicinity of the site. In additional to preparing a full PI-CRA, FCS drafted mitigation measures in coordination with the Tribe and District to effectively allow the project to proceed while protecting the Tribal Cultural resources in question. The District approved the project in May 2016, with the approval of the tribe and all parties involved. FCS will provide coordination with Tribal representatives from the Yocha Dehe Wintun Nation, as well as a "tailgate" sensitivity training session for construction personnel. Ms. Adame is a Field Archaeological Monitor on the project.

Prior Work Experience

Archaeologist, Material Culture Consulting, City of Pomona, CA

As an archaeologist, Ms. Adame performed excavations, recorded prehistoric and historic artifacts, and catalogued data using ArcGIS. She conducted Phase I, II, and III Environmental Site Assessments (ESAs) and drafted EIRs. Ms. Adame also prepared Department of Parks and Recreation (DPR) forms, searched records, and monitored projects in the State and county.

Field Archaeologist, ICF International, City of Los Angeles, CA

As a field archaeologist, Ms. Adame conducted environment surveys, performed excavations, and catalogued prehistoric and historic artifacts using ArcGIS. She prepared Federal Environment Management environmental reviews, DPR forms, and ESAs. Ms. Adame also worked with different transportation agencies, including the Orange County Transportation Authority, OC 405 Partners, LA Metro, and the California Department of Transportation.

Field Archaeologist, Dudek , City of Pasadena, CA

As a field archaeologist, Ms. Adame performed architectural and cultural historical assessments and conducted surveys for various projects to evaluate conflicts during construction period. Her responsibilities also include evaluating historic resource significance, cataloguing exhibit pieces, and gathering daily records of environmental compliances.

FIRSTCARBON SOLUTIONS™

NATALIE ADAME—ARCHAEOLOGICAL MONITOR

Grants and Proposal Writer – Applied Anthropology Coursework, California State University, East Bay, City of Hayward, CA

As a Grants and Proposal Writer, Ms. Adame analyzed organizational cultures, conducted needs assessment, and prepared social impact reports. Part of her task was to identify the appropriate research disciplines necessary for specific jobs.

Student Museum Docent, California State University, East Bay, City of Hayward, CA

Ms. Adame served as a docent at the university's C.E. Smith Museum of Anthropology. Her responsibilities include preparing materials for exhibits, researching and writing about artifacts, and mounting display materials in the museum.

Re: Native American Tribal Consultation, Pursuant to the Assembly Bill 52 (AB 52), Amendments to the California Environmental Quality Act (CEQA) (Chapter 532, Statutes of 2014), Public Resources Code Sections 5097.94 (m), 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2 and 21084.3, Orange Street Residential Development Project, Riverside County

Dear Ms. Griffin:

Pursuant to Public Resources Code section 21080.3.1 (c), attached is a consultation list of tribes that are traditionally and culturally affiliated with the geographic area of the above-listed project. Please note that the intent of the AB 52 amendments to CEQA is to avoid and/or mitigate impacts to tribal cultural resources, (Pub. Resources Code §21084.3 (a)) ("Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.")

Public Resources Code sections 21080.3.1 and 21084.3(c) require CEQA lead agencies to consult with California Native American tribes that have requested notice from such agencies of proposed projects in the geographic area that are traditionally and culturally affiliated with the tribes on projects for which a Notice of Preparation or Notice of Negative Declaration or Mitigated Negative Declaration has been filed on or after July 1, 2015. Specifically, Public Resources Code section 21080.3.1 (d) provides:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

The AB 52 amendments to CEQA law does not preclude initiating consultation with the tribes that are culturally and traditionally affiliated within your jurisdiction prior to receiving requests for notification of projects in the tribe's areas of traditional and cultural affiliation. The Native American Heritage Commission (NAHC) recommends, but does not require, early consultation as a best practice to ensure that lead agencies receive sufficient information about cultural resources in a project area to avoid damaging effects to tribal cultural resources.

The NAHC also recommends, but does not require that agencies should also include with their notification letters, information regarding any cultural resources assessment that has been completed on the area of potential effect (APE), such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

- A listing of any and all known cultural resources that have already been recorded on or adjacent to the APE, such as known archaeological sites;
- Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
- Whether the records search indicates a low, moderate, or high probability that unrecorded cultural resources are located in the APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

    - Any report that may contain site forms, site significance, and suggested mitigation measures.

      All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code section 6254.10.

3. The result of any Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was positive. Please contact the tribes on the attached list for more information.

4. Any ethnographic studies conducted for any area including all or part of the APE; and

5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS are not exhaustive and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Greetings,

A records check of the Tribal Historic preservation office's cultural registry revealed that this project is not located within the Tribe's Traditional Use Area. Therefore, we defer to the other tribes in the area. This letter shall conclude our consultation efforts.

Thank you,

Hi there,

I wanted clarify an inaccuracy in the letter attached to my previous email. The letter states that the California Historical Resources Information System (CHRIS) search did not return any results. However, we have not actually received results back from the CHRIS search. Please let me know if you have any questions.

Best regards,

Appendix E:
Regulatory Framework

THIS PAGE INTENTIONALLY LEFT BLANK

REGULATORY FRAMEWORK

Local, state, and federal government agencies have developed laws and regulations designed to protect significant cultural resources that may be affected by projects regulated, funded, or undertaken by the agency. Federal and state laws that govern the preservation of historic and archaeological resources of national, state, regional, and local significance include the National Environmental Policy Act (NEPA), the National Historic Preservation Act (NHPA), and the California Environmental Quality Act (CEQA). In addition, laws specific to work conducted on federal lands include the Archaeological Resources Protection Act, the American Antiquities Act, and the Native American Graves Protection and Repatriation Act.

The following federal or CEQA criteria were used to evaluate the significance of potential impacts on cultural resources for the proposed project. An impact is considered significant if it would affect a resource eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR), or if it is identified as a unique archaeological resource.

Federal-Level Evaluations

Federal agencies are required to consider the effects of their actions on historic properties and afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on such undertakings under Section 106 of the NHPA regulations Section (36 Code of Federal Regulations [CFR] 800). Additionally, federal agencies are responsible for initiating NHPA Section 106 review and completing the steps that are outlined in these regulations. They must determine if NHPA Section 106 applies to a given project and, if so, initiate review in consultation with the State Historic Preservation Officer (SHPO) and/or the Tribal Historic Preservation Officer (THPO). Federal agencies are also responsible for involving the public and other interested parties. Furthermore, NHPA Section 106 requires that any federal or federally assisted undertaking, or any undertaking requiring federal licensing or permitting, consider the effect of the action on historic properties listed in or eligible for the NRHP. Under the Code of Federal Regulations, 36 CFR Part 800.8, federal agencies are specifically encouraged to coordinate compliance with NHPA Section 106 and the NEPA process. The implementing regulations "Protection of Historic Properties" are found in 36 CFR Part 800. Resource eligibility for listing on the NRHP is detailed in 36 CFR Part 63 and the criteria for resource evaluation are found in 36 CFR Part 60.4 [a-d].

The NHPA established the NRHP as the official federal list for cultural resources that are considered important for their historical significance at the local, state, or national level. To be determined eligible for listing in the NRHP, properties must meet specific criteria for historic significance and possess certain levels of integrity of form, location, and setting. The criteria for listing on the NRHP include—significance in American history, architecture, archaeology, engineering, and culture as present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

a) That are associated with events that have made significant contributions to the broad patterns of our history; or

b) That are associated with the lives of persons significant in our past; or

c) That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that; represent a significant and distinguishable entity whose components may lack individual distinction; or

d) That have yielded, or may be likely to yield, information important in prehistory or history.

Criterion D is usually reserved for archaeological resources. Eligible properties must meet at least one of the criteria and exhibit integrity, measured by the degree to which the resource retains its historical properties and conveys its historical character.

Criteria Considerations

Ordinarily, cemeteries, birthplaces, graves of historical figures, properties owned by religious institutions or used for religious purposes, buildings that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the NRHP. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

a) A religious property deriving primary significance from architectural or artistic distinction or historical importance.

b) A building or structure removed from its original location, but which is primarily significant for architectural value, or which is the surviving structure most importantly associated with a historic person or event.

c) A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building associated with his or her productive life.

d) A cemetery that derives its primary importance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events.

e) A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived.

f) A property primarily commemorative in intent if design, age, tradition, or symbolic value

g) A property achieving significance within the past 50 years if it is of exceptional importance.

Thresholds of Significance

In consultation with the SHPO/THPO and other entities that attach religious and cultural significance to identified historic properties, the agency shall apply the criteria of adverse effect to historic properties within the Area of Potential Effect (APE). The agency official shall consider the views of consulting parties and the public when considering adverse effects.

Federal Criteria of Adverse Effects

Under federal regulations, 36 CFR Part 800.5, an adverse effect is found when an undertaking alters, directly or indirectly, any of the characteristics of a historic property that qualifies the property for inclusion in the NR in a manner that diminishes the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration will be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for listing in the NR. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance, or be cumulative.

According to 36 CFR Part 800.5, adverse effects on historic properties include, but are not limited to:

- Physical destruction of or damage to all or part of the property.
- Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the U.S. Secretary of the Interior's Standards for the Treatment of Historic Properties per 36 CFR Part 68 and applicable guidelines.
- Removal of the property from its historic location.
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance.
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features.
- Neglect of a property that causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization.
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long term preservation of the property's historic significance.

If Adverse Effects are Found

If adverse effects are found, the agency official shall continue consultation as stipulated in 36 CFR Part 800.6. The agency official shall consult with the SHPO/THPO and other consulting parties to develop alternatives to the undertaking that could avoid, minimize, or mitigate adverse effects to historic resources. According to 36 CFR Part 800.14(d), if adverse effects cannot be avoided then standard treatments established by the ACHP may be used as a basis for a Memorandum of Agreement (MOA).

According to 36 CFR Part 800.11(e), the filing of an approved MOA, and appropriate documentation, concludes the NHPA Section 106 process. The MOA must be signed by all consulting parties and approved by the ACHP prior to construction activities. If no adverse effects are found and the SHPO/THPO or the ACHP do not object within 30 days of receipt, the agencies' responsibilities under NHPA Section 106 will be satisfied upon completion of report and documentation as stipulated in 36

CFR Part 800.11. The information must be made available for public review upon request, excluding information covered by confidentiality provisions.

State-Level Evaluation Processes

An archaeological site may be considered a historical resource if it is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California per Public Resources Code (PRC) Section 5020.1(j) or, if it meets the criteria for listing on the CRHR per the California Code of Regulations (CCR) at Title 14 CCR Section 4850.

The most recent amendments to the CEQA Guidelines direct lead agencies to first evaluate an archaeological site to determine if it meets the criteria for listing in the CRHR. If an archaeological site is a historical resource, in that it is listed or eligible for listing in the CRHR, potential adverse impacts to it must be considered as stated in PRC Sections 21084.1 and 21083.2(l). If an archaeological site is considered not to be a historical resource, but meets the definition of a "unique archeological resource" as defined in PRC Section 21083.2, then it would be treated in accordance with the provisions of that section.

With reference to PRC Section 21083.2, each site found within a project area will be evaluated to determine if it is a unique archaeological resource. A unique archaeological resource is described as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets one or more of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

As used in this report, a "non-unique archaeological resource" means an archaeological artifact, object, or site that does not meet the criteria for eligibility for listing on the CR, as noted in subdivision (g) of PRC Section 21083.2. A non-unique archaeological resource requires no further consideration, other than the simple recording of its components and features. Isolated artifacts are typically considered non-unique archaeological resources. Historic structures that have had their superstructures demolished or removed can be considered historic archaeological sites and are evaluated following the processes used for prehistoric sites. Finally, the California State Office of Historic Preservation recognizes an age threshold of 45 years. Cultural resources built less than 45 years ago may qualify for consideration, but only under the most extraordinary circumstances.

Title 14 of the CCR, Chapter 3, Section 15064.5 is associated with determining the significance of impacts to archaeological and historical resources. Here, the term historical resource includes the following:

1. A resource listed in, or determined eligible by the State Historical Resources Commission, for listing in the CRHR (PRC § 5024.1; Title 14 CCR, § 4850 *et seq*.).
2. A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the PRC Section 5024.1(g) requirements, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
3. Any object, building, structure, site, area, place, record, or manuscript, which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be historically significant if the resource meets the criteria for listing on the CRHR (PRC § 5024.1; Title 14 CCR § 4852) including the following:
   A. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
   B. Is associated with the lives of persons important in our past.
   C. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
   D. Has yielded, or may be likely to yield, information important in prehistory or history.

Typically, archaeological sites exhibiting significant features qualify for the CRHR under Criterion D because such features have information important to the prehistory of California. A lead agency may determine that a resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1 even if it is:

- Not listed in or determined to be eligible for listing in the CRHR.
- Not included in a local register of historical resources pursuant to PRC Section 5020.1(k).
- Identified in a historical resources survey per PRC Section 5024.1(g).

Threshold of Significance

If a project will have a significant impact on a cultural resource, several steps must be taken to determine if the cultural resource is a "unique archaeological resource" under CEQA. If analysis and/or testing determine that the resource is a unique archaeological resource and therefore subject to mitigation prior to development, a threshold of significance should be developed. The threshold of significance is a point where the qualities of significance are defined, and the resource is determined to be unique under CEQA. A significant impact is regarded as the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource will be reduced to a point that it no longer meets the significance criteria. Should analysis indicate that project development will destroy the unique elements of a resource; CEQA regulations require that that the project implement appropriate and feasible

mitigation measures. The preferred form of mitigation is to preserve the resource in place, in an undisturbed state. However, as that is not always possible or feasible, appropriate mitigation measures may include, but are not limited to:

1. Planning construction to avoid the resource.
2. Deeding conservation easements.
3. Capping the site prior to construction.

If a resource is determined to be a "non-unique archaeological resource," no further consideration of the resource by the lead agency is necessary.

Tribal Consultation

The following serves as an overview of the procedures and timeframes for the Tribal Consultation process, for the complete Tribal Consultation Guidelines, please refer to the State of California Office of Planning and Research website.

Prior to the amendment or adoption of general or specific plans, local governments must notify the appropriate tribes of the opportunity to conduct consultation for the purpose of preserving or mitigating impacts to cultural places located on land within the local government's jurisdiction that is affected by the plan adoption or amendment. The tribal contacts for this list are maintained by the NAHC and are distinct from the Most Likely Descendent (MLD) list. It is suggested that local governments send written notice by certified mail with return receipt requested. The tribes have 90 days from the date they receive notification to request consultation. In addition, prior to adoption or amendment of a general or specific plan, local government must refer the proposed action to tribes on the NAHC list that have traditional lands located within the city or county's jurisdiction. Notice must be sent regardless of prior consultation. The referral must allow a 45-day comment period.

In brief, notices from the local government to the tribes should include:

- A clear statement of purpose.
- A description of the proposed general or specific plan, the reason for the proposal, and the specific geographic areas affected.
- Detailed maps to accompany the description.
- Deadline date for the tribes to respond.
- Government representative(s) contact information.
- Contact information for project proponent/applicant, if applicable.

The basic schedule for this process is:

- **30 days**: time the NAHC has to provide tribal contact information to the local government; this is recommended, not mandatory.

- **90 days**: time the tribe has to respond indicating whether or not they want to consult. Note: tribes can agree to a shorter timeframe. In addition, consultation does not begin until/unless requested by the tribe within 90 days of receiving notice of the opportunity to consult. The consultation period, if requested, is open-ended. The tribes and local governments can discuss issues for as long as necessary or productive, and need not result in agreement.
- **45 days**: time the local government has to refer proposed action, such as adoption or amendment to a general or specific plan, to agencies, including the tribes. Referral is required even if there has been prior consultation. This opens the 45-day comment period.
- **10 days:** time the local government has to provide the tribes with notice of a public hearing.

MANAGEMENT SUMMARY

At the request of the MLC, Holdings Inc. (Client), FirstCarbon Solutions (FCS) conducted a Phase I Cultural Resource Assessment (Phase I CRA) Orange Street Residential Development Project (proposed project) located in the City of Eastvale, in Riverside County, California. The purpose of the assessment was to identify the presence or absence of potentially significant cultural resources within the project area, and if impacted by the proposed development, propose recommendations for mitigation. Completion of this investigation fulfills the requirements of the California Environmental Quality Act (CEQA) under Section 15064.5. This report follows the California Office of Historic Preservation (OHP) procedures for cultural resource surveys and the OHP Archaeological Resource Management Report (ARMR) format for archaeological reports.

On February 25, 2021, a records search was conducted at the Eastern Information Center (EIC) located at University of California, Riverside, for the project site and a 0.5-mile radius area beyond the project boundaries. To identify additional historic properties or resources, the search also included current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), the California Historical Landmarks (CHL) list, the California Points of Historical Interest (CPHI) list, and the California Built Environment Resource Directory (BERD) for Riverside County. The results of the records search indicate that only one linear historic resource has been recorded north of the project site within the 0.5-mile search radius, and no historic or prehistoric resources have been recorded within the project boundaries. In addition, there are 12 area-specific survey reports on file with the EIC, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that portions of the project site have been previously surveyed.

On January 15, 2021, FCS sent a request to the Native American Heritage Commission (NAHC) in an effort to determine if any sacred sites are listed on its Sacred Lands File for the project site. A response was received on February 1, 2021, indicating that the Sacred Lands File was positive for the presence of Native American cultural resources in the immediate project area. The NAHC included a list of 22 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential Tribal Cultural Resources (TRCs) that may be affected by the proposed project are addressed, a letter containing project information requesting any additional information was sent to each tribal representative on February 4, 2020. A response from the Agua Caliente Band of Cahuilla Indians Tribe was received on March 10, 2021, indicating that the proposed project is not located within the Tribe's Traditional Use Area and defer to the other tribes ethnographically associated with the project site. No other responses have been received to date. Correspondence with the NAHC can be found in Appendix C.

On April 2, 2021, FCS Staff Archaeologists, Natalie Adame and Kweku Williams, MA, conducted a pedestrian survey for unrecorded cultural resources within the project boundaries of the proposed project site. The survey had to split into a western and eastern side due to home and livestock stables positioned in the middle of the project site. The survey began on the westside of the project site, along the southeast border, and moved west, using north-south transects, spaced at 15-meter

intervals whenever possible. Soil visibility was poor across the project site, raging >5 percent due to the heavy vegetation and tall grasses. Areas of exposed soil consisted of light brown sandy loam with gravel inclusions. There is a residential property on site, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered a potential historic resources under CEQA.

Survey conditions were documented using digital photographs and field notes. During the survey, Mr. Williams and Ms. Adame examined all areas of the exposed ground surface for prehistoric artifacts (e.g., fire-affected rock, milling tools, flaked stone tools, tool-making debris, ceramics), soil discoloration and depressions that might indicate the presence of a cultural midden, faunal and human osteological remains, and features indicative of the former presence of structures or buildings (e.g., postholes, standing exterior walls, foundations) or historic debris (e.g., glass, metal, ceramics. No additional resources were encountered.

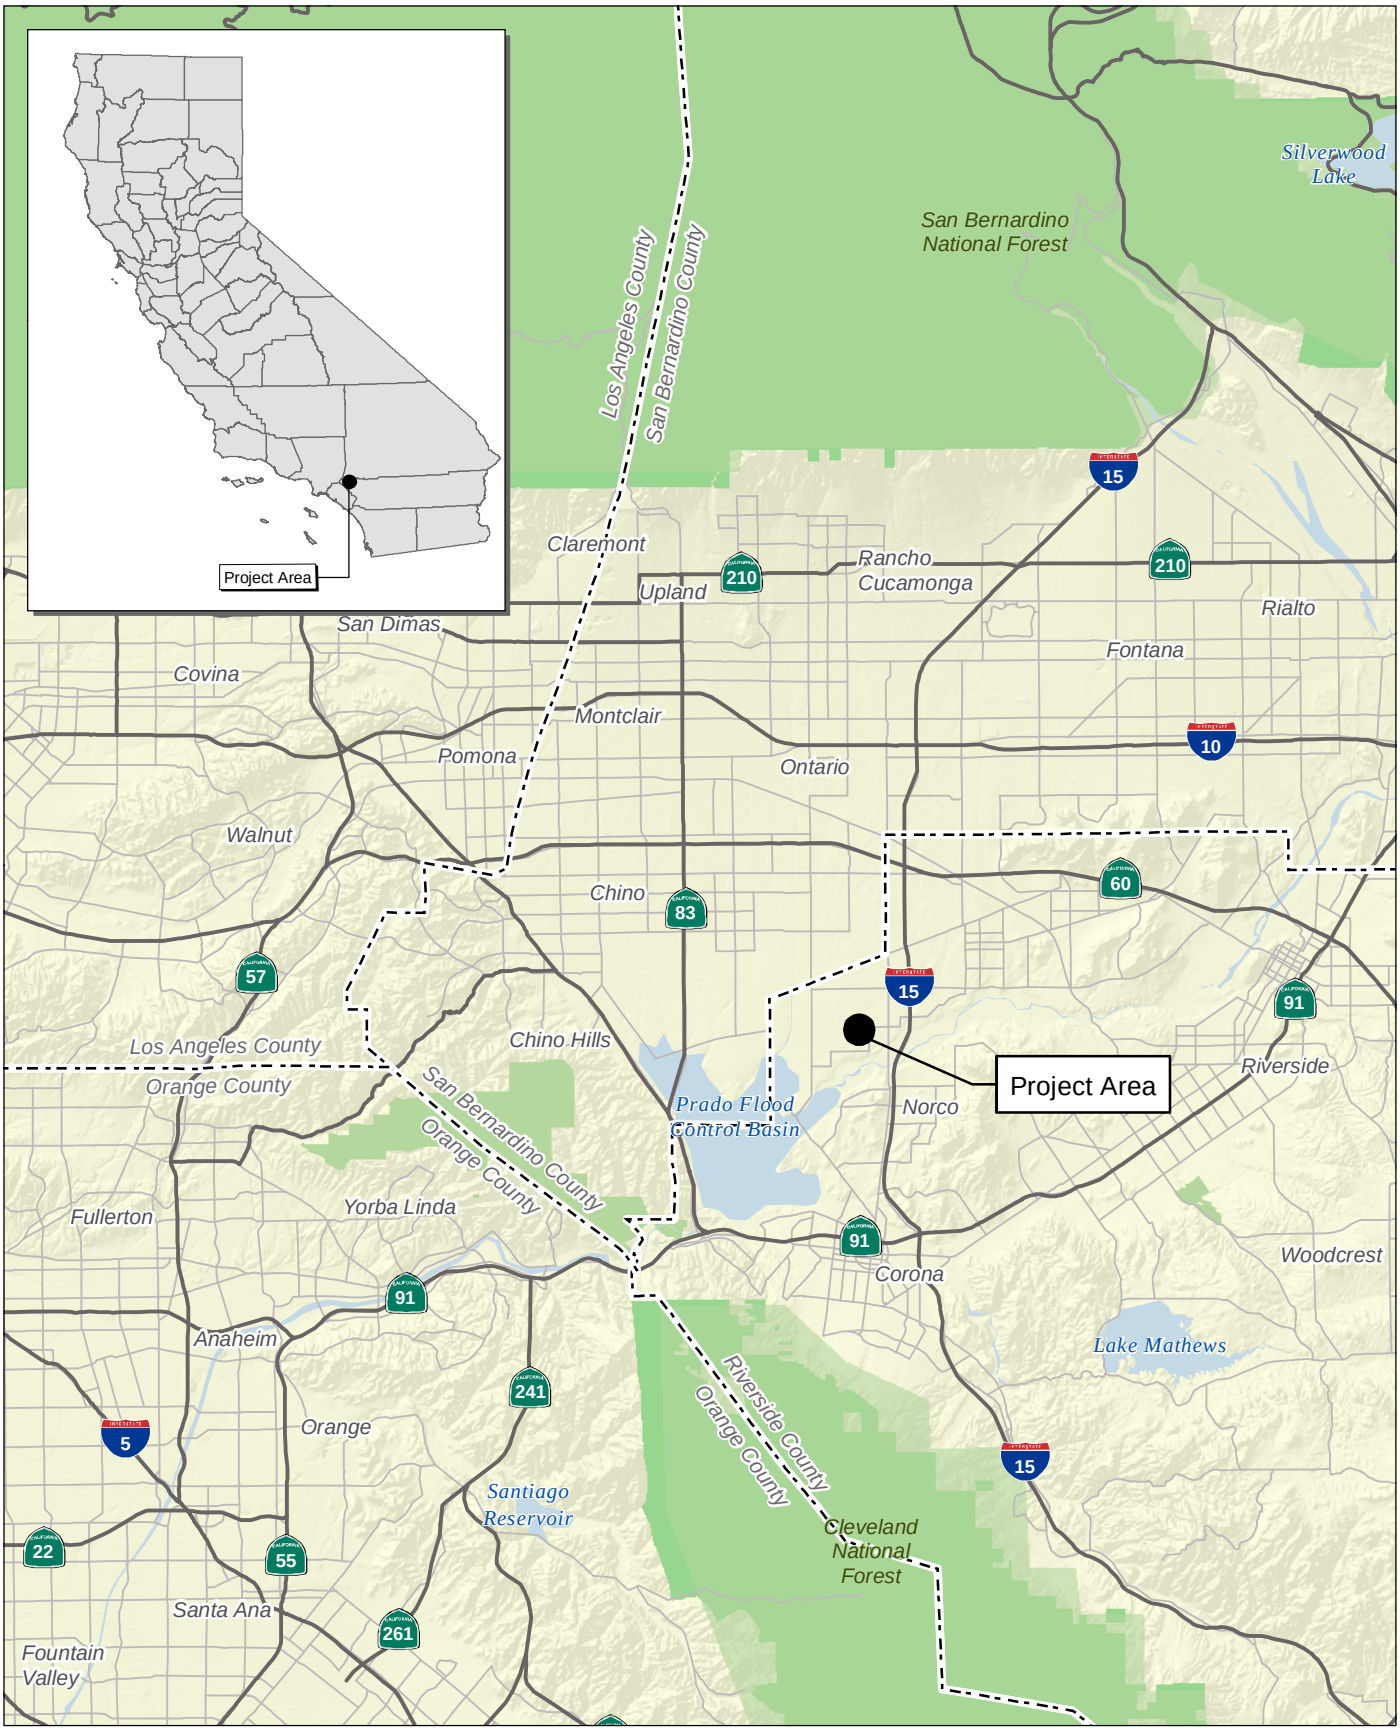
Based on the results of the records searches, archival research, tribal correspondence, and pedestrian survey, FCS considers the potential for the proposed project to have an adverse effect on cultural resources to be moderate. No prehistoric or historic resources were identified during the pedestrian survey, however the positive results from the NAHC and lack of soil visibility during the pedestrian survey increases the probability that potential resources may be encountered during project subsurface construction activities and demolition.

FCS therefore recommends that a qualified Archaeologist who meets the Secretary of Interior's Professional Qualification Standards for Archaeology perform an inspection of the site following grubbing, ground clearing, and demolition, and prior to any grading or project related ground disturbance. In the event exposed soils indicate cultural materials may be present, this may be followed by regular or periodic archaeological monitoring as determined by the Archaeologist, but full-time archaeological monitoring is not recommended at this time. Additional recommended procedures for the inadvertent discovery of archaeological resources or human remains are included in this report.

SECTION 1: INTRODUCTION

1.1 - Project Location

The project site is 10 gross acres (8.28 net acres) in size and located at 13175 Orange Street, in the City of Eastvale, in Riverside County, California (Exhibit 1). The project site is located within the Jurupa (Stearns) Land Grant of the *Corona North, California* United States Geological Survey (USGS) 7.5-minute Quadrangle Topographic Map (Exhibit 2). The project is bounded by Orange Street to the south, Schleisman Road to the north, residential neighborhood to the west and Eastvale Elementary School to the east, and encompasses Assessor's Parcel Numbers (APNs) 152-040-003 (Exhibit 3).



1.2 - Project Description

MLC Holdings Inc. (Client) is proposing to develop a residential development community, consisting of 41 single-family detached homes on 8.28 acres for a density of 4.95 dwelling units per acre (du/acre). The homes would range from 2,054 square feet to 3,153 square feet in size and consist of 11 one-story homes with four bedrooms and 30 two-story homes with five bedrooms and a loft. The proposed project would include vehicular access from Schleisman Road and secondary access from Orange Street. The proposed project would provide two garage spaces and two driveway spaces per dwelling unit, for a total of 164 spaces, as well as an additional 59 parallel street parking spaces. A 45-foot-wide paseo would be located in the center of the community that would consist of a trail, bench, and dog station that would be maintained by the Homeowner's Association (HOA).

1.3 - Assessment Team

FCS Staff Archaeologists, Natalie Adame and Kweku Williams MA, conducted the pedestrian survey and Ms. Adame authored this report. Dr. Dana DePietro, RPA, provided senior review and served as principal investigator. Ms. Adame, Mr. Williams, and Dr. DePietro exceed the professional standards set for their respective roles by the Secretary of the Interior. Professional qualifications for Ms. Adame, Mr. Williams, and Dr. DePietro can be found in Appendix A.

SECTION 2: CULTURAL SETTING

Following is a brief overview of the prehistory, ethnography, and historic background, providing context in which to understand the background and relevance of sites found in the general project area. This section is not intended to be a comprehensive review of the current resources available; rather, it serves as a general overview.

Further details can be found in ethnographic studies, mission records, and major published sources, including Beardsley (1948), Bennyhoff (1950), Fredrickson (1973), Kroeber (1925), Chartkoff and Chartkoff (1984), and Moratto (1984).

2.1 - Prehistoric Background

Fagan (2003), Moratto (1984), and Chartkoff and Chartkoff (1984) provide recent overviews of California archaeology and historical reviews of the inland Southern California among other locales. An early and widely used regional chronology for coastal Southern California is Wallace's four-part Horizon format (1955), which was later updated and revised by Warren (1968) and more recently by Chartkoff and Chartkoff (1984), and King (1990 and 2000). The sequence provides a framework that relates societal change to change in material culture; the advantages and weaknesses of Southern California chronological sequences are reviewed by Warren (in Moratto 1984), Chartkoff and Chartkoff (1984), and Heizer (ed. 1978).

2.1.1 - Paeloamericans

In North America, radiocarbon dates from existing samples of archaeological materials demonstrate human presence as early as 15,000 years Before Present (BP) (Waters et al. 2018). The lithics from the earliest (14,000 to 15,000 BP) documented sites in North America include cores, flakes and flake tools (e.g., 5 blades, 14 bladelets, 12 bifaces, one discoidal flake core, 23 edge-modified tools that includes scrapers and gravers from the Debra L. Friedkin site in, Texas) with an absence of projectile points (Waters et al. 2011, 2018). The first known projectile points in North America are from 13,000 years BP, with lanceolate fluted points (Clovis Complex) in sites from central and eastern North America, and stemmed projectile points from sites in areas of western North America that were not glaciated (Jenkins et al. 2012; Beck and Jones 2010). Glennan (1972) provides an early study of the hypothesis of Pre-Clovis in Southern California. The oldest California radiocarbon date as of 2007 from archaeological materials confirms a human presence in the northeastern part of the State (from site CA-SIS-218) as early as 13,500 years BP (Jones and Klar 2007). The radiocarbon date corresponds to the period of fluted points and fluted points have been found throughout California (Rondeau et al. 2007; Rondeau 2009) although projectile points and other chronologically and culturally informative materials are absent from the SIS-218 sample.

2.1.2 - Millingstone Complex or Early Period

During the early post glacial period after 8,500 BP the Southern California climate became warmer and drier (Fagan 2003). Groundstone artifacts that include manos and metates correspond to the Early Period. The Early period in Southern California begins as early or earlier than 8,000 BP and ends

by about 2,800 BP (King 1990). The Early period corresponds to the earliest known sites in Southern California with year-round habitation and cemeteries. Manos and metates consist of a variety of types. Mano and metates of the Early period in Southern California, correspond to types from studies in the U.S. southwest that efficiently grind small, oily annual and biennial wild seeds (Adams 1999; Ciolek-Torello 1995; Gilman 1988; Lancaster 1984; Whittlesey 1995). Most annual and biennial wild seed plant types in Southern California are best adapted for warm and dry environments (e.g., Hemizonia fasciculata, which is a summer seed source). Annual and biennial seed crops are highly reliable, nutritious, and productive. Annual and biennial seed producers are also, diverse and afford reliable seed production throughout the year. Compared to later periods, utilitarian artifacts are most frequently found with Early Period burials.

Manos and metates are “kitchen tools” and concentrate within residential areas of Early period habitation sites in Southern California (King and Merrill 2002; Merrill 2015). Other kinds of lithics that correspond to the Early period include many kinds of core tools (e.g., hammers, choppers, and scraper planes), knives, bifaces, scrapers (many types), gravers, burins, dart points, and compound bone fishhooks. Sedentism apparently increased in areas with abundant resources that were available for longer periods. Arid inland regions and offshore desert islands (e.g., San Nicolas Island) provided less opportunity for long term residence without trade and possibly for more mobile subsistence. The Early period ends about 2,800 BP (King 1990).

2.1.3 - Middle Period

The Middle Period lasted from about 2,800 BP to 750 BP (King 1990). Excavated assemblages retain many attributes of the Early Period but with more diverse artifact types. Middle Period sites can contain large-stemmed or notched small projectile points suggestive of bow and arrow use, especially near the end of the Period, and the use of portable grinding tools continued. Intensive use of mortar and pestles signaled processing of acorns as the primary vegetative staple as opposed to a mixed diet of seeds and acorns. Because of a general lack of data, neither the settlement and subsistence systems nor the cultural evolution of this Period are well understood, but it is very likely that the nomadic ways continued. It has been proposed that sedentism increased with the exploitation of storable food resources, such as acorns, but coastal sites from the Period exhibit higher fishing activity than in previous periods. The first permanently occupied villages make their appearance in this Period (Chartkoff and Chartkoff 1984).

2.1.4 - Late Prehistoric

Extending from 750 BP to Spanish Contact in 1769, the Late Prehistoric includes changes in trade networks and political and secular economic subsystems. There was also a differentiation of types of political economies. Exploitation of marine resources continued to intensify. Assemblages characteristically contain projectile points, and toward the end of the Period the size of the points decreased and notched and stemmed bases appeared, which implies the use of the bow and arrow. Use of personal ornaments such as shell beads, were widely distributed east of the coast, suggesting well-organized and codified trade networks. Additional assemblages in this Period included steatite bowls, asphaltum, grave goods, and elaborate shell ornaments. The use of bedrock milling stations was widespread during this horizon. Increased hunting efficiency and widespread exploitation of acorns provided reliable and storable food resources. Village size increased during this time, and

some of these villages may have held 1,500 or more residents (Chartkoff and Chartkoff 1984). Analyses of skeletons showed that the first signs of malnutrition appeared in this Period, signaling greater competition for food resources (Fagan 2003).

The earliest part of this Period may have seen an incursion of Cupan-Takic speakers from the Great Basin (the "Shoshonean wedge" of Kroeber 1925) may have replaced the Hokan speakers in the area. At the time of Spanish conquest, Cupan-Takic speakers were distributed throughout Orange County, western Riverside County, and the Los Angeles Basin (Gabrieliño, Juaneño, and Cahuilla peoples). Serran-Takic speakers are now represented by the Serranos in the San Bernardino Mountains. Recent work (O'Neil 2002) suggests that the "Shoshonean wedge" is misnamed—the original Los Angeles inhabitants replaced by the incoming Takic-speakers may have actually been Yuman speakers (similar to those in the California Delta region of the Colorado River) and not Hokan Salinan-Seri (Chumash) speakers as was suggested by Kroeber.

At the time of Spanish conquest, local indigenous groups were composed of constantly moving and shifting clans and cultures. Early ethnographers applied the concept of territorial boundaries to local indigenous groups purely as a conceptualization device, and the data was based on fragmented information provided to them from second-hand sources. At least three Native American groups, the Cahuilla, Serrano, and Gabrieliño are known to have occupied or utilized resources within the vicinity of the project site at different points in history. A brief overview of these three tribal groups follows.

2.2 - Native American Background

2.2.1 - The Tongva (Gabrieliño)

Ethnographic accounts of Native Americans indicate that the Tongva (or Gabrieliño) once occupied the region that encompasses the project area. At the time of contact with Europeans, the Tongva were the main occupants of the southern Channel Islands, the Los Angeles basin, much of Orange County, and extended as far east as the western San Bernardino Valley. The term "Gabrieliño" came from the tribe's association with Mission San Gabriel Arcangel, established in 1771. However, today the tribe prefers to be known by their ancestral name, Tongva. The Tongva are believed to have been one of the most populous and wealthy Native American tribes in Southern California prior to European contact, second only to the Chumash (Bean and Smith 1978; McCawley 1996; Moratto 1984).

The Tongva occupied numerous villages with populations ranging from 50 to 200 inhabitants. Residential structures within the villages were domed, circular, and made from thatched tule or other available wood. Tongva society was organized by kinship groups, with each group composed of several related families who together owned hunting and gathering territories. Settlement patterns varied according to the availability of floral and faunal resources (Bean and Smith 1978; McCawley 1996; Miller 1991). Vegetable staples consisted of acorns, chia, seeds, piñon nuts, sage, cacti, roots, and bulbs. Animals hunted included deer, antelope, coyote, rabbits, squirrels, rodents, birds, snakes, and the Tongva also fished (Bean and Smith 1978; McCawley 1996; Miller 1991).

By the late 18th Century, Tongva population had significantly dwindled due to the introduction of diseases and dietary deficiencies. Tongva communities near the missions disintegrated as individuals succumbed to Spanish control, fled the region, or died. Later, many of the Tongva fell into indentured

servitude to Anglo-Americans. By the early 1900s, few Tongva people had survived and much of their culture had been lost (Bean and Smith 1978; McCawley 1996; Miller 1991). However, in the 1970s, a revival of the Tongva culture began which continues to this day with growing interest and support.

2.2.2 - The Cahuilla

The project area is located in the region known to have been occupied by the Cahuilla Indians. Cahuilla territory was bounded on the north by the San Bernardino Mountains, on the east by the Orocopia Mountains, on the west by the Santa Ana River, the San Jacinto Plain and the eastern slope of the Palomar Mountains, and on the south by Borrego Springs and the Chocolate Mountains (Bean 1978).

The diversity of the territory provided the Cahuilla with a variety of foods. It has been estimated that the Cahuilla exploited more than 500 native and non-native plants (Bean and Saubel 1972). Acorns, mesquite, screw beans, piñon nuts, and various types of cacti were used. A variety of seeds, wild fruits and berries, tubers, roots, and greens were also a part of the Cahuilla diet. A marginal agricultural existence provided corn, beans, squashes, and melons. Rabbits and small animals were also hunted to supplement the diet. During high stands of Ancient Lake Cahuilla, fish, migratory birds, and marshland vegetation were also taken for sustenance and utilitarian purposes (Bean 1978).

Structures within permanent villages ranged from small brush shelters to dome-shaped or rectangular dwellings. Villages were situated near water sources, in the canyons near springs, or on alluvial fans at man-made walk-in wells (Bean 1972). Mortuary practices entailed cremation of the dead. Upon a person's death, the body was bound or put inside a net and then taken to a place where the body would be cremated. Secondary interments also occurred. A mourning ceremony took place about a year after a person's death. During this ceremony, an image of the deceased was burned along with other goods (Lando and Modesto 1977; Strong 1929).

Precontact Cahuilla population has been estimated as low as 2,500 to as high as 10,000. At the time of first contact with Europeans, around 1774, the Cahuilla numbered approximately 6,000. Although they were the first to come into contact with the Cahuilla, the Spanish had little to do with those of the desert region. Some of the Cahuilla who lived in the plains and valleys west of the desert and mountains, however, were missionized through the asistencia located near present day San Bernardino. Cahuilla political, economic, and religious autonomy was maintained until 1877 when the United States government established Indian reservations in the region. Protestant missionaries came into the area to convert and civilize the Native American population. During this era, traditional cultural practices, such as cremation of the dead, were prohibited. Today, the Cahuilla reside on eight separate reservations in southern California, located from Banning in the north to Warner Springs in the south and from Hemet in the west to Thermal in the east (Bean 1978).

2.3 - Regional Historic Background

2.3.1 - The Spanish Period (1769–1821)

The first Europeans to traverse the territory that constitutes modern Riverside County were Spanish soldier Pedro Fages and Father Francisco Garcés. This expedition to locate deserting soldiers eventually brought the group through the foothills of the San Jacinto Mountains, along Coyote Canyon, on the southern edge of Riverside County. They then continued into the Anza Valley, the San Jacinto Valley, Riverside and eventually into San Bernardino and the Cajon Pass. Later, in 1774, Captain Juan Bautista de Anza would also utilize Coyote Canyon and enter the confines of modern Riverside County as his expedition searched for an overland route from Sonora to coastal Southern California. These expeditions sparked an influx of non-natives to Southern California, and the first of these groups were the Spanish. Associated with the Spanish migration is the establishment of missions and military presidios along the coast of California. Although neither the missions nor presidios were ever located within the confines of modern Riverside County, their influence was far reaching. Land belonging to Mission San Gabriel extended to inland Southern California, east of the periphery of the Coachella Valley. Mission officials then converted portions of these holdings into ranchos during the Mexican period. Several ranchos were located in modern Riverside County, and the project area is located in the Jurupa Rancho.

2.3.2 - The Mexican Period (1821–1848)

Administration of the Southern California ranchos shifted to Mexican hands about 1824, but effective control did not occur until the early 1830s. Once the ranchos were secularized, the Mexican administrators began granting vast tracts of the original Mission properties to members of prominent families who had helped cut ties from the Spanish system. In 1838, title to the Mission San Gabriel's outpost in this area, the Jurupa Rancho, was granted to Juan Bandini, the appointed administrator of the Mission San Gabriel. This land grant was the first officially recognized Mexican land grant within modern Riverside County. The Jurupa Rancho consisted of roughly 30,000 acres, bounded by the Jurupa Hills to the north, the Santa Ana River to the south and east, and the Chino Rancho to the west.

During the period of the Mexican ranchos, rancho owners were constantly harassed by thieves and native groups from the Mojave region. Groups whose intent was to steal horses and cattle often attacked the northern part of the Rancho San Bernardino, so that Juan Bandini donated the very northeastern portion of the Jurupa Rancho for resettlement in 1842. By 1843, Bandini further fragmented the Jurupa Rancho, selling a sizable portion to Benjamin D. Wilson, who then sold the property known as Jurupa (Rubidoux) Rancho to Louis Rubidoux in 1847. The Rancho would be further divided within the upcoming decade.

2.3.3 - Riverside County

Riverside County is the 4th largest county in California in both size and population. It is 7,206 square miles and is home to 4,470,546 people. It is bordered by Orange County to the west, San Bernardino County to the north, San Diego County to the south, and Arizona to the east. Riverside County was

formed in 1893 from a small portion of San Bernardino County and a larger part of San Diego County and received its name from the already established City of Riverside (County of Riverside 2020).

The majority of Riverside County was part of Rancho San Jacinto Viejo, which was given to Don José Antonio Estudillo; Sierra (Yorba) Rancho, and Rincon Grant, which were given to Bernardo Yorba through land grants that were given to prominent Spanish families by the Spanish Government. Following the establishment of the community of Riverside, it maintained the same agricultural business practices that brought commerce to the region; however, the success in fruit growing and export of good, the profitable land, proximity to a water source, the arrival of several investors and the acquisition of irrigation rights, leading to the formation of the Riverside Land and Irrigation Company, Riverside was rapidly becoming an attractive destination to settle in. The addition of the Southern Pacific Railroad in the region further facilitated the distribution of goods and travelers, bringing financial prosperity and more business to Riverside. Rapid growth meant that institutions needed to be formed to meet the needs of the growing population, and in 1891 the first attempt to form a new county was held (Brown and Boyd 1922; Guinn 1902).

Riverside continues to be one of the fastest growing counites in California with a population of 2,470,546 people (United States Census Bureau 2020). It's ecological diversity, with rivers, deserts, mountains and beaches, affordable housing, the Wine Country near Temecula and renowned UC Riverside are key factors in the continued appeal of the County.

2.3.4 - City of Eastvale

The City of Eastvale was originally part of the Riverside School District that formed in 1893. The name Eastvale may have come given that the majority of the new school district was located east of the Milton Vale Ranch, *east* of the *Vale* Ranch. Likewise, from a suggestion of the Fuller Family, whose land housed the new elementary school, which was located *eas*t of the previous *Valley School*. The Fuller Family was one of the prominent Eastvale families, residing in Eastvale from 1889 to the mid-1950's. The Fuller's ventured in several business, having found success in cattle and racehorse breeding and transportation, establishing the Pioneer Truck and Transfer Company in the early 1900's and successfully transitioning from horse drawn carriages to motor vehicles, thus playing a pivotal role in the bringing business to the small community. Following the creation of Riverside County and the Eastvale School District in 1893, the community of Eastvale continued to gradually grow, attracting agricultural and dairy farmers, maintaining its rural identity until the 2000's. Beginning in 2007, citizens of Eastvale began the process of giving cityhood to Eastvale, establishing the Eastvale Incorporation Committee, officially incorporating Eastvale on October 1, 2010. Today, Eastvale continues to grow at a rapid pace, attracting future residents with its delicately planned residential neighborhoods and opportunities with the ever growing business and commerce expansion (eastvale.gov; Meissner & Johnson 2013)

SECTION 3: RESULTS

3.1 - Records Search

3.1.1 - Eastern Information Center

On February 25, 2021, a records search for the project site and a 0.5-mile radius beyond the project boundaries was conducted at the EIC located at University of California, Riverside. To identify additional historic properties or resources, the current inventories of the NRHP, CRHR, CHL list, CPHI list, and the BERD for Riverside County were reviewed to determine the existence of previously documented historic and prehistoric resources.

The results of the records search indicate that only one historic linear historic resource north of the project site has been recorded within the 0.5-mile search radius, and no resources are located within the project boundary (Table 1). In addition, 12 area-specific survey reports (Table 2) are on file with the EIC, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that portions of the project site have been previously surveyed (Table 2). Complete EIC records search results may be found in Appendix B.

Table 1: Cultural Resources within 0.5-mile of the Project Area

3.1.2 - Historic Aerials

A review of 13 historical aerial photographs depicting the project site from 1938 to 2016 indicate that the project site and the surrounding lands remained generally undeveloped and used for agricultural purposes until approximately 1994. Between 1967 and 1994 a homestead was built within the boundaries of the project site. The images from 1938 to 2002 depict gradual residential

development surrounding the project site. Sometime after 1995 the surrounding area became more urbanized with construction of the Eastvale Elementary School east of the project site and River Heights Intermediate School located south of the project site (Historic Aerials 2020).

3.1.3 - Native American Heritage Commission

On January 15, 2021, FCS sent a request to the NAHC in an effort to determine if any sacred sites are listed on its Sacred Lands File for the project site. A response was received on February 1, 2021, indicating the results of their search was positive for the presence of TCRs. The NAHC provided a list of 22 tribal representatives available for consultation. To ensure that all Native American knowledge and concerns over potential tribal cultural resources that may be affected by the proposed project are addressed, a letter containing project information requesting any additional information was sent to each tribal representative on February 5, 2020. A response from the Agua Caliente Band of Cahuilla Indians tribe was received on March 10, 2021, indicating that the project is not located within the Tribe's Traditional Use Area and defer to the other tribes ethnographically associated with the project site. No other responses have been received to date. No other responses have been received to date. Correspondence related to the NAHC letters and tribal representatives can be found in Appendix C.

3.2 - Pedestrian Survey

On April 2, 2021, FCS Staff Archaeologist's Natalie Adame and Kweku Williams, MA, conducted a pedestrian survey for unrecorded cultural resources within the project boundaries of the proposed project site. The survey had to split in a western and eastern side due to home and -livestock stables positioned in the middle of the project site. The survey began on the westside of the project site, along the southeast border, and moved west, using north-south transects, spaced at 15-meter intervals whenever possible. Soil visibility was poor, throughout the project site, raging >5 percent due to the heavy vegetation and tall grasses. Areas of exposed soil consisted of light brown sandy loam with gravel inclusions. There is a residential property on site, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered potential historic resources under CEQA.

Survey conditions were documented using digital photographs and field notes. During the survey, Mr. Williams and Ms. Adame examined all areas of the exposed ground surface for prehistoric artifacts (e.g., fire-affected rock, milling tools, flaked stone tools, tool-making debris, ceramics), soil discoloration and depressions that might indicate the presence of a cultural midden, faunal and human osteological remains, and features indicative of the former presence of structures or buildings (e.g., postholes, standing exterior walls, foundations) or historic debris (e.g., glass, metal, ceramics).

To the extent possible, all areas of the project site were inspected for culturally modified soils or other indicators of potential historic or prehistoric resources. No historic or prehistoric cultural resources or raw materials commonly used in the manufacture of tools (e.g., obsidian, Franciscan chert, etc.) were found within the project site. Pedestrian Survey photos can be found in Appendix D.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 4: SUMMARY AND RECOMMENDATIONS

4.1 - Summary

In accordance with CEQA Guidelines, FCS assessed the potential impacts of the proposed project for known and potential cultural resources at the project site. Results from the EIC indicate that there are no cultural resources within the project site, and only a single historic resource has been recorded within the 0.5 mile radius. In addition, 12 area-specific survey reports are on file with the EIC for the project site and its 0.5-mile, three of which (RI-05049, RI-04980, and RI-05052) transect the northern boundary of the proposed project site, indicating that the project site has been previously surveyed. The results of the pedestrian field survey failed to identify additional unrecorded cultural resources within the project site, however grasses and ground cover greatly reduced the visibility of native soils.

The NAHC Sacred Lands File search contained positive results, but subsequent correspondence with Native American representatives did not identify any TCRs that may be adversely affected by the proposed project. Although the pedestrian survey failed to locate any cultural resources, the pedestrian survey did confirm the presence of a residential property, which according to the County of Riverside Assessors Office is under 50 years of age and thus ineligible for inclusion on the CRHR and should not be considered potential a historic resources under CEQA

4.2 - Recommendations

4.2.1 - Cultural Resources Recommendations

Based on the results of the records searches, archival research, tribal correspondence, and pedestrian survey, FCS considers the potential for the proposed project to have an adverse effect on cultural resources to be moderate. No archaeological resources were identified in the records searches or during the pedestrian survey; however, the positive results from the Sacred Lands Files search, and overall poor visibility across the project site increases the possibility that historic and prehistoric cultural resources may be encountered during the course of project construction.

FCS therefore recommends that a qualified Archaeologist who meets the Secretary of Interior's Professional Qualification Standards for Archaeology perform an inspection of the site following grubbing, ground clearing, and demolition, and prior to any grading or project related ground disturbance. In the event exposed soils indicate cultural materials may be present, this may be followed by regular or periodic archaeological monitoring as determined by the Archaeologist, but full-time archaeological monitoring is not recommended at this time.

The following section recommends measures that would result in avoidance or minimization of potential project-related impacts to cultural resources on-site, and recommended procedures to be followed in the event cultural resources are encountered during project construction:

4.3 - Inadvertent Discovery Procedures

4.3.1 - Inadvertent Discovery of Human Remains

There is always the possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. Should this occur, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed.

In the event of an accidental discovery or recognition of any human remains, Public Resource Code Section 5097.98 shall be followed. In this instance, once project-related earthmoving begins and if there is inadvertent discovery or recognition of any human remains, the following steps shall be taken:

1. There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the County Coroner is contacted to determine if the remains are Native American and if an investigation of the cause of death is required. If the coroner determines the remains to be Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the "most likely descendant" of the deceased Native American. The most likely descendant may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains, and any associated grave goods as provided in Public Resources Code Section 5097.98, or
2. Where the following conditions occur, the landowner or his/her authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the most likely descendent or on the project site in a location not subject to further subsurface disturbance:
   - The NAHC is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 48 hours after being notified by the Commission;
   - The descendent identified fails to make a recommendation; or
   - The landowner or his authorized representative rejects the recommendation of the descendent, and the mediation by the NAHC fails to provide measures acceptable to the landowner.

4.3.2 - Inadvertent Discovery of Cultural Resources

It is always possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources. If buried cultural resources are discovered during construction, operations shall stop in the immediate vicinity of the find and a qualified Archaeologist shall be consulted to determine whether the resource requires further study. The qualified Archeologist shall make recommendations to the Lead Agency on the measures that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with Section 15064.5 of the CEQA Guidelines. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area should be recorded on appropriate DPR forms and evaluated for significance in terms of CEQA criteria.

If the resources are determined to be unique historic resources as defined under Section 15064.5 of the CEQA Guidelines, mitigation measures shall be identified by the Archaeological Monitor and recommended to the Lead Agency. Appropriate mitigation measures for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.

No further grading shall occur in the area of the discovery until the Lead Agency approves the measures to protect these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the Lead Agency where they would be afforded long-term preservation to allow future scientific study.

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

OVERVIEW

- More than 15 Years' Experience in Archaeology and Cultural Resources

Education

- Ph.D., Near Eastern Art and Archaeology, University of California at Berkeley, 2012
- M.A., Near Eastern Art and Archaeology, University of California at Berkeley, 2005
- B.A., Archaeology and History (double major), University of California at San Diego, 2002

Fellowships and Awards

- Albright Institute Educational and Cultural Affairs Fellowship (2015)
- Katherine Davis Foundation Projects for Peace Prize (2012)
- International House Gateway Fellowship (2011-2012)
- The George Franklin Dales Foundation Fellowship for Archaeological Research (2011)
- CAORC Multi-Country Dissertation Research Fellowship (2010)

Dana DePietro, Ph.D. is a Registered Professional Archaeologist who meets the Secretary of Interior's standards for historic preservation programs in archaeology. Dr. DePietro has over 15 years of experience in all aspects of cultural resource management, including prehistoric and historic archaeology, paleontology, materials conservation, history of art and architecture, and community engagement. He has experience in compliance with the National Environmental Policy Act (NEPA), the California Environment Quality Act (CEQA), the National Historic Preservation Act (NHPA), and the Archaeological Resources Protection Act (ARAP). Dr. DePietro has completed cultural resource projects that have involved agency, client, Native American, and subcontractor coordination; treatment plans and research design development; archival research; field reconnaissance; site testing; data recovery excavation; construction monitoring; site recordation; site protection/preservation, mapping/ cartography; spatial analysis/GIS; laboratory analysis; materials conservation; artifact curation and exhibition; and report production. He has completed projects in California within the jurisdiction of the Bureau of Land Management (BLM) and other federal agencies requiring compliance with Section 106 of the NHPA. He has also completed projects throughout California under CEQA for state and local governments and municipalities, including the California Department of Transportation (Caltrans) and has worked with clients to insure deliverables meet and exceed the standards set by the State Historic Preservation Office (SHPO).

RELATED EXPERIENCE AND CLIENT SUMMARY

FirstCarbon Solutions

As the Lead Archaeologist/Cultural Resource Specialist for FCS, Dr. DePietro conducts evaluations and performs field documentation of historic and prehistoric cultural resources; prepares environmental impact reports (EIRs), cultural resources assessments (CRAs), DPR forms and Section 106 reports; conducts mapping, GIS analysis, and state and county record searches; leads archaeological surveys and field monitoring efforts; and coordinates with state, federal and tribal officials and institutions for a variety of FCS projects, including the following:

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

- Atherton Baptist Homes Master Plan/Phase II, City of Alhambra, Los Angeles County
- Biological and Cultural Resources Assistance 140-Acre Project Site Woodcrest, Riverside County, CA

Other Relevant Experience

The Society for Humanitarian Archaeological Research and Exploration

Dr. DePietro is the Founder and Executive Director of The Society for Humanitarian Archaeological Research and Exploration. He manages the projects, staff, and the daily operation of this not-for-profit organization. Dr. DePietro likewise establishes relationships with partner universities and institutions, writes grant proposals, supervises fundraising projects, and maintains accounts, financial records, and the organization's online presence.

University of California at Berkeley

Dr. DePietro was a lecturer at the University of California, Berkeley from August 2003 to January 2015. During his tenure, he prepared University-level source and lectures in the history of the modern and ancient Middle East, performed student advising and evaluation, and university administrative duties. Dr. DePietro provided resources and opportunities that empower people to critically engage with other cultures as well as with their own communities.

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

Penn State University—Tel Akko Total Archaeology Project

Dr. DePietro was the Director of Community Engagement from 2013 to 2014 at the Penn State University for the Tel Akko Total Archaeology Project. He developed and executed a community engagement program, supervised staff and community participants, taught excavation and conservation techniques to groups of young people in Akko, and performed outreach, dialogue, and program developments in partnership[with community leaders.

Harvard University—Leon Levy Expedition to Ashkelon, Israel

Dr. De Pietro was the excavation supervisor during the summers of 2007-2013 for the Harvard University—Leon Levy Expedition to Ashkelon, Israel. He supervised the excavation and stratagraphic interpretation and instructed students in excavation techniques, data collection, photography, analysis, and publication.

Early Iron Age Cemetery Excavation—Dhamar, Yemen

Dr. De Pietro was the Area Supervisor during the summer of 2004 for the Early Iron Age Cemetery Excavation in Dhamar, Yemen. He supervised the excavation and stratagraphic interpretation, taught excavation techniques, strategy and implementation, field conservation, surveying techniques, data collection and analysis, and site management.

Journal of Associated Graduates in Near Eastern Studies (JAGNES)

Dr. DePietro was the Associate Editor from August 2003 to May 2012 for the Journal of Associated Graduates in Near Eastern Studiers (JAGNES). He solicited and proofread submissions, fundraising, and advertisements.

"Travel Today: Egypt" Magazine

Dr. De Pietro was an Archaeological Correspondent from December 2002 to February 2005. He wrote magazine articles, conducted relevant interviews and research, and procured photos and images to compliment articles.

FIRSTCARBON SOLUTIONS™

KWEKU WILLIAMS, MA, RPA—ARCHAEOLOGICAL MONITOR

OVERVIEW

- More than 12 years of experience

Education

- Master of Arts, Archaeology and Physical Anthropology, Northern Illinois University, DeKalb, IL, 2014
- Bachelor of Arts, Anthropology and World History, Cum Laude, State University of New York, Albany, NY, 2010

License

- Registered Professional Archaeologist, License No. 17953, 2019

Affiliations

- Phi Beta Delta Honor Society for International Scholars, 2012 to present
- Lambda Alpha National Anthropology Honor Society, 2009 to present

Awards and Fellowships

- Superior Exhibit Award for *Trowels and Fair Trade: Revealing the Underground Railroad and Contemporary Slavery* exhibit, Anthropology Museum, Northern Illinois University, Illinois Association of Museums, IL, 2013
- Rhoten A. Smith Fellowship, Northern Illinois University, DeKalb, IL, 2012–2014
- Anthropology Foundation Fund Award, Northern Illinois University, DeKalb, IL, 2012

Kweku Williams, MA, RPA, is a Registered Professional Archaeologist (License No. 17953) with more than 12 years of experience specializing in archaeology and physical anthropology. He possesses knowledge on excavation practices, artifact analysis, and osteology. Mr. Williams has worked on the field in sites around the US and parts of Europe, as well as in the academe where he served as Adjunct Professor in Anthropology at Berkeley City College, Berkeley, California, and Las Positas College, Livermore, California.

RELATED EXPERIENCE AND CLIENT SUMMARY

FirstCarbon Solutions

Tulocay Cemetery Project for Holman Teague Roche Anglin, LLP Archaeological Monitoring, City of Napa, CA

FCS provided archaeological monitoring for excavations during boundary determination testing at Tulocay Cemetery. Mr. Williams served as Archaeological Monitor.

KWEKU WILLIAMS, MA, RPA—ARCHAEOLOGICAL MONITOR

Ritz-Carlton Napa Valley Resort Hotel Project Data Recovery of CA-NAP-928, City of Napa, CA

FCS is currently assisting the US Army Corps of Engineers (USACE) with the data recovery of CA-NAP-928. FCS is implementing the Memorandum of Agreement (MOA) and Historic Properties Treatment Plan (HPTP) for the Ritz-Carlton Napa Valley Resort Project, which was determined to have an adverse effect on the prehistoric site CA-NAP-928. The project proponent is a private developer whose application for the hotel site (which included a wetland) prompted Section 106 review by the USACE, San Francisco District. The project would result in the complete displacement of CA-NAP-928, which was determined eligible for listing in the National Register of Historic Places under criterion D for its data potential. To address this adverse effect, the USACE and the California State Historic Preservation Officer executed an MOA calling for the implementation of the HPTP. Treatment includes data recovery of the large, complex, multi-period site, involving the analysis of macrobotanical remains, lithics, fire-affected rock, obsidian hydration analysis, C-14 dating, and the treatment and recovery of faunal and human osteological remains. FCS is also working closely with Scott Gabaldon, the Chairperson of the Mishewal Wappo Tribe of Alexander Valley, who has assigned one Native American monitor to be present at the site during all ground-disturbing activities. Mr. Williams is providing archaeological testing and monitoring services for the project.

Previous Field Experience

Applied EarthWorks, Inc. and Cogstone Resource Management, Inc., Crowder Canyon, San Bernardino County, CA

Mr. Williams worked with Applied EarthWorks, Inc. and Cogstone Resource Management as a Field Technician on the Project State Route Realignment—Crowder Canyon Data Recovery Project for California Department of Transportation (Caltrans).

Schoharie Valley Field School, State University of New York, Albany, NY

Mr. Williams received training in archaeological techniques in surveying, excavation, and artifact analysis and preservation from Dr. Christina Rieth.

Cultural Resources Survey Program, New York State Museum, New York, NY

Under the supervision of Dr. Christina Rieth, Mr. Williams served as Archaeological Field Technician and conducted archaeological surveys and excavation for the New York State Museum.

Far Western Anthropological Research Group, Multiple Locations

As Field Technician, Mr. Williams' work included excavation and osteological recovery in compliance with the Native American Graves Protection and Repatriation Act with the Enterprise people; excavation testing for infrastructure development in Camp Pendleton for the Department of Defense; excavation and teaching demonstration in archaeological practices at Camp Tawonga, California; excavation and boundary site testing for a known archaeological site in Aliso Creek for the USACE; test excavation at Mariposa Leach Field for the US Forest Service (USFS); artifact processing for the Feather River West Levy project of the USACE and the Enterprise Tribal Group; the Moke 3700-Acre Survey in Pioneer, California for the USFS; the Onyx Ranch Survey in Mojave, California, for the Bureau of Land Management; Goleta Data Recovery for the Caltrans; archaeological field surveys, monitoring, and

excavation/burial recovery for the Feather River West Levee Project in Live Oak, California; and archaeological field surveys and excavation in Mariposa Grove at the Yosemite National Park.

Ka'Kabish Field School, Orange Walk, Belize

Through Trent University, Canada, Mr. Williams worked with Dr. Helen Haines as Crew Chief and Field Manager at the Ka'Kabish Field School in the province of Orange Walk, Belize.

Archaeological Field School in Salemi, Sicily, Italy

Through Northern Illinois University's Archaeological Field School, Mr. Williams collected data for his Master's thesis and received further training in archaeological techniques in surveying, excavation, and artifact analysis and preservation from Dr. Michael Kolb.

Hydro-archaeology Project, Universidad de Granada, Andalusia, Spain

Mr. Williams assisted Dr. José Maria Cervantes in mapping waterways in Andalusia, Spain.

Academic Positions

Berkeley City College, Berkeley, CA

Mr. Williams served as Adjunct Professor in Anthropology, teaching Introduction to Physical Anthropology, Introduction to Cultural Anthropology, and Introduction to Archaeology.

Las Positas College, Livermore, CA

Mr. Williams served as Adjunct Professor in Anthropology teaching Introduction to Physical Anthropology, Introduction to Cultural Anthropology, Introduction to Forensic Anthropology, and Introduction to Archaeology.

Archaeology Camp, College of Liberal Arts and Science, Northern Illinois University, DeKalb, IL

Mr. Williams served as Co-coordinator and Counselor for the Archaeology Camp of the College of Liberal Arts and Science in Northern Illinois University, DeKalb.

Anthropology Museum, Northern Illinois University, DeKalb, IL

Mr. Williams served as Graduate Assistant in Northern Illinois University, DeKalb's Anthropology Museum, where he coordinated the exhibit development team, provided tours and lectures on the content of exhibits, and fostered appreciation for education and cultural diversity. He also assisted in the development and installation of the *Fast Food Nation: 10,000 B.C.* and *Trowels and Fair Trade: Revealing the Underground Railroad and Contemporary Slavery* exhibits.

Department of Anthropology, Northern Illinois University, DeKalb, IL

As Teaching Assistant, Mr. Williams taught Introduction to Physical Anthropology, where he discussed The Life History and Social Behavior of the Mountain Gorilla, and Exploratory Archaeology, where he discussed The Rise of the City States of Mesopotamia, The Bronze Age in the Western Mediterranean, and Classic Period of the Maya Lowlands.

KWEKU WILLIAMS, MA, RPA—ARCHAEOLOGICAL MONITOR

Ka'Kabish Field School, Orange Walk, Belize

Through Trent University, Canada, Mr. Williams served as Field School Instructor where he provided students with the essentials for archaeological studies, such as laying out units, mapping (plan view and profile), calculating elevations and stadia metric distances, the essentials of logistical management of unit forms, proper notetaking in field journals, and the collection and labeling of artifact bags.

Academic Events and Speaking Engagements

- Learning Community Revolutionary Scholars First Year Experience, Berkeley City College, Berkeley, CA, Fall 2017
- Panelist on the Islamophobia Open Talk, Muslim Student Association and Peace and Social Justice Student Association, Las Positas College, Livermore, CA, Fall 2016
- Panelist on the African-American Science, Technology, Engineering, and Math Panel, Black Student Union, Las Positas College, Livermore, CA, Spring 2016
- Midwestern Mesoamerican Archaeological Conference, Northern Illinois University, DeKalb, IL, Spring 2014

Community Service

Mr. Williams participated in Northern Illinois University Cares Day where he participated in the beautification of DeKalb historical landmarks and public parks.

Publications

Williams, K.A. (2014). *Space and Specialization: Understanding the Medieval Economic Behavior through Ceramics in Salemi, Sicily* (master's thesis). Northern Illinois University, Illinois, United States.

FIRSTCARBON SOLUTIONS™

NATALIE ADAME—ARCHAEOLOGICAL MONITOR

OVERVIEW

- More than 2 years of experience

Education

- Bachelor of Arts, Biological Anthropology, Minor in Geology, California State University, East Bay, Hayward, CA, 2016
- Associate of Arts, Geology, Mt. San Antonio College, Walnut, CA, 2011

Skill

- Esri Aeronautical Reconnaissance Coverage Geographic Information System (ArcGIS)

Natalie Adame has more than 2 years of experience in archaeology, which she gained from extensive fieldwork and museum experience. Ms. Adame has established excellent research skills exemplified by her ability to prepare comprehensive reports and presentations. Her experience includes performing land use analyses and preparing Initial Studies and EIRs for various development projects. As an Archaeological Monitor/Field Technician, Ms. Adame implements Worker Environmental Awareness Programs (WEAP) 'tailgate' training sessions and coordinates with construction staff and Native American Monitors, construction monitoring, and the salvage and recordation of archaeological resources.

RELATED EXPERIENCE AND CLIENT SUMMARY

Biological, Archaeological, and Paleontological Monitoring and Reporting Services, Los Angeles Regional Interoperable Communications System, Los Angeles County, CA

FCS is providing monitoring and reporting services during the construction of more than 150 land mobile radio (LMR) facilities at sites located primarily in Los Angeles County. The LMR sites contain the infrastructure and equipment necessary to provide voice communications coverage throughout the County for emergency responders. These locations are widely dispersed across the County in both urban (intensively developed) and rural (less developed) settings and include coastal locations, sites in downtown Los Angeles, remote mountain peaks across the County, and the northern high desert. FCS is conducting the biological, archaeological, and paleontological pre-construction and construction monitoring and reporting services in accordance with the Construction Management Requirements outlined in the NEPA Environmental Assessment that FCS prepared for the project. Ms. Adame is a Field Archaeological Monitor on the project.

Barton Road Logistics Facility Project EIR, Technical Studies, and Peer Review, City of Colton, CA

FCS is providing CEQA documentation and peer review services for the Barton Road Logistics Facility Project in the City of Colton, in San Bernardino County. The proposed project includes the demolition of four industrial buildings, an office building, and parking lot. The proposed project would construct two state-of-the-art speculative concrete tilt-up industrial warehouse logistics facilities with a total square footage of 960,040 square feet. The project will develop Best-in-Class industrial facilities in the City of Colton that are designed to meet contemporary industry standards, can easily accommodate a wide

variety of warehouse and distribution uses, and are economically competitive with similar warehouse facilities in the local Inland Empire marketplace. FCS is preparing an EIR with supporting stand-alone Air Quality and Greenhouse Gas (GHG) Emissions Analysis with Health Risk Assessment, Biological Resources Assessment, Phase I Cultural Resources Assessment (CRA), Noise Impact Analysis, and Traffic Impact Analysis. Our team will also peer review the Geotechnical Report. The Phase I Cultural Resources Assessment will provide an evaluation and recommendations regarding potential construction related impacts to cultural resources. Ms. Adame is a Field Archaeological Monitor on the project.

Library/Learning Resource Center Building Project Biological and Cultural Construction Monitoring Services for the Solano Community College District, Fairfield, CA

FCS prepared the IS/MND and provided the subsequent biological and cultural construction monitoring services for the construction of a new 59,252-gross-square-foot, 2-story Library/Learning Resources Center building on the Fairfield Campus of the Solano Community College Campus. The building would be constructed on an open quad in the center of campus, replacing an open lawn. FCS conducted AB 52 consultation in coordination with the District and tribal representatives from the Yocha Dehe Wintun Nation to address concerns about tribal cultural resources in the immediate vicinity of the site. In additional to preparing a full PI-CRA, FCS drafted mitigation measures in coordination with the Tribe and District to effectively allow the project to proceed while protecting the Tribal Cultural resources in question. The District approved the project in May 2016, with the approval of the tribe and all parties involved. FCS will provide coordination with Tribal representatives from the Yocha Dehe Wintun Nation, as well as a "tailgate" sensitivity training session for construction personnel. Ms. Adame is a Field Archaeological Monitor on the project.

Prior Work Experience

Archaeologist, Material Culture Consulting, City of Pomona, CA

As an archaeologist, Ms. Adame performed excavations, recorded prehistoric and historic artifacts, and catalogued data using ArcGIS. She conducted Phase I, II, and III Environmental Site Assessments (ESAs) and drafted EIRs. Ms. Adame also prepared Department of Parks and Recreation (DPR) forms, searched records, and monitored projects in the State and county.

Field Archaeologist, ICF International, City of Los Angeles, CA

As a field archaeologist, Ms. Adame conducted environment surveys, performed excavations, and catalogued prehistoric and historic artifacts using ArcGIS. She prepared Federal Environment Management environmental reviews, DPR forms, and ESAs. Ms. Adame also worked with different transportation agencies, including the Orange County Transportation Authority, OC 405 Partners, LA Metro, and the California Department of Transportation.

Field Archaeologist, Dudek , City of Pasadena, CA

As a field archaeologist, Ms. Adame performed architectural and cultural historical assessments and conducted surveys for various projects to evaluate conflicts during construction period. Her responsibilities also include evaluating historic resource significance, cataloguing exhibit pieces, and gathering daily records of environmental compliances.

FIRSTCARBON SOLUTIONS™

NATALIE ADAME—ARCHAEOLOGICAL MONITOR

Grants and Proposal Writer – Applied Anthropology Coursework, California State University, East Bay, City of Hayward, CA

As a Grants and Proposal Writer, Ms. Adame analyzed organizational cultures, conducted needs assessment, and prepared social impact reports. Part of her task was to identify the appropriate research disciplines necessary for specific jobs.

Student Museum Docent, California State University, East Bay, City of Hayward, CA

Ms. Adame served as a docent at the university's C.E. Smith Museum of Anthropology. Her responsibilities include preparing materials for exhibits, researching and writing about artifacts, and mounting display materials in the museum.

Re: Native American Tribal Consultation, Pursuant to the Assembly Bill 52 (AB 52), Amendments to the California Environmental Quality Act (CEQA) (Chapter 532, Statutes of 2014), Public Resources Code Sections 5097.94 (m), 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2 and 21084.3, Orange Street Residential Development Project, Riverside County

Dear Ms. Griffin:

Pursuant to Public Resources Code section 21080.3.1 (c), attached is a consultation list of tribes that are traditionally and culturally affiliated with the geographic area of the above-listed project. Please note that the intent of the AB 52 amendments to CEQA is to avoid and/or mitigate impacts to tribal cultural resources, (Pub. Resources Code §21084.3 (a)) ("Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.")

Public Resources Code sections 21080.3.1 and 21084.3(c) require CEQA lead agencies to consult with California Native American tribes that have requested notice from such agencies of proposed projects in the geographic area that are traditionally and culturally affiliated with the tribes on projects for which a Notice of Preparation or Notice of Negative Declaration or Mitigated Negative Declaration has been filed on or after July 1, 2015. Specifically, Public Resources Code section 21080.3.1 (d) provides:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

The AB 52 amendments to CEQA law does not preclude initiating consultation with the tribes that are culturally and traditionally affiliated within your jurisdiction prior to receiving requests for notification of projects in the tribe's areas of traditional and cultural affiliation. The Native American Heritage Commission (NAHC) recommends, but does not require, early consultation as a best practice to ensure that lead agencies receive sufficient information about cultural resources in a project area to avoid damaging effects to tribal cultural resources.

The NAHC also recommends, but does not require that agencies should also include with their notification letters, information regarding any cultural resources assessment that has been completed on the area of potential effect (APE), such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

- A listing of any and all known cultural resources that have already been recorded on or adjacent to the APE, such as known archaeological sites;
- Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
- Whether the records search indicates a low, moderate, or high probability that unrecorded cultural resources are located in the APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

    - Any report that may contain site forms, site significance, and suggested mitigation measures.

      All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code section 6254.10.

3. The result of any Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was positive. Please contact the tribes on the attached list for more information.

4. Any ethnographic studies conducted for any area including all or part of the APE; and

5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS are not exhaustive and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Greetings,

A records check of the Tribal Historic preservation office's cultural registry revealed that this project is not located within the Tribe's Traditional Use Area. Therefore, we defer to the other tribes in the area. This letter shall conclude our consultation efforts.

Thank you,

Hi there,

I wanted clarify an inaccuracy in the letter attached to my previous email. The letter states that the California Historical Resources Information System (CHRIS) search did not return any results. However, we have not actually received results back from the CHRIS search. Please let me know if you have any questions.

Best regards,

Appendix E:
Regulatory Framework

THIS PAGE INTENTIONALLY LEFT BLANK

REGULATORY FRAMEWORK

Local, state, and federal government agencies have developed laws and regulations designed to protect significant cultural resources that may be affected by projects regulated, funded, or undertaken by the agency. Federal and state laws that govern the preservation of historic and archaeological resources of national, state, regional, and local significance include the National Environmental Policy Act (NEPA), the National Historic Preservation Act (NHPA), and the California Environmental Quality Act (CEQA). In addition, laws specific to work conducted on federal lands include the Archaeological Resources Protection Act, the American Antiquities Act, and the Native American Graves Protection and Repatriation Act.

The following federal or CEQA criteria were used to evaluate the significance of potential impacts on cultural resources for the proposed project. An impact is considered significant if it would affect a resource eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR), or if it is identified as a unique archaeological resource.

Federal-Level Evaluations

Federal agencies are required to consider the effects of their actions on historic properties and afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on such undertakings under Section 106 of the NHPA regulations Section (36 Code of Federal Regulations [CFR] 800). Additionally, federal agencies are responsible for initiating NHPA Section 106 review and completing the steps that are outlined in these regulations. They must determine if NHPA Section 106 applies to a given project and, if so, initiate review in consultation with the State Historic Preservation Officer (SHPO) and/or the Tribal Historic Preservation Officer (THPO). Federal agencies are also responsible for involving the public and other interested parties. Furthermore, NHPA Section 106 requires that any federal or federally assisted undertaking, or any undertaking requiring federal licensing or permitting, consider the effect of the action on historic properties listed in or eligible for the NRHP. Under the Code of Federal Regulations, 36 CFR Part 800.8, federal agencies are specifically encouraged to coordinate compliance with NHPA Section 106 and the NEPA process. The implementing regulations "Protection of Historic Properties" are found in 36 CFR Part 800. Resource eligibility for listing on the NRHP is detailed in 36 CFR Part 63 and the criteria for resource evaluation are found in 36 CFR Part 60.4 [a-d].

The NHPA established the NRHP as the official federal list for cultural resources that are considered important for their historical significance at the local, state, or national level. To be determined eligible for listing in the NRHP, properties must meet specific criteria for historic significance and possess certain levels of integrity of form, location, and setting. The criteria for listing on the NRHP include—significance in American history, architecture, archaeology, engineering, and culture as present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

a) That are associated with events that have made significant contributions to the broad patterns of our history; or

b) That are associated with the lives of persons significant in our past; or

c) That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that; represent a significant and distinguishable entity whose components may lack individual distinction; or

d) That have yielded, or may be likely to yield, information important in prehistory or history.

Criterion D is usually reserved for archaeological resources. Eligible properties must meet at least one of the criteria and exhibit integrity, measured by the degree to which the resource retains its historical properties and conveys its historical character.

Criteria Considerations

Ordinarily, cemeteries, birthplaces, graves of historical figures, properties owned by religious institutions or used for religious purposes, buildings that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the NRHP. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

a) A religious property deriving primary significance from architectural or artistic distinction or historical importance.

b) A building or structure removed from its original location, but which is primarily significant for architectural value, or which is the surviving structure most importantly associated with a historic person or event.

c) A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building associated with his or her productive life.

d) A cemetery that derives its primary importance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events.

e) A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived.

f) A property primarily commemorative in intent if design, age, tradition, or symbolic value

g) A property achieving significance within the past 50 years if it is of exceptional importance.

Thresholds of Significance

In consultation with the SHPO/THPO and other entities that attach religious and cultural significance to identified historic properties, the agency shall apply the criteria of adverse effect to historic properties within the Area of Potential Effect (APE). The agency official shall consider the views of consulting parties and the public when considering adverse effects.

Federal Criteria of Adverse Effects

Under federal regulations, 36 CFR Part 800.5, an adverse effect is found when an undertaking alters, directly or indirectly, any of the characteristics of a historic property that qualifies the property for inclusion in the NR in a manner that diminishes the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration will be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for listing in the NR. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance, or be cumulative.

According to 36 CFR Part 800.5, adverse effects on historic properties include, but are not limited to:

- Physical destruction of or damage to all or part of the property.
- Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the U.S. Secretary of the Interior's Standards for the Treatment of Historic Properties per 36 CFR Part 68 and applicable guidelines.
- Removal of the property from its historic location.
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance.
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features.
- Neglect of a property that causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization.
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long term preservation of the property's historic significance.

If Adverse Effects are Found

If adverse effects are found, the agency official shall continue consultation as stipulated in 36 CFR Part 800.6. The agency official shall consult with the SHPO/THPO and other consulting parties to develop alternatives to the undertaking that could avoid, minimize, or mitigate adverse effects to historic resources. According to 36 CFR Part 800.14(d), if adverse effects cannot be avoided then standard treatments established by the ACHP may be used as a basis for a Memorandum of Agreement (MOA).

According to 36 CFR Part 800.11(e), the filing of an approved MOA, and appropriate documentation, concludes the NHPA Section 106 process. The MOA must be signed by all consulting parties and approved by the ACHP prior to construction activities. If no adverse effects are found and the SHPO/THPO or the ACHP do not object within 30 days of receipt, the agencies' responsibilities under NHPA Section 106 will be satisfied upon completion of report and documentation as stipulated in 36

CFR Part 800.11. The information must be made available for public review upon request, excluding information covered by confidentiality provisions.

State-Level Evaluation Processes

An archaeological site may be considered a historical resource if it is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California per Public Resources Code (PRC) Section 5020.1(j) or, if it meets the criteria for listing on the CRHR per the California Code of Regulations (CCR) at Title 14 CCR Section 4850.

The most recent amendments to the CEQA Guidelines direct lead agencies to first evaluate an archaeological site to determine if it meets the criteria for listing in the CRHR. If an archaeological site is a historical resource, in that it is listed or eligible for listing in the CRHR, potential adverse impacts to it must be considered as stated in PRC Sections 21084.1 and 21083.2(l). If an archaeological site is considered not to be a historical resource, but meets the definition of a "unique archeological resource" as defined in PRC Section 21083.2, then it would be treated in accordance with the provisions of that section.

With reference to PRC Section 21083.2, each site found within a project area will be evaluated to determine if it is a unique archaeological resource. A unique archaeological resource is described as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets one or more of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

As used in this report, a "non-unique archaeological resource" means an archaeological artifact, object, or site that does not meet the criteria for eligibility for listing on the CR, as noted in subdivision (g) of PRC Section 21083.2. A non-unique archaeological resource requires no further consideration, other than the simple recording of its components and features. Isolated artifacts are typically considered non-unique archaeological resources. Historic structures that have had their superstructures demolished or removed can be considered historic archaeological sites and are evaluated following the processes used for prehistoric sites. Finally, the California State Office of Historic Preservation recognizes an age threshold of 45 years. Cultural resources built less than 45 years ago may qualify for consideration, but only under the most extraordinary circumstances.

Title 14 of the CCR, Chapter 3, Section 15064.5 is associated with determining the significance of impacts to archaeological and historical resources. Here, the term historical resource includes the following:

1. A resource listed in, or determined eligible by the State Historical Resources Commission, for listing in the CRHR (PRC § 5024.1; Title 14 CCR, § 4850 *et seq*.).
2. A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the PRC Section 5024.1(g) requirements, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
3. Any object, building, structure, site, area, place, record, or manuscript, which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be historically significant if the resource meets the criteria for listing on the CRHR (PRC § 5024.1; Title 14 CCR § 4852) including the following:
   A. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
   B. Is associated with the lives of persons important in our past.
   C. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
   D. Has yielded, or may be likely to yield, information important in prehistory or history.

Typically, archaeological sites exhibiting significant features qualify for the CRHR under Criterion D because such features have information important to the prehistory of California. A lead agency may determine that a resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1 even if it is:

- Not listed in or determined to be eligible for listing in the CRHR.
- Not included in a local register of historical resources pursuant to PRC Section 5020.1(k).
- Identified in a historical resources survey per PRC Section 5024.1(g).

Threshold of Significance

If a project will have a significant impact on a cultural resource, several steps must be taken to determine if the cultural resource is a "unique archaeological resource" under CEQA. If analysis and/or testing determine that the resource is a unique archaeological resource and therefore subject to mitigation prior to development, a threshold of significance should be developed. The threshold of significance is a point where the qualities of significance are defined, and the resource is determined to be unique under CEQA. A significant impact is regarded as the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the resource will be reduced to a point that it no longer meets the significance criteria. Should analysis indicate that project development will destroy the unique elements of a resource; CEQA regulations require that that the project implement appropriate and feasible

mitigation measures. The preferred form of mitigation is to preserve the resource in place, in an undisturbed state. However, as that is not always possible or feasible, appropriate mitigation measures may include, but are not limited to:

1. Planning construction to avoid the resource.
2. Deeding conservation easements.
3. Capping the site prior to construction.

If a resource is determined to be a "non-unique archaeological resource," no further consideration of the resource by the lead agency is necessary.

Tribal Consultation

The following serves as an overview of the procedures and timeframes for the Tribal Consultation process, for the complete Tribal Consultation Guidelines, please refer to the State of California Office of Planning and Research website.

Prior to the amendment or adoption of general or specific plans, local governments must notify the appropriate tribes of the opportunity to conduct consultation for the purpose of preserving or mitigating impacts to cultural places located on land within the local government's jurisdiction that is affected by the plan adoption or amendment. The tribal contacts for this list are maintained by the NAHC and are distinct from the Most Likely Descendent (MLD) list. It is suggested that local governments send written notice by certified mail with return receipt requested. The tribes have 90 days from the date they receive notification to request consultation. In addition, prior to adoption or amendment of a general or specific plan, local government must refer the proposed action to tribes on the NAHC list that have traditional lands located within the city or county's jurisdiction. Notice must be sent regardless of prior consultation. The referral must allow a 45-day comment period.

In brief, notices from the local government to the tribes should include:

- A clear statement of purpose.
- A description of the proposed general or specific plan, the reason for the proposal, and the specific geographic areas affected.
- Detailed maps to accompany the description.
- Deadline date for the tribes to respond.
- Government representative(s) contact information.
- Contact information for project proponent/applicant, if applicable.

The basic schedule for this process is:

- **30 days**: time the NAHC has to provide tribal contact information to the local government; this is recommended, not mandatory.

- **90 days**: time the tribe has to respond indicating whether or not they want to consult. Note: tribes can agree to a shorter timeframe. In addition, consultation does not begin until/unless requested by the tribe within 90 days of receiving notice of the opportunity to consult. The consultation period, if requested, is open-ended. The tribes and local governments can discuss issues for as long as necessary or productive, and need not result in agreement.
- **45 days**: time the local government has to refer proposed action, such as adoption or amendment to a general or specific plan, to agencies, including the tribes. Referral is required even if there has been prior consultation. This opens the 45-day comment period.
- **10 days:** time the local government has to provide the tribes with notice of a public hearing.

Attention: Mr. Bret Ilich

Subject: Geotechnical and Infiltration Evaluation
Proposed Single- and Multi-Family Residential Development
Assessor's Parcel Number 152-040-003
Eastvale, Riverside County, California

Dear Mr. Ilich:

We are pleased to provide the results of our geotechnical and infiltration evaluation for the subject project located in Eastvale, Riverside County, California. This report presents the results of our evaluation and discussion of our findings.

Based on the results of our evaluation, development of the property appears feasible from a geotechnical viewpoint provided that the recommendations presented in this report and in future reports are incorporated into design and construction.

The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to call our office.

Respectfully submitted,
GeoTek, Inc.

1. PURPOSE AND SCOPE OF SERVICES

The purpose of this study was to evaluate the geotechnical conditions for the proposed development. Services provided for this study included the following:

- Research and review of available geologic and geotechnical data, and general information pertinent to the site,
- Excavation of six (6) geotechnical borings extended to depths ranging from approximately 20 to 51-½ feet below grade;
- Excavation of two (2) borings to a depth of about 5 feet each for infiltration testing;
- Collection of bulk and undisturbed samples from the test borings;
- Performance of laboratory testing on select soil samples;
- Review and evaluation of site seismicity, and
- Compilation of this geotechnical and infiltration evaluation report which presents our findings and a general summary of pertinent geotechnical conditions relevant for site development.

The intent of this report is to aid in the evaluation of the site for future development from a geotechnical perspective. The professional opinions and geotechnical information contained in this report will likely need to be updated based on our review of final site development plans. These should be provided to GeoTek for review when available.

2. SITE DESCRIPTION AND PROPOSED DEVELOPMENT

2.1 SITE DESCRIPTION

The project is a nearly square shaped approximate 10-acre site located north of Orange Street and easterly of Calina Lane in Eastvale, California. The site currently occupied by a single-family residence, flatwork, landscaping and animal pens. The site topography can be considered as relatively flat terrain with elevations ranging from approximately 618 to 622 feet above mean sea level. The general site location is presented on the attached Figure 1.

2.2 PROPOSED DEVELOPMENT

It is our understanding that site developments will consist of a total of 138 homesites consisting of two-story single-family residential structures and three-story multi-family residential structures and associated parking/drive areas, recreational improvements and lot improvements. Stormwater facilities are also proposed as part of the planned development. We anticipate that the residential structures will be supported by a shallow post-tensioned foundation system. Although structural loading information was not available at the time of this report preparation, we anticipate maximum column and wall loads on the order of 50 kips and 3 kips per foot, respectively. Once actual structural loads are known that information should be provided to GeoTek to determine if modifications to the recommendations contained in this report are warranted.

Based on the relatively flat topography at each site, we anticipate that the maximum depth of cut or fill will be less than about five (5) feet, not including any remedial grading.

As site development planning progresses and plans become available, the plans should be provided to GeoTek for review and comment. Additional engineering analyses may be necessary in order to provide specific earthwork recommendations and geotechnical design parameters for actual site development.

3. FIELD EXPLORATION & LABORATORY TESTING

3.1 FIELD EXPLORATION

GeoTek performed a field exploration at this site on January 6, 2021 which consisted of excavating six (6) exploratory borings to depths ranging from about 20 to 51-½ feet. In addition, two (2) percolation test borings about 5 feet deep were advanced. The borings were drilled with a hollow-stem auger drill rig and logged by a GeoTek geologist.

The approximate locations of our site explorations are shown on the Boring Location Map, Figure 2. Logs of the borings are provided in Appendix A.

3.2 LABORATORY TESTING

Laboratory testing was performed on selected relatively undisturbed and bulk soil samples collected during the field exploration. The purpose of the laboratory testing was to confirm the field classification of the soil materials encountered and to evaluate the soils physical

properties for use in the engineering design and analysis. Our test results along with a brief description and relevant information regarding testing procedures are included on the boring logs included in Appendix A or in Appendix B.

4. PERCOLATION TESTING

Percolation testing was performed at boring locations I-1 and I-2 to assess the infiltration characteristics of the site soils. The borings were excavated to approximately 5 feet below the existing grade. The boring diameter was approximately eight inches. Subsequent to pre-soaking, percolation testing was performed within the lower approximately 20 inches in the borings by a representative of our firm, in general conformance with the Boring Percolation Test Procedure (per Riverside County requirements). As required, the percolation rates were corrected to account for discharge of water from both the sides and bottom of the borings. This correction was performed using the Porchet Method, obtaining the infiltration rates tabulated below:

SUMMARY OF RESULTS		
Boring	Measured Field Percolation Rate (minutes per inch)	Calculated Infiltration Rate (inches per hour)
I-1	4.8	1.2
I-2	2.3	2.7

Copies of the field data sheets and infiltration conversion calculations (Porchet Method) are included in Appendix C. The reported infiltration rates are the measured rate without any factor of safety applied. Over the lifetime of the storm water facility, the infiltration rates may be affected by silt build up and biological activities, as well as local variations in near surface soil conditions. A suitable factor of safety should be applied to the field rates in design the infiltration system.

It should be noted that the infiltration rates provided above were performed in relatively undisturbed native soils. Infiltration rates will vary and are mostly dependent on the underlying consistency of the site soils and relative density. Infiltration rates will be impacted by weight of equipment travelling over the soils, placement of engineered fill and other various factors. GeoTek, Inc. assumes no responsibility or liability for the ultimate design or performance of the storm water facility.

5. GEOLOGIC AND SOILS CONDITIONS

5.1 REGIONAL SETTING

The subject property is situated in the Peninsular Ranges geomorphic province. The Peninsular Ranges province is one of the largest geomorphic units in western North America. Basically, it extends roughly 975 miles from the north and extends from the Transverse Ranges geomorphic province to the tip of Baja California, from north to south. This province varies in width from about 30 to 100 miles. It is bounded on the west by the Pacific Ocean, on the south by the Gulf of California and on the east by the Colorado Desert Province.

The Peninsular Ranges are essentially a series of northwest-southeast oriented fault blocks. Several major fault zones are found in this province. The Elsinore Fault zone and the San Jacinto Fault zone trend northwest-southeast and are found in the near the middle of the province. The San Andreas Fault zone borders the northeasterly margin of the province.

More specific to the subject property, the site is located in an area geologically mapped to be underlain by alluvium (Morton, D.M. and Miller, F.K., 2006).

5.2 EARTH MATERIALS

A brief description of the earth materials encountered during our subsurface exploration is presented in the following section. Based on the exploratory excavations and review of published geologic maps, the site is underlain by alluvium. Although not encountered, localized areas of undocumented fill may be present.

5.2.1 Alluvium

Alluvial soils were encountered within all borings and extended to the maximum depths explored ranging from 20 to 51-½ feet below grade. The alluvial soils encountered generally consisted of clayey sand, silt, clay and silty sand. The sandy soils were noted to possess a relative density ranging from dense to very dense and the silty/clayey soils generally possessed a stiff to hard consistency.

According to the results of the laboratory testing performed on two (2) samples of the near surface alluvial soils, the materials tested and observed have a "very low" ($0 \leq EI \leq 20$) and "low" ($21 \leq EI \leq 50$) expansion potential when tested and classified in accordance with ASTM D 4829. The test results are provided in Appendix B.

5.3 SURFACE WATER AND GROUNDWATER

5.3.1 Surface Water

If encountered during earthwork construction, surface water on this site is the result of precipitation or possibly some minor surface run-off from immediately surrounding properties. Overall site area drainage is generally in a southwesterly direction, as directed by site topography. Provisions for surface drainage will need to be accounted for by the project civil engineer.

5.3.2 Groundwater

Groundwater was not encountered within our exploratory borings performed for this evaluation. Based on the lack of water encountered in the borings and a review of the groundwater information contained on the State Department of Water Resources Water Data Library website, we estimate that the depth to high groundwater at the site is about 50 feet below grade. Based on this depth to water, groundwater-related problems are not expected during or after construction.

It is possible that seasonal variations (temperature, rainfall, etc.) will cause fluctuations in the groundwater level. Additionally, perched water may be encountered at shallow depths following extensive rain events. If shallow perched water is encountered, we anticipate that it can be managed with conventional sump pumps.

5.4 FAULTING AND SEISMICITY

The geologic structure of the entire southern California area is dominated mainly by northwest-trending faults associated with the San Andreas system. The sites are in a seismically active region. No active or potentially active fault is known to exist at these sites nor are the sites situated within a State of California designated *"Alquist-Priolo"* Earthquake Fault Zone. Additionally, the site is not situated within an Earthquake Fault Zone as noted on the Riverside County GIS "Map My County" website.

5.4.1 Seismic Design Parameters

This site is located at approximately 33.959950º Latitude and -117.570312º Longitude. Site spectral accelerations (S_a and S_1), for 0.2 and 1.0 second periods for a Class "D" site, was determined from the SEAOC/OSHPD web interface that utilizes the USGS web services and retrieves the seismic design data and presents that information in a report format. Using the ASCE 7-16 option on the SEAOC/OSHPD website results in the values for S_{M1} and S_{D1}

reported as "null-See Section 11.4.8" (of ASCE 7-16). As noted in ASCE 7-16, Section 11.4.8, a site-specific ground motion procedure is recommended for Site Class D when the value S_1 exceeds 0.2. The value S_1 for the subject site exceeds 0.2.

For a site Class D, an exception to performing a site-specific ground motion analysis is allowed in ASCE 7-16 where S_1 exceeds 0.2 provided the value of the seismic response coefficient, Cs, is conservatively calculated by Eq 12.8-2 of ASCE 7-16 for values of $T \leq 1.5T_s$ and taken as equal to 1.5 times the value computed in accordance with either Eq. 12.8-3 for $T_L \geq T > 1.5T_s$ or Eq. 12.8-4 for $T > T_L$.

The results, based on the 2015 NEHRP and the 2019 CBC, are presented in the following table and we have assumed that the exception as allowed in ASCE 7-16 is applicable. If the exception is deemed not appropriate, a site-specific ground motion analysis will be required.

SITE SEISMIC PARAMETERS	
Mapped 0.2 sec Period Spectral Acceleration, S_S	1.65g
Mapped 1.0 sec Period Spectral Acceleration, S_1	0.591g
Site Coefficient for Site Class "D," F_a	1.0
Site Coefficient for Site Class "D," F_v	1.709
Maximum Considered Earthquake Spectral Response Acceleration for 0.2 Second, S_{MS}	1.65g
Maximum Considered Earthquake Spectral Response Acceleration for 1.0 Second, S_{M1}	1.01g
5% Damped Design Spectral Response Acceleration Parameter at 0.2 Second, S_{DS}	1.1g
5% Damped Design Spectral Response Acceleration Parameter at 1 second, S_{D1}	0.673g
PGA_M	0.747g
Seismic Design Category	D

Final selection of the appropriate seismic design coefficients should be made by the project structural engineer based upon the local practices and ordinances, expected building response and desired level of conservatism.

5.4.2 Surface Fault Rupture

The site is in a seismically active region; however, no active or potentially active fault is known to exist at this site nor is the site situated within an *"Alquist-Priolo"* Earthquake Fault Zone. The nearest known active fault is the Elsinore fault zone situated about 8 miles to the southwest. Therefore, the potential for surface rupture at the site is considered to be nil.

5.4.3 Liquefaction & Dynamic Densification

Liquefaction describes a phenomenon in which cyclic stresses, produced by earthquake-induced ground motion, create excess pore pressures in relatively cohesionless and some low-plastic soils. These soils may thereby acquire a high degree of mobility, which can lead to lateral movement, sliding and settlement of loose sediments, sand boils and other damaging deformations. This phenomenon occurs only below the water table, but, after liquefaction has developed, the effects can propagate upward into overlying non-saturated soil as excess pore water dissipates.

The factors known to influence liquefaction potential include soil type and grain size, relative density, groundwater level, confining pressures, and both intensity and duration of ground shaking. In general, materials that are most susceptible to liquefaction are loose, saturated granular soils having low fines content under low confining pressures.

The Riverside County GIS "Map My County" website indicates that the site is located within a "high" liquefaction potential zone.

Based on the presence of alluvial soils, an estimated high groundwater depth of 50 feet and the "high" liquefaction potential for the site, an assessment of the liquefaction potential was performed. The computer software program LIQUEFYPRO was utilized for this assessment. For this analysis, we utilized the soil profile from Boring B-2, a ground acceleration (PGA_M) of 0.747g and a mean earthquake magnitude of 6.73. The ground acceleration and earthquake magnitude were obtained from the USGS websites. The results of this analysis indicates that the site soils are not susceptible to liquefaction upon application of the design earthquake.

The dry settlement potential of the site soil was also evaluated to assess the potential settlement of the unsaturated soils resulting from seismic activity. The results of this analysis indicates a seismic dry settlement of less than ½ inch is estimated. We recommend a seismic differential seismic settlement of ¼ inch over a 40-foot span be considered for design. Based on the estimated magnitude of seismic settlement, mitigation and/or special foundation design is not considered warranted. A copy of the liquefaction and seismic settlement analysis is presented in Appendix D.

5.4.4 Other Seismic Hazards

The potential for secondary seismic hazards such as seiche and tsunami is considered to be remote due to site elevation and distance from an open body of water. Due to the low liquefaction hazard, the potential for lateral spreading is considered to be nil.

6. CONCLUSIONS AND RECOMMENDATIONS

6.1 GENERAL

Development of the site appears feasible from a geotechnical viewpoint. Specific recommendations for site development provided in this report will need to be further evaluated when development plans are provided for our review. The following sections present general recommendations. More specific geotechnical recommendations for site development can be provided when more finalized site development plans are available for review.

6.2 EARTHWORK CONSIDERATIONS

6.2.1 General

Earthwork and grading should be performed in accordance with the applicable grading ordinances of the City of Eastvale, the 2019 California Building Code (CBC) and recommendations contained in this report. The General Grading Guidelines included in Appendix E outline general procedures and do not anticipate all site-specific situations. In the event of conflict, the recommendations presented in the text of this report should supersede those contained in Appendix E.

6.2.2 Site Clearing

Site preparation should start with removal of all deleterious materials and vegetation within the planned development areas of the site. All debris and deleterious materials should be properly disposed of off-site.

6.2.3 Remedial Grading

Due to the collapse potential of the near surface soils, we recommend that the existing soils beneath the planned buildings be over-excavated to a depth of at least 5 feet below existing or finished grade and at least 3 feet below the bottom of the planned foundations, whichever is deeper. If existing fill soils are encountered, the over-excavations should also be extended to removal of all undocumented fill. The lateral extent of this recommended over-excavation should extend at least 5 feet beyond the building perimeters and beneath all adjacent patio slabs. The soils exposed at the base of the soil over-excavations should be examined by a GeoTek representative to document that the exposed soils are suitable for support of the planned improvements and meet a minimum 85 percent relative compaction with little to no

visible porosity. If unsuitable soils are observed, the over-excavation should be extended in depth until suitable soils, as determined by GeoTek, are encountered.

Beneath concrete flatwork and street pavements, it our opinion that the over-excavations may be limited to 12 inches below existing or finished grade, whichever is deeper, and meet a minimum 85 percent relative compaction with little to no visible porosity, provided all existing undocumented fill is removed.

Following the recommended removals and observations by GeoTek, the exposed soils should be scarified to a depth of about 12 inches, be moisture conditioned to slightly above the soil's optimum moisture content and then be compacted to at least 90 percent of the soil's maximum dry density, per ASTM D 1557.

6.2.4 Engineered Fill

The on-site soils are generally considered suitable for reuse as engineered fill provided they are free from vegetation, debris and other deleterious material. Any over-sized material (greater than 3 inches in maximum dimension) should be removed from the soil prior to use as fill. The undercut areas should be brought to final subgrade elevations with fill materials that are placed and compacted in general accordance with minimum project standards. Engineered fill should be placed in six-inch to eight-inch loose lifts, moisture conditioned to about two percent above the optimum moisture content and compacted to a minimum relative compaction of 90 percent as determined by ASTM D 1557.

6.2.5 Excavation Characteristics

Excavations in the on-site alluvial materials should be readily accomplished with heavy-duty earthmoving or excavating equipment in good operating condition.

6.2.6 Trench Excavations and Backfill

Temporary trench excavations within the on-site materials should be stable at 1:1 inclination for short durations during construction and where cuts do not exceed 10 feet in height. We anticipate that temporary cuts to a maximum height of four feet can be excavated vertically.

Trench excavations should conform to Cal-OSHA regulations. The contractor should have a competent person, per OSHA requirements, on site during construction to observe conditions and to make the appropriate recommendations.

Utility trench backfill should be compacted to at least 90 percent relative compaction (as determined per ASTM D 1557). Under-slab trenches should also be compacted to project specifications. Where applicable, based on jurisdictional requirements, the top 12 inches of

backfill below subgrade for road pavements should be compacted to at least 95 percent relative compaction. On-site materials may not be suitable for use as bedding material but should be suitable as backfill provided particles larger than 6 inches are removed.

Compaction should be achieved with a mechanical compaction device. Ponding or jetting of trench backfill is not recommended. If backfill soils have dried out, they should be thoroughly moisture conditioned prior to placement in trenches.

6.2.7 Shrinkage and Subsidence

For planning purposes, a shrinkage factor of about 5 to 10 percent may be considered for materials that may need to be removed and replaced. A subsidence loss of about 0.1 foot should also be anticipated.

Site balance areas should be available in order to adjust project grades, depending on actual field conditions at the conclusion of earthwork construction.

6.3 DESIGN RECOMMENDATIONS

6.3.1 Foundation Design Criteria

We understand that a post-tension foundation system is planned for the site. Foundation design criteria for a post-tensioned foundation system in general conformance with the 2019 CBC, are presented herein. These are typical design criteria and are not intended to supersede the design by the structural engineer.

Expansion Index (EI) testing performed on representative samples collected from the site has indicated the site soils possess a "very low" to "low" expansion potential. The results of the EI testing are included in Appendix B. The foundation elements for the proposed structures should bear entirely in engineered fill soils and should be designed in accordance with the *2019 California Building Code (CBC).*

Presented below are post-tensioned foundation design parameters for the proposed residential structures at the site. These parameters are in general conformance with *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundation on Expansive Soil* (PTI, 2012).

DESIGN PARAMETERS FOR POST-TENSIONED SLABS	
Foundation Design Parameter	**Design Value**
	Soil Characteristics: LL≤40; PI≤20; Passing #200 Sieve < 50%; Clay fines ≈ 40%; EI=22
Edge Moisture Variation Distance, e_m - Edge Lift (swelling) - Center Lift (shrinkage)	 4.9 ft 9.0 ft
Soil Differential Movement, y_m - Edge Lift (swelling) - Center Lift (shrinkage)	 ≈0.3 in ≈0.2 in
Ext. Perimeter Beam Embedment	One- or Two-Story – 12 inches* Three-Story – 18 inches*
Presaturation of Subgrade Soil (Percent of Optimum)	Minimum 100% to a depth of 12 inches

* Required depth of perimeter beam/stiffening rib per structural calculations may govern.

The following assumptions were used to generate e_m and y_m values: Thornthwaite Moisture Index = -20; constant suction value = 3.6pF; post-equilibrium case assumed with wet (swelling) cycle going from 3.9pF to 3.0pF and drying (shrinking) cycle going from 3.6pF to 4.5pF.

Post-tensioned slabs should be designed in accordance with the *2019 CBC* and PTI design methodology. The bottom of the perimeter edge beam/deepened footing should be designed to resist tension forces using either cable or conventional reinforcement, per the structural engineer. The table above provides design criteria for foundations resting on "low" expansive soils. Foundations on soils with "very low" expansion potential could be safely designed for "low" soil expansion.

The following criteria for design of foundations are preliminary and should be re-evaluated based on the results additional laboratory testing of samples obtained at/near finish pad grade.

An allowable bearing capacity of 2,000 pounds per square foot (psf) may be used for design of building and retaining wall footings. This allowable soil bearing capacity is based on a minimum foundation depth and width of 12 inches. The allowable bearing capacity may be increased by one-third when considering short-term wind and seismic loads.

The bottom of the perimeter edge beam/deepened footing for post tension systems should be deepened a minimum of 12 inches and designed to resist tension forces using either cable or conventional reinforcement, per the structural engineer.

It should be noted that the criteria provided are based on soil support characteristics only. The structural engineer should design the slab and beam reinforcement based on actual loading conditions. We estimate static settlement of foundations designed as recommended in this report to be less than 1-inch total and ½ inch differential over a 40-foot span.

The passive earth pressure may be computed as an equivalent fluid having a density of 250 psf per foot of depth, to a maximum earth pressure of 2,000 psf for footings founded on engineered fill. A coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

A moisture and vapor retarding system should be placed below slabs-on-grade where moisture migration through the slab is undesirable. Guidelines for these are provided in the 2019 California Green Building Standards Code (CALGreen) Section 4.505.2, the 2019 CBC Section 1907.1 and ACI 360R-10. The vapor retarder design and construction should also meet the requirements of ASTM E 1643. A portion of the vapor retarder design should be the implementation of a moisture vapor retardant membrane.

It should be realized that the effectiveness of the vapor retarding membrane can be adversely impacted as a result of construction related punctures (e.g., stake penetrations, tears, punctures from walking on the vapor retarder placed atop the underlying aggregate layer, etc.). These occurrences should be limited as much as possible during construction. Thicker membranes are generally more resistant to accidental puncture than thinner ones. Products specifically designed for use as moisture/vapor retarders may also be more puncture resistant. Although the CBC specifies a 6-mil vapor retarder membrane, it is GeoTek's opinion that a minimum 10 mil thick membrane with joints properly overlapped and sealed should be considered, unless otherwise specified by the slab design professional. The membrane should consist of Stego wrap or the equivalent.

Moisture and vapor retarding systems are intended to provide a certain level of resistance to vapor and moisture transmission through the concrete, but do not eliminate it. The acceptable level of moisture transmission through the slab is to a large extent based on the type of flooring used and environmental conditions. Ultimately, the vapor retarding system should be comprised of suitable elements to limited migration of water and reduce transmission of water vapor through the slab to acceptable levels. The selected elements should have suitable properties (i.e. thickness, composition, strength, and permeability) to achieve the desired performance level.

Moisture retarders can reduce, but not eliminate, moisture vapor rise from the underlying soils up through the slab. Moisture retarder systems should be designed and constructed in accordance with applicable American Concrete Institute, Portland Cement Association, Post-Tensioning Concrete Institute, ASTM and California Building Code requirements and guidelines.

GeoTek recommends that a qualified person, such as the flooring contractor, structural engineer, architect, and/or other experts specializing in moisture control within the building be consulted to evaluate the general and specific moisture and vapor transmission paths and associated potential impact on the proposed construction. That person (or persons) should provide recommendations relative to the slab moisture and vapor retarder systems and for migration of potential adverse impact of moisture vapor transmission on various components of the structures, as deemed appropriate.

In addition, the recommendations in this report and our services in general are not intended to address mold prevention; since we, along with geotechnical consultants in general, do not practice in the area of mold prevention. If specific recommendations addressing potential mold issues are desired, then a professional mold prevention consultant should be contacted.

We recommend that control joints be placed in two directions spaced approximately 24 to 36 times the thickness of the slab in inches. These joints are a widely accepted means to control cracks and should be reviewed by the project structural engineer.

6.3.2 Miscellaneous Foundation Recommendations

6.3.2.1 To minimize moisture penetration beneath the slab-on-grade areas, utility trenches should be backfilled with engineered fill, lean concrete or concrete slurry where they intercept the perimeter footing or thickened slab edge.

6.3.2.2 Soils from the footing excavations should not be placed in the slab-on-grade areas unless properly compacted and tested. The excavations should be free of loose/sloughed materials and be neatly trimmed at the time of concrete placement.

6.3.3 Foundation Setbacks

Where applicable, the following setbacks should apply to all foundations. Any improvements not conforming to these setbacks may be subject to lateral movements and/or differential settlements:

- The outside bottom edge of all footings should be set back a minimum of H/3 (where H is the slope height) from the face of any descending slope. The setback should be at least 7 feet and need not exceed 40 feet.
- The bottom of all footings for structures near retaining walls should be deepened so as to extend below a 1:1 projection upward from the bottom inside edge of the wall stem. This applies to the existing retaining walls along the perimeter, if they are to remain.

- The bottom of any proposed foundations for structures should be deepened so as to extend below a 1:1 projection upward from the bottom of the nearest excavation.

6.4 RETAINING WALL DESIGN AND CONSTRUCTION

6.4.1 General Design Criteria

Recommendations presented herein may apply to typical masonry or concrete vertical retaining walls to a maximum height of six feet. Additional review and recommendations should be requested for higher walls.

Retaining wall foundations embedded a minimum of 12 inches into engineered fill should be designed using an allowable bearing capacity of 2,000 psf. An increase of one-third may be applied when considering short-term live loads (e.g. seismic and wind loads).

The passive earth pressure may be computed as an equivalent fluid having a density of 250 psf per foot of depth, to a maximum earth pressure of 2,500 psf. A coefficient of friction between soil and concrete of 0.35 may be used with dead load forces. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

An equivalent fluid pressure approach may be used to compute the horizontal active pressure against the wall. The appropriate fluid unit weights are given in the table below for specific slope gradients of retained materials.

Surface Slope of Retained Materials (H:V)	Equivalent Fluid Pressure (PCF) Select Backfill*
Level	40
2:1	60

*Backfill should consist of soil with an expansion index less than or equal to 50.

The above equivalent fluid weights do not include superimposed loading conditions such as expansive soils, vehicular traffic, structures, seismic conditions or adverse geologic conditions.

As required by code, additional lateral forces induced on retaining walls during an earthquake must be considered for wall design for sites with a Site Class D designation. For level backfill,

an incremental seismic equivalent fluid pressure of 23.1 pcf is recommended, where required. This pressure can be assumed to be a conventional triangular distribution.

6.4.2 Wall Backfill and Drainage

Wall backfill should consist of low expansive (EI<50) soil that should include a minimum one-foot wide section of ¾- to 1-inch clean crushed rock (or approved equivalent). The rock should be placed immediately adjacent to the back of the wall and extend up from the backdrain to within approximately 12 inches of finish grade. The upper 12 inches should consist of compacted on-site materials. The presence of other materials might necessitate revision to the parameters provided and modification of wall designs.

The backfill materials should be placed in lifts no greater than eight inches in thickness and compacted to a minimum of 90 percent relative compaction in accordance with ASTM Test Method D 1557. Proper surface drainage needs to be provided and maintained. Water should not be allowed to pond behind retaining walls. Waterproofing of site walls should be performed where moisture migration through the walls is undesirable.

Retaining walls should be provided with an adequate pipe and gravel back drain system to reduce the potential for hydrostatic pressures to develop. A 4-inch diameter perforated collector pipe (Schedule 40 PVC, or approved equivalent) in a minimum of one cubic foot per linear foot of ¾-inch or one-inch clean crushed rock or equivalent, wrapped in filter fabric should be placed near the bottom of the backfill and be directed (via a solid outlet pipe) to an appropriate disposal area.

Walls from two to four feet in height may be drained using localized gravel packs behind weep holes at 8 feet maximum spacing (e.g. approximately 1.5 cubic feet of gravel in a woven plastic bag). Weep holes should be provided or the head joints omitted in the first course of block extended above the ground surface. However, nuisance water may still collect in front of the wall.

Drain outlets should be maintained over the life of the project and should not be obstructed or plugged by adjacent improvements.

6.4.3 Restrained Retaining Walls

Any retaining wall that will be restrained prior to placing backfill or walls that have male or reentrant corners should be designed for at-rest soil conditions using an equivalent fluid pressure of 65 pcf (very low expansive backfill), plus any applicable surcharge loading. For areas having male or reentrant corners, the restrained wall design should extend a minimum distance

equal to twice the height of the wall laterally from the corner, or as otherwise determined by the structural engineer.

6.4.3.1 Other Design Considerations

- Retaining and garden wall foundation elements should be designed in accordance with building code setback requirements. A minimum horizontal setback distance of five feet as measured from the bottom outside edge of the footing to a sloped face is recommended.
- Wall design should consider the additional surcharge loads from superjacent slopes and/or footings, where appropriate.
- No backfill should be placed against concrete until minimum design strengths are evident by compression tests of cylinders.
- The retaining wall footing excavations, backcuts and backfill materials should be approved by the project geotechnical engineer or their authorized representative.
- Positive separations should be provided in garden walls at horizontal distances not exceeding 20 feet.

6.4.4 Soil Corrosivity

The soil resistivity at this site was tested in the laboratory on two (2) samples collected by our firm. The results of the testing indicate that the soil samples were considered *"mildly corrosive"* to "*moderately corrosive*" (6,097 to 13,400 ohm-cm) to buried ferrous metals in accordance with current standards commonly used by corrosion engineers. We recommend that a corrosion engineer be consulted to determine what corrosion protection may be warranted for the site. The laboratory test results are provided in Appendix B.

6.4.5 Soil Sulfate Content

The sulfate content was determined in the laboratory for two representative soil samples collected by our firm. The results indicate that the water-soluble sulfate for the tested sample was less than 0.1 percent by weight, which is considered "not applicable" (i.e. negligible) as per Table 4.2.1 of ACI 318. Based upon the test result, no special concrete mix design is required for sulfate attack resistance. The laboratory test result is provided in Appendix B.

6.4.6 Import Soils

Import soils should have expansion characteristics similar to the on-site soils. GeoTek also recommends that the proposed import soils be tested for expansion and sulfate potential.

GeoTek should be notified a minimum of 72 hours prior to importing so that appropriate sampling and laboratory testing can be performed.

6.5 PRELIMINARY PAVEMENT DESIGN

A preliminary pavement section has been developed based on assumed traffic loading and our estimate of the pavement subgrade soils following completion of site grading. Given the preliminary nature of the pavement sections presented below, final pavement design should be based on R-value testing of the as-graded soils and the known or assigned Traffic Indexes for the site roadways. Based on the near-surface soil types encountered in our test borings, we estimate that an as-graded R-value of 40 is appropriate for this preliminary design. For this preliminary design, we have assumed a Traffic Index of 5.5. Based on the above discussion, the following preliminary pavement design is presented.

Street	Assumed Traffic Index	Asphaltic Concrete/Aggregate Base (inches)
Interior Streets	5.5	3/6

The final pavement sections are subject to the review and approval by the local jurisdictional agency. Performance of the pavement sections will ultimately be based largely on construction methods, traffic loading and subgrade performance. All aggregate base and the upper 12 inches of subgrade should be compacted to at least 95 percent of the material's maximum dry density, per ASTM D-1557.

All pavement installation, including preparation and compaction of subgrade and base material and placement and rolling of asphaltic concrete, should be done in accordance with the City of Eastvale specifications, and under the observation and testing of GeoTek and a City or County inspector where required.

The aggregate base should consist of crushed rock with an R-Value and gradation in accordance with Crushed Aggregate Base (Section 200-2 of the "Greenbook"). Minimum compaction requirements should be 95 percent for both subgrade and aggregate base (ASTM D 1557). Jurisdictional minimum compaction requirements in excess of the aforementioned minimums may govern.

6.6 CONCRETE CONSTRUCTION

6.6.1 General

Concrete construction should follow the 2019 CBC and ACI guidelines regarding design, mix placement and curing of the concrete. If desired, we could provide quality control testing of the concrete during construction.

6.6.2 Concrete Flatwork

Exterior concrete slabs, sidewalks and driveways should be designed using a four-inch minimum thickness. No specific reinforcement is required from a geotechnical perspective. However, some shrinkage and cracking of the concrete should be anticipated as a result of typical mix designs and curing practices commonly utilized in industrial construction.

Sidewalks and driveways may be under the jurisdiction of the governing agency. If so, jurisdictional design and construction criteria would apply, if more restrictive than the recommendations presented in this report.

Subgrade soils should be pre-moistened prior to placing concrete. The subgrade soils below exterior slabs, sidewalks, driveways, etc. should be pre-saturated to a minimum of 100% of the optimum moisture content to a depth of 12 inches.

All concrete installation, including preparation and compaction of subgrade, should be done in accordance with the City of Eastvale specifications, and under the observation and testing of GeoTek and a City inspector, if necessary.

6.6.3 Concrete Performance

Concrete cracks should be expected. These cracks can vary from sizes that are essentially unnoticeable to more than 1/8 inch in width. Most cracks in concrete while unsightly do not significantly impact long-term performance. While it is possible to take measures (proper concrete mix, placement, curing, control joints, etc.) to reduce the extent and size of cracks that occur, some cracking will occur despite the best efforts to minimize it. Concrete undergoes chemical processes that are dependent on a wide range of variables, which are difficult, at best, to control. Concrete, while seemingly a stable material, is subject to internal expansion and contraction due to external changes over time.

One of the simplest means to control cracking is to provide weakened control joints for cracking to occur along. These do not prevent cracks from developing; they simply provide a relief point for the stresses that develop. These joints are a widely accepted means to control

cracks but are not always effective. Control joints are more effective the more closely spaced they are. GeoTek suggests that control joints be placed in two directions and located a distance apart approximately equal to 24 to 36 times the slab thickness.

Exterior concrete flatwork (patios, walkways, driveways, etc.) is often some of the most visible aspects of site development. They are typically given the least level of quality control, being considered "non-structural" components. We suggest that the same standards of care be applied to these features as to the structures themselves.

6.7 POST CONSTRUCTION CONSIDERATIONS

6.7.1 Landscape Maintenance and Planting

Water has been shown to weaken the inherent strength of soil, and slope stability is significantly reduced by overly wet conditions. Positive surface drainage away from graded slopes should be maintained and only the amount of irrigation necessary to sustain plant life should be provided for planted slopes. Controlling surface drainage and runoff and maintaining a suitable vegetation cover can minimize erosion. Plants selected for landscaping should be lightweight, deep-rooted types that require little water and are capable of surviving the prevailing climate.

Overwatering should be avoided. Care should be taken when adding soil amendments to avoid excessive watering. Leaching as a method of soil preparation prior to planting is not recommended. An abatement program to control ground-burrowing rodents should be implemented and maintained. This is critical as burrowing rodents can decreased the long-term performance of slopes.

It is common for planting to be placed adjacent to structures in planter or lawn areas. This will result in the introduction of water into the ground adjacent to the foundations. This type of landscaping should be avoided. Planters within 10 feet of the buildings should be above ground and underlain by a concrete slab. Waterproofing of the foundation and/or subdrains may be warranted and advisable. We could discuss these issues, if desired, when plans are made available.

6.7.2 Drainage

The need to maintain proper surface drainage and subsurface systems cannot be overly emphasized. Positive site drainage should be maintained at all times. Drainage should not flow uncontrolled down any descending slope. Water should be directed away from foundations

and not allowed to pond or seep into the ground adjacent to the footings and floor-slabs. Pad drainage should be directed toward approved areas and not be blocked by other improvements.

Roof gutters should be installed that will direct the collected water at least 20 feet from the buildings.

It is the owner's responsibility to maintain and clean drainage devices on or contiguous to their lot. In order to be effective, maintenance should be conducted on a regular and routine schedule and necessary corrections made prior to each rainy season.

6.8 PLAN REVIEW AND CONSTRUCTION OBSERVATIONS

We recommend that site grading, specifications, retaining wall/shoring plans and foundation plans be reviewed by this office prior to construction to check for conformance with the recommendations of this report. Additional recommendations may be necessary based on these reviews. We also recommend that GeoTek representatives be present during site grading and foundation construction to check for proper implementation of the geotechnical recommendations. The owner/developer should have GeoTek's representative perform at least the following duties:

- Observe site clearing and grubbing operations for proper removal of unsuitable materials.
- Observe and test bottom of removals prior to fill placement.
- Evaluate the suitability of on-site and import materials for fill placement and collect soil samples for laboratory testing when necessary.
- Observe the fill for uniformity during placement including utility trenches.
- Test the fill for field density and relative compaction.
- Test the near-surface soils to verify proper moisture content.
- Observe and probe foundation excavations to confirm suitability of bearing materials.

If requested, a construction observation and compaction report can be provided by GeoTek, which can comply with the requirements of the governmental agencies having jurisdiction over the project. We recommend that these agencies be notified prior to commencement of construction so that necessary grading permits can be obtained.

7. LIMITATIONS

This evaluation does not and should in no way be construed to encompass any areas beyond the specific area of proposed construction as indicated to us by the client. Further, no evaluation of any existing site improvements is included. The scope is based on our understanding of the project and the client's needs, our proposal (Proposal No. 0804120-CR) dated August 13, 2020 and geotechnical engineering standards normally used on similar projects in this region.

The materials observed on the project site appear to be representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during site construction. Site conditions may vary due to seasonal changes or other factors. GeoTek, Inc. assumes no responsibility or liability for work, testing or recommendations performed or provided by others.

Since our recommendations are based on the site conditions observed and encountered, and laboratory testing, our conclusions and recommendations are professional opinions that are limited to the extent of the available data. Observations during construction are important to allow for any change in recommendations found to be warranted. These opinions have been derived in accordance with current standards of practice and no warranty is expressed or implied. Standards of practice are subject to change with time.

A - FIELD TESTING AND SAMPLING PROCEDURES

The Modified Split-Barrel Sampler (Ring)

The ring sampler is driven into the ground in accordance with ASTM Test Method D 3550. The sampler, with an external diameter of 3.0 inches, is lined with 1-inch long, thin brass rings with inside diameters of approximately 2.4 inches. The sampler is typically driven into the ground 12 or 18 inches with a 140-pound hammer free falling from a height of 30 inches. Blow counts are recorded for every 6 inches of penetration as indicated on the log of boring. The samples are removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

Bulk Samples (Large)

These samples are normally large bags of earth materials over 20 pounds in weight collected from the field by means of hand digging or exploratory cuttings.

Bulk Samples (Small)

These are plastic bag samples which are normally airtight and contain less than 5 pounds in weight of earth materials collected from the field by means of hand digging or exploratory cuttings. These samples are primarily used for determining natural moisture content and classification indices.

B - BORING LOG LEGEND

The following abbreviations and symbols often appear in the classification and description of soil and rock on the log of borings:

SOILS

USCS	Unified Soil Classification System
f-c	Fine to coarse
f-m	Fine to medium

GEOLOGIC

B: Attitudes	Bedding: strike/dip
J: Attitudes	Joint: strike/dip
C: Contact line	
……..	Dashed line denotes USCS material change
———	Solid Line denotes unit / formational change
———	Thick solid line denotes end of the boring

(Additional denotations and symbols are provided on the log of boring)

APPENDIX B

LABORATORY TEST RESULTS

Single- and Multi-Family Residential Developments
Eastvale, Riverside County, California
Project No. 2603-CR

GEOTEK

SUMMARY OF LABORATORY TESTING

Classification

Soils were classified visually in general accordance with the Unified Soil Classification System (ASTM Test Method D 2487). The soil classifications are shown on the logs of exploratory borings in Appendix A.

Collapse

Collapse testing was performed on selected samples of the site soils according to ASTM Test Method D 4546. The results of this testing are presented in Appendix B.

Direct Shear

Shear testing was performed in a direct shear machine of the strain-control type in general accordance with ASTM Test Method D 3080. The rate of deformation is approximately 0.035 inch per minute. The samples were sheared under varying confining loads in order to determine the coulomb shear strength parameters, angle of internal friction and cohesion. The results of the testing are presented in Appendix B.

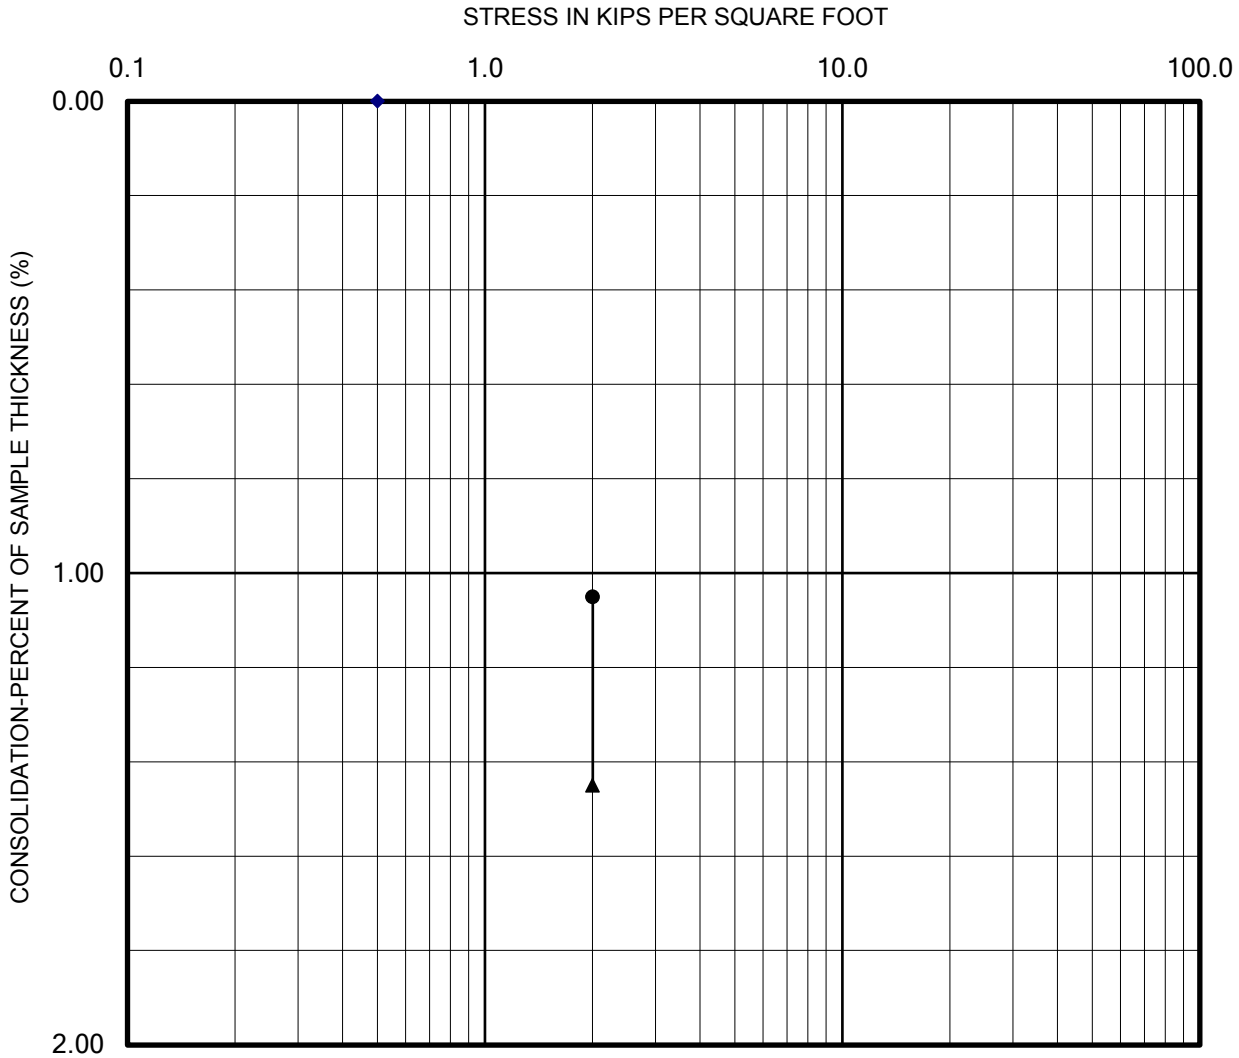
Expansion Index

Expansion Index testing was performed on two representative soil samples. Testing was performed in general accordance with ASTM Test Method D 4829. The results of the testing are provided below.

Boring No.	Depth (ft.)	Soil Type	Expansion Index	Classification
B-1	1-5	Clayey Sand	22	Low
B-4	1-5	Silty Sand	1	Very Low

Moisture-Density Relationship

Laboratory testing was performed on representative site samples collected during the recent subsurface exploration. The laboratory maximum dry density and optimum moisture content for the sample tested was determined in general accordance with test method ASTM Test Procedure D 1557. The results are included in Appendix B.



Percent of Soil Finer than No. 200 Sieve

Tests to determine the percent of soil finer than No. 200 sieve were performed on selected samples obtained from the properties. The tests were conducted in general accordance with ASTM D1140. The test results are shown on the logs of borings in Appendix A.

Sulfate Content, Resistivity and Chloride Content

Testing to determine the water-soluble sulfate content, resistivity testing and the chloride content was performed by others. The results of the testing are provided below and in Appendix B.

Boring No.	Depth (ft.)	pH ASTM G51	Chloride ASTM D4327 (ppm)	Sulfate ASTM D4327 (% by weight)	Resistivity ASTM G187 (ohm-cm)
B-1	1-5	8.6	9.4	0.0009	6,097
B-4	1-5	7.4	7.6	0.0015	13,400

DIRECT SHEAR TEST

Project Name:	MLC Holdings	***Sample Location:***	B1 @ 0-5 feet
Project Number:	2603-CR	***Date Tested:***	1/25/2021

Shear Strength: **Φ = 29 °, C = 139 psf**

Notes: 1 - The soil specimen used in the shear box was a ring sample remolded to approximately 90% relative compaction from a bulk sample collected during the field investigation.

2 - The above reflect direct shear strength at saturated conditions.

3 - The tests were run at a shear rate of 0.035 in/min.

APPENDIX E

GENERAL GRADING GUIDELINES

Single- and Multi-Family Residential Developments
Eastvale, Riverside County, California
Project No. 2603-CR

GEOTEK

GENERAL GRADING GUIDELINES

Guidelines presented herein are intended to address general construction procedures for earthwork construction. Specific situations and conditions often arise which cannot reasonably be discussed in general guidelines, when anticipated these are discussed in the text of the report. Often unanticipated conditions are encountered which may necessitate modification or changes to these guidelines. It is our hope that these will assist the contractor to more efficiently complete the project by providing a reasonable understanding of the procedures that would be expected during earthwork and the testing and observation used to evaluate those procedures.

General

Grading should be performed to at least the minimum requirements of governing agencies, Chapters 18 and 33 of the Uniform Building Code, CBC (2019) and the guidelines presented below.

Preconstruction Meeting

A preconstruction meeting should be held prior to site earthwork. Any questions the contractor has regarding our recommendations, general site conditions, apparent discrepancies between reported and actual conditions and/or differences in procedures the contractor intends to use should be brought up at that meeting. The contractor (including the main onsite representative) should review our report and these guidelines in advance of the meeting. Any comments the contractor may have regarding these guidelines should be brought up at that meeting.

Grading Observation and Testing

1. Observation of the fill placement should be provided by our representative during grading. Verbal communication during the course of each day will be used to inform the contractor of test results. The contractor should receive a copy of the "Daily Field Report" indicating results of field density tests that day. If our representative does not provide the contractor with these reports, our office should be notified.
2. Testing and observation procedures are, by their nature, specific to the work or area observed and location of the tests taken, variability may occur in other locations. The contractor is responsible for the uniformity of the grading operations; our observations and test results are intended to evaluate the contractor's overall level of efforts during grading. The contractor's personnel are the only individuals participating in all aspect of site work. Compaction testing and observation should not be considered as relieving the contractor's responsibility to properly compact the fill.
3. Cleanouts, processed ground to receive fill, key excavations, and subdrains should be observed by our representative prior to placing any fill. It will be the contractor's responsibility to notify our representative or office when such areas are ready for observation.

4. Density tests may be made on the surface material to receive fill, as considered warranted by this firm.
5. In general, density tests would be made at maximum intervals of two feet of fill height or every 1,000 cubic yards of fill placed. Criteria will vary depending on soil conditions and size of the fill. More frequent testing may be performed. In any case, an adequate number of field density tests should be made to evaluate the required compaction and moisture content is generally being obtained.
6. Laboratory testing to support field test procedures will be performed, as considered warranted, based on conditions encountered (e.g. change of material sources, types, etc.) Every effort will be made to process samples in the laboratory as quickly as possible and in progress construction projects are our first priority. However, laboratory workloads may cause in delays and some soils may require a **minimum of 48 to 72 hours to complete test procedures**. Whenever possible, our representative(s) should be informed in advance of operational changes that might result in different source areas for materials.
7. Procedures for testing of fill slopes are as follows:
   a) Density tests should be taken periodically during grading on the flat surface of the fill, three to five feet horizontally from the face of the slope.
   b) If a method other than over building and cutting back to the compacted core is to be employed, slope compaction testing during construction should include testing the outer six inches to three feet in the slope face to determine if the required compaction is being achieved.
8. Finish grade testing of slopes and pad surfaces should be performed after construction is complete.

Site Clearing

1. All vegetation, and other deleterious materials, should be removed from the site. If material is not immediately removed from the site it should be stockpiled in a designated area(s) well outside of all current work areas and delineated with flagging or other means. Site clearing should be performed in advance of any grading in a specific area.
2. Efforts should be made by the contractor to remove all organic or other deleterious material from the fill, as even the most diligent efforts may result in the incorporation of some materials. This is especially important when grading is occurring near the natural grade. All equipment operators should be aware of these efforts. Laborers may be required as root pickers.
3. Nonorganic debris or concrete may be placed in deeper fill areas provided the procedures used are observed and found acceptable by our representative.

Treatment of Existing Ground

1. Following site clearing, all surficial deposits of alluvium and colluvium as well as weathered or creep effected bedrock, should be removed unless otherwise specifically indicated in the text of this report.
2. In some cases, removal may be recommended to a specified depth (e.g. flat sites where partial alluvial removals may be sufficient). The contractor should not exceed these depths unless directed otherwise by our representative.
3. Groundwater existing in alluvial areas may make excavation difficult. Deeper removals than indicated in the text of the report may be necessary due to saturation during winter months.
4. Subsequent to removals, the natural ground should be processed to a depth of six inches, moistened to near optimum moisture conditions and compacted to fill standards.
5. Exploratory back hoe or dozer trenches still remaining after site removal should be excavated and filled with compacted fill if they can be located.

Fill Placement

1. Unless otherwise indicated, all site soil and bedrock may be reused for compacted fill; however, some special processing or handling may be required (see text of report).
2. Material used in the compacting process should be evenly spread, moisture conditioned, processed, and compacted in thin lifts six (6) to eight (8) inches in compacted thickness to obtain a uniformly dense layer. The fill should be placed and compacted on a nearly horizontal plane, unless otherwise found acceptable by our representative.
3. If the moisture content or relative density varies from that recommended by this firm, the contractor should rework the fill until it is in accordance with the following:
    a) Moisture content of the fill should be at or above optimum moisture. Moisture should be evenly distributed without wet and dry pockets. Pre-watering of cut or removal areas should be considered in addition to watering during fill placement, particularly in clay or dry surficial soils. The ability of the contractor to obtain the proper moisture content will control production rates.
    b) Each six-inch layer should be compacted to at least 90 percent of the maximum dry density in compliance with the testing method specified by the controlling governmental agency. In most cases, the testing method is ASTM Test Designation D 1557.
4. Rock fragments less than eight inches in diameter may be utilized in the fill, provided:
    a) They are not placed in concentrated pockets;
    b) There is a sufficient percentage of fine-grained material to surround the rocks;
    c) The distribution of the rocks is observed by, and acceptable to, our representative.

5. Rocks exceeding eight (8) inches in diameter should be taken off site, broken into smaller fragments, or placed in accordance with recommendations of this firm in areas designated suitable for rock disposal. On projects where significant large quantities of oversized materials are anticipated, alternate guidelines for placement may be included. If significant oversize materials are encountered during construction, these guidelines should be requested.
6. In clay soil, dry or large chunks or blocks are common. If in excess of eight (8) inches minimum dimension, then they are considered as oversized. Sheepsfoot compactors or other suitable methods should be used to break up blocks. When dry, they should be moisture conditioned to provide a uniform condition with the surrounding fill.

Slope Construction

1. The contractor should obtain a minimum relative compaction of 90 percent out to the finished slope face of fill slopes. This may be achieved by either overbuilding the slope and cutting back to the compacted core, or by direct compaction of the slope face with suitable equipment.
2. Slopes trimmed to the compacted core should be overbuilt by at least three (3) feet with compaction efforts out to the edge of the false slope. Failure to properly compact the outer edge results in trimming not exposing the compacted core and additional compaction after trimming may be necessary.
3. If fill slopes are built "at grade" using direct compaction methods, then the slope construction should be performed so that a constant gradient is maintained throughout construction. Soil should not be "spilled" over the slope face nor should slopes be "pushed out" to obtain grades. Compaction equipment should compact each lift along the immediate top of slope. Slopes should be back rolled or otherwise compacted at approximately every 4 feet vertically as the slope is built.
4. Corners and bends in slopes should have special attention during construction as these are the most difficult areas to obtain proper compaction.
5. Cut slopes should be cut to the finished surface. Excessive undercutting and smoothing of the face with fill may necessitate stabilization.

UTILITY TRENCH CONSTRUCTION AND BACKFILL

Utility trench excavation and backfill is the contractors responsibility. The geotechnical consultant typically provides periodic observation and testing of these operations. While efforts are made to make sufficient observations and tests to verify that the contractors' methods and procedures are adequate to achieve proper compaction, it is typically impractical to observe all backfill procedures. As such, it is critical that the contractor use consistent backfill procedures.

Compaction methods vary for trench compaction and experience indicates many methods can be successful. However, procedures that "worked" on previous projects may or may not prove effective on a given site. The contractor(s) should outline the procedures proposed, so that we may discuss them **prior** to construction. We will offer comments based on our knowledge of site conditions and experience.

1. Utility trench backfill in slopes, structural areas, in streets and beneath flat work or hardscape should be brought to at least optimum moisture and compacted to at least 90 percent of the laboratory standard. Soil should be moisture conditioned prior to placing in the trench.
2. Flooding and jetting are not typically recommended or acceptable for native soils. Flooding or jetting may be used with select sand having a Sand Equivalent (SE) of 30 or higher. This is typically limited to the following uses:
   a) shallow (12 + inches) under slab interior trenches and,
   b) as bedding in pipe zone.

   The water should be allowed to dissipate prior to pouring slabs or completing trench compaction.
3. Care should be taken not to place soils at high moisture content within the upper three feet of the trench backfill in street areas, as overly wet soils may impact subgrade preparation. Moisture may be reduced to 2% below optimum moisture in areas to be paved within the upper three feet below sub grade.
4. Sand backfill should not be allowed in exterior trenches adjacent to and within an area extending below a 1:1 projection from the outside bottom edge of a footing, unless it is similar to the surrounding soil.
5. Trench compaction testing is generally at the discretion of the geotechnical consultant. Testing frequency will be based on trench depth and the contractors procedures. A probing rod would be used to assess the consistency of compaction between tested areas and untested areas. If zones are found that are considered less compact than other areas, this would be brought to the contractors attention.

JOB SAFETY

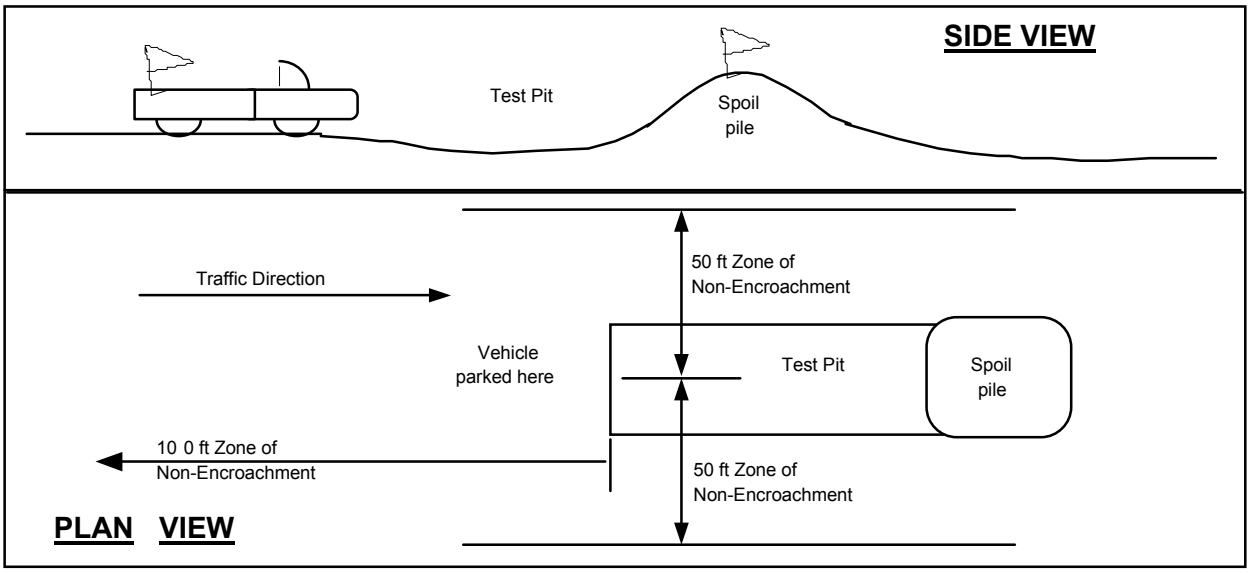
General

Personnel safety is a primary concern on all job sites. The following summaries are safety considerations for use by all our employees on multi-employer construction sites. On ground personnel are at highest risk of injury and possible fatality on grading construction projects. The company recognizes that construction activities will vary on each site and that job site safety is the contractor's responsibility. However, it is, imperative that all personnel be safety conscious to avoid accidents and potential injury.

In an effort to minimize risks associated with geotechnical testing and observation, the following precautions are to be implemented for the safety of our field personnel on grading and construction projects.

1. Safety Meetings: Our field personnel are directed to attend the contractor's regularly scheduled safety meetings.
2. Safety Vests: Safety vests are provided for and are to be worn by our personnel while on the job site.
3. Safety Flags: Safety flags are provided to our field technicians; one is to be affixed to the vehicle when on site, the other is to be placed atop the spoil pile on all test pits.

In the event that the contractor's representative observes any of our personnel not following the above, we request that it be brought to the attention of our office.



Test Pits Location, Orientation and Clearance

The technician is responsible for selecting test pit locations. The primary concern is the technician's safety. However, it is necessary to take sufficient tests at various locations to obtain a representative sampling of the fill. As such, efforts will be made to coordinate locations with the grading contractors authorized representatives (e.g. dump man, operator, supervisor, grade checker, etc.), and to select locations following or behind the established traffic pattern, preferably outside of current traffic. The contractors authorized representative should direct excavation of the pit and safety during the test period. Again, safety is the paramount concern.

Test pits should be excavated so that the spoil pile is placed away from oncoming traffic. The technician's vehicle is to be placed next to the test pit, opposite the spoil pile. This necessitates that the fill be maintained in a drivable condition. Alternatively, the contractor may opt to park a piece of equipment in front of test pits, particularly in small fill areas or those with limited access.

A zone of non-encroachment should be established for all test pits (see diagram below). No grading equipment should enter this zone during the test procedure. The zone should extend outward to the sides approximately 50 feet from the center of the test pit and 100 feet in the direction of traffic flow. This zone is established both for safety and to avoid excessive ground vibration, which typically decreases test results.

TEST PIT SAFETY PLAN

Slope Tests

When taking slope tests, the technician should park their vehicle directly above or below the test location on the slope. The contractor's representative should effectively keep all equipment at a safe operation distance (e.g. 50 feet) away from the slope during testing.

The technician is directed to withdraw from the active portion of the fill as soon as possible following testing. The technician's vehicle should be parked at the perimeter of the fill in a highly visible location.

Trench Safety

It is the contractor's responsibility to provide safe access into trenches where compaction testing is needed. Trenches for all utilities should be excavated in accordance with CAL-OSHA and any other applicable safety standards. Safe conditions will be required to enable compaction testing of the trench backfill.

All utility trench excavations in excess of 5 feet deep, which a person enters, are to be shored or laid back. Trench access should be provided in accordance with OSHA standards. Our personnel are directed not to enter any trench by being lowered or "riding down" on the equipment.

Our personnel are directed not to enter any excavation which;

1. is 5 feet or deeper unless shored or laid back,
2. exit points or ladders are not provided,
3. displays any evidence of instability, has any loose rock or other debris which could fall into the trench, or

4. displays any other evidence of any unsafe conditions regardless of depth.

If the contractor fails to provide safe access to trenches for compaction testing, our company policy requires that the soil technician withdraws and notifies their supervisor. The contractors representative will then be contacted in an effort to effect a solution. All backfill not tested due to safety concerns or other reasons is subject to reprocessing and/or removal.

Procedures

In the event that the technician's safety is jeopardized or compromised as a result of the contractor's failure to comply with any of the above, the technician is directed to inform both the developer's and contractor's representatives. If the condition is not rectified, the technician is required, by company policy, to immediately withdraw and notify their supervisor. The contractor's representative will then be contacted in an effort to effect a solution. No further testing will be performed until the situation is rectified. Any fill placed in the interim can be considered unacceptable and subject to reprocessing, recompaction or removal.

In the event that the soil technician does not comply with the above or other established safety guidelines, we request that the contractor bring this to technicians attention and notify our project manager or office. Effective communication and coordination between the contractors' representative and the field technician(s) is strongly encouraged in order to implement the above safety program and safety in general.

The safety procedures outlined above should be discussed at the contractor's safety meetings. This will serve to inform and remind equipment operators of these safety procedures particularly the zone of non-encroachment.

The safety procedures outlined above should be discussed at the contractor's safety meetings. This will serve to inform and remind equipment operators of these safety procedures particularly the zone of non-encroachment.

Irvine, California 92606

RE: Phase I Environmental Site Assessment
13175 Orange Street
Eastvale, California 92880
Hillmann Project No: C3-8285

Dear Mr. Ilich:

Hillmann Consulting LLC is pleased to provide the results of our Phase I Environmental Site Assessment of the above referenced property. This assessment was performed in general accordance with the scope and limitations of ASTM Practice E1527-13, which is the latest version of the E1527 standard published by the ASTM.

We appreciate the opportunity to provide environmental due diligence services. If you have any questions concerning this report, or if we can assist you in any other matter, please contact our office at 908-688-7800.

Sincerely,

Hillmann Consulting, LLC

Davis Tang
Environmental Scientist

Ryan Terwilliger
West Coast Operations Manager

List of Abbreviations/Acronyms

Hillmann may use the following abbreviations and acronyms for common terminology described in our report. Not all abbreviations or acronyms may be applicable to this report:

ACM	– Asbestos Containing Material
AOC	– Area of Concern
AST	– Aboveground Storage Tank
ASTM	– American Society for Testing Materials
BER	– Business Environmental Risk
CEA	– Classification Exception Area
CERCLA	– Comprehensive Environmental Response Compensation and Liability Act
CERCLIS	– Comprehensive Environmental Response Compensation and Liability Information System
CESQG	– Conditionally Exempt Small Quantity Generator
COC	– Chemicals of Concern
CORRACTS	– Corrective Action Sites
CREC	– Controlled Recognized Environmental Condition
DNPL	– Delisted National Priority List
DTSC	– Department of Toxic Substances Control
ENG	– Engineering
ERNS	– Emergency Response Notification System
FDEP	– Florida Department of Environmental Protection
FDNY	– Fire Department, City of New York
FDOT	– Florida Department of Transportation
FOI/FOIA/FOIL	– Freedom of Information / Freedom of Information Act / Freedom of Information Letter
HVAC	– Heating Ventilation & Air Conditioning
HREC	– Historic Recognized Environmental Condition
IAQ	– Indoor Air Quality
ISRA	– Industrial Site Recovery Act
LBP	– Lead-Based Paint
LQG	– Large Quantity Generator
LTANK	– Leaking Storage Tank
LUST	– Leaking Underground Storage Tank
MassDEP	– Massachusetts Department of Environmental Protection
SDS/MSDS	– Safety Data Sheet / Material Safety Data Sheet
NA	– Not Applicable
NCDOH	– Nassau County Department of Health
NFA	– No Further Action
NFRAP	– No Further Remedial Actions Planned
NJDEP	– New Jersey Department of Environmental Protection
NPDES	– National Pollutant Discharge Elimination System
NPL	– National Priority List
NYCDEP	– New York City Department of Environmental Protection
NYCDOB	– New York City Department of Buildings
NYCOER	– New York City Office of Environmental Remediation
NYSDEC	– New York State Department of Environmental Conservation
OPRA	– Open Public Records Act
PADEP	– Pennsylvania Department of Environmental Protection
PAH	– Polycyclic Aromatic Hydrocarbon
PCE	– Perchloroethylene
RAO	– Response Action Outcome
RCRA	– Resource Conservation and Recovery Act
RCRIS	– Resource Conservation and Recovery Information System
REC	– Recognized Environmental Condition
RWQCB	– Regional Water Quality Control Board
SCAQMD	– South Coast Air Quality Management District
SCDHS	– Suffolk County Department of Health Services
SDG	– Significant Data Gap
SEMS	– Superfund Enterprise Management System
SRP	– Site Remediation Program
SQG	– Small Quantity Generator
SVOC	– Semi-Volatile Organic Compound
TCE	– Trichloroethylene
TSDF	– Treatment Storage and/or Disposal Facility
USEPA	– United States Environmental Protection Agency
UST	– Underground Storage Tank
VEC	– Vapor Encroachment Condition
VOC	– Volatile Organic Compound

1.0 FINDINGS, OPINIONS, AND CONCLUSIONS

Hillmann Consulting, LLC (Hillmann) performed a Phase I Environmental Site Assessment (ESA) of 13175 Orange Street, Eastvale, California (the Property). The assessment has been conducted in accordance with our contracted scope of work and the ASTM Standard Practice E 1527-13 for Phase I Environmental Site Assessments and All Appropriate Inquiries (AAI) Final Rule 40 CFR Part 312. This section contains a summary of findings, opinions and conclusions made by this assessment. However, this section, alone, does not constitute the complete assessment. The report must be read in its entirety.

1.1 Summary of Project Details

Primary Street Address:		13175 Orange Street			
City:	Eastvale	**County:**	Riverside	**State:**	California
Tax ID/Parcel Number:		152-040-003			
Property Owner:		Kraig A. Kirschner			
Zoning Designation:		Residential			
Approx. Property Area:		9.65 acres			
Buildings/# of Floors		One / Single-story			
Approx. Building Area:		5,300 SF			
Approx. Year Built:		Circa 1990			
Commercial Occupants:		None			
Current Use:		Vacant single-family residence			
Prior Uses:		Agricultural			
Inspected By:		Mr. Davis Tang			
Site Contact/Company:		Mr. Matt Maehara / Meritage Homes			
Site Escort/Company:		Mr. Peter Haringsma / Vander Dussen & Haringsma			
Inspection Date:		January 14, 2021			
Weather Conditions:		Sunny, 72 ^{o}F

1.3 Findings, Opinions and Conclusions

1.3.1 Recognized Environmental Conditions

Hillmann has performed a Phase I Environmental Site Assessment in accordance with the scope and limitations of ASTM Practice E1527-13 of the Property as described in Section 2 of this report. Any additions to, exceptions to, or deletions from this practice are also described in Section 2 of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the Property, except for the following:

RECOGNIZED ENVIRONMENTAL CONDITIONS	
	No RECs were identified.
HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS	
	No HRECs were identified.
CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS	
	No CRECs were identified.
SIGNIFICANT DATA GAPS	
	No SDGs were identified.

1.3.2 REC Response Action Recommendations

The following table presents recommended response actions to the identified RECs for further investigation and/or corrective action:

REC RESPONSE ACTION SUMMARY TABLE	
REC	**Response Action**
	No further investigations are warranted at this time.

1.3.3 Notable Environmental Conditions / De Minimis Conditions

The following environmental conditions were identified, but are not considered to be a REC in connection with the Property:

NOTABLE ENVIRONMENTAL CONDITIONS / DE MINIMIS CONDITIONS	
1.	The review of historical records indicated evidence of the following potential RECs in connection with the Property: The Property appears to have been utilized as agricultural land from circa 1931 to 1989. There is the potential for soil contamination due to historic applications of pesticides. Due to this, Hillmann cored twenty (20) soil borings and composited five (5) soil samples in order to determine the presence of any subsurface contamination from pesticides or Title 22 Metals. The borings were collected between 0.5 and 2.0 feet bgs. The samples all appeared visually clean with no discernable odor. Soil samples collected were preserved for analysis in laboratory jars, sealed with Teflon tape and plastic end caps, wrapped in aluminum foil and stored on ice. Samples were submitted to A&R Laboratories in Ontario, California for laboratory analysis of organo-chlorine pesticides (OCP) by EPA Method 8081A, analysis of Title 22 Metals by EPA Method 6010B as recommended by DTSC guidance. The results identified Heptachlor Epoxide pesticide from composite sample P17-20 at 0.027 mg/kg concentration, well below the 0.07 mg/kg screening limit for residential soils. No other OCPs were detected, as well as no elevated levels of heavy metals. The complete lab report can be found in Appendix F. Due to this, the historic usage of the Property as orchards/agricultural land is not considered to be a REC in connection with the Property.
2.	According to Mr. Haringsma, a septic system is present and utilized for on-site disposal of sanitary sewage. Mr. Haringsma is unaware of the location of the septic system and Hillmann was not able to visually identify the location, but is most likely located adjoining to the north of the residential structure. Given the lack of identified prior industrial or other high-risk site uses, septic systems formerly used at the Property would not be considered to be a REC in connection with the Property. Hillmann recommends that prior to redevelopment; the septic system should be removed and disposed of under applicable local rules and regulations.
3.	A pump system for a water well was observed at the southeastern portion of the Property. Hillmann recommends that prior to redevelopment; the water well should be properly abandoned under applicable local rules and regulations.

1.3.4 Environmental Professional Statement

I declare that, to the best of my professional knowledge and belief, I meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training and experience to assess a *property* of the nature, history and setting of the subject *property*. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Ryan Terwilliger
Environmental Professional

1.4 Business Environmental Risks / Non-ASTM Scope

Hillmann has performed a limited review of the following potential Business Environmental Risks (BER), also known as "Non-ASTM Scope concerns", in accordance with the contracted scope of work scope for this assessment. The following is a summary of findings for applicable BERs. For a more detailed discussion of the findings and contracted scope of work, please see the referenced report section.

BUSINESS ENVIRONMENTAL RISKS / NON-ASTM SCOPE			
Subject	**Findings**	**Not Appl.**	**Rpt. Ref.**
Asbestos	No buildings built prior to 1990 were present at the Property.	X	7.1
Lead Paint	Painted surfaces observed within the accessed areas of the residential building were noted to be in good condition.	X	7.2
Radon	Property is located in the USEPA radon designation Zone 2 or 'moderate risk' area for radon.		7.3
Mold / Microbial Damage	Hillmann did not observe evidence of significant problems with moisture intrusion or mold/microbial growth at the Property.		7.4
NWI Wetlands	No mapped wetland areas were depicted at the Property.		7.5
Lead in Drinking Water	Potable water service at the Property is provided by a private well located at the southeastern portion of the Property. No water quality testing data for the on-site potable well was provided by the Property contact.	X	7.6

2.0 INTRODUCTION

2.1 Purpose and Scope

This assessment was conducted utilizing generally accepted Phase I ESA industry standards in accordance with the ASTM Standard Practice E1527-13. The ASTM describes these methodologies as representing good commercial and customary practice in the United States of America for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and petroleum products. As such, this practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner or bona fide prospective purchaser limitations on CERCLA liability (hereinafter, the "landowner liability protections," or "LLPs"): that is, the practice that constitutes all appropriate inquiries into the previous ownership and uses the property consistent with good commercial and customary practice as defined at 42 U.S.C. §9601(35) (B). The primary goal of the processes established by ASTM E1527-13 is to identify *recognized environmental conditions* in connection with the Property.

The term *recognized environmental condition (REC)* is defined by the ASTM as the presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

The ASTM has also defined the terms *historical recognized environmental conditions* and *controlled recognized environmental conditions* as two additional types of RECs. The term *historical recognized environmental condition (HREC)* is defined as a past release of any hazardous substances or petroleum products that has occurred in connection with the Property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the Property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls or engineering controls).

The term *controlled recognized environmental condition (CREC)* is defined as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

Conditions determined to be *"de minimis conditions"* are not considered to be RECs, HRECs or CRECs. *De minimis condition* is defined by the ASTM, "…as a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

The chief components of this assessment are generally described as follows:

- A non-invasive visual reconnaissance of the Property and adjoining properties in accordance with ASTM guidelines for evidence of RECs.

- Interviews of past and present owners and occupants and state and local government officials, seeking information related to the potential presence of RECs at the Property.

- A review of standard physical record sources for available topographic, geologic and groundwater data.

- A review of standard historic record sources, such as fire insurance maps, city directories, aerial photographs, prior reports and interviews, etc., to determine prior uses of the Property from the present, back to the Property's first developed use, or back to 1940, whichever is earlier.

- A review of standard environmental record sources including federal and state environmental databases, and additional environmental record sources, to identify potential regulatory concerns with the Property, adjoining properties and properties located within the surrounding area.

An evaluation of environmental or other regulatory compliance matters is excluded from the scope of this assessment.

These methodologies are described as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

2.1.1 Business Environmental Risks/Non-ASTM Scope Considerations

In accordance with our contract agreement, Hillmann may have addressed the following potential environmental subject matters that are outside of the requirements of the ASTM E1527-13 standard:

Asbestos-Containing Materials (ACM): A cursory non-intrusive visual screening for the presence of suspect ACM within the accessed areas of buildings built prior to 1990 on the Property. It is emphasized that this cursory non-intrusive visual screening does not constitute an asbestos survey/inspection of the premises. An asbestos survey/inspection should be sought by the report User(s) if more certainty is desired regarding ACM and potential asbestos hazards at the Property. Furthermore, a review of regulatory compliance matters pertaining to asbestos is excluded from the scope of work.

Lead-Based Paint (LBP): A cursory non-intrusive visual screening of the condition of painted surfaces in the accessed areas of residential buildings/units built prior to 1980 on the Property. It is emphasized that this cursory non-intrusive visual screening does not constitute a comprehensive survey for LBP or potential lead hazards. A comprehensive inspection should be sought by the report User(s) if more certainty is desired regarding LBP at the Property. Furthermore, a review of regulatory compliance matters pertaining to lead-based paint is excluded from the scope of work.

USEPA Designated Radon Potential: Review of general non-site specific data published by the USEPA regarding the Radon Zone classification for the area of the Property.

Mold/Microbial Damage: A cursory non-intrusive visual screening within the accessed areas of buildings on the Property for evidence of systemic microbial problems, including visible mold growth, water damaged building materials or musty odors. It is emphasized that this cursory non-intrusive visual screening does not constitute a comprehensive survey for moisture/mold/microbial damage. A more comprehensive inspection should be sought by the report User(s) if more certainty is desired regarding the potential for moisture/mold/microbial damages at the Property.

NWI Wetlands: Review of US Fish and Wildlife Service National Wetland Inventory digitized data of mapped wetlands as presented in the attached EDR Radius Map plus Geocheck Report.

It is emphasized that, regardless of the wetlands data obtained via the EDR Geocheck-Physical Setting Source Addendum, a delineation of regulated wetlands by a qualified professional would be warranted to determine the presence or absence of regulated wetlands at the Property.

Lead in Drinking Water: Review of the potential for elevated levels of lead in the drinking water by determining the source of the drinking water supply and a review of available testing or compliance data reports.

2.2 Property Location/Legal Description

Property location and legal description details are described as follows:

Primary Street Address:	13175 Orange Street				
City:	Eastvale	**County:**	Riverside	**State:**	California
Tax ID/Parcel Number:	152-040-003				
Approx. Land Area:	9.65 acres				
Apprx. Latitude/Longitude:	North 33.959958 degrees/West 117.570294 degrees				
Additional Details (if appl.):	NA				
Property Owner:	Kraig A. Kirschner				
Zoning Designation:	Residential				

2.3 Data Gaps

A *data gap* is defined by the ASTM as a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. A data gap is only significant if other information and/or professional experience raises reasonable concerns involving the data gap and the ability to determine the presence or absence of recognized environmental conditions. The following table summarizes data gaps encountered during the assessment as well as a discussion of their significance.

Data Gap:	Significant (Yes/No)?	Discussion
Historical records data failure	No	Record gaps exceeding five years were encountered; however, no significant site use changes are suspected during these intervals.
Response to agency records requests not received as of date of report.	No	Any additional information indicative of a REC will be forwarded upon receipt.

2.4 User Reliance

This report is for the exclusive use of the User(s) named on the front cover. No other party(ies) shall have any right to rely on the content of this report without first obtaining the consent of the original report User; and without obtaining written consent from Hillmann in the form of a letter of reliance or report recertification.

2.5 Significant Assumptions

The following significant assumptions are made:

- The site operations at the time of the site visit are assumed to reflect typical site conditions relative to potential environmental conditions and that no concealment of environmental conditions or releases by site owners or occupants has occurred. Likewise, it is assumed that no areas of the Property with potential environmental concerns or RECs were concealed or otherwise not reported, intentionally or unknowingly, by the Property owners/occupants and/or site escort at the time of the site visit.

- For the purpose of estimating the approximate direction of groundwater flow in the absence of site specific groundwater data, unless indicated otherwise, an assumption has been made that the gradient of groundwater flow follows the surface topography of the Property and immediate surrounding area.

2.6 General Limitations and Exceptions

2.6.1 Limitations

The report turnaround time specified by the contract agreement for this assessment may present a limitation to the availability of pertinent regulatory agency records. Such limitations, if encountered, are further specified in Section 4.4.

Significant limitations related to the condition or accessibility of the Property at the time of the site reconnaissance, if encountered, are reported in Section 5.1.

2.6.2 Other Exceptions or Deletions

No other exceptions or deletions from the ASTM Standard E1527-13 are reported.

2.6.3 Special Terms and Conditions

This Phase I Environmental Site Assessment has been prepared using reasonable efforts in each phase of its work to identify recognized environmental conditions associated with hazardous substances, wastes and petroleum products at the Property. Findings within this report are based on information collected from observations made on the day of the site reconnaissance and from reasonably ascertainable information obtained from governing public agencies and private sources.

This report is not definitive and should not be assumed to be a complete or specific definition of the conditions above or below grade. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation, site development, redevelopment, or other construction purposes. No representation or warranty is made that the past or current operations at the Property are, or have been, in compliance with all applicable federal, state and local laws, regulations and codes.

Findings, conclusions and recommendations presented in this report are based on visual observations of the Property, interviews conducted, the records reviewed, information provided by the Client, and/or a review of readily available and supplied drawings and documents. Information obtained during the assessment, whether written, graphic or verbal, provided by the Property contact(s) or as shown on any documents reviewed or received from the Property contact, owner or agent, or government agency source; is assumed to be accurate except as specifically stated otherwise in this report. Independent verification of the accuracy or completeness of all information reviewed or received during the course of this assessment is not made and excluded from the scope of work for this assessment. No warranty or guarantee is made of the accuracy or completeness of information that was obtained from ostensibly knowledgeable individuals, regulatory agency representatives or other secondary sources.

Regardless of the findings stated in this report, Hillmann is not responsible for consequences or conditions arising from facts that were concealed, withheld or not fully disclosed at the time the assessment was conducted.

This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

The regulatory database report provided is based on an evaluation of the data collected and compiled by a contracted data research company. The regulatory research is designed to meet the requirements of ASTM Standard E1527-13. Hillmann can neither warrant nor guarantee the accuracy or completeness of the information obtained from the regulatory database report provider during the course of this assessment.

Subsurface conditions may differ from the conditions implied by the surface observations and can only be reliably evaluated through intrusive techniques.

Reasonable efforts have been made during this assessment to identify aboveground and underground storage tanks and ancillary equipment. Reasonable efforts are limited to information gained from visual observation of largely unobstructed areas, recorded database information held

in public record and available information gathered from interviews. Such methods may not identify surficial and subsurface features that may have been hidden from view due to parked automobiles and other vehicles, snow cover, vegetative growth, pavement, construction or debris pile storage or incorrect information from sources.

No guarantee, explicit or implied, is made that the records pertaining to historical ownership or occupancy which were reviewed represent a comprehensive or precise delineation of past Property ownership or tenancy for legal purposes.

The ASTM E1527-13 standard states that recommendations are not required to be included in a Phase I ESA report; however, further that recommendations are an additional service that may be useful in the User's analysis of landowner liability protections or business environmental risks; and that the User should consider whether recommendations for additional inquiries or other services are desired.

The recommended response actions to the identified RECs presented in Section 1.3, if any, are not intended to represent the only course(s) of action to take; nor does it imply any opinion as to the timing of the action. Furthermore, it is emphasized that additional response actions may become warranted depending on the outcome of the initial action(s) taken. Hillmann advises that consultation with legal counsel familiar with environmental and real estate law may be beneficial to the decision making process for the type and timing of a response action to identified RECs, if any.

Due to the limited nature of our review of potential Business Environmental Risks, the User of the report should consider whether to take additional action(s) to further define, properly manage and/or mitigate potential BERs.

In the event of any conflict between the terms and conditions of this report and the terms and conditions of the consulting services agreement for this project, the consulting services agreement shall control.

3.0 USER PROVIDED INFORMATION

The term "User" is defined by ASTM as the party seeking to use Practice E1527 to complete an environmental site assessment of the Property; specifically, the entities named on the front cover to which the report has been addressed.

3.1 Prior Environmental Reports/Documentation

No prior environmental reports/documentation were provided.

3.2 User Questionnaire

Section 6 of the ASTM E1527-13 standard describes certain tasks required to be performed by the report User in order to qualify for landowner liability protections to CERCLA liability. To assist the report User to meet these requirements, the ASTM E1527-13 standard recommends a questionnaire of inquiries (User Questionnaire) specified in 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31 be provided to the original report User. The following is a summary of the User's response:

Question:	Yes/No:	Detail:
Environmental liens that are filed or recorded against the property: Did a search of recorded land title records identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?	No	
Activity and use limitations that are in place on the property or that have been filed or recorded against the property: Did a search of recorded land title records (or judicial records where appropriate, identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?	No	
Specialized knowledge or experience of the person seeking to qualify for the LLP: Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?	No	
Relationship of the purchase price to the fair market value of the property if it were not contaminated: Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?	Yes	
Commonly Known or Reasonably Ascertainable Information: Are you aware of commonly known or reasonably ascertainable information about the property that would help the		

Question:	Yes/No:	Detail:
environmental professional to identify conditions indicative of releases or threatened releases? For example,		
-Do you know the past uses of the property?	No	
-Do you know of specific chemicals that are present or were once present at the property?	No	
-Do you know of spills or other chemical releases that have taken place at the property?	No	
-Do you know of any environmental cleanups that have taken place at the property?	No	
The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation: Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?	No	
Litigation/Administrative Proceedings/Government Notices As the User of this ESA, do you have knowledge of (1) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property; (2) any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the property; and (3) any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.	No	

NR-no response

3.3 Reason for Performing Phase I ESA

The User indicated that the purpose of the assessment is to identify any environmental issues during feasibility period.

4.0 RECORDS REVIEW

4.1 Physical Setting Sources

The following physical setting sources were reviewed:

Source	Discussion
USGS 7.5 minute Topographic Map Data: (EDR Geocheck-Physical Setting Source Addendum)	The Property lies at an elevation of approximately 620 feet above mean sea level. An interpretation of topographic contour lines as well as a review of the EDR Geocheck-General Topographic Gradient suggested terrain sloping downward towards the west-southwest. There are no nearby downgradient water bodies from the Property.
USDA SCS Soil Data: (EDR Geocheck-Physical Setting Source Addendum)	The dominant soil type at the Property is classified as "Ramona". This soil type is described as a soil with sandy loam surface textures and moderate infiltration rates. They have deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Geologic Data: (EDR Geocheck-Physical Setting Source Addendum)	The geologic formation in the vicinity of the Property is described as stratified sequence of the Cenozoic Era, Quaternary System, and Quaternary Series.
Prior Env. Reports: (Section 3.1)	No prior environmental reports were obtained.
Additional Sources/ Data:	No additional physical setting sources or data was obtained.
Groundwater Flow Discussion:	Based on a review of the above information as well as observation of the site, the direction of shallow groundwater flow at the site is inferred to be towards the west-southwest.
NWI Wetlands Data: (EDR Geocheck-Physical Setting Source Addendum)	No NWI mapped wetlands areas were depicted at the Property.

4.2 Historical Use – Property and Adjoining Properties

Research has been conducted in an attempt to develop a history of the previous uses of the property and surrounding area, in order to help identify the likelihood of past uses having led to RECs in connection with the property. Standard historical sources have been sought in an attempt to document the past uses of the Property as far back as it can be shown that the Property contained structures; or from the time the Property was first used for residential, agricultural, commercial, industrial or governmental purposes.

4.2.1 Fire Insurance Maps

A Certified Sanborn Map Report was obtained from EDR for a review of published historic fire insurance maps for the Property and surrounding area. The following is a summary of site uses and notable details depicted by the available maps:

Year(s)	Prop/Adj	Depicted Use(s)	Notable Details
None identified	**Property:**		
	Adjoining:		

A copy of the Certified Sanborn Map Report is attached in Appendix D.

4.2.2 City Directories

An EDR City Directory Abstract report was reviewed for data of former occupants of the Property's street address. The following is a generalized summary of the findings of city directory research for past occupants of the Property.

Property	
Use(s) / Occupant(s):	**Years**
Private individuals	1999-2017

The EDR City Directory Abstract report was also reviewed for listings of historic occupants of the adjoining properties. The following is a general summary of listings of historic adjoining property occupants:

Adjoining Properties	
Use and/or Occupant(s)	**Years**
School	1981-2017
Residential	2005-2017

A copy of the EDR City Directory report is attached in Appendix D.

4.2.3 Historical Topographic Maps

Historical topographic maps of the Property and vicinity obtained from an EDR Historical Topographic Map report (as attached in Appendix D) have been reviewed. The following interpretation of land usage was made by review of the maps:

Year(s)	Summary	
1902, 1942, 1947, 1954	**Property:**	No improvements or other notable depictions are shown
	Adjoining:	Structures are depicted adjoining to the east and west. No other improvements or notable depictions are shown.
1967, 1973, 1981	**Property:**	No improvements or other notable depictions are shown
	Adjoining:	The Eastvale School is depicted to the east and a structure is depicted to the west. No other improvements or notable depictions are shown.
2012	**Property:**	No improvements or other notable depictions are shown
	Adjoining:	No improvements or other notable depictions are shown

4.2.4 Historical Aerial Photographs

Historical aerial photographs of the Property and vicinity obtained from an EDR Aerial Photo Decade Package report, as attached in Appendix D, were reviewed. The following interpretation of land usage was made by review of the aerial photographs:

Year(s)	Summary of Interpretation	
1931, 1938, 1948, 1953	**Property:**	Agricultural land
	Adjoining:	Residences and agricultural land

1959, 1967, 1975, 1985, 1989	**Property:**	Agricultural land
	Adjoining:	A school, residences and agricultural land
1990, 1994, 2002	**Property:**	Residential
	Adjoining:	A school and residential and agricultural land
2006, 2009, 2012, 2016	**Property:**	Residential
	Adjoining:	Schools and residential

4.2.5 EDR High-Risk Historical Records

The EDR Radius Map™ report, which is discussed in greater detail in Section 4.3, provided a search of proprietary databases of potential historical high-risk uses at or in the vicinity of the Property. These databases include EDR Historic Cleaners – a database of property addresses with records of historical occupancy by suspected cleaners businesses; EDR Historic Auto – a database of property addresses with records of historical occupancy by potential automotive gas/filling stations and repair facilities; and EDR MGP- a database of sites historically occupied by manufactured gas plants and related facilities.

EDR Database	On-site Listings:	Adjoining/Off-Site Listings
Historic Cleaners: (on-site/adjoining only)	None	None
Historic Auto: (on-site/adjoining only)	None	None
MGP: (1-mile distance)	None	None

4.2.6 Petroleum/Natural Gas Well Review

The historical record sources and the California Geologic Energy Management Division (CalGEM) online mapping application were reviewed for records of historic petroleum and/or natural gas wells at the Property. No record of any historical petroleum/natural gas wells at or adjoining the Property was identified.

4.2.7 Additional Historical Data

Where applicable, the following additional pertinent historical data was obtained:

Interviews/Anecdotal:	No additional pertinent historical data was obtained.
Local Gov't Records:	No additional pertinent historical data was obtained.
Prior Env. Reports: (Section 3.1)	Not applicable; no prior reports were provided.
Site Observations:	As further detailed in Section 5.2.1, indications of the following historic uses of the Property and/or adjoining properties were observed during the site reconnaissance:
Other Sources:	No additional pertinent historical data was obtained.

4.2.8 Summary of Identified Historic Uses

The following table presents a summary of the types and approximate date ranges of identified prior uses of the Property:

Property	
Date Range	**Use**
1931-1989	Agricultural land
1990-Present	Residential

The following table presents a summary of the types of identified prior uses of the adjoining properties:

Adjoining Properties	
Date Range	**Use**
1931-1953	Residential and agricultural land
1959-2002	Residential and agricultural land and schools
2006-Present	Residential and schools

4.2.9 Historical Records Data Failure

The ASTM E1527-13 standard defines data failure as a failure to achieve the ASTM specified historical research objectives after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful. The objective is to identify all obvious uses of the property from the present, back to the property's first developed use, or back to 1940, whichever is earlier. Furthermore, records of historic use/conditions should be sought in intervals no less than approximately five years, unless the property conditions appear unchanged over a longer interval.

Objective	Met?	Detail	Significant?
First developed use/date determined?	Yes	The first developed use of the Property was agricultural circa 1931	NA
Record sources at 5-year intervals back to 1940 or first developed use?	No	Historical record gaps exceeding five years were encountered. However, significant site-use changes or undiscovered site uses appear unlikely to have occurred during the record gaps.	No
All obvious prior uses identified?	Yes	See Section 4.2.8.	NA

Please refer to Section 2.3 for additional discussion of data gaps and their significance to the findings of the assessment.

4.2.10 Historic Uses REC Discussion

The review of historical records indicated evidence of the following potential RECs in connection with the Property: The Property appears to have been utilized as agricultural land from circa 1931 to 1989. There is the potential for soil contamination due to historic applications of pesticides.

Due to this, Hillmann cored twenty (20) soil borings and composited five (5) soil samples in order to determine the presence of any subsurface contamination from pesticides or Title 22 Metals. The borings were collected between 0.5 and 2.0 feet bgs. The samples all appeared visually clean with no discernable odor. Soil samples collected were preserved for analysis in laboratory jars, sealed with Teflon tape and plastic end caps, wrapped in aluminum foil and stored on ice. Samples were submitted to A&R Laboratories in Ontario, California for laboratory analysis of

organo-chlorine pesticides (OCP) by EPA Method 8081A, analysis of Title 22 Metals by EPA Method 6010B as recommended by DTSC guidance. The results identified Heptachlor Epoxide pesticide from composite sample P17-20 at 0.027 mg/kg concentration, well below the 0.07 mg/kg screening limit for residential soils. No other OCPs were detected, as well as no elevated levels of heavy metals. The complete lab report can be found in **Appendix F**. Due to this, the historic usage of the Property as orchards/agricultural land is not considered to be a REC in connection with the Property.

4.3 Standard Environmental Record Sources

A regulatory database report, titled EDR Radius Map™ Report, prepared by Environmental Data Resources of Shelton, CT was obtained and reviewed. The report provided a search of standard environmental record sources for listings of the Property, adjoining properties and sites within the surrounding area; and has been reviewed for the purpose of identifying listings suggesting a potential impact to the Property due to presence or migration of hazardous substances and/or petroleum products. Additional descriptions of the meaning and significance of the regulatory databases can be found in the regulatory database report in Appendix E. The EDR Radius Map™ Report provided a search of the following database categories in accordance with the requirements of the ASTM Standard E1527-13:

Regulatory Database	Search Distance
Fed. National Priorities List (NPL/a.k.a. "Superfund" sites) & Proposed NPL	1-mile
Fed. Delisted NPL	½-mile
Fed. Superfund Enterprise Management System (SEMS; formerly CERCLIS)	½-mile
Fed. SEMS-ARCHIVE (formerly known as CERCLIS NFRAP)	½-mile
Fed. RCRA Corrective Action Sites (CORRACTS)	1-mile
Fed. RCRA Transport/Storage/Disposal (TSD) sites	½-mile
Fed. RCRA Generators (LQG, SGQ & CESQG)	Site & Adjoining
Fed. Institutional Control/Engineering Control (IC/EC) Registries	Site only
Fed. Emergency Response Notification System (ERNS)	Site only
State/Tribal Hazardous Waste Sites (SHWS)	1-mile
State/Tribal Landfill and/or Solid Waste Disposal (LF/SWF)	½-mile
State/Tribal Leaking Storage Tanks	½-mile
State/Tribal Registered Storage Tanks	Site & Adjoining
State/Tribal IC/EC Registries	Site
State/Tribal Voluntary Cleanup Sites	½-mile
State/Tribal Brownfields	½-mile
Additional Federal, State, Tribal and Local Environmental Databases	Variable

Reported distances for adjoining listings discussed in Section 4.3.4, if applicable, are approximate and indicative of the presence of a public roadway or right-of-way between the adjoining site and Property.

The reported gradients indicated where applicable in Sections 4.3.4 and 4.3.5 have been estimated based on a number of factors including but not necessarily limited to field observation, review of topographic maps, database listing details and/or site specific geo-technical data.

4.3.1 Supplemental Database Listings

The regulatory database report was also reviewed for listings on supplemental databases, in addition to the Standard Environmental Record Sources. Any property or adjoining property listings on such databases of significant concern, if identified, is discussed in Sections 4.3.3 and 4.3.4. Otherwise, none of the other supplemental database listings identified by the regulatory database report are considered to be a REC in connection with the Property.

4.3.2 Limited Tier I Vapor Encroachment Screening

Limited analysis of the details of on-site, adjoining and vicinity database sites was conducted to identify potential sources of sub-surface vapor encroachment. This review was based on elements of the ASTM "Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions" (ASTM E2600-15); and also on elements of "Methodology for Identifying the Area of Concern Around a Property Potentially Impacted by Vapor Migration from Nearby Contaminated Sources" (Buonicore, 2011-S-103-AWMA). Vicinity database sites pertaining to non-petroleum product releases within 1,760 feet of the Property in the up-gradient direction, 365 feet of the Property in the cross gradient direction and 100 feet of the Property in the down gradient direction; and vicinity database sites pertaining to petroleum product releases within 528 feet of the Property in the up-gradient direction, 165 feet of the Property in the cross gradient direction and 100 feet of the Property in the down gradient direction were reviewed to identify active contamination sites with the potential to affect subsurface vapor conditions at the subject property. The potential for vapor encroachment was considered in assessing whether or not a REC exists in connection with the Property when reviewing applicable sites within those distances.

Regulatory database sites with active petroleum or non-petroleum releases that are considered to constitute a vapor encroachment condition (VEC) to the Property, if any, are identified and discussed in Sections 4.3.3, 4.3.4 and 4.3.5.

4.3.3 Property Listings

The following listings of the Property were identified:

Name/Address:	None identified
Database(s):	
Data Discussion:	
REC Discussion:	
VEC Discussion:	

4.3.4 Adjoining Property Listings

The following adjoining property listings were identified. Reported distances, where applicable, are approximate and indicative of the presence of a public roadway or right-of-way between the adjoining site and Property. The reported gradient has been estimated based on a number of factors including but not necessarily limited to field observation, review of topographic maps, database listing details and/or site specific geo-technical data.

Name/Address:	Eastvale Elementary; 13031 Orange Street				
Database(s):	ENVIROSTOR, SCH, CERS				
Distance in feet:	Adjoining	**Direction:**	E	**Gradient:**	Up
Data Discussion:	The ENVIROSTOR, SCH, and CERS databases all indicate this site was part of a school investigation due to nitrate impacts from historical agricultural operations on-site. This site received "No Further Action" on September 12, 2001. No other pertinent data was provided. Based on the no further action status and the current operation as a school, these listings are not considered to be RECs in connection with the Property.				
REC Discussion:	Based on the details provided above, a REC is not suspected in connection with the Property.				
VEC Discussion:	Based on the available data, a VEC is not suspected.				

Name/Address:	River Heights Intermediate School; 7227 Scholar way				
Database(s):	RCRA-NonGen/NLR, ENVIROSTOR, SCH				
Distance in feet:	Adjoining	**Direction:**	SE	**Gradient:**	Cross
Data Discussion:	The ENVIROSTOR and SCH databases indicate this site was part of a school cleanup as part of the Voluntary Cleanup Program due to potential impacts from historical agricultural operations on-site. This site received a "Certified" status on September 12, 2012 and no further action was required. This site is listed on the RCRA-NonGen / NLR database as a non-generator that did not generate hazardous waste in 2012. No violations were listed. Based on the absence of reported violations and the no further action required, these listings are not considered to be RECs in connection with the Property.				
REC Discussion:	Based on the details provided above, a REC is not suspected in connection with the Property.				
VEC Discussion:	Based on the available data, a VEC is not suspected.				

4.3.5 ASTM Search Distance Findings

The following is a discussion of non-adjoining sites identified as located within the ASTM specified search distance surrounding the Property. In order to keep this discussion informative and concise, discussion(s) is/are provided of the listed site(s) for each database category that appears most likely to impact the Property based on distance, area topography and/or regulatory status. Listings of sites within the applicable search distances not specifically discussed below were reviewed and concluded not to be RECs in connection with the Property or VECs based on various factors including distance, area topography, known or inferred groundwater flow direction and/or regulatory status. Listings for the following databases, if identified, have been discussed above in Sections 4.3.3 and 4.3.4: Registered Storage Tanks, Federal RCRA Generators, Federal and State EC/IC, ERNS. A copy of the full regulatory database report, including available details of all listed sites, is included in Appendix E.

Federal NPL				**# of sites:**	0	**Search Distance:**	1-mile

State HAZARDOUS WASTE SITE				**# of sites:**	2	**Search Distance:**	1-mile
Notable Listing:	Dick Vander Meer Sons Dairy; 6851 Harrison Avenue						
Distance in feet:	3,910	**Direction:**	W	**Gradient:**	Cross		
Data Discussion:	This site is listed as a school cleanup site due to potential methane off-gassing from historical agricultural operations. This site received no further action on July 6, 2015. Based on the distance and no further action required, this site is not considered to be a REC in connection with the Property.						
REC Discussion:	Based on the details provided above, a REC is not suspected in connection with the Property.						
VEC Discussion:	Based on the available data, a VEC is not suspected.						

State SOLID WASTE FACILITY/LANDFILL				# of sites:	0	Search Distance:	½-mile

UNMAPPED/ORPHAN LIST SITES	
Notable Listings:	Hillmann has also reviewed a list of unmapped sites (a.k.a. "Orphan List" sites) indicated by the database report. Unmapped sites that were identified as falling within an applicable specific search distance or warranting discussion have either been discussed in the preceding tables or are detailed below: None

4.4 Additional Environmental Record Sources

Requests have been submitted to local, municipal and state agencies for pertinent records pertaining to the Property, particularly with regard to potential environmental concerns such as petroleum storage tanks, storage and usage of hazardous substances and petroleum products, and/or known or suspected environmental contamination. Where applicable, internet research of government environmental regulatory databases was also conducted, as well as a general cursory

internet search of the Property address, for information indicative of a REC. The following table summarizes the findings of the research:

Source	Type of Request	Outcome
EPA MyProperty	Online search	Hillmann searched online for records pertaining to the Property. No records pertaining to the property were found.
EPA Envirofacts	Online search	Hillmann searched online for records pertaining to the Property. No records pertaining to the property were found.
Riverside County Department of Environmental Health Hazardous Materials Management Branch	FOI request	No response was received prior to report issuance.
Riverside County Department of Environmental Health Land Use & Water Resources	FOI request	A response was recieved stating that no records were found.
Riverside County Agricultural Commission	FOI request	No response was received prior to report issuance.
California Department of Toxic Substances Control (DTSC)	FOI request	No response was received prior to report issuance.
CA DTSC (Envirostor)	Online search	Hillmann searched online for records pertaining to the Property. No records pertaining to the property were found.
Regional Water Quality Control Board (RWQCB)	FOI request	No response was received prior to report issuance.
CA SWRCB (GeoTracker)	Online search	Hillmann searched online for records pertaining to the Property. No records pertaining to the property were found.
South Coast Air Quality Management District (SCAQMD)	FOI request	No response was received prior to report issuance.

5.0 SITE RECONNAISSANCE

5.1 Methodology and Limiting Conditions

The site reconnaissance consisted of visual and/or physical observations of the Property and improvements, adjoining properties as viewed from the Property boundaries and the surrounding area based on visual observations from adjoining public thoroughfares. Building exteriors were observed at ground level, unless otherwise indicated. Where applicable, representative areas of building interiors were accessed and observed to the extent they were made safely accessible with the cooperation of the site escort.

Site Inspection Personnel:	Mr. Davis Tang
Property Escort/Company:	Mr. Peter Haringsma / Vander Dussen & Haringsma
Inspection Date:	January 14, 2021
Weather Conditions:	Sunny, 72 ºF

5.1.1 Significant Inaccessible Areas

No significant areas of the Property inaccessible at the time of the inspection were noted.

5.1.2 Significant Limiting Site Conditions

No significant limiting site conditions were noted at the time of the site reconnaissance.

5.2 General Site Setting

5.2.1 Site and Vicinity Characteristics

Abutting Roadways:	Schleisman Road to the north; Orange Street to the south
Current Property Use:	Residential
Evidence of Past Property Uses:	A canopy and fencing were present on the Property. According to Mr. Haringsma, the Property owner previously kept a horse onsite.
Evidence of Past Adjoining Property Uses:	None observed
Surrounding Area Uses:	Residential and schools

5.2.2 Current Adjoining Property Uses

Dir	Street Address	Description
N	Schleisman Road	Residential
E	13031 Orange Street	Eastvale Elementary School
S	7227 Scholar Way	River Heights Intermediate School
W	Calina Street	Residential

No visual observations indicative of a potential environmental concern were noted on the adjoining properties.

5.2.3 Topographic Characteristics

Terrain:	Relatively flat
Direction of Downward Slope:	Gently towards the west-southwest
On-site Water Bodies:	None observed
Other Significant Features:	None observed

5.2.4 General Description of Structures

Buildings/# of Floors	One / Single-story
Approx. Building Area:	5,300 SF
Approx. Year Built:	Circa 1990
Ancillary Structures:	A canopy is present to the north of the residential structure.
Sources of Heating & Cooling:	Natural gas and electric powered systems
Potable Water/Sewage Disposal:	Potable well and septic system. See Sections 5.3.15 and 5.3.16 for additional details.

5.3 Interior & Exterior Observations

5.3.1 Storage/Usage of Hazardous Substances and Petroleum Products

The following hazardous substances and petroleum products were observed to be stored and used by property occupants:

Occupant	Substance	Qty/Container Type	Storage Conditions
NA	No significant storage or use noted		

5.3.2 Drums

No hazardous substance or petroleum product drums were noted on the Property.

5.3.3 Unidentified Substance Containers

No unidentified substance containers suspected of containing hazardous substance or petroleum product were noted on the Property.

5.3.4 Other Hazardous Substances/Petroleum Products

No other containers of hazardous substances or petroleum products were noted on the Property.

5.3.5 Bulk Petroleum/Hazardous Material Storage Tanks

The following storage tanks for bulk petroleum or hazardous material storage were identified or reported to be present; or are suspected to be present based on visual observations:

AST/ UST	Product	Capacity	Construction	Year Installed	Status	Location/Notes
(none)						

5.3.6 PCBs in Oil Filled Electrical/Hydraulic Equipment

No oil-filled electrical or hydraulic equipment was identified at the Property.

5.3.7 Odors

No strong, pungent or noxious odors were noted at the Property.

5.3.8 Pools of Liquid

No standing water or pools of liquid likely to contain hazardous substances or petroleum products were noted at the Property.

5.3.9 Interior Stains or Corrosion

No interior stains or corrosion due to hazardous substance/petroleum products spills/releases were noted at the Property.

5.3.10 Interior Drains/Sumps

No floor drains or sump pits were noted at the Property other than for storm water or sewage management.

5.3.11 Exterior Pits/Ponds/Lagoons

No exterior pits, ponds or lagoons was identified on the Property in connection with waste treatment or disposal.

5.3.12 Stained Soil, Pavement/Stressed Vegetation

No stained soil, pavement or stressed vegetation was observed at the Property.

5.3.13 On-Site Solid Waste Disposal/Fill Material

No evidence of any on-site solid waste dumping was noted at the Property. No evidence of recently deposited fill materials was observed at the Property.

5.3.14 Waste Water

Sanitary sewage generated at the Property is discharged via an on-site septic system. See Section 5.3.15 for additional details regarding the septic system.

Storm water runoff at the Property is discharged off-site to local streams/drainage systems via overland flow.

No additional waste water discharges were identified at the Property.

5.3.15 Septic Systems

According to Mr. Haringsma, a septic system is present and utilized for on-site disposal of sanitary sewage. Mr. Haringsma is unaware of the location of the septic system and Hillmann was not able to visually identify the location, but is most likely located adjoining to the north of the residential structure. Given the lack of identified prior industrial or other high risk site uses, septic systems formerly used at the Property would not be considered to be a REC in connection with the Property. Hillmann recommends that prior to redevelopment, the septic system should be removed and disposed of under applicable local rules and regulations.

5.3.16 Wells

The following groundwater wells were identified at the Property:

A pump system for a water well was observed at the southeastern portion of the Property. Hillmann recommends that prior to redevelopment, the water well should be properly abandoned under applicable local rules and regulations.

5.3.17 Railroad Spurs

No railroad spurs were identified on the Property.

6.0 INTERVIEWS

6.1 Interviews with Past and Present Owners and Occupants

Subject	Name/Affiliation	Summary
Property Owner / Representative	Mr. Peter Haringsma / Vander Dussen & Haringsma	Mr. Haringsma was interviewed via email about the historical uses at the site. Pertinent information where applicable are discussed in the relevant sections of the report.
Property Occupants	Not applicable	Property was unoccupied.
Past Owners, Occupants, Operators	Not applicable	Past owners/occupants of the Property were not available for interview at the time of the assessment.
Owners/Occupants of Adjoining or Nearby Properties	Not applicable	The Property was not an abandoned property with evidence of unauthorized uses or uncontrolled access; therefore, interviews with adjoining or nearby property owners or occupants were not conducted.

6.2 Interviews with State and/or Local Government Officials

Written and on-line requests for environmental records of the Property from State and Local governmental agencies are detailed in Section 4.4.

7.0 BUSINESS ENVIRONMENTAL RISKS

In accordance with the contract agreement for this assessment, Hillmann has performed cursory reviews of several potential Business Environmental Risks (also known as "Non-Scope Considerations"). The ASTM E1527-13 standard defines the term business environmental risk (BER) as, *"a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice."*

7.1 Asbestos-Containing Material (ACM)

The contracted scope of work included a cursory visual screening of the accessed portions of buildings at the Property built prior to 1990 for suspect asbestos containing materials (ACM). The information provided in this section, where applicable, is limited to identification of potential suspect materials in the readily accessible and observed areas of the building, and their general condition. This is not intended to be a comprehensive survey for the presence of ACM, and no testing has been conducted.

No buildings built prior to 1990 were present at the Property.

7.2 Lead-Based Paint

The contracted scope of work included a cursory visual screening of the condition of painted surfaces in the accessed areas of residential buildings/units built prior to 1980. This is not intended to constitute a comprehensive survey for LBP or potential lead hazards, and no testing has been conducted.

Painted surfaces observed within the accessed areas of the residential building were noted to be in good condition.

7.3 Radon

Data compiled by the USEPA, as summarized by the regulatory database report, indicated that the Property is located in an area classified as Zone 2 or 'moderate risk' area for radon. Radon testing was not included in the scope of this assessment.

7.4 Mold/Microbial Damage

As per the contracted scope of work, Hillmann conducted a cursory visual screening of the accessed areas of the building for evidence of significant damage to building materials and finishes as result of moisture intrusion and/or mold/microbial growth. Hillmann did not observe evidence of significant problems with moisture intrusion or mold/microbial growth at the Property.

7.5 NWI Mapped Wetlands

As indicated in the Physical Setting Source table of Section 4.1, no NWI mapped wetlands areas were depicted at the Property by the EDR Geocheck-Physical Setting Source Addendum (attached in Appendic E).

The scope of work for this assessment excludes a visual determination of regulated wetlands at the Property. It is emphasized that, regardless of the wetlands data obtained via the EDR Geocheck-Physical Setting Source Addendum, a delineation of regulated wetlands by a qualified professional would be warranted to determine the presence or absence of regulated wetlands at the Property.

7.6 Lead in Drinking Water

The scope of work for this assessment included a review of the potential for elevated levels of lead in drinking water by determining the source of the drinking water supply and a review of available compliance or testing data.

Potable water service at the Property is provided by a private well located at the southeastern portion of the Property. No water quality testing data for the on-site potable well was provided by the Property contact.

QUESTIONNAIRES/USER PROVIDED DOCUMENTATION

HILLMANN
CONSULTING

Phase I ESA - User Questionnaire

Instructions: This form should be completed by a representative of the USER of the Phase I ESA report and returned to Hillmann via email, or in person during the site inspection. Typically, the report USER is the entity on whose behalf the report is being prepared.

In order to qualify for one of the Landowner Liability Protections (LLPs)187 offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"),188 the user must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete. Please complete the following questionnaire and provide any of the referenced information (if available) to Hillmann.

Respondent Name:	Matt Maehara
Company/Affiliation:	Meritage Homes
Address:	5 Peters Canyon Road, Suite 310, Irvine, CA 92606
Response Date:	1/25/21

1. Environmental liens that are filed or recorded against the property (40 CFR 312.25).

Did a search of recorded land title records identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

Yes ☐ *No* ☑

2. Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of recorded land title records (or judicial records where appropriate, identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

Yes ☐ *No* ☑

3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

Yes ☐ *No* ☑

4. Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

Yes ☑ *No* ☐

5. Commonly Known or Reasonably Ascertainable Information

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,

5a. Do you know the past uses of the property?

Yes ☐ *No* ☑

5b. Do you know of specific chemicals that are present or were once were present at the property?

Yes ☐ *No* ☑

5c. Do you know of spills or other chemical releases that have taken place at the property?

Yes ☐ *No* ☑

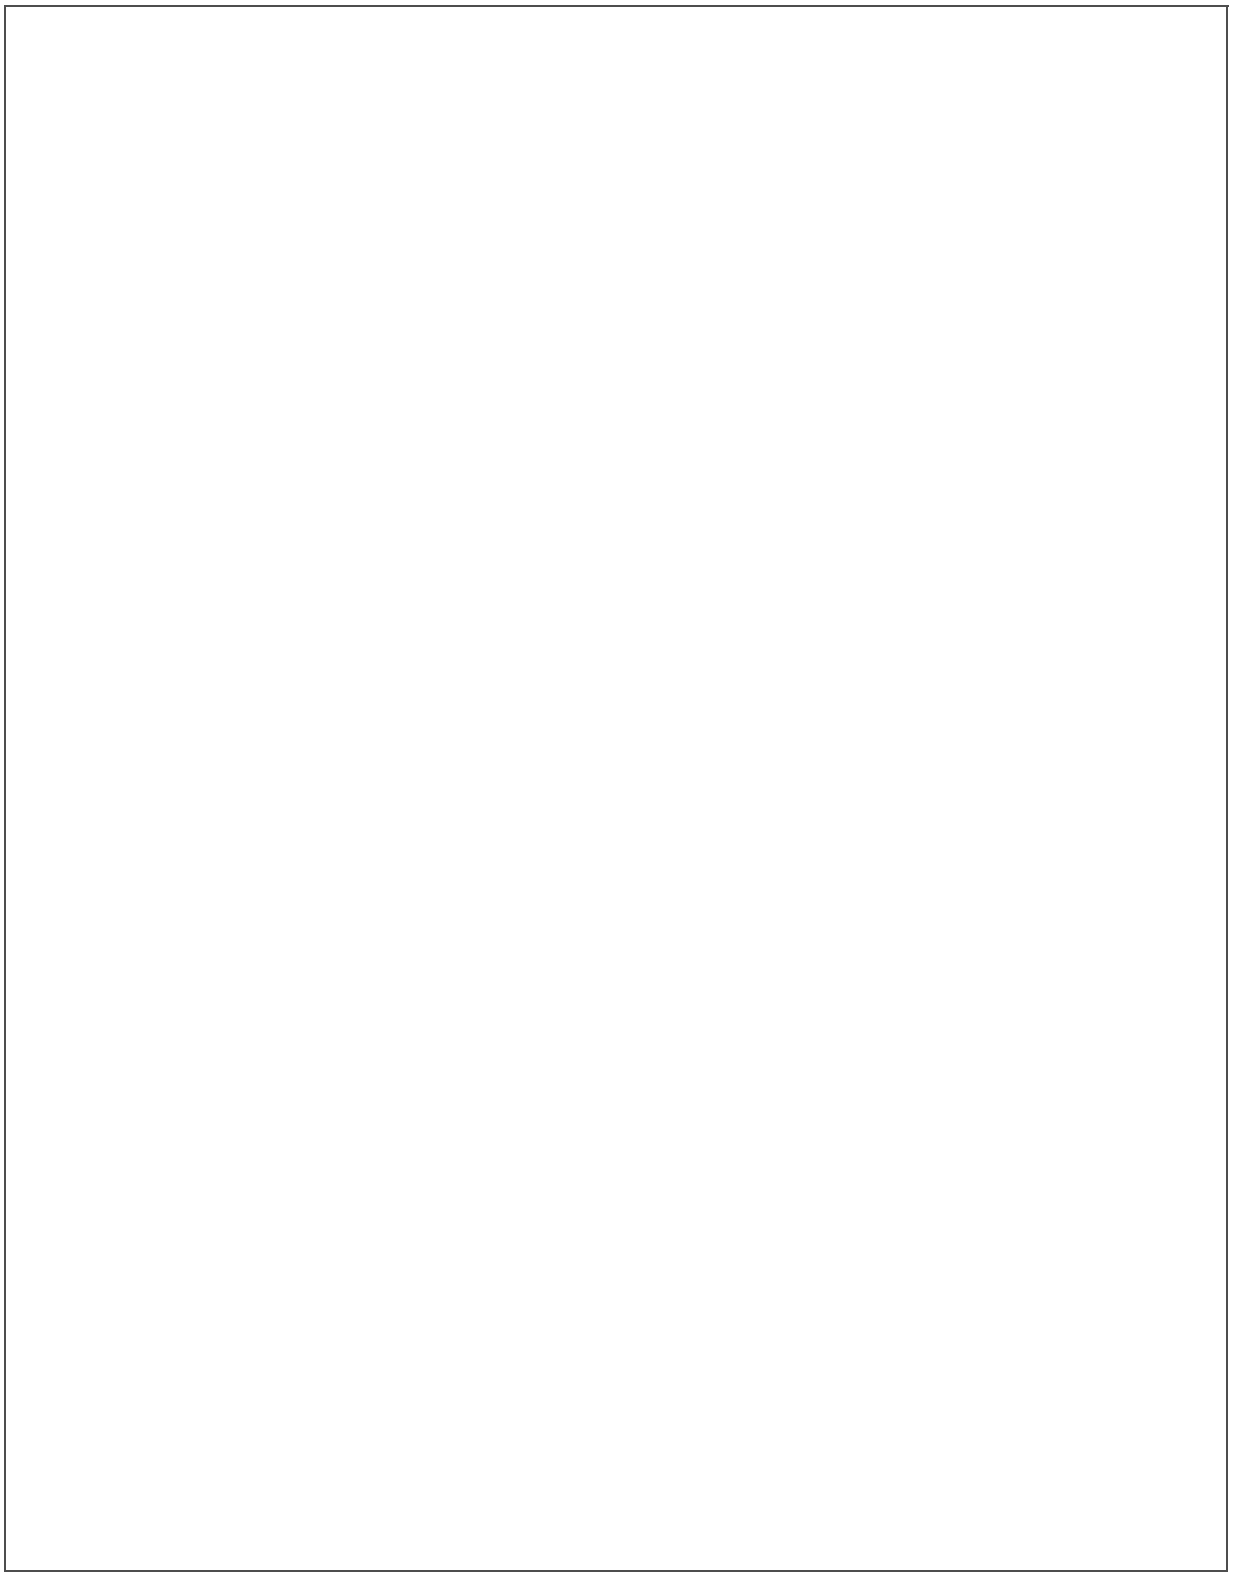
5d. Do you know of any environmental cleanups that have taken place at the property?

Yes ☐ *No* ☑

6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation:

Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

Yes ☐ *No* ☑



7. Litigation/Administrative Proceedings/Government Notices

As the User of this ESA, do have knowledge of *(1)* any pending, threatened, or past litigation relevant to *hazardous substances* or *petroleum products* in, on, or from the *property*; *(2)* any pending, threatened, or past administrative proceedings relevant to *hazardous substances* or *petroleum products* in, on or from the *property*; and *(3)* any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to *hazardous substances* or *petroleum products*.

Yes ☐ *No* ☑

Where applicable, provide additional details regarding any questions that were answered "Yes".

8. Reason for Performing Phase I ESA: Meritage Homes is requesting for a Phase I ESA investigation because the Home Builder is looking to purchase the property and is looking to review any environmentally related issues with the site during feasibility.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Hillmann Environmental Co. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # F1F2-4768-B153

PO # NA

Project C3-8285

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: F1F2-4768-B153

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

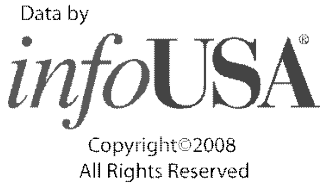
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1921 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/27/2020 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there is 1 LUST site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
PABLO ECHEVERRIA DAI	***7481 CLEVELAND***	***SSE 1/4 - 1/2 (0.416 mi.)***	***6***	***30***
Database: LUST, Date of Government Version: 09/08/2020 Status: Completed - Case Closed Global Id: T0606523936				

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

SCH: This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category. depending on the level of threat to public health and safety or the. environment they pose.

A review of the SCH list, as provided by EDR, and dated 07/27/2020 has revealed that there are 2 SCH sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
EASTVALE ELEMENTARY Facility Id: 33010022 Status: No Further Action	***13031 ORANGE STREET***	***ESE 0 - 1/8 (0.086 mi.)***	***A1***	***9***
RIVER HEIGHTS INTER/ Facility Id: 33020005 Status: Certified	***CLEVELAND AVENUE/ORA***	***ESE 1/8 - 1/4 (0.132 mi.)***	***A3***	***15***

Local Lists of Registered Storage Tanks

HIST UST: Historical UST Registered Database.

A review of the HIST UST list, as provided by EDR, and dated 10/15/1990 has revealed that there are 2 HIST UST sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
BOERSMA BROS Facility Id: 00000052692	7080 CLEVELAND	ESE 1/8 - 1/4 (0.152 mi.)	B4	29
JOHN HOOGENDAM DAIRY Facility Id: 00000036724	12871 SCHLEISMAN ROA	ENE 1/8 - 1/4 (0.185 mi.)	5	30

Other Ascertainable Records

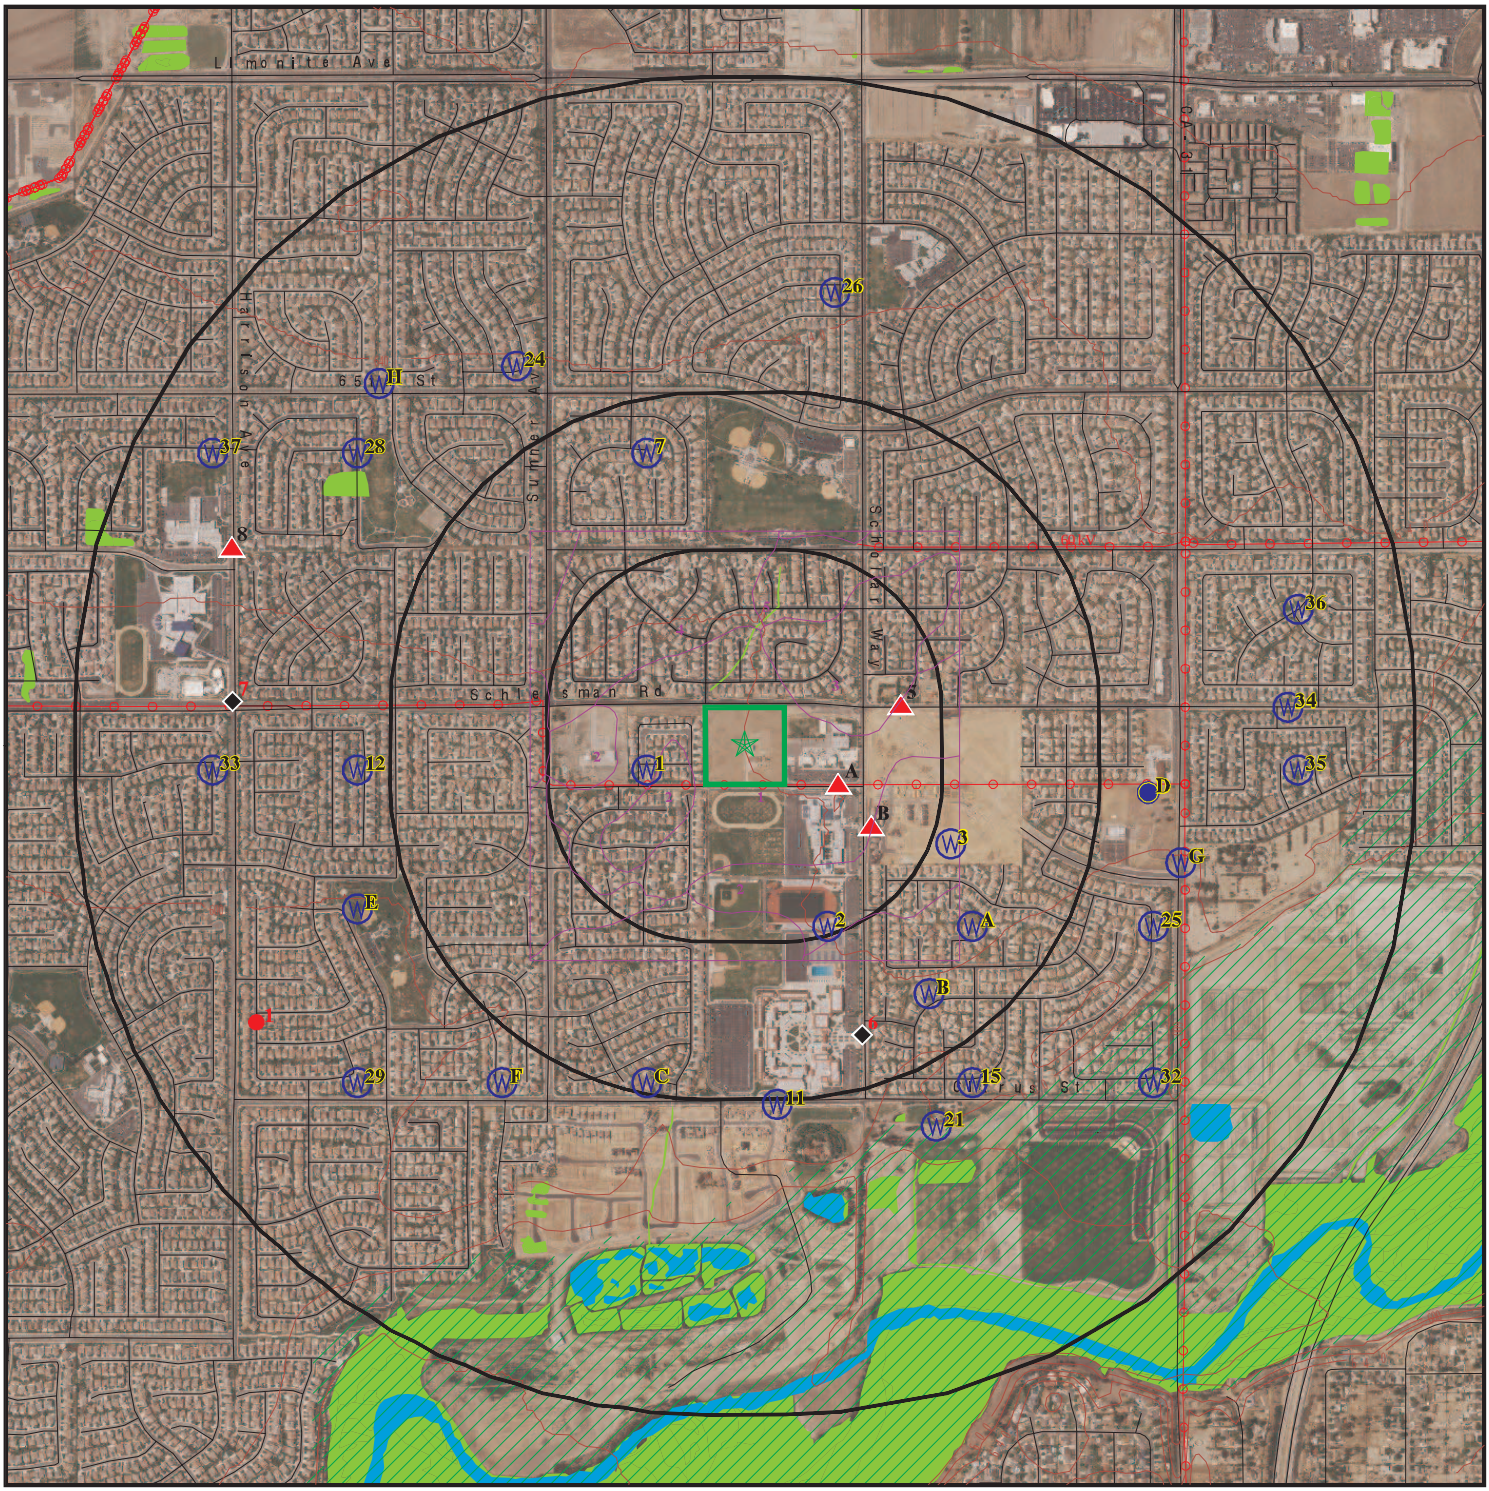
RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/14/2020 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
RIVER HEIGHTS INTERM EPA ID:: CAL000373545	7227 SCHOLAR WAY	SE 1/8 - 1/4 (0.131 mi.)	B2	12

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the Cortese list, as provided by EDR, and dated 06/22/2020 has revealed that there is 1 Cortese site within approximately 0.5 miles of the target property.



Lower Elevation	Address	Direction / Distance	Map ID	Page
PABLO ECHEVERRIA DAI Cleanup Status: COMPLETED - CASE CLOSED	***7481 CLEVELAND***	***SSE 1/4 - 1/2 (0.416 mi.)***	***6***	***30***

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 08/20/2014
Comments: On August 20, 2014, DTSC provided a cost estimate of DTSC oversight activities for June 1, 2014 through July 30, 2015.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: No Further Action Letter
Completed Date: 07/06/2015
Comments: On July 6, 2015, DTSC concurred with the Methane Monitoring Report recommendation for No Further Action in Area B of the Site; accordingly, No Further Action is necessary for the Site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Amendment - Order/Agreement
Completed Date: 12/21/2009
Comments: On December 21, 2009, DTSC received a letter from the District requesting the School Cleanup Agreement be amended to indicate the site boundary change per an attached Exhibit A and B. The site acreage changes from 28.90 acres to 25.35 acres, which occurred as part of construction of the adjacent northern site and installation of Whispering Hills Drive. On December 24, 2009, DTSC notified CDE of the project area change and provided a PDF file of the District's letter via email.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Certification
Completed Date: 03/24/2016
Comments: On March 24, 2016, DTSC certified that the site poses no significant threat to public health, welfare, or the environment and implementation of removal/remedial measures is not necessary.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Cost Recovery Closeout Memo
Completed Date: 04/14/2016
Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 05/17/2004
Comments: PEA approved, further action for methane.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Workplan
Completed Date: 02/04/2005
Comments: SSI TM approved. Fieldwork scheduled for April 2005.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 11/23/2005
Comments: DTSC approved Report and indicated methane mitigation should be addressed through the RAW process. DTSC requested RAW be submitted by December 23, 2005.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 10/30/2006
Comments: On October 30, 2006, DTSC approved the RAW for Implementation; however, the RAW was not implemented. After no activity at the Site for several years, a methane soil gas survey was conducted in 2009 to assess current Site conditions and evaluate whether a methane mitigation system is still warranted. On February 11, 2010, DTSC concurred with the SSI Addendum report recommending rescission of the RAW, including no further action in Area A (~21.82 acres) and further methane monitoring in Area B (~3.53 acres).

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 4.15 Request
Completed Date: 08/11/2006
Comments: Approved.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: *Correspondence - Received
Completed Date: 10/14/2009
Comments: On October 14, 2009, DTSC received a letter from the District , dated October 6, 2009, requesting that the Environmental Oversight Agreement be re-opened to provide for resampling of soil gas for methane under a SSI Addendum. The letter indicated a technical memorandum for the SSI addendum will be provided to DTSC the week of October 12, 2009.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Tech Memo
Completed Date: 11/17/2009
Comments: On November 17, 2009, DTSC approved the Technical Memorandum provided DTSC comments be incorporated during field work and in the SSI Addendum report.

Completed Area Name: PROJECT WIDE

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 02/11/2010
Comments: On February 11, 2010, DTSC concurred with the SSI Addendum report conclusions and recommendations provided DTSC comments be incorporated in future Site activities. The report included the following recommendations: rescission of the Removal Action Workplan; no further action in Area A (~21.82 acres); further methane monitoring in Area B (~3.53 acres); and restrictions on Site features that could result in methane accumulations would apply to Area B until no further action is obtained from DTSC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fact Sheets
Completed Date: 08/01/2006
Comments: A Fact Sheet regarding the Draft RAW, dated August 2006, was produced in English and Spanish languages.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fieldwork
Completed Date: 12/23/2009
Comments: Via email on 01/04/2010, DTSC received summary tables of the first two rounds of soil gas sampling results which indicated the second round of soil gas sampling was completed on 12/23/2009.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Community Profile
Completed Date: 04/01/2006
Comments: In April 2006, DTSC approved the (joint) Community Profile for the Rosa Parks Elementary School and the Augustine Ramirez Intermediate School.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Public Notice
Completed Date: 08/01/2006
Comments: Public Notice for Draft RAW (in English and Spanish languages): Public Comment period is August 1 - 31, 2006.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 4.15 Request
Completed Date: 02/11/2010
Comments: On February 11, 2010, DTSC determined that no further action is required for Area A of the Site, school construction may proceed in Area A, and a new SFPD 4.15 form is not necessary.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fact Sheets
Completed Date: 03/03/2010
Comments: Via email on March 3, 2010, DTSC provided the Fact Sheet to the District with instructions regarding distribution prior to the first quarterly methane monitoring event scheduled for March 23, 2010.

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 04/29/2010
Comments: DTSC reviewed the First Quarter 2010 Methane Monitoring Report and requested a couple comments to be addressed, accordingly.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 07/30/2010
Comments: DTSC reviewed the Second Quarter 2010 Methane Monitoring Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 10/26/2010
Comments: DTSC reviewed the Third Quarter 2010 Methane Monitoring Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 02/08/2011
Comments: DTSC reviewed the Fourth Quarter 2010 Methane Monitoring Report and concurred with the recommendation to change to a semi-annual monitoring schedule beginning second quarter (June) 2011.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 08/04/2011
Comments: DTSC reviewed the first semi-annual Methane Monitoring Report and concurred with the recommendations.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 01/25/2012
Comments: DTSC reviewed the second semi-annual Methane Monitoring Report and concurred with the recommendations.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 08/09/2012
Comments: DTSC reviewed the Semi-Annual Methane Monitoring Report and did not concur with the recommendation for a No Further Action (NFA) determination on Area B and requested that comments be addressed in future reports. DTSC recommended a minimum of two additional quarterly or semi-annual monitoring events be conducted prior to DTSC's potential NFA determination.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 10/22/2012
Comments: DTSC reviewed the quarterly Methane Monitoring Report and concurred

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

with the recommendation for continued monitoring.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 03/04/2013
Comments: DTSC reviewed the quarterly Methane Monitoring Report and requested that monitoring continue on a quarterly basis to assess methane concentration and trends in Area B.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 06/03/2013
Comments: DTSC reviewed the quarterly Methane Monitoring Report and requested that monitoring continue on a quarterly basis to assess methane concentration and trends in Area B.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/18/2013
Comments: On September 18, 2013, DTSC provided comments on the Report; also, DTSC recommended that methane monitoring continue on a quarterly basis and that the District propose and discuss additional actions regarding Area B with DTSC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Tech Memo
Completed Date: 11/18/2013
Comments: On November 14, 2013, DTSC approved a Technical Memorandum to install methane ventilation wells in Area B.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 04/11/2014
Comments: On April 11, 2014, DTSC provided comments on the Report and requested such comments be addressed in future methane monitoring activities and reports. The next methane monitoring event is to be conducted during the second half of 2014.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/08/2014
Comments: On September 8, 2014, DTSC provided comments on the Report, requested such comments be addressed in future methane monitoring activities and reports, and requested a conference call to discuss previously unaddressed comments. Two semi-annual monitoring events are anticipated to be conducted in 2015.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 03/18/2015

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Comments: On March 18, 2015, DTSC provided comments on the Report and requested such comments be addressed in future methane monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 07/06/2015
Comments: On July 6, 2015, DTSC concurred with the Report recommendation for No Further Action in Area B of the Site, discontinuation of the methane monitoring program, and maintaining the passive vent wells to promote passive venting of the subsurface methane.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: School Cleanup Agreement
Completed Date: 01/05/2006
Comments: DTSC signed Agreement and sent (FedEx) to District.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Notice of Exemption
Completed Date: 10/30/2006
Comments: DTSC signed the CEQA Notice of Exemption on October 27, 2006; the NOE was filed with the State Clearing House on November 3, 2006.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Environmental Oversight Agreement
Completed Date: 07/09/2003
Comments: DTSC entered into an Environmental Oversight Agreement (Docket Number HSA-A 02/03-187) with the Corona-Norco Unified School District to provide oversight for a Preliminary Endangerment Assessment for the proposed Sumner Elementary and Eastvale Middle School.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Annual Oversight Cost Estimate
Completed Date:	08/20/2014
Comments:	On August 20, 2014, DTSC provided a cost estimate of DTSC oversight activities for June 1, 2014 through July 30, 2015.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Document Type: No Further Action Letter
Completed Date: 07/06/2015
Comments: On July 6, 2015, DTSC concurred with the Methane Monitoring Report recommendation for No Further Action in Area B of the Site; accordingly, No Further Action is necessary for the Site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Amendment - Order/Agreement
Completed Date: 12/21/2009
Comments: On December 21, 2009, DTSC received a letter from the District requesting the School Cleanup Agreement be amended to indicate the site boundary change per an attached Exhibit A and B. The site acreage changes from 28.90 acres to 25.35 acres, which occurred as part of construction of the adjacent northern site and installation of Whispering Hills Drive. On December 24, 2009, DTSC notified CDE of the project area change and provided a PDF file of the District's letter via email.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Certification
Completed Date: 03/24/2016
Comments: On March 24, 2016, DTSC certified that the site poses no significant threat to public health, welfare, or the environment and implementation of removal/remedial measures is not necessary.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Cost Recovery Closeout Memo
Completed Date: 04/14/2016
Comments: Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 05/17/2004
Comments: PEA approved, further action for methane.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Workplan
Completed Date: 02/04/2005
Comments: SSI TM approved. Fieldwork scheduled for April 2005.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 11/23/2005
Comments: DTSC approved Report and indicated methane mitigation should be addressed through the RAW process. DTSC requested RAW be submitted by December 23, 2005.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 10/30/2006

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Comments:	On October 30, 2006, DTSC approved the RAW for Implementation; however, the RAW was not implemented. After no activity at the Site for several years, a methane soil gas survey was conducted in 2009 to assess current Site conditions and evaluate whether a methane mitigation system is still warranted. On February 11, 2010, DTSC concurred with the SSI Addendum report recommending rescission of the RAW, including no further action in Area A (~21.82 acres) and further methane monitoring in Area B (~3.53 acres).
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	4.15 Request
Completed Date:	08/11/2006
Comments:	Approved.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	*Correspondence - Received
Completed Date:	10/14/2009
Comments:	On October 14, 2009, DTSC received a letter from the District , dated October 6, 2009, requesting that the Environmental Oversight Agreement be re-opened to provide for resampling of soil gas for methane under a SSI Addendum. The letter indicated a technical memorandum for the SSI addendum will be provided to DTSC the week of October 12, 2009.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Supplemental Site Investigation Tech Memo
Completed Date:	11/17/2009
Comments:	On November 17, 2009, DTSC approved the Technical Memorandum provided DTSC comments be incorporated during field work and in the SSI Addendum report.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Supplemental Site Investigation Report
Completed Date:	02/11/2010
Comments:	On February 11, 2010, DTSC concurred with the SSI Addendum report conclusions and recommendations provided DTSC comments be incorporated in future Site activities. The report included the following recommendations: rescission of the Removal Action Workplan; no further action in Area A (~21.82 acres); further methane monitoring in Area B (~3.53 acres); and restrictions on Site features that could result in methane accumulations would apply to Area B until no further action is obtained from DTSC.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Fact Sheets
Completed Date:	08/01/2006
Comments:	A Fact Sheet regarding the Draft RAW, dated August 2006, was produced in English and Spanish languages.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Fieldwork

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Date:	12/23/2009
Comments:	Via email on 01/04/2010, DTSC received summary tables of the first two rounds of soil gas sampling results which indicated the second round of soil gas sampling was completed on 12/23/2009.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Community Profile
Completed Date:	04/01/2006
Comments:	In April 2006, DTSC approved the (joint) Community Profile for the Rosa Parks Elementary School and the Augustine Ramirez Intermediate School.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Public Notice
Completed Date:	08/01/2006
Comments:	Public Notice for Draft RAW (in English and Spanish languages): Public Comment period is August 1 - 31, 2006.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	4.15 Request
Completed Date:	02/11/2010
Comments:	On February 11, 2010, DTSC determined that no further action is required for Area A of the Site, school construction may proceed in Area A, and a new SFPD 4.15 form is not necessary.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Fact Sheets
Completed Date:	03/03/2010
Comments:	Via email on March 3, 2010, DTSC provided the Fact Sheet to the District with instructions regarding distribution prior to the first quarterly methane monitoring event scheduled for March 23, 2010.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Monitoring Report
Completed Date:	04/29/2010
Comments:	DTSC reviewed the First Quarter 2010 Methane Monitoring Report and requested a couple comments to be addressed, accordingly.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Monitoring Report
Completed Date:	07/30/2010
Comments:	DTSC reviewed the Second Quarter 2010 Methane Monitoring Report.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Monitoring Report
Completed Date:	10/26/2010
Comments:	DTSC reviewed the Third Quarter 2010 Methane Monitoring Report.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Document Type: Monitoring Report
Completed Date: 02/08/2011
Comments: DTSC reviewed the Fourth Quarter 2010 Methane Monitoring Report and concurred with the recommendation to change to a semi-annual monitoring schedule beginning second quarter (June) 2011.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 08/04/2011
Comments: DTSC reviewed the first semi-annual Methane Monitoring Report and concurred with the recommendations.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 01/25/2012
Comments: DTSC reviewed the second semi-annual Methane Monitoring Report and concurred with the recommendations.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 08/09/2012
Comments: DTSC reviewed the Semi-Annual Methane Monitoring Report and did not concur with the recommendation for a No Further Action (NFA) determination on Area B and requested that comments be addressed in future reports. DTSC recommended a minimum of two additional quarterly or semi-annual monitoring events be conducted prior to DTSC's potential NFA determination.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 10/22/2012
Comments: DTSC reviewed the quarterly Methane Monitoring Report and concurred with the recommendation for continued monitoring.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 03/04/2013
Comments: DTSC reviewed the quarterly Methane Monitoring Report and requested that monitoring continue on a quarterly basis to assess methane concentration and trends in Area B.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 06/03/2013
Comments: DTSC reviewed the quarterly Methane Monitoring Report and requested that monitoring continue on a quarterly basis to assess methane concentration and trends in Area B.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Date: 09/18/2013
Comments: On September 18, 2013, DTSC provided comments on the Report; also, DTSC recommended that methane monitoring continue on a quarterly basis and that the District propose and discuss additional actions regarding Area B with DTSC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Tech Memo
Completed Date: 11/18/2013
Comments: On November 14, 2013, DTSC approved a Technical Memorandum to install methane ventilation wells in Area B.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 04/11/2014
Comments: On April 11, 2014, DTSC provided comments on the Report and requested such comments be addressed in future methane monitoring activities and reports. The next methane monitoring event is to be conducted during the second half of 2014.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/08/2014
Comments: On September 8, 2014, DTSC provided comments on the Report, requested such comments be addressed in future methane monitoring activities and reports, and requested a conference call to discuss previously unaddressed comments. Two semi-annual monitoring events are anticipated to be conducted in 2015.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 03/18/2015
Comments: On March 18, 2015, DTSC provided comments on the Report and requested such comments be addressed in future methane monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 07/06/2015
Comments: On July 6, 2015, DTSC concurred with the Report recommendation for No Further Action in Area B of the Site, discontinuation of the methane monitoring program, and maintaining the passive vent wells to promote passive venting of the subsurface methane.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: School Cleanup Agreement
Completed Date: 01/05/2006
Comments: DTSC signed Agreement and sent (FedEx) to District.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Notice of Exemption

DICK VANDER MEER SONS DAIRY (Continued) **S102005836**

Completed Date:	10/30/2006
Comments:	DTSC signed the CEQA Notice of Exemption on October 27, 2006; the NOE was filed with the State Clearing House on November 3, 2006.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Environmental Oversight Agreement
Completed Date:	07/09/2003
Comments:	DTSC entered into an Environmental Oversight Agreement (Docket Number HSA-A 02/03-187) with the Corona-Norco Unified School District to provide oversight for a Preliminary Endangerment Assessment for the proposed Sumner Elementary and Eastvale Middle School.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/28/2020

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/28/2020

Next Scheduled EDR Contact: 04/12/2021
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 10/28/2020

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 12/14/2020

US INST CONTROLS: Institutional Controls Sites List

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 10/28/2020

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

Next Scheduled EDR Contact: 02/22/2021
Data Release Frequency: Varies

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

Date of Government Version: 12/31/2019
Date Data Arrived at EDR: 04/15/2020

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

13175 ORANGE STREET
13175 ORANGE STREET
CORONA, CA 92880

TARGET PROPERTY COORDINATES

Latitude (North):	33.959958 - 33° 57' 35.85''
Longitude (West):	117.570294 - 117° 34' 13.06''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	447308.4
UTM Y (Meters):	3757668.5
Elevation:	620 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5640930 CORONA NORTH, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

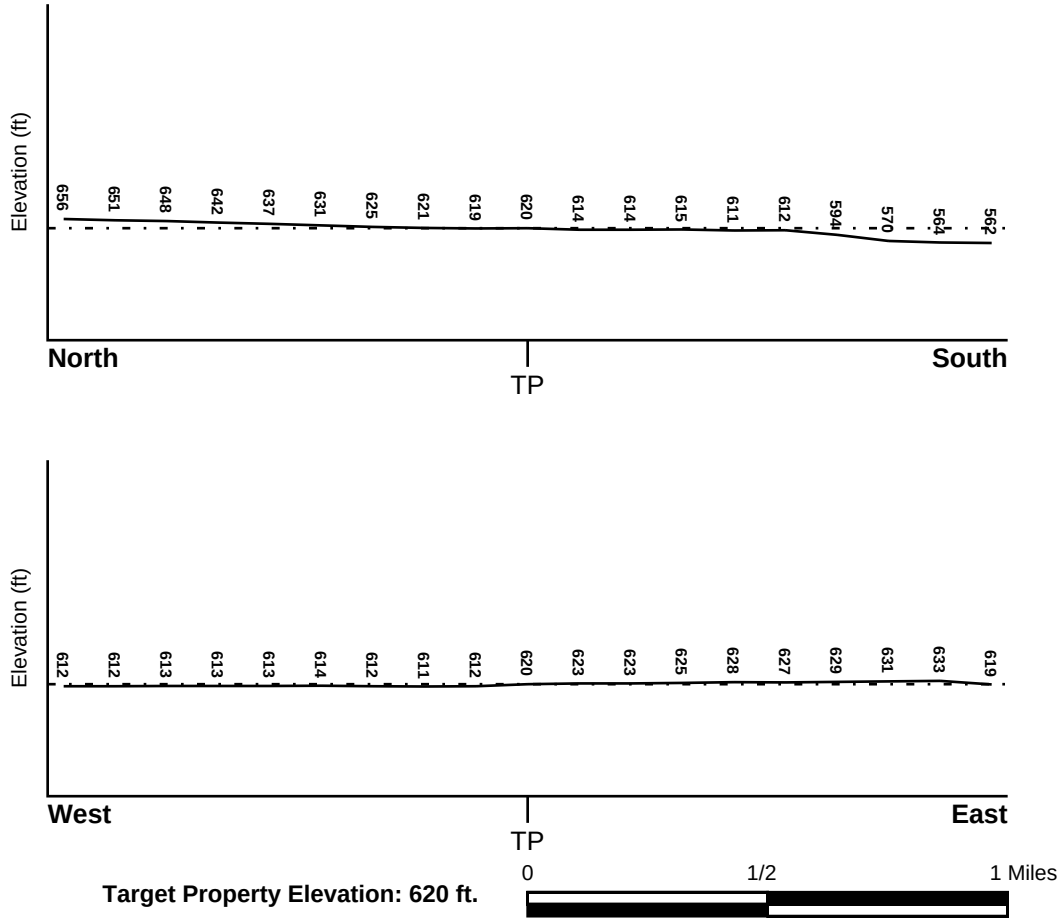
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06071C9375H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06065C0681G	FEMA FIRM Flood data
06065C0683G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CORONA NORTH	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: RAMONA

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
2	14 inches	22 inches	fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
3	22 inches	68 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
4	68 inches	74 inches	gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6

Soil Map ID: 2

Soil Component Name: RAMONA

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

PHYSICAL SETTING SOURCE RECORDS SEARCHED

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Ken Zheng - Lab Director

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

The data and information on this, and other accompanying documents, represent only the sample(s) analyzed and is rendered upon condition that it is not to be reproduced, wholly or in part, for advertising or other purposes without approval from the laboratory.

INSTRUCTIONS FOR REQUESTING RECORDS

(California Public Records Act, Govt. Code Sections 6250-6276.48)

1. In order to expedite your request, please fill out the form completely. Requests may also be submitted by phone at (909) 396-3700, by facsimile to (909) 396-3330, or by email to PublicRecordsRequests@aqmd.gov.

2. Requests must be for records prepared, owned, used, or retained by the District (Gov. Code Sec. 6252(e)). Requests should be for clearly identifiable records. The District is not required to create a new record in response to a request. The District will assist the requestor in making a request that describes reasonably identifiable records (Gov. Code Sec. 6253.1). Documents will not be provided if disclosure would infringe upon a copyright, trade secret, or is otherwise exempt in accordance with state law.

3. A search for facility records can only be conducted by one or all of the following:

-- a) Facility Name, Address, or Identification Number

-- b) Facility Application Number, or Permit to Operate Number; or

-- c) Facility Notice of Violation/Notice to Comply Number.

4. You will be notified within ten (10) days whether your request seeks copies of disclosable public records prepared, owned, used, or retained by this agency. In some cases, the District may need an additional 14 days to respond. If so, you will be notified in writing. You will also be provided an estimated date of when the records will be made available.

5. Communications regarding your request, and any records, will be provided by email, unless specified otherwise.

6. If the search for records finds the records voluminous, you will be notified of the approximate number of pages and/or length of time it will take to process your request.

7. If the records you requested have been marked confidential by the source of the record, you will be notified and given the option of continuing with the District's Trade Secret process.

8. If your request is to review records, rather than receive copies, the District will notify you once the records are gathered, and arrangements will be made for your review.

9. The charge for the direct cost of duplication is as follows: Paper Copies, $0.15/page each over 10 pages (first 10 pages are free); Copied CD's or flash drives, no charge; and Copied Audio Tapes, $5.00 each. After a preliminary estimate, advance payment may be required.

10. If the request is for information in an electronic format, the requestor shall bear the cost of producing a copy of the record, including the cost to construct the record and the cost of programming and computer services necessary to produce a copy of the record, when either of the following applies: (1) the District would be required to produce a copy of an electronic record and the record is one that is produced only at otherwise regularly scheduled intervals, or (2) the request would require data compilation, extraction, or programming to produce the record. (Gov. Code Sec. 6253.9(b)). The transfer of gathered electronic records onto CD, DVD or flash drive typically costs $10.00 each. An invoice will accompany your records when completed.

Note: For further information, please refer to the District's Guidelines for Implementing the California Public Records Act. The Guidelines are available in the lobby of the District Headquarters or on the District's web site at www.aqmd.gov.

Note: If you have questions pertaining to the submittal of a Public Records Act request, you may contact the Public Records Unit, (909) 396-3700, Tuesday through Friday, 7:00 a.m. to 5:30 p.m. Our Fax number is (909) 396-3330. Our email address is PublicRecordsRequests@aqmd.gov.

From: Olney, Ryan
To: Davis Tang
Subject: Records request for 13175 Orange Street
Date: Monday, January 25, 2021 11:46:27 AM
Attachments: image001.png

Hi Davis,
I could not find any records for this property in our septic system files. Our records retention is 30 years, and appears this structure was built in 1990. It is possible that we did have records, but they were purged from our files.

Sorry I couldn't be more help.

Thanks,

Ryan Olney

PROJECT PERSONNEL QUALIFICATIONS

HILLMANN
CONSULTING

Davis Tang

Industrial Hygienist

EDUCATION:

B.S. Environmental Science,
University of Riverside, California

CERTIFICATIONS:

OSHA 40-Hour HAZWOPER Training

EPA/ AHERA Accredited Asbestos Building Inspector

EPA/ AHERA Certified Site Surveillance Technician

Lead-Related Construction Sampling Technician

YEARS OF EXPERIENCE:

With Hillmann: 3 years

Total: 7 years

PROFESSIONAL EXPERIENCE:

As an environmental technician in our Orange, CA office, Mr. Tang provides technical consulting for asbestos investigation and sampling, environmental site assessments, and mold investigations. Mr. Tang also conducts hazard evaluations, compliance inspections, and prepares technical reports recommending management plans, hazard remediation, and abatement cost estimates for government, manufacturing, healthcare, educational, and public utility clients.

Mr. Tang performs various inspections including industrial hygiene, indoor air quality, and microbial delineation according to OSHA and government regulations.

Mr. Tang is well-versed in the requirements of the Occupational Safety and Health Administration (OSHA), the Environmental Protection Agency (EPA), the National Institute for Occupational Safety and Health (NIOSH), and numerous other federal, state, and local regulations and guidelines which affect environmental health and safety.

Representative experience includes:

Warmington Residential, Various locations: Hillmann has been providing Warmington Residential with Phase I environmental site assessments involving multiple residential redevelopment projects. Mr. Tang is an Environmental Scientist and has been involved with providing site assessments of various Warmington projects.

CapRock Partners, Various locations: Hillmann has provided Phase I site assessments, hazardous materials surveys, asbestos surveys, and lead surveys for a variety of projects. Mr. Tang is an Environmental Scientist on this contract performing surveys and environmental site assessments.

Westfield – Environmental Program, Various locations:
Since 2000, Hillmann has been providing an environmental program encompassing environmental health and safety, Phase I environmental site assessments, asbestos and lead surveys, air monitoring, bid administration and O&M programs, industrial hygiene and indoor air quality programs, and hazardous materials assessments on their mall properties throughout the county. Mr. Tang is an Environmental Scientist on this contract performing industrial hygiene services that include indoor air quality monitoring, Phase I environmental site assessments, asbestos and lead surveys.

Tishman Speyer Properties, Various locations: Hillmann has provided the complete environmental program for Tishman Speyer's properties since 1987. Our services include environmental health and safety, industrial hygiene, phase I environmental site assessments, asbestos surveys, air monitoring, bid administration, O&M programs and indoor air quality programs on various commercial, industrial and multi-family residential properties. Mr. Tang is an Environmental Scientist on this contract, conducting on-site environmental services including quarterly indoor air-quality testing and NPDES water quality testing.

CorePower Yoga, Various locations: CorePower Yoga has provided Hillmann with a variety of microbial investigative projects. Mr. Tang is an Environmental Scientist and has provided industrial hygiene services conducted microbial investigations at CorePower Yoga studios and prepared remediation plans.

CERTIFICATION:

Cal-OSHA Certified Asbestos Consultant
CDPH Accredited Lead Inspector/Assessor/ Project Monitor

CA Certified Site Surveillance Technician

OSHA 40 - Hr HAZWOPER

YEARS OF EXPERIENCE:

With Hillmann: 4 years

Total: 8 years

PROFESSIONAL EXPERIENCE:

Mr. Terwilliger is responsible for business operations, fiscal management and field staff management for Hillmann's California Office. He also performs asbestos surveys and investigations to identify asbestos and lead materials associated with occupational hazards. He supervises work practices and controls in accordance with job specifications, current EPA, OSHA and State Regulations for Asbestos remediation projects in commercial, industrial and multi-family residential buildings. Mr. Terwilliger performs IAQ, mold and moisture investigations in commercial, industrial and residential facilities nationwide. He also performs awareness training for asbestos, lead and microbial agents. Mr. Terwilliger provides litigation support consultation.

Representative Experience Includes:

Tishman Speyer Properties, Various locations: Hillmann has provided the complete environmental program for Tishman Speyer's properties since 1987. Our services include environmental health and safety, industrial hygiene, phase I environmental site assessments, asbestos surveys, air monitoring, bid administration, O&M programs and indoor air quality programs on various commercial, industrial and multi-family residential properties. Mr. Terwilliger is an Environmental Scientist on this contract, conducting on-site environmental services including phase I site assessments and NPDES water quality testing.

Westfield – Environmental Program, Various locations: Since 2000, Hillmann has been providing an environmental program encompassing environmental health and safety, Phase I environmental site assessments, asbestos and lead surveys, air monitoring, bid administration and O&M programs, industrial hygiene and indoor air quality programs, and hazardous materials assessments on their mall properties throughout the county. Mr. Terwilliger is an Environmental Scientist on this contract performing industrial hygiene services that include indoor air quality monitoring, Phase I environmental site assessments, asbestos and lead surveys.

Brookfield Office Properties, Various sites, CA: Hillmann has been providing hazardous materials surveys, development abatement specifications, and managing the oversight activities during the abatement at various Brookfield owned sites throughout California. Mr. Terwilliger functions as a Project Manager for this contract.

California Department of Transportation, Central Valley and Northern CA: Hillmann has been performing asbestos and Lead-based Paint Surveys for the California Department of Transportation. Performed comprehensive asbestos containing materials and lead-based paint surveys of residential and commercial buildings that were slated for demolition and generated report of findings in order to aid the Department of Transportation (DOT) in facilitating the road improvement programs and building renovations throughout the

HILLMANN
CONSULTING

Central Valley area. Also during the abatement of asbestos from DOT owned buildings, provided contractor oversight and air monitoring services for regulatory compliance.

Verizon, Various Sites, CA. Hillmann conducted hazardous materials surveys, development abatement specifications, and project monitoring during abatement at various Verizon owned sites throughout California. Mr. Terwilliger functioned as the Project Manager.

Public Storage, Los Angeles, CA: Hillman preformed comprehensive asbestos, lead-based paint and universal waste materials survey of commercial and industrial buildings throughout Southern California. Hazardous materials surveys were conducted prior to renovation for the storage units. Mr. Terwilliger developed abatement specifications and managed the abatement activities during the renovations of the buildings. He functioned as the Project Manager on this contract.

DISCUSSION

Purpose:

The purpose of this report is to provide hydraulic and hydraulic calculations for the proposed APN# 152-040-003 and provide the design of the onsite storm drain systems for the proposed SFR development. The project site is located in the city of Eastvale, County of Riverside. The site is north of Orange Street, south of Schleisman Road, and existing residential/commercial development to the east/west.

Purpose

The purpose of this report is to demonstrate how the developed runoff for the proposed tract of SFR development retained and mitigated water quality volume, and sizing of onsite storm drain system for 100-yr storm event. The retention/infiltration basin overflow into the proposed onsite storm drain system and drains to the existing City storm drain (48" RCP) in Orange Road.

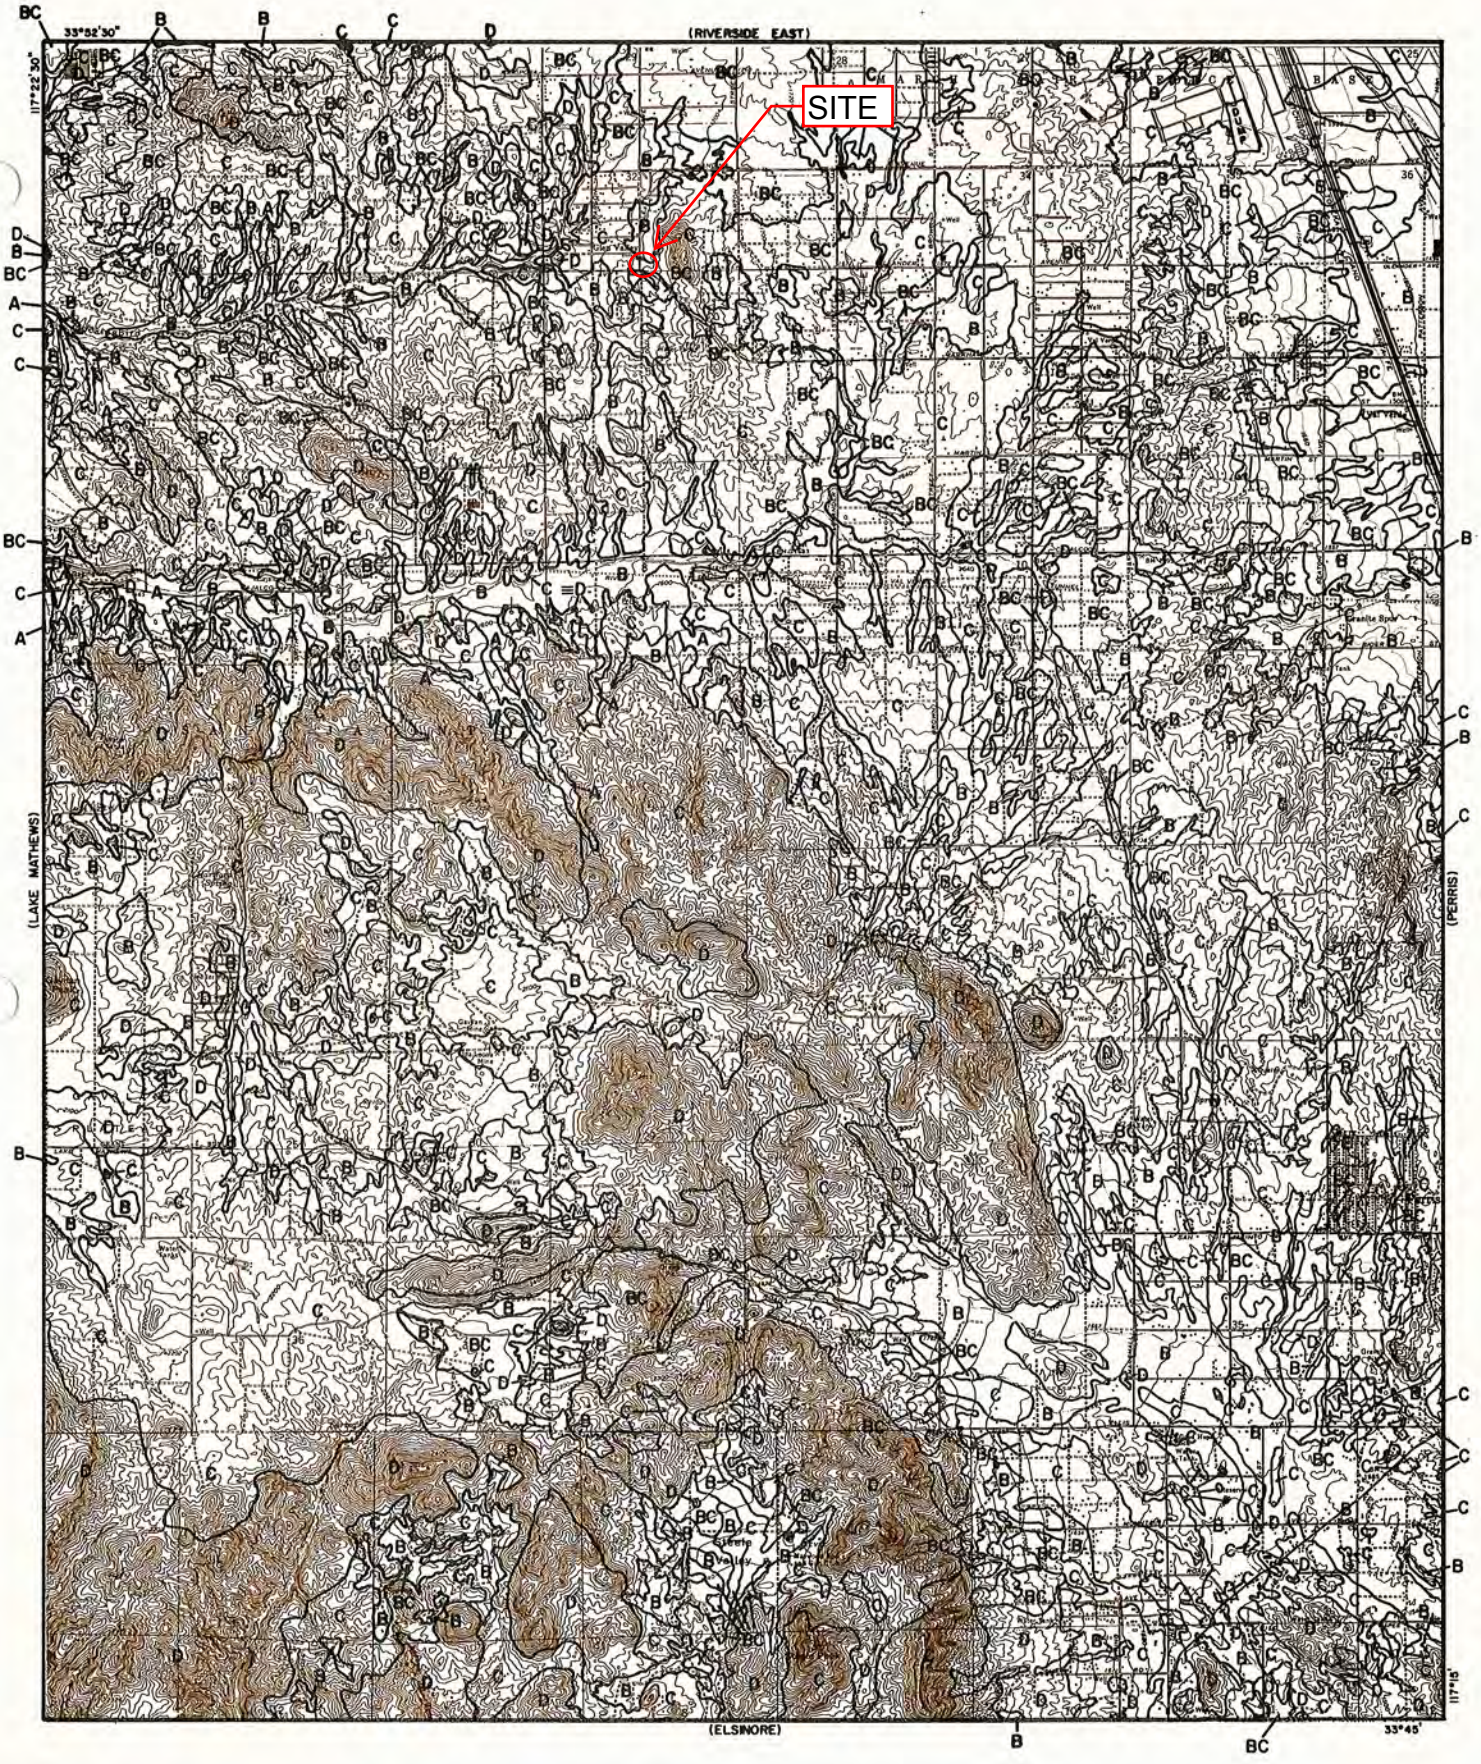
Criteria

The criteria utilized for hydrologic and Hydraulic analysis is the Riverside County Hydrology Manual and Rational Method Hydrology Analysis utilizing AES software to perform computations. 100-yr storm analysis was performed for the developed & un-developed condition.

Findings

Due the preliminary nature of this report, only the 100-yr storm event for the developed hydrology has been analyzed.

In pre-developed condition, the site consist of a single structure residential development and drain out to the south to the existing City Storm Drain System in Orange Street via proposed lateral.



In the proposed developed (Tract of single family residential development) site will drain to the proposed two below surface retention/infiltration chamber system-1,2 for low flow infiltration. Once the retention/infiltration chamber system-1,2 reach its capacity, it will overflow into the onsite storm drain system and finally drains to the existing City Storm Drain System in Orange Street via the proposed 30" RCP lateral. It was calculated in proposed condition the site will generate a peak runoff flowrate of 22.8 from 100-yr storm event. All the proposed onsite storm drainage system are sized based the flow rate for100-yr storm event. The proposed onsite drainage system conveys runoff to the existing storm drain system south of the site which is also consistence with the existing drainage pattern.
In pre-developed condition the runoff rate calculated as 15.5 CFS and in developed condition the runoff rate calculated as 22.8 CFS. There will be an increase of 7.3 CFS in developed condition. By implementing the Retention/Infiltration Chamber System-1,2 onsite, and by attenuation of runoff in the Retention/Infiltration Chamber System-1,2, the outflow from the site in developed

condition will substantially reduce and will be at or below the pre-developed condition runoff rate.

There is an existing storm drain system in Orange Street across the sites frontage which begins as a 42” and transitions to a 48” part way through the site. This storm drain had a lateral A-2 which was bulk headed off at the front of our site for this development to tie into. Lateral A-2 was estimated to carry 24.7 CFS, which is greater than the 22.8 CFS the project generates. Therefore, this project is consistent with the anticipated flows of the existing City storm drain system, and will not affect the HGL found on the city reference drawings. These plans are included as reference.

DISCUSSION

Purpose:

The purpose of this report is to provide hydraulic and hydraulic calculations for the proposed APN# 152-040-003 and provide the design of the onsite storm drain systems for the proposed SFR development. The project site is located in the city of Eastvale, County of Riverside. The site is north of Orange Street, south of Schleisman Road, and existing residential/commercial development to the east/west.

Purpose

The purpose of this report is to demonstrate how the developed runoff for the proposed tract of SFR development retained and mitigated water quality volume, and sizing of onsite storm drain system for 100-yr storm event. The retention/infiltration basin overflow into the proposed onsite storm drain system and drains to the existing City storm drain (48" RCP) in Orange Road.

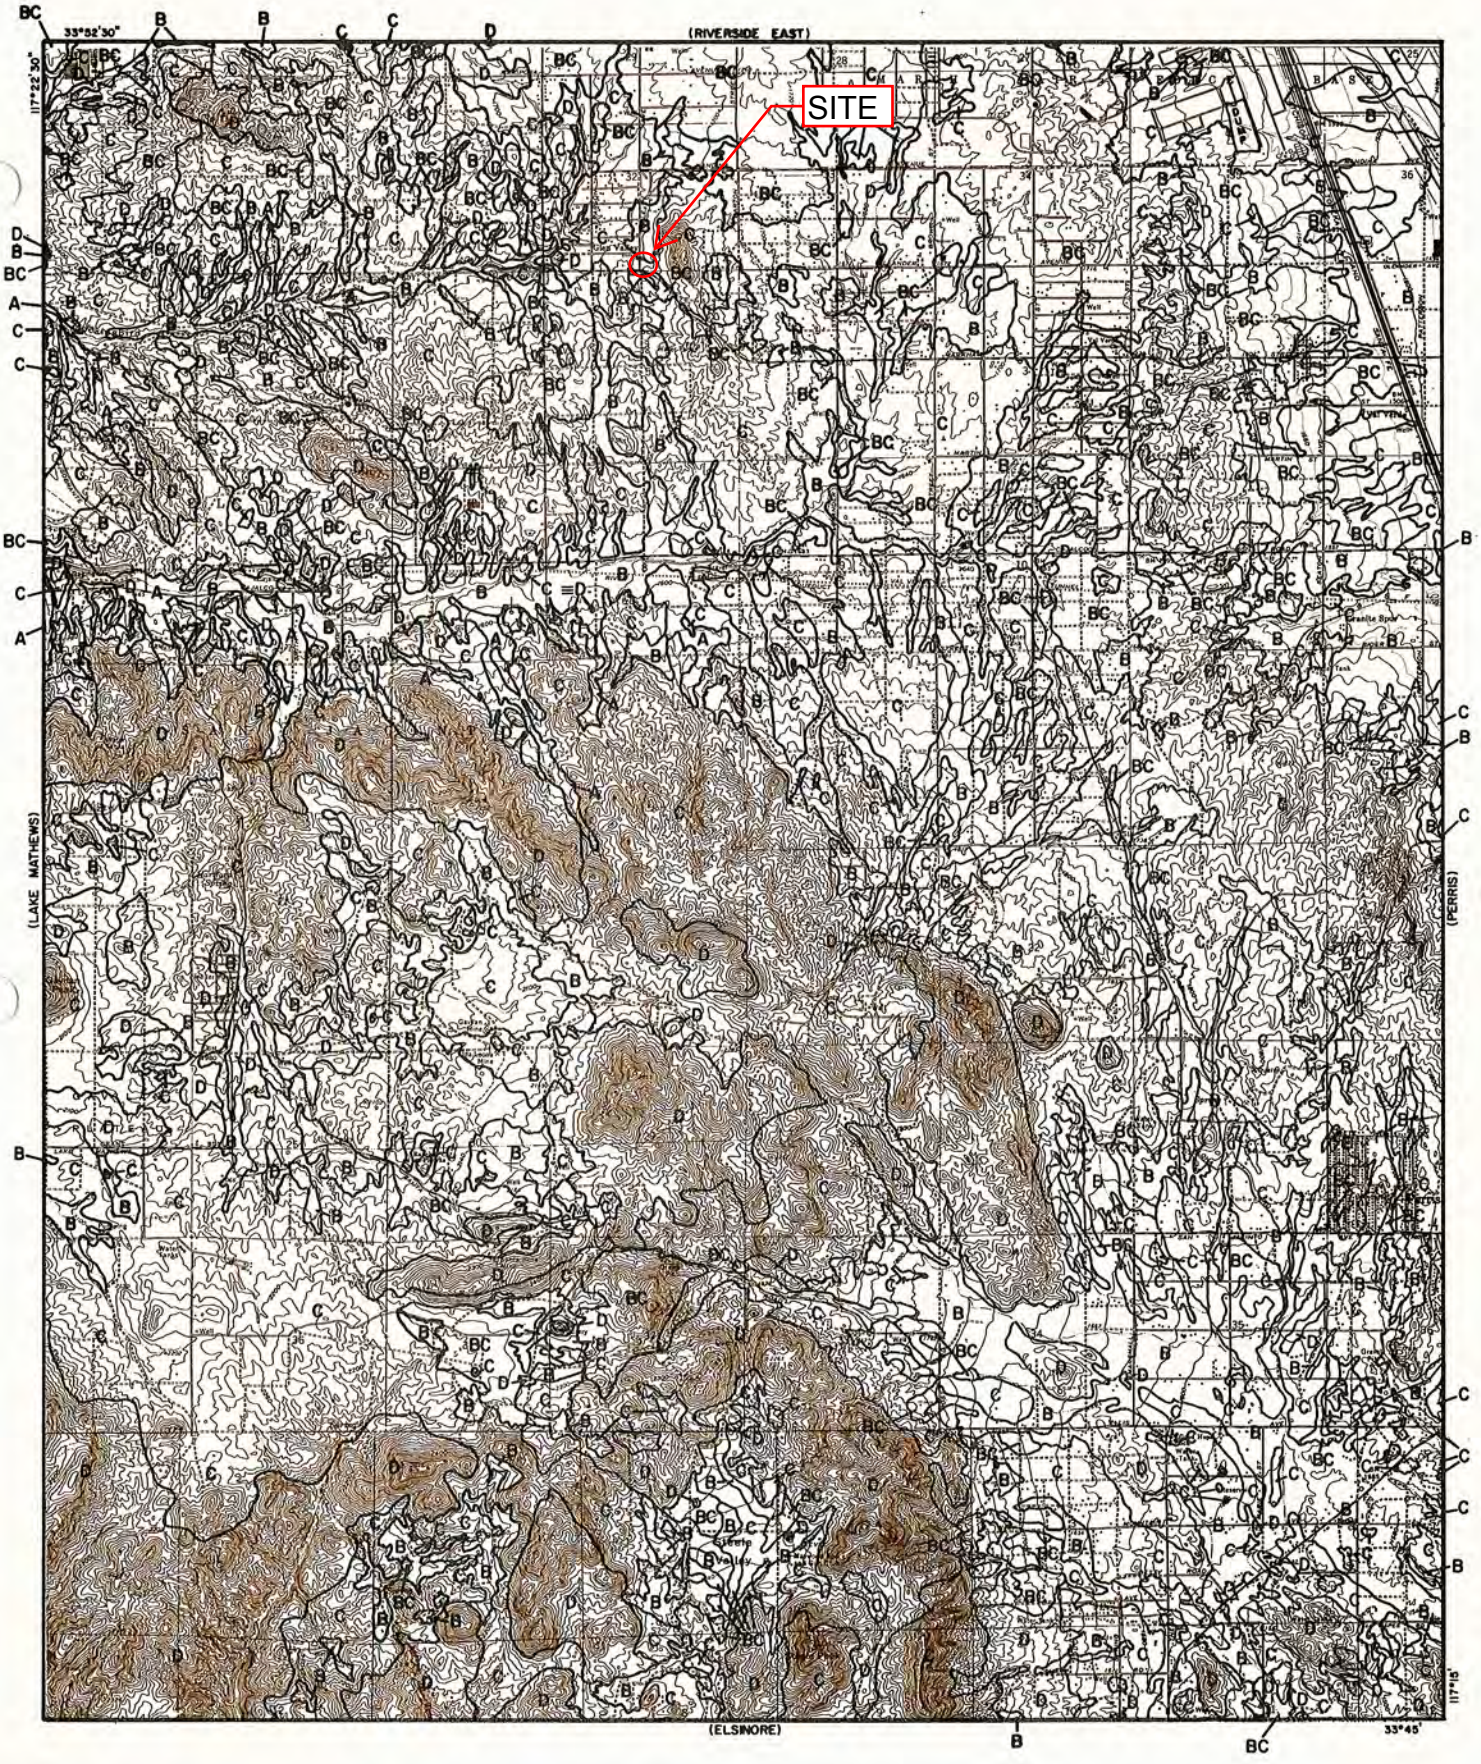
Criteria

The criteria utilized for hydrologic and Hydraulic analysis is the Riverside County Hydrology Manual and Rational Method Hydrology Analysis utilizing AES software to perform computations. 100-yr storm analysis was performed for the developed & un-developed condition.

Findings

Due the preliminary nature of this report, only the 100-yr storm event for the developed hydrology has been analyzed.

In pre-developed condition, the site consist of a single structure residential development and drain out to the south to the existing City Storm Drain System in Orange Street via proposed lateral.



In the proposed developed (Tract of single family residential development) site will drain to the proposed two below surface retention/infiltration chamber system-1,2 for low flow infiltration. Once the retention/infiltration chamber system-1,2 reach its capacity, it will overflow into the onsite storm drain system and finally drains to the existing City Storm Drain System in Orange Street via the proposed 30" RCP lateral. It was calculated in proposed condition the site will generate a peak runoff flowrate of 22.8 from 100-yr storm event. All the proposed onsite storm drainage system are sized based the flow rate for100-yr storm event. The proposed onsite drainage system conveys runoff to the existing storm drain system south of the site which is also consistence with the existing drainage pattern.
In pre-developed condition the runoff rate calculated as 15.5 CFS and in developed condition the runoff rate calculated as 22.8 CFS. There will be an increase of 7.3 CFS in developed condition. By implementing the Retention/Infiltration Chamber System-1,2 onsite, and by attenuation of runoff in the Retention/Infiltration Chamber System-1,2, the outflow from the site in developed

condition will substantially reduce and will be at or below the pre-developed condition runoff rate.
