1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

RE: SMP 38, SMP 39. SMP 40

Dear Ms. Vera,

I write to comment on potential impacts to biological resources that could result from the proposed SMP 38, SMP 39. SMP 40 Project, which I understand would add 1,514,275 square feet of floor space in eight speculative industrial buildings up to 55 feet tall on 217.04 acres located on APNs) 904-1-7-21; 904-1-2-12; 904-1-7-32; 904-3-1-4; 904-10-2-2, -3, -5, -7, and -8 west of Isabel Avenue, north of Stanley Boulevard, south of West Jack London Boulevard, and east of El Charro Road. I comment on the analyses of impacts to biological resources in the DEIR and in Monk & Associates (2021).

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I also worked as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, wildlife interactions with the anthrosphere, and conservation of rare and endangered species. I authored many papers on these and other topics. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and Raptor Research Foundation, and I've lectured part-time at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-seven years. My CV is attached.

SITE VISIT

I visited the SMP 40 for 2.22 hours from 14:43 to 16:35 hours on 28 November 2023, and SMP 38 and SMP 39 for 2.83 hours from 06:45 to 09:35 hours on 29 November 2023. At SMP 40, I surveyed from a cul-du-sac on the north edge of the site. At SMP 38 and SMP 39, I walked the northern perimeters, stopping to scan for wildlife with use of binoculars. I recorded all species of vertebrate wildlife I detected, including those whose members flew over the sites or were seen nearby, off the sites. Animals of uncertain species identity were either omitted or, if possible, recorded to the Genus or higher taxonomic level.

Conditions were mostly cloudy still with temperatures of 62-55° F on the 28th and 46-50° F on the 29th. The sites have been previously disked, and at the time of the surveys they were covered by annual grasses and ruderal vegetation (Photos 1–2).

Photos 1–2. *Views of SMP 40 (top) and SMP 39 with a flock of Canada goose (bottom), 28-29 November 2023.*

I detected 46 species of vertebrate wildlife at or adjacent to the project site, including 10 species with special status (Table 1). I saw Botta's pocket gopher (Photo 3) and California ground squirrel (Photo 4), both species of which are ecological keystone species. I saw loggerhead shrike (Photo 5), Cooper's hawk and American kestrel (Photos 6 and 7), western meadowlark (Photo 8), house finch and killdeer (Photos 9 and 10), black phoebe and white-crowned sparrow (Photos 11 and 12), mourning dove (Photo 13), Say's phoebe and yellow-rumped warbler (Photos 14 and 15), savannah sparrow (Photo 16), and lesser goldfinch and bushtit (Photos 17 and 18), among the other species listed in Table 1. Many of the species actively foraged on the site, including coyote, Cooper's hawk, red-tailed hawk, horned lark, Canada goose and Aleutian cackling goose, killdeer, western meadowlark, house finch and others. I observed Some species in high abundance, including western meadowlark and mourning dove. California ground squirrels occupied all three sites, but were particularly abundant on SMP 40.

Table 1. *Species of wildlife I observed during 5.05 hours of survey on 28-29 November 2023.*

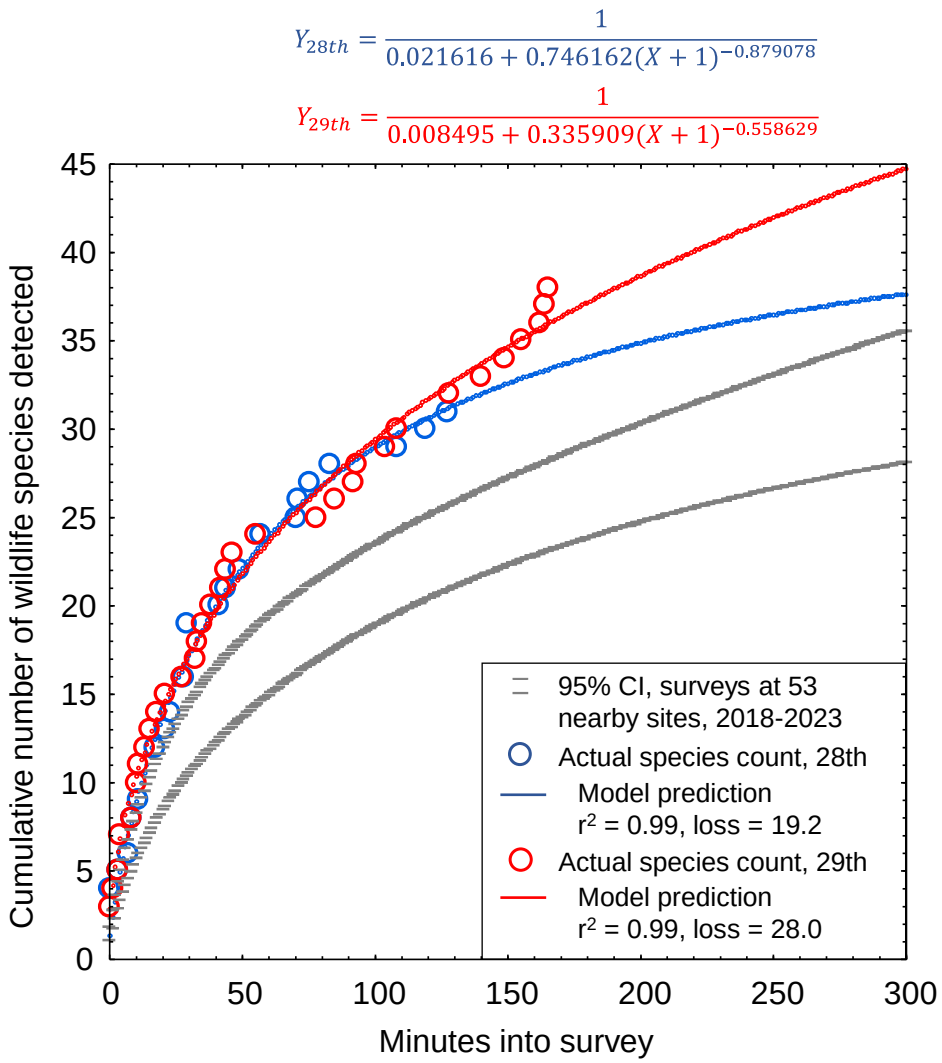
I fit nonlinear regression models to the cumulative numbers of vertebrate species I detected with time into my surveys to predict the number of species that I would have detected with a longer survey or perhaps with additional biologists available to assist. The models are logistic growth models which reach asymptotes that correspond with the maximum numbers of vertebrate wildlife species that could have been detected during each survey. In this case, the models predict 46 and 118 species of vertebrate wildlife were available to be detected on the evening of the 28th and the morning of the 29th, respectively, the difference likely due to the onset of darkness during the evening survey of the 28th. Compared to models fit to data I collected from 18 other sites in the region between 2019 and 2023, the data from this project site exceeds the upper bound of the 95% confidence interval of the rate of accumulated species detections with time into the survey (Figure 1). Importantly, however, the species I detected on November 28-29 composed only a fraction of the species that would occur at the project site over the period of a year or longer. This is because many species are seasonal in their occurrence.



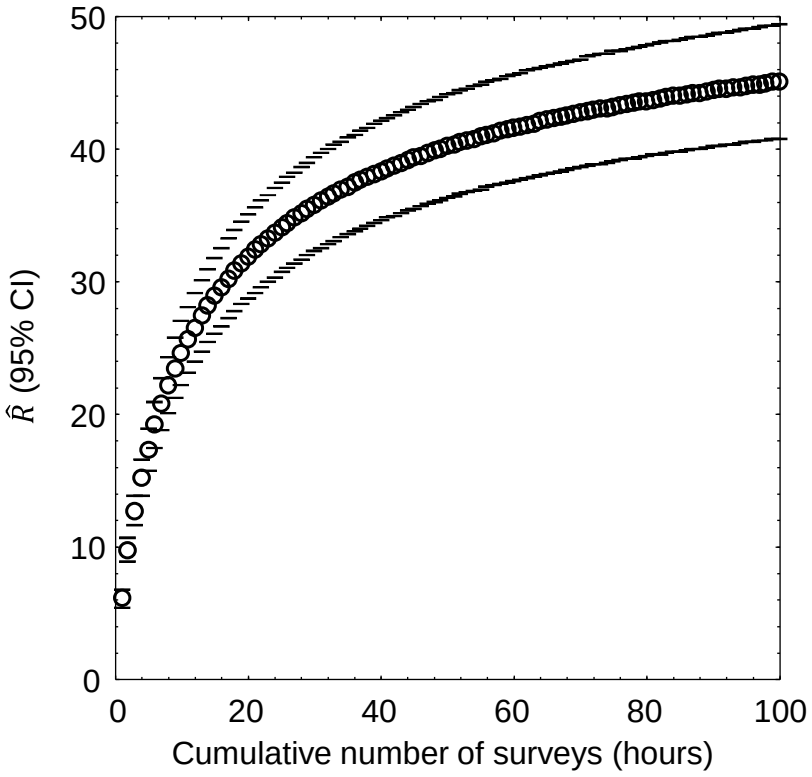


Figure 1. *Actual and predicted relationships between the number of vertebrate wildlife species detected and the elapsed survey time based on visual-scan surveys on 28-29 November 2023. Note that the relationships would differ if the surveys were based on another method or during another season.*

At least a year's worth of surveys would be needed to more accurately report the number of vertebrate species that occur at the project site, but I only have Noriko's one survey. However, by use of an analytical bridge, a modeling effort applied to a large, robust data set from a research site can predict the number of vertebrate wildlife species that likely make use of the site over the longer term. As part of my research, I completed a much larger survey effort across 167 km² of annual grasslands of the Altamont Pass Wind Resource Area, where from 2015 through 2019 I performed 721 1-hour visual-scan surveys, or 721 hours of surveys, at 46 stations. I used binoculars and otherwise the methods were the same as the methods I and other consulting biologists use for surveys at proposed project sites. At each of the 46 survey stations, I tallied new species detected with each sequential survey at that station, and then related the cumulative species detected to the hours (number of surveys, as each survey lasted 1 hour) used to accumulate my counts of species detected. I used combined quadratic and simplex methods of estimation in Statistica to estimate least-squares, best-fit nonlinear models of the number of cumulative species detected regressed on hours of survey (number of surveys) at the station: $\hat{R} = \frac{1}{1/a+b\times(Hours)^c}$, where $\hat{R}$ represented cumulative species

richness detected. The coefficients of determination, r^2, of the models ranged 0.88 to 1.00, with a mean of 0.97 (95% CI: 0.96, 0.98); or in other words, the models were excellent fits to the data.

I projected the predictions of each model to thousands of hours to find predicted asymptotes of wildlife species richness. The mean model-predicted asymptote of species richness was 57 after 11,857 hours of visual-scan surveys among the 46 stations of my research site. I also averaged model predictions of species richness at each incremental increase of number of surveys, i.e., number of hours (Figure 2). On average I would have detected 17.5 species over my first 5.05 hours of surveys at my research site in the Altamont Pass (5.05 hours to match the 5.05 hours I surveyed at the project site), which composed 30.7% of the predicted total number of species I would detect with a much larger survey effort at the research site. Given the example illustrated in Figure 2, the 46 species I detected after my 5.05 hours of survey at the project site likely represented 30.7% of the species to be detected after many more visual-scan surveys over another year or longer. With many more repeat surveys through the year, I would likely detect $^{46}/_{0.307} = 150$ species of vertebrate wildlife at the site. Assuming my ratio of special-status to non-special-status species was to hold through the detections of all 150 predicted species, then continued surveys would eventually detect 33 special-status species of vertebrate wildlife.

Figure 2. *Mean (95% CI) predicted wildlife species richness, $\hat{R}$, as a nonlinear function of hour-long survey increments across 46 visual-scan survey stations across the Altamont Pass Wind Resource Area, Alameda and Contra Costa Counties, 2015–2019. Note that the location of the study is largely irrelevant to the utility of the graph to the interpretation of survey outcomes at the project site. It is the pattern in the data that is relevant, because the pattern is typical of the pattern seen elsewhere.*

Because my prediction of 150 species of vertebrate wildlife, including 33 special-status species of vertebrate wildlife, is derived from daytime visual-scan surveys, and would detect few nocturnal mammals such as bats, the true number of species composing the wildlife community of the site must be larger. My reconnaissance surveys should serve

only as a starting point toward characterization of the site's wildlife community, but they certainly cannot alone inform of the inventory of species that use the site. More surveys are needed than my two survey to inventory use of the project site by wildlife. Nevertheless, the large number of species I predict at the project site is indicative of a relatively species-rich wildlife community that warrants a serious survey effort.

EXISTING ENVIRNMENTAL SETTING

The first step in analysis of potential project impacts to biological resources is to accurately characterize the existing environmental setting, including the biological species that use the site, their relative abundances, how they use the site, key ecological relationships, and known and ongoing threats to those species with special status. A reasonably accurate characterization of the environmental setting can provide the basis for determining whether the site holds habitat value to wildlife, as well as a baseline against which to analyze potential project impacts. For these reasons, characterization of the environmental setting, including the project site's regional setting, is one of CEQA's essential analytical steps. Methods to achieve this first step typically include (1) surveys of the site for biological resources, and (2) reviews of literature, databases and local experts for documented occurrences of special-status species. In the case of the proposed project, these needed steps have been inadequate.

Environmental Setting informed by Field Surveys

To CEQA's primary objective to disclose potential environmental impacts of a proposed project, the analysis should be informed of which biological species are known to occur at the proposed project site, which special-status species are likely to occur, as well as the limitations of the survey effort directed to the site. Analysts need this information to characterize the environmental setting as a basis for opining on, or predicting, potential project impacts to biological resources.

Herein I discuss several types of surveys, which are common to environmental review, but which are often misunderstood and misapplied. A ***reconnaissance survey***, also often referred to as a general biological survey, is intended to (1) detect as many of the species as feasible during the time of the survey, (2) search for and map the locations of approximate boundaries of wetlands and coarse representations of vegetation cover, and (3) assess the likelihood of occurrences of special-status species. The latter objective is often referred to as habitat assessment. CDFW (2018) provides guidelines for reconnaissance surveys directed toward plant species, but there are no guidelines for reconnaissance-level wildlife surveys, other than the expected use of sound scientific methodology. A ***protocol-level survey*** is a survey guided by a written protocol, usually by a resource agency or professional group of biologists. Such surveys can be for various objectives, but in environmental review they are usually intended for detection surveys. ***Detection surveys*** are formulated by experts on a particular species to, at reasonable cost, give survey personnel the best chance at detecting members of a species if the species is indeed present. The additional purpose of detection surveys is to support absence determinations when the protocol was followed but the species was nevertheless not detected. Absence determinations made for special-status species are

supportable only if the results of detection surveys were negative, or when the site is outside the species' geographic range or clearly does not provide habitat.

Preconstruction surveys are take-avoidance surveys intended to be completed after reconnaissance surveys and detection surveys and just prior to construction ground-disturbance activities such as clearing and grubbing or grading. For some species, protocols for preconstruction surveys are included in mitigation guidelines. The preconstruction survey is a mitigation measure, and therefore not to be confused with other types of surveys. This type of survey will be discussed in the Mitigation section near the end of my comments.

Monk & Associates (2021) performed a reconnaissance survey of the SMP 39 project site on 5 November 2021 "to record biological resources and to assess the likelihood of resource agency regulated areas occurring on the project site," and "searching all habitats on the site and recording all plant and wildlife species observed," and "examination of the site to determine if there could be potential areas within the project site that would be regulated as waters of the United States and/or State." Monk & Associates (2023) performed two reconnaissance surveys of the SMP 40 project site on 10 June 2019 and 10 September 2021. The objectives of the surveys at SMP 40 were essentially the same as those for the survey of SMP 39. In all three of these surveys, Monk & Associates recorded all the species observed. A wetland delineation was alco completed at SMP 40.

For none of the above surveys was there reporting of what time the surveys began, or how long the surveys lasted. No checklist is shared of habitat elements that the biologists might have used during their survey to later crosscheck against documented habitats of each special-status species. No explanation is provided of whether or how animal behavior data or other evidence contributed to the biologist's assessment of the site for its importance to animal movement. It is therefore difficult to assess survey outcomes relative to survey effort and methods.

Monk & Associates (2021) detected 14 species of vertebrate wildlife on SMP 39, and Monk & Associates (2023) detected 22 species of vertebrate wildlife on SMP 40. In comparison, and even though I was unable to access either of the project sites, I detected 34 species in only 1.83 hours at SMP 39, and 29 species in only 2.22 hours at SMP 40. I also detected twice the number of special-status species at SMP 39 and 1.5 times the number of special-status species at SMP 40. Based on my surveys of the project sites, the existing environmental setting of each appears substantially different from the setting characterized by Monk & Associates (2021, 2023). Considering the differences between what Monk & Associates and what I found, I suggest that Monk & Associates must have either been distracted by other too many survey objectives, or lacked the skill needed to perform the surveys. The results of the Monk and Associates (2021, 2023) surveys have been misinterpreted in the reports, resulting in inaccurate characterizations of the existing environmental settings of SMP 39 and SMP 40.

Combining my survey results with those of Monk & Associates (2021, 2023), 38 species of vertebrate wildlife have been detected at SMP 39, and 44 species have been detected

at SMP 40. These combined results increase the documented number of species at SMP 39 by nearly 3-fold and they double the number of species at SMP 40. In other words, the combined survey outcomes support my modeling predictions of much larger numbers of species of wildlife making use of the project sites than can be demonstrated by one or two reconnaissance surveys. My modeling predicts at least 150 species of vertebrate wildlife make use of the two sites, and this prediction was based solely on diurnal visual-scan surveys, and not on live-trapping for small mammals and nocturnal surveys for nocturnally active animals. The wildlife communities of SMP 39 and SMP 40 are much richer than portrayed in the DEIR.

The DEIR (page 4.3-25) reports that "western burrowing owls have not been observed within SMP 39 or SMP 40." This is factually incorrect, as CNDDB includes a record of burrowing owl occurrence on SMP 39 (Monk & Associates 2023: Figure 4). Even if this reporting was correct, it would still qualify as pseudoscientific. The appropriate surveys for detecting burrowing owls are detailed in the survey guidelines of CDFW (2012). Lack of detections of burrowing owls during reconnaissance surveys would be meaningful only after completion of many reconnaissance surveys at the appropriate time of year and by qualified biologists. Considering that ground squirrels occur in abundance on SMP 39 and SMP 40, and considering that one of California's most significant populations of burrowing owls occurs within the nearby Altamont Pass (Smallwood et al. 2013), and considering that the appropriate detection surveys have not been completed at SMP 39 and SMP 40, it would be prudent to assume that burrowing owls occur on the project sites.

Regarding tricolored blackbird, the DEIR (page 4.3-26) reports that "the species has not been observed near SMP 39 in nearly 40 years." This is factually incorrect, as eBird includes a 2003 record of tricolored blackbird occurrence only 300 m north of SMP 39. The DEIR also reports that tricolored blackbird would not occur on SMP 9 because "aquatic habitat does not exist within SMP 39." But this is also factually incorrect. I have many times recorded tricolored blackbird occurrences on grasslands of the Altamont Pass far from bodies of water (Photos 19 and 20). Grassland environments is where tricolored blackbirds do most of their foraging in Alameda County, and it is where they sometimes nest within the Altamont Pass (Photo 20).

The DEIR reports that loggerhead shrikes do not occur on SMP 39. But again, the DEIR is factually inaccurate. I observed a loggerhead shrike on SMP 39 (Photo 21), which as it turned out, was near where a loggerhead shrike sighting was also reported to eBird in 2018. Loggerhead shrike does occur on SMP 39, as well as on SMP 40.

The DEIR reports that SMP 39 and SMP 40 contains potential habitat of raptors. However, the word "potential" insinuates uncertainty remains on the question of whether the sites provide raptor habitat. Of course, they do. Those portions of the environment used by raptors are considered raptor habitat. Between my surveys and those of Monk & Associates, and including CNDDB and eBird records, the following raptors have been seen on SMP 39 and SMP 40: turkey vulture, northern harrier, white-tailed kite, red-tailed hawk, ferruginous hawk, Cooper's hawk, American kestrel, merlin,

and burrowing owl. There should be no ambiguity around the question of whether raptor habitat occurs on SMP 39 and SMP 40; raptor habitat is present.

Photos 19 and 20. *Top, tricolored blackbirds forage on grassland far from aquatic environments, and bottom, they breed on rapeseed and thistle in the Altamont Pass Wind Resource Area.*

Photo 21. *Loggerhead shrike on the SMP 39 portion of the project site, 29 November 2023.*

Reconnaissance surveys for wildlife are not designed to detect special-status species. Special-status species can be detected during such surveys, as has been the case for 10 special-status species at the project site, but these surveys are not formulated to detect them, nor are there minimum standards to be met in these surveys to support absence determinations. For the latter purpose, protocol-level detection surveys have been formulated by species experts. Monk & Associates (2021, 2023) did not perform any detection surveys. Based on Monk & Associates (2021, 2023), the DEIR's characterization of the existing environmental setting is therefore incomplete and inaccurate.

The same is true for special-status species of plants. According to the DEIR (page 4.3-25), "special-status plants have not been observed during several surveys of the project sites conducted during various months over the years." However, this reporting is misleading, because only one of the several surveys was conducted during the plant blooming season. Monk and Associates (2021, 2023) did not meet the minimum standards of CDFW's (2018) plant survey guidelines.

Environmental Setting informed by Desktop Review

The purpose of literature and database review and of consulting with local experts is to inform the field survey, and to augment interpretation of its outcome. Analysts need this information to identify which species are known to have occurred at or near the project site, and to identify which other special-status species could conceivably occur at the site due to geographic range overlap and migration flight paths.

Monk & Associates (2021) did not reportedly review eBird (https://eBird.org) or iNaturalist (https://www.inaturalist.org) for documented occurrence records at or near the project site. Instead, Monk & Associates (2021, 2023) queried the California Natural Diversity Data Base (CNDDB) for documented occurrences of special-status species within the three miles of the project sites. By taking this approach, Monk & Associates (2021, 2023) and the DEIR screen out many special-status species from further consideration in the characterization of the wildlife community as part of the existing environmental setting. CNDDB is not designed to support absence determinations or to screen out species from characterization of a site's wildlife community. As noted by CNDDB, "*The CNDDB is a positive sighting database. It does not predict where something may be found. We map occurrences only where we have documentation that the species was found at the site. There are many areas of the state where no surveys have been conducted and therefore there is nothing on the map. That does not mean that there are no special status species present*." Monk & Associates (2021, 2023) and the DEIR misuse CNDDB.

According to Monk & Associates (2021:6), "No special-status animal records have ever been mapped on the project site." The word "ever" adds emphasis to the finding. However, by implication, Monk & Associates (2021) misrepresents CNDDB as a database with uniform representation of California properties, which is far from the case. CNDDB relies entirely on volunteer reporting from biologists who were allowed access to whatever properties they report from. Many properties have never been surveyed by biologists. Many properties have been surveyed, but the survey outcomes never reported to CNDDB. Many properties have been surveyed multiple times, but not all survey outcomes reported to CNDDB. Furthermore, CNDDB is interested only in the findings of special-status species, which means that species more recently assigned special status will have been reported many fewer times to CNDDB than were species assigned special status since the inception of CNDDB. The lack of many CNDDB records for species recently assigned special status had nothing to do with whether the species' geographic ranges overlapped the project site, but rather more to do with the brief time for records to have accumulated since the species were assigned special status. And because negative findings are not reported to CNDDB, CNDDB cannot provide the basis for estimating occurrence likelihoods, either.

In my assessment based on database reviews and site visits, 128 special-status species of wildlife are known to occur near enough to the site (SMP 38, SMP 39, SMP 40) to warrant analysis of occurrence potential (Table 2). Of these 128 species, 19 (15%) were recorded on the project site, and another 35 (27%) species have been documented within 1.5 miles of the site ('Very close'), another 13 (10%) within 1.5 and 4 miles

('Nearby'), and another 57 (45%) within 4 to 30 miles ('In region'). More than half (52%) of the species in Table 2 have been reportedly seen within 4 miles of the project site. The site therefore supports multiple special-status species of wildlife and carries the potential for supporting many more special-status species of wildlife based on proximity of recorded occurrences. The site is far richer in special-status species than is characterized in the DEIR.

Whereas Monk & Associates (2021, 2023) reportedly queried CNDDB for occurrence records within three miles of the project sites, the DEIR analyzes the occurrence likelihoods of only 6 (<5%) of the species in Table 2. That only 6 special-status species were identified from occurrence records within 3 miles strains credulity. As noted above, using eBird and iNaturalist, I found records of 54 special-status species of wildlife within only 1.5 miles of the project sites, and 67 within 4 miles of the sites.

Of the 6 species included in Monk & Associates (2021, 2023) analyses of occurrence likelihoods, the DEIR concludes that 4 have no chance of occurrence, 1 has low to no chance, and 1 has low to moderate chance of occurrence. Except for species whose habitat is compellingly absent from the site, absence determinations are inappropriate based on the evidence gathered by Monk & Associates (2021, 2023). Absence determinations are supportable only after species-specific protocol-level detection surveys have been completed to the standards of the protocols, and the species were nevertheless not detected. No such surveys have been completed. It is inappropriate to conclude that a species is absent simply by looking at a site, and it is especially inappropriate to do so for 125 species of wildlife. Important findings of Monk & Associates (2021, 2023) and the DEIR are not supportable.

Of the special-status species that Monk & Associates (2021, 2023)) claims to be absent from one or both of the project sites, two – burrowing owl and loggerhead shrike – have been seen where they were reported to be absent. Occurrence records of another 2 supposedly absent special-status species have been reported within only 1.5 miles of the site, and another has been reported within 1.5 and 4 miles of the project site. Important findings of Monk & Associates (2021, 2023) and the DEIR are not supportable.

Of the 122 special-status species in Table 2, but which the DEIR does not analyze for occurrence potential, some are unlikely to occur, whereas many *are* likely to occur. With ground squirrels known to be present on SMP 39 and SMP 40, there is reason to expect the occurrences of American badger, ferruginous hawk, bald eagle and golden eagle. I regularly observed these species in the Altamont Pass Wind Resource Areas while I performed various studies there from 1999 through 2019. Golden eagles, I continue to record both in the Altamont Pass and over and on the project sites (Figure 3). Of the 45 golden eagles that Douglas Bell captured and fit with GPS telemetry backpacks since 2013, 11 have flown to or perched in the areas of the project sites (Figure 3).

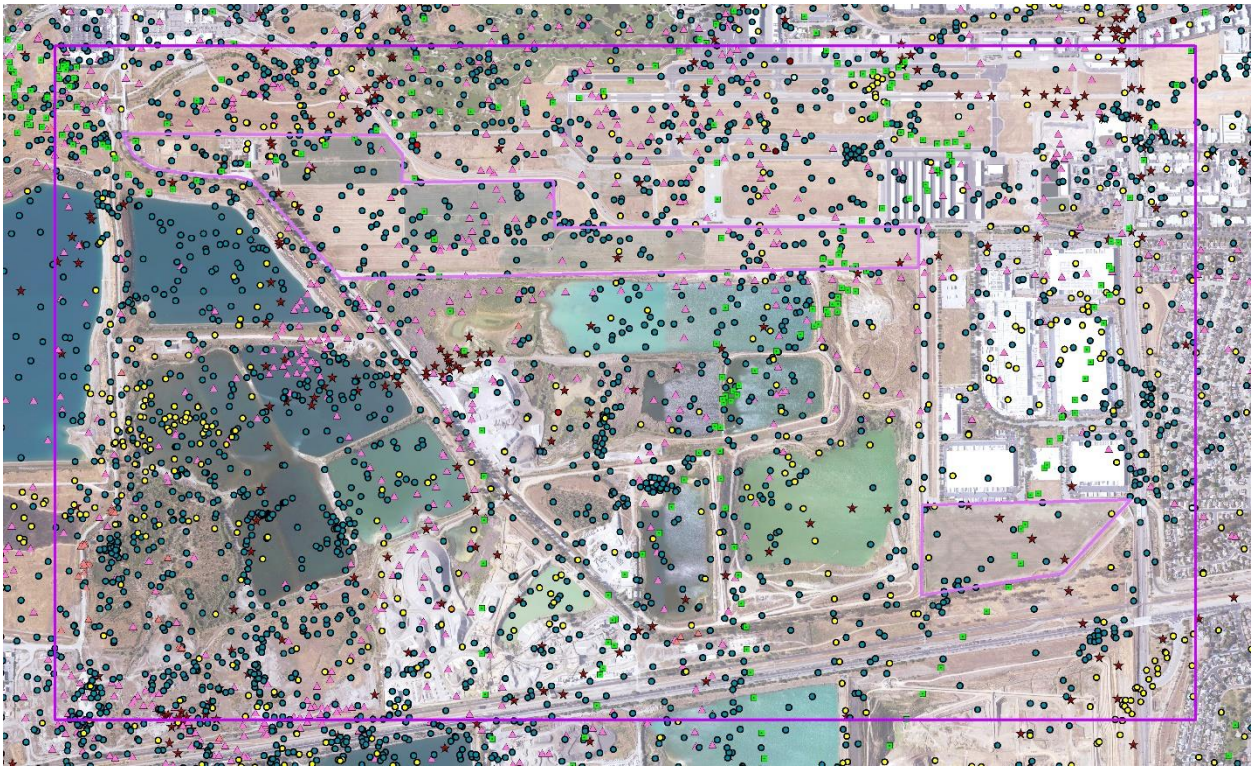

Figure 3. *GPS telemetry positions (N = 3,478) of 11 golden eagles from 2014 through 2023, each distinct color-symbol combination representative of one golden eagle. Many of the positions are on SMP 38, SMP 39, and SMP 40. Many of the positions are of flying golden eagles, and some are of perched golden eagles.*

Considering the inaccuracies of the DEIR's characterization of the existing environmental setting, the reasonable course of action would be to withdraw the current draft EUIR and prepare a new one to appropriately characterize the existing environmental setting. The public needs to understand the nature of the sensitive biological assets that exist on the project sites.

Table 2. *Occurrence likelihoods of special-status bird species at or near the proposed project site, according to eBird/iNaturalist records (https://eBird.org, https://www.inaturalist.org) and on-site survey findings, where 'Very close' indicates within 1.5 miles of the site, "nearby" indicates within 1.5 and 4 miles, and "in region" indicates within 4 and 30 miles, and 'in range' means the species' geographic range overlaps the site. Entries in bold font indicate those species I detected during my reconnaissance surveys.*

POTENTIAL BIOLOGICAL IMPACTS

An impacts analysis should consider whether and how a proposed project would affect members of a species, larger demographic units of the species, the whole of a species, and ecological communities. The accuracy of this analysis depends on an accurate characterization of the existing environmental setting. In the case of the proposed project, the existing environmental setting has not been accurately characterized, and several important types of potential project impacts have been inadequately analyzed. These types of impacts include habitat loss, interference with wildlife movement, and wildlife-automobile collision mortality.

HABITAT LOSS

Habitat loss results in a reduced productive capacity of affected wildlife species, but the DEIR offers no prediction of this lost capacity for any of the wildlife species potentially affected. In the case of birds, two methods exist for estimating the loss of productive capacity that would be caused by the project. One method would involve surveys to count the number of bird nests and chicks produced. The alternative method would be to infer productive capacity from estimates of total nest density elsewhere.

Because the project is located within an area that has undergone severe habitat fragmentation, the habitat that remains in fragmented patches probably no longer supports its original productive capacity of wildlife (Smallwood 2015, Smallwood and Smallwood 2023). However, several studies have estimated total avian nest density at locations that had likewise been highly fragmented. Two study sites in grassland/wetland/woodland complexes within agricultural matrices had total bird nesting densities of 32.8 and 35.8 nests per acre (Young 1948, Yahner 1982) for an average 34.3 nests per acre. Assuming total nest density at the project site is about a third of that of the above-cited study sites due to the annual disking of the project site's interior areas, I predict SMP 38 (111.7 acres), SMP 39 (51.9 acres) and SMP 40 (41 acres) support 11.4 bird nests/acre/year. Based on this assumption, the combined projects, SMP 39 and SMP 40, on 92.9 acres would eliminate 1,059 nest sites, and assuming SMP 38 is also later developed, then the combined projects, SMP 38, SMP 39, and SMP 40, on 204.6 would eliminate 2,332 nest sites.

The loss of 1059 to 2,332 nest sites would easily qualify as a significant project impact that has not been quantitatively addressed in the DEIR. But the impact would not end with the immediate loss of nest sites as nest substrate is removed and foraging grounds graded in preparation for impervious surfaces. The reproductive capacity of the site would be lost. The average number of fledglings per nest in Young's (1948) study was 2.9. Assuming Young's (1948) study site typifies bird productivity, the project would prevent the production of 3,071 to 6,763 fledglings per year, depending on whether SMP 38 is developed. Assuming an average bird generation time of 5 years, the lost capacity of both breeders and annual fledgling production can be estimated from an equation in Smallwood (2022): {(nests/year × chicks/nest × number of years) + (2 adults/nest × nests/year) × (number of years ÷ years/generation)} ÷ (number of years) = 3,495 to 7,696 birds per year denied to California, depending on whether SMP 38 is developed.

These losses of birds from California would be substantial, nearly equal to the annual loss of birds caused by wind turbine collision mortality in the nearby Altamont Pass Wind Resource Area (Adams Broadwell Joseph & Cardozo 8 January 2021 letter to Alameda County Planning Department regarding Comments on the Draft Subsequent Environmental Impact Report for the Mulqueeney Ranch Wind Repowering Project (SCH No. 2010082063), CUP Application No. PLN2019-00226). These losses would be highly significant.

INTERFERENCE WITH WILDLIFE MOVEMENT

One of CEQA's principal concerns regarding potential project impacts is whether a proposed project would interfere with wildlife movement in the region. Unfortunately, the DEIR's analysis of whether the project would interfere with wildlife movement in the region is flawed and misleading. According to the DEIR, "The project area does not fall within an Essential Habitat Connectivity area mapped by the CDFW." However, at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18486, the California Essential Habitat Connectivity Project specifically points out that it is not: "A California Department of Fish and Game or US Fish and Wildlife Service response to potential impacts to a habitat or species from a project subject to the California Environmental Quality Act (CEQA)," nor "Fine scale, with every important piece of habitat identified" nor ""Essential", meaning the only places of importance" nor "A solution by itself for how to provide necessary linkages for any given species of plant or animal… Linkage designs will vary depending on focal species chosen and the goal of providing connected habitat for a chosen species might be met several different ways" nor "The final word on connectivity for California." With analytical grid cells of 2,000 acres, the spatial grain of the California Essential Habitat Connectivity Project is much too coarse for the conclusion the DEIR draws from it.

The next flaw in the DEIR is in the argument that SMP 39 is cut off from open areas by well-trafficked roads, the airport, the gravel quarries, and therefore cannot function as a wildlife movement corridor. The same argument is made for SMP 40. On this point, the DEIR merely speculates, and offers no supporting evidence to its assertion. Monk & Associates (2021, 2023) report no survey methodology designed to determine whether wildlife rely on the site for movement in the region. They implemented no sampling regime nor a program of observation to record wildlife movement patterns. They failed to quantitatively or qualitatively analyze movement patterns of observed wildlife. Based on what is reported, Monk & Associates (2021, 2023) did not record or measure wildlife movement in any way. The conclusions of the DEIR regarding wildlife movement on the project site are speculative and conclusory.

On the other hand, the coyote I saw on site got there somehow, and so did the ground squirrels and pocket gophers, and so did all of the birds I saw on and over SMP 39. I observed hundreds if not thousands of gulls of multiple species flying in both easterly and westerly directions across SMP 38, SMP 39, and SMP 40. I observed Canada geese and Aleutian cackling geese flying to and from the quarry ponds and the project sites to forage. I saw a Cooper's hawk fly from the airport to SMP 39 to forage, crossing the well-trafficked road in about 2 seconds of flight time. Figure 3 illustrates that our telemetered

golden eagles from the Altamont Pass make frequent visits to the project site. That thousands of our golden eagle telemetry positions appear in the project area is consistent with the pattern that my co-investigators and I have noticed about golden eagle movement across California and beyond to other states and border nations, and that is that golden eagles carefully select open spaces as parts of their travel routes. The project area is important to golden eagle movement in the region, just as it is important to the 10 special-status species I observed on the project site, and to the 19 special-status species so far documented on the project site. Th evidence is overwhelming that the project site is important to wildlife movement in the region. Losing the open space of this site would be devastating to many species of wildlife, including to golden eagle.

Furthermore, whether the site includes or is within a wildlife movement corridor is not the only consideration when it comes to the standard CEQA Checklist question of whether the project would interfere with wildlife movement in the region. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. In fact, a site such as the project site is critically important for wildlife movement because it composes an increasingly diminishing area of open space within a growing expanse of anthropogenic uses, forcing more species of volant wildlife to use the site for stopover and staging during migration, dispersal, and home range patrol (Warnock 2010, Taylor et al. 2011, Runge et al. 2014). The project, due to its elimination of at least 92.9 acres of open space, and more realistically 204.6 acres of open space, and due to its insertion of multiple new buildings into the aerospace currently used by birds, bats and butterflies. would cut wildlife off from one of the last remaining stopover and staging opportunities in the region, forcing volant wildlife to travel even farther between remaining stopover sites. This impact would be significant, and as the project is currently proposed, it would be unmitigated.

TRAFFIC IMPACTS TO WILDLIFE

Project-generated traffic would endanger wildlife that must, for various reasons, cross roads used by the project's traffic to get to and from the project site (Photos 22—26), including along roads far from the project footprint. Vehicle collisions have accounted for the deaths of many thousands of amphibian, reptile, mammal, bird, and arthropod fauna, and the impacts have often been found to be significant at the population level (Forman et al. 2003). Across North America traffic impacts have taken devastating tolls on wildlife (Forman et al. 2003). In Canada, 3,562 birds were estimated killed per 100 km of road per year (Bishop and Brogan 2013), and the US estimate of avian mortality on roads is 2,200 to 8,405 deaths per 100 km per year, or 89 million to 340 million total per year (Loss et al. 2014). Local impacts can be more intense than nationally.

The nearest study of traffic-caused wildlife mortality was performed only 11 miles away, along a 2.5-mile stretch of Vasco Road in Contra Costa County, California. Fatality searches in this study found 1,275 carcasses of 49 species of mammals, birds, amphibians and reptiles over 15 months of searches (Mendelsohn et al. 2009). This fatality number needs to be adjusted for the proportion of fatalities that were not found due to scavenger removal and searcher error. This adjustment is typically made by placing carcasses for searchers to find (or not find) during their routine periodic fatality

searches. This step was not taken at Vasco Road (Mendelsohn et al. 2009), but it was taken as part of another study I completed next to Vasco Road concurrent to the Mendelsohn et al. study (Brown et al. 2016). Brown et al.'s (2016) adjustment factors for carcass persistence resembled those of Santos et al. (2011), which were derived from carcasses placed along roads. Applying searcher detection rates from Brown et al. (2016), the adjusted total number of fatalities was estimated at 12,187 animals killed by traffic on the reach of road that was studied. This fatality number over 1.25 years and 2.5 miles of road translates to 3,900 wild animals per mile per year. In terms comparable to the national estimates, the estimates from the Mendelsohn et al. (2009) study would translate to 243,740 animals killed per 100 km of road per year, or 29 times that of Loss et al.'s (2014) upper bound estimate and 68 times the Canadian estimate. An analysis is needed of whether increased traffic generated by the project site would similarly result in local impacts on wildlife.

Photo 22. *A Gambel's quail dashes across a road* on *3 April 2021. Such road crossings are usually successful, but too often prove fatal to the animal. Photo by Noriko Smallwood.*

Photo 23. *California ground squirrel in the middle of an eastern Alameda County road on 13 March 2014.*

Photo 24. *Western Pacific rattlesnake on an eastern Alameda County road, 23 August 2011. Photo by Shawn Smallwood.*

Photo 25. *Mourning dove killed by vehicle on a California road. Photo by Noriko Smallwood, 21 June 2020.*

Photo 26 *Raccoon killed on Road 31 just east of Highway 505 in Solano County. Photo taken on 10 November 2018.*

For wildlife vulnerable to front-end collisions and crushing under tires, road mortality can be predicted from the study of Mendelsohn et al. (2009) as a basis, although it would be helpful to have the availability of more studies like that of Mendelsohn et al. (2009) at additional locations. My analysis of the Mendelsohn et al. (2009) data resulted in an estimated 3,900 animals killed per mile along a county road in Contra Costa County. Two percent of the estimated number of fatalities were birds, and the balance was composed of 34% mammals (many mice and pocket mice, but also ground squirrels, desert cottontails, striped skunks, American badgers, raccoons, and others), 52.3% amphibians (large numbers of California tiger salamanders and California red-legged frogs, but also Sierran treefrogs, western toads, arboreal salamanders, slender salamanders and others), and 11.7% reptiles (many western fence lizards, but also skinks, alligator lizards, and snakes of various species). VMT is useful for predicting wildlife mortality because I was able to quantify miles traveled along the studied reach of Vasco Road during the time period of the Mendelsohn et al. (2009), hence enabling a

rate of fatalities per VMT that can be projected to other sites, assuming similar collision fatality rates.

From October 2016 through December 2019, I maintained my own database of wildlife mortality I encountered on Vasco Road between Marsh Creek Road and Livermore, which encompassed the wildlife mortality study site of Mendelsohn et al. (2009). Table 3 includes the wildlife I found as fatalities, and it compares my crudely calculated ratio of observed fatalities per mile. From Table 3, it is apparent that mortality along the reach of road studied by Mendelsohn et al. (2009) was relatively low compared to the rest of Vasco Road: $^{19.178}/_{13.200} = 5{,}667$ fatalities per mile predicted for the 14.1 miles of Vasco Road that were not studies by Mendelsohn et al. (2009).

Table 3. *Fatalities I found along Vasco Road from October 2016 though December 2019, and along 14.1 miles of road that was not studied by Mendelsohn et al. (2009) and 2.5 miles that were studied.*

Predicting project-generated traffic impacts to wildlife

The DEIR predicts the project would generate 8,622,395 annual VMT. During the Mendelsohn et al. (2009) study, 19,500 cars traveled Vasco Road daily, so the vehicle miles that contributed to my estimate of non-volant fatalities was 19,500 cars and trucks × 2.5 miles × 365 days/year × 1.25 years = 22,242,187.5 vehicle miles per 12,187 wildlife fatalities, or 1,825 vehicle miles per fatality. This rate divided into the predicted annual VMT, above, would predict 4,725 vertebrate wildlife fatalities per year. My analysis of data in Table 3 suggests that the project-caused mortality along local roadways would be even higher.

Based on my analysis, the project-generated traffic would cause substantial, significant impacts to wildlife. The DEIR does not address this potential impact, let alone propose to mitigate it. Mitigation measures to improve wildlife safety along roads are available and are feasible, and they need exploration for their suitability with the proposed project. Given the predicted level of project-generated, traffic-caused mortality, and the lack of any proposed mitigation, it is my opinion that the proposed project would result in potentially significant adverse biological impacts. The DEIR should be withdrawn

from circulation and revised to appropriately analyze the potential impacts of project-generated automobile traffic on wildlife.

CUMULATIVE IMPACTS

The DEIR attempts to minimalize the project's contributions to cumulative impacts to biological resources by asserting that "ruderal herbaceous land is not considered sensitive wildlife habitat." However, CEQA does not require that the habitat that would be lost to a project be labeled as sensitive; no such standard exists.

The DEIR presents a flawed analysis of cumulative impacts, including to biological resources. The DEIR asserts that it "sets forth mitigation measures to ensure all potential project-specific impacts that would occur to biological resources are reduced to a less-than-significant level." And therefore, "the proposed project would not result in substantial adverse effects to biological resources protected by CEQA." The DEIR contrives the false standard that a given project impact is cumulatively considerable only when it has not been fully mitigated at the project level. The DEIR implies that cumulative impacts are really residual impacts left over by inadequate mitigation of project impacts. This notion of residual impacts being the source of cumulative impacts is inconsistent with CEQA's definition of cumulative effects. Individually mitigated projects do not negate the significance of cumulative impacts. If they did, then CEQA would not require a cumulative effects analysis. To summarize, the DEIR presents no cumulative effects analysis as defined in two ways by CEQA.

MITIGATION

Western Burrowing Owl

4.3-2(a) If project construction begins during the western burrowing owl nesting season (February 15 to August 31), a qualified biologist shall conduct targeted burrowing owl nest surveys within 14 days prior to construction activities using seven- to 20-foot transects. … The survey shall … follow CDFW guidelines outlined in the 2012 Staff Report on Burrowing Owl Mitigation.

The avian breeding season recognized by the CDFW is now 1 February through 15 September. The DEIR should be revised accordingly.

Whereas I concur that preconstruction, take-avoidance surveys should be completed, the DEIR falsely characterizes preconstruction surveys as detection surveys by insinuating that conducting preconstruction surveys without first having completed detection surveys would follow CDFW guidelines. Detection surveys are entirely different than preconstruction surveys, and are implemented to achieve a different set of objectives. Contrary to the DEIR's implication, preconstruction surveys are not designed to detect burrowing owls with anywhere close to the same likelihood as are protocol-level detection surveys that are designed for this purpose. It would be very easy for a preconstruction survey to fail to detect burrowing owls that are in fact present. Therefore, implementing a preconstruction survey as a surrogate for detection surveys would be reckless and would fail to meet the minimum standard of care for wildlife

protection. In any case, preconstruction surveys need to be implemented after completion of detection surveys per CDFW (2012).

Tricolored Blackbird

4.3-2(c) Prior to any ground disturbance on SMP 40, a qualified biologist shall conduct a preconstruction survey in all accessible areas identified as supporting potential tricolored blackbird nesting habitat. The survey shall document the current, and to the extent possible, historical presence or absence of nesting colonies of tricolored blackbird. …

Whereas I concur that preconstruction, take-avoidance surveys should be completed, a detection survey is needed first to inform the readers of the DEIR of whether and where tricolored blackbirds occur on or near the project sites. A detection survey would likely also improve the efficacy of the preconstruction survey.

Nesting Birds and Raptors (Including Loggerhead Shrike)

4.3-2(d) If project construction begins during the nesting season (February 1 to August 31), a qualified biologist shall conduct a nesting bird survey within 7 days prior to construction activities. … If migratory birds are identified nesting on or within the zone of influence, … A qualified biologist shall establish a temporary protective nest buffer around the nest(s). The nest buffer shall be staked with orange construction fencing. The buffer must be of sufficient size to protect the nesting site from construction-related disturbance and shall be established by a qualified ornithologist or biologist with extensive experience working with nesting birds near and on construction sites.

Typically, adequate nesting buffers are 75 feet from the nest site or nest tree dripline for small birds and up to 300 feet for sensitive nesting birds that include several raptor species known in the region of the project site but that are not expected to occur on the project site. Upon completion of nesting surveys, if nesting birds are identified on or within a zone of influence of the project site, a qualified ornithologist/biologist that frequently works with nesting birds shall prescribe adequate nesting buffers to protect the nesting birds from harm while the project is constructed.

First, the avian breeding season recognized by the CDFW is now 1 February through 15 September. The DEIR should be revised accordingly.

Second, whereas I concur that preconstruction, take-avoidance surveys should be completed, in my experience the majority of bird nests would not be found by biologists assigned to the survey. For instance, I surveyed for grassland nesters as part of an intensive survey effort that I performed from March through mid-August 2023 on a Central Valley site. I surveyed the site 30 times. I found that the nests of grassland birds are the most difficult to locate. Cavity nesters can more effectively defend their nests against predators, whereas ground nesters are highly vulnerable to predation, and thus the most cryptic of nesters. Ground nesters, which include bird species that occur at the project site, are highly adept at concealing their nests both physically and behaviorally. Based on my experience, it is highly likely that preconstruction survey would fail to find

any of the nests of ground-nesting birds that truly occur on the project site. The DEIR's implication that preconstruction survey would reduce potential impacts to nesting birds to less-than-significant is unsubstantiated by evidence in the DEIR.

The mitigation measure appears to be specifically directed toward loggerhead shrike, presumably because this special-status species was detected during a reconnaissance survey of SMP 40. Finding the nests of loggerhead shrikes is particularly difficult, as this species is expert at deceiving observers as to the whereabouts of their nests (Smallwood and Smallwood 2021). To adequately survey for nest sites of loggerhead shrike, many surveys are needed, and the survey methods need to include long sessions of visual-scans, preferably from blinds such as automobiles. Observers would need to be experienced in bird behavior, and capable of tracking the movements of individual loggerhead shrikes. A preconstruction survey for loggerhead shrike nest would be ineffective by having inexperienced biologists walk back and forth along transects.

Third, the mitigation language (second italicized paragraph above) allows a single individual to make a subjective decision, outside the public's view, to determine the buffer area for any given species. This measure lacks objective criteria, and is unenforceable.

Even assuming some or even all of the nests would be found and salvaged, this benefit to birds nesting on site would apply only to a single breeding season of nesters. The project would nevertheless eliminate the site's productive capacity to birds.

SMP 40 and Trail Connection Option 2
4.3-3(c) Prior to the commencement of ground-disturbing activities for SMP 40 or Trail Connection Option 2, … [Six minimization and mitigation measures follow, one of which is] *… the riparian corridor of Arroyo Mocho, disturbed areas shall be revegetated with native riparian plant species. Replacement of riparian trees to be removed shall be planted near the creek as feasible and/or adjacent to the existing limits of the riparian corridor to contribute to the existing riparian canopy. Riparian plantings shall be maintained for a minimum of 5 years to ensure that the canopy is enhanced and the understory restored.*

Trail Connection Option 2 – Undercrossing at Isabel Bridge
4.3-3(d) Prior to initiation of any groundbreaking activity associated with Trail Connection Option 2, … The project applicant shall ensure that the proposed project replaces, restores, or enhances on a "no net loss" basis (in accordance with the RWQCB) the acreage of all riparian habitat and waters of the State that would be removed, lost, and/or degraded due to project implementation by methods agreeable to the RWQCB and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 permitting processes. Methods include, but are not limited to implementation of a riparian enhancement planting plan and/or tree planting mitigation at a 1:1 ratio, or as otherwise prescribed by the RWQCB.

Trail Connection Option 2 – Undercrossing at Isabel Bridge

4.3-3(e) If it is determined that work below the OHWM cannot be avoided for Trail Connection Option 2, … Waters that would be lost or disturbed shall be restored, replaced, or rehabilitated on a "no-net-loss" basis. Habitat restoration, rehabilitation, and/or replacement, including the purchase of credits from a USACE approved mitigation bank at a 1:1 ratio, shall be at a location and by methods acceptable to the USACE.

I concur that all of the measures described above should be implemented if the project goes forward. However, these measure alone would be inadequate. Also needed is monitoring of wildlife that is integrated with thresholds of success and failure. If thresholds of failure are exceeded, then the City should be required to take additional steps to achieve success. To this end, an adequate performance bond should be provided by the applicant to the City.

RECOMMENDED MEASURES

Road Mortality: Compensatory mitigation is needed for the increased wildlife mortality that would be caused by bird-window collisions and the project-generated road traffic in the region. I suggest that this mitigation can be directed toward funding research to identify fatality patterns and effective impact reduction measures such as reduced speed limits and wildlife under-crossings or overcrossings of particularly dangerous road segments. Compensatory mitigation can also be provided in the form of donations to wildlife rehabilitation facilities (see below).

Fund Wildlife Rehabilitation Facilities: Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Many animals would likely be injured by collisions with automobiles traveling to and from the project's buildings.

Landscaping: If the project goes forward, California native plant landscaping (i.e., chaparral, grassland, and locally appropriate scrub plants) should be considered to be used as opposed to landscaping with lawn and exotic shrubs. Native plants offer more structure, cover, food resources, and nesting substrate for wildlife than landscaping with lawn. Native plant landscaping has been shown to increase the abundance of arthropods which act as importance sources of food for wildlife and are crucial for pollination and plant reproduction (Narango et al. 2017, Adams et al. 2020, Smallwood and Wood 2022.). Further, many endangered and threated insects require native host plants for reproduction and migration, e.g., monarch butterfly. Around the world, landscaping with native plants over exotic plants increases the abundance and diversity of birds, and is particularly valuable to native birds (Lerman and Warren 2011, Burghardt et al. 2008, Berthon et al. 2021, Smallwood and Wood 2022). Landscaping with native plants is a way to maintain or to bring back some of the natural habitat and lessen the footprint of urbanization by acting as interconnected patches of habitat for wildlife (Goddard et al. 2009, Tallamy 2020). Lastly, not only does native plant landscaping benefit wildlife, it requires less water and maintenance than traditional landscaping with lawn and hedges.

Thank you for your consideration,

Shawn Smallwood, Ph.D.

Subject: **City of Livermore SMP 38/SMP 39/SMP 40 Project**
Review of DEIR Noise Section & Appendices

Dear Stephanie:

We have completed a review of Section 4.6 (Noise), as well as Appendices J and K (Environmental Noise Assessments) of the Draft Environmental Impact Report for the City of Livermore SMP 38/SMP 39/SMP 40 Project, focusing on the adequacy of the noise impact analyses. Here are our findings:

OVERVIEW

Section 4.6 of the DEIR is based on environmental noise assessments prepared by Salter.

- Significance Standards

  The DEIR significance standards for noise and vibration impacts are based directly on Section XIII of the Environmental Checklist in Appendix G of the current CEQA Guidelines, which reads as follows:

  XIII. NOISE - Would the project result in:

  a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of the local general plan or noise ordinance, or applicable standards of other agencies?

  b) Generation of excessive groundborne vibration or groundborne noise levels?

  c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the area to excessive noise levels?

  Salter has proposed a 3 dBA increase in ambient noise levels as the threshold for a "substantial increase". We concur that this is a reasonable value for CEQA evaluation of this project.

- Operational Noise & Construction Vibration

  The analysis in Section 4.6 shows that noise impacts from operational noise (loading dock activity, HVAC, on-site vehicle movements) as well as vibration during on-site construction are less-than-significant. Generally, the analysis supporting this finding appears to be methodical and well done, consistent with current CEQA Guidelines, and we take no exception to it.

- Construction Noise Impacts

  Section 4.6 also includes an analysis of construction noise impacts on the nearest sensitive uses – i.e.: the single-family residential neighborhood to the east of the project sites. This analysis covers on-site construction activity for SMP 40 as well as the construction of off-site trail connections at three potential locations (each within 200-feet of the nearest residential use).

The impact of construction noise on the SMP 39 site is not covered in the DEIR.

For the off-site trail connection construction, the DEIR states that noise impacts are significant without mitigation and provides a list of mitigation measures (4.6-1) to reduce this impact to less-than-significant level. Generally, we agree with this finding and the proposed mitigation measures.

For on-site construction, the DEIR states that noise impacts will be less-than-significant. However, the analysis presented in the DEIR does not – in our opinion – adequately support this conclusion, for the reasons outlined below.

PROBLEMS WITH THE ON-SITE CONSTRUCTION NOISE IMPACT ANALYSIS

- <u>SMP 39 is Excluded</u>

  Construction noise from the SMP 39 site is not included in the analysis in Section 4.6 of the DEIR. An explanation for this omission is provided in the final paragraph on page 4.6-21, which reads in part:

  "Due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated that construction noise associated SMP 39 would be below the City of Livermore's exterior noise level threshold of 60 dBA DNL at the nearest sensitive receptor locations. Thus, construction noise levels for SMP 39 were not evaluated as part of the Environmental Noise Study for SMP 39."

  There are two problems with this explanation:

  First, CEQA requires an actual analysis to show whether a project impact is significant or less-than-significant. Simply "anticipating" that there will be no significant impact falls short of the standard required for a CEQA study.

  Second, the 60 dBA DNL exterior noise standard (which comes from the land-use compatibility table in the Noise Element of the City of Livermore General Plan) is only one of the applicable local regulations. The DEIR analysis should address all applicable regulations in both the General Plan and Municipal Code.

- <u>Analysis for SMP 40 is Incomplete</u>

  The noise impact analysis for construction on the SMP 40 site compares Salter's noise level predictions with instantaneous maximum noise level (Lmax) limits of 70 dBA during the day and 60 dBA at night, which are taken from Policy N-1.5.P3 of the City of Livermore General Plan.

  However, these Lmax noise limits are not the only local regulations that would apply to construction noise on the SMP 40 site.

  For example, the DEIR does not show how construction noise from SMP 40 would compare to Policy N-1.5.P2 of the General Plan, which prescribes the following noise limits, depending on the cumulative duration of the noise:

Daytime Noise Limit (7AM – 10PM)	Nighttime Noise Limit (10PM – 7AM)	Cumulative Duration
60 dBA	50 dBA	No more than 15-minutes in any hour.
65 dBA	55 dBA	No more than 5-minutes in any hour.
70 dBA	60 dBA	No more than 1-minute in any hour.

Similarly, the DEIR does not include an DNL analysis for construction noise from SMP 40 to show that it will be below the 60 dBA exterior noise standard taken from land-use compatibility table (Table 9-7) in the General Plan. This will be particularly important if any construction work is to occur at night.

- <u>There is an Error in the Calculations for SMP 40</u>

  Table 4.6-6 of the DEIR lists estimated Lmax noise levels for various pieces of construction equipment at a distance of 50-feet (these are standard reference values, taken from the FHWA Construction Noise Handbook) and extrapolates them to a distance of 884 feet.

  According to Table 4.6-6, the equipment noise levels received at a distance of 884 are 57 dBA lower than lower than those received at a distance of 50-feet. This is incorrect. According to the radiation equation for point sources (such as individual pieces of construction equipment) the reduction in noise level from 50-feet to 884 feet is:

  $10 \times LOG_{10}(884/50) = 25$ dBA

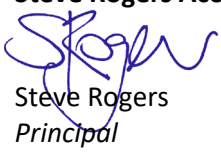
  So, the estimated Lmax noise levels provided in Table 4.6-6 are 32 dBA lower than they should be. Which means that noise from several of the pieces of equipment listed should be expected to produce a maximum level of noise at the nearest residences that is either right at the 60 dBA nighttime limit or, in the case of paving equipment, 4 dBA above it.

- <u>Construction on the East Side of the SMP 40 Site is Overlooked</u>

  The construction noise analysis in the DEIR for SMP 40 considers assumes receivers 884-feet away from the equipment – which is the distance between the location proposed for Building 2 and the nearest residences. However, there will be certain phases of construction – such as site preparation and paving/landscaping/site concrete – when noisy equipment could be operating closer than 884-feet from nearby residential uses.

  For example, the eastern corner of the SMP 40 site is within 600-feet of the nearest residential use. Received noise levels at a distance of 600-feet from the equipment would be 3 dBA higher than those received at 884-feet, which means that the expected noise level at the nearest residences when paving equipment is in use in the eastern corner of the site would be 67 dBA, Lmax and not 32 dBA, Lmax as reported in Table 4.6-6.

SUMMARY & RECOMMENDATIONS



We find that, while much of the noise analysis in the DEIR has been done to the standard expected of a CEQA study, the evaluation of noise impacts during the construction phases is incomplete and contains a significant calculation error. We therefore recommend that the preparers be requested to revise/correct the Noise Section (4.6) of the DEIR as follows:

- Include SMP 39 in the on-site construction noise impact analysis. The analysis should take account of the anticipated number of pieces of equipment in use at any one time during each phase as well as estimated usage factors, so that construction noise impacts can be evaluated in the in the context of the City of Livermore General Plan DNL 60 dBA exterior noise standard (from Table 9-7) and the time-dependent noise limits in Policy N-1.5.P2, as well as the Lmax noise limits in Policy N-1.5.P3.
- For on-site construction on the SMP 40 site, the noise impact analysis should be expanded to take account of the anticipated number of pieces of equipment in use at any one time during each phase as well as estimated usage factors, so that construction noise impacts can be evaluated in the in the

context of the City of Livermore General Plan DNL 60 dBA exterior noise standard (from Table 9-7) and the time-dependent noise limits in Policy N-1.5.P2, as well as the Lmax noise limits in Policy N-1.5.P3.

- Table 4.6-6 should be revised to show the correct (25 dBA) reduction in point-source noise levels from 50-feet to 884-feet.
- Provide additional analysis for any construction activity on the SMP 40 site (such as site preparation, paving/landscaping) that could occur closer than 884-feet from the nearest residential use.

Yours sincerely,
Steve Rogers Acoustics, LLC

RE: City of Livermore's SMP 39 and 40 Planning Commission Meeting

Dear Ashley Vera,

On behalf of "**Carpenters Local 713**", my Office is submitting these supplemental comments for the City of Livermore's ("**City**") Draft Environmental Impact Report ("**Draft EIR**" or "**DEIR**") and Final Environmental Impact Report ("**Final EIR**" or "**FEIR**") for the **March 5, 2024 Planning Commission Meeting** for the SMP 39 and 40 Project ("**Project**").

According to the Project's Notice of Availability ("**NOA**") of a Draft EIR Project Description:

> "On **SMP 38**, the proposed project includes a Sphere of Influence (SOI) Amendment to **include** SMP 38 within the **City of Livermore** SOI and **remove** it from the **City of Pleasanton's** SOI. The City of Livermore General Plan land use designation for SMP 38 would remain Limited Agriculture and Open Space/Sand and Gravel and the Alameda County zoning designation would remain Agriculture. **Development of SMP 38** is **not proposed**.
>
> For **SMP 39**, the proposed project would include development of a total of **up to six light industrial buildings**, consisting of **up to approximately 755,500 square feet** (sf) of new building space, and associated **internal roadways** and **other** improvements. **For SMP 40**, the proposed project would include development of **two industrial buildings** containing up to **759,275 sf of new building space** with

related **internal roadways** and **other** improvements. A number of approvals would be required for development of SMP 39 and SMP 40, including a **SOI Amendment for SMP 39**, **General Plan Amendment**, **Pre-zoning** and **Annexation**, **Zoning Map Amendment**/Planned Development, Vesting Tentative Subdivision **Maps**, a **Pre-Annexation Agreement**, and **Development Agreement**. A **Site Plan Design Review** entitlement is required for SMP 39 and SMP 40, which would include a review of the site plan, building, and landscape design; however, the entitlement is **only proposed for SMP 40 at this time**. A Site Plan Design Review entitlement will be required **at a later date** for the future development of **SMP 39**. In addition, the proposed project would include **annexation of four additional parcels** (APNs 904-10-2-3, -5, -7, and -8) located **east of SMP 40**. Development is **not proposed** on the additional parcels **as part** of the proposed project.

The project would include a **paved at-grade, on-site trail along the boundaries** of the SMP 40 site, consistent with the City's Active Transportation Plan. Specifically, the on-site trail would extend from the northeastern corner of the site, along the project site's eastern, southern, and western boundaries, before connecting to an existing off-site paved shared-use path at the northwestern corner of site, which extends along the west side of the Oaks Business Park to the north and connects to West Jack London Boulevard.

In addition, the project would include a **new off-site connection to the existing Arroyo Mocho Trail**, located on the east side of Isabel Avenue/SR 84. For the purposes of the Draft EIR analysis, three alternatives for the proposed off-site Isabel Avenue/SR 84 crossing to the existing Arroyo Mocho Trail are considered and evaluated in the Draft EIR, including the following, and described in more detail in the Draft EIR:

- Trail Connection Option 1 – **At-Grade** Crossing at **Discovery Drive**;
- Trail Connection Option 2 – **Undercrossing** at **Isabel** Bridge; and
- Trail Connection Option 3 – **Overcrossing** of **Isabel** Avenue/SR 84."

NOA of Draft EIR, pp. 1-2, emph. added.

The concurrently circulated Draft EIR contains the same project description. DEIR, pp. 1-2—1-4.

Carpenters Local 713 is a labor union representing union carpenters in Alameda County , and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Local 713 members live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Carpenters Local 713 expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

Carpenters Local 713 incorporates by reference all comments related to the Project or its CEQA review, including the Environmental Impact Report. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, Carpenters Local 713 requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**) (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). California Public Resources Code Sections 21092.2, and 21167(f) and California Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

I. CEQA REQUIRES SUBSEQUENT OR SUPPLEMENTAL ENVIRONMENTAL REVIEW WHEN SUBSTANTIAL CHANGES OR NEW INFORMATION COMES TO LIGHT

Section 21092.1 of the California Public Resources Code requires that "[w]hen significant new information is added to an environmental impact report after notice has been given pursuant to Section 21092 … but prior to certification, the public agency shall give notice again pursuant to Section 21092, and consult again pursuant to Sections 21104 and 21153 before certifying the environmental impact report" in order to give the public a chance to review and comment upon the information. (CEQA Guidelines § 15088.5.)

Significant new information includes "changes in the project or environmental setting as well as additional data or other information" that "deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative)." (CEQA Guidelines § 15088.5(a).) Examples of significant new information requiring recirculation include "new significant environmental impacts from the project or from a new mitigation measure," "substantial increase in the severity of an environmental impact," "feasible project alternative or mitigation measure considerably different from others previously analyzed" as well as when "the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." (Id.)

An agency has an obligation to recirculate an environmental impact report for public notice and comment due to "significant new information" regardless of whether the agency opts to include it in a project's environmental impact report. (Cadiz Land Co. v. Rail Cycle (2000) 83 Cal.App.4th 74, 95 [finding that in light of a new expert report disclosing potentially significant impacts to groundwater supply "the EIR should have been revised and recirculated for purposes of informing the public and governmental agencies of the volume of groundwater at risk and to allow the public and governmental agencies to respond to such information."].) If significant new information was brought to the attention of an agency prior to certification, an agency is required to revise and recirculate that information as part of the environmental impact report.

The City's Supplemental Memorandum ("**Exhibit A**") identifies numerous substantial changes to the EIR. Most notably Noise Impacts section was dramatically changed based on updated Noise Studies for SMP 39 and 40 and newly determined significance thresholds were applied. These updated studies were only finalized one day ago and given to the public ***less than four hours*** before the Planning Commission hearing. Moreover, the updated studies and significance thresholds resulted in an entirely new

mitigation measure in the MMRP. (See **Exhibit A** at 695). Indeed, the most recent revision now predicts SMP 40 construction-related noise will exceed the thresholds established by the City. As such, the dramatic change in the findings of the EIR ***requires recirculation*** so that the public may provide its input.

II. THE FEIR IS IMPROPER AS IT DOES NOT INCLUDE ALL CHANGES TO THE DEIR

The FEIR cannot be certified by the Planning Commission as it does not include the numerous changes created by the Supplemental Memorandum released mere hours before the Planning Commission Hearing. Under CEQA Guidelines Section 15132, a FEIR shall include:

> "(a) The draft EIR or a revision of the draft.
> (b) Comments and recommendations received on the draft EIR either verbatim or in summary.
> (c) A list of persons, organizations, and public agencies commenting on the draft EIR.
> (d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process.
> (e) Any other information added by the Lead Agency."

As the FEIR has received ***two rounds of revisions*** since it was originally prepared in January 2024, the document proposed for certification is an inaccurate reflection of the FEIR. As such, the Planning Commission must not certify the FEIR until, at a minimum, the document reflects the most up-to-date version.

III. CONCLUSION

Based on the foregoing, the Planning Commission should deny the FEIR's certification, and the Environmental Impact Report should be revised and recirculated pursuant to CEQA, consistent with the comments and issues identified in this and previous comment letters.

Sincerely,

Grace Holbrook
Attorneys for Carpenters Local 713

Supplemental Memorandum (Exhibit A).

LIVERMORE
CALIFORNIA

PLANNING COMMISSION STAFF REPORT **ITEM NO. 10.1**

DATE: March 5, 2024

TO: Chairperson and Members of the Planning Commission

FROM: Steve Riley, Acting Planning Manager

SUBJECT: Supplemental Materials received prior to the meeting.

RECOMMENDED ACTION

SUMMARY

These materials were posted online and made available to the public at the same time that they were distributed to the Planning Commission.

5.1 - Hearing to consider a request for an Annexation/Prezoning, Pre-Annexation and Development Agreements, General Plan Amendment, Zoning Map Amendment, Development Code Amendment, Vesting Tentative Parcel Map, Vesting Tentative Tract Map, Planned Development, and Site Plan Design Review for the SMP 39 and 40 Project to zone for and develop light industrial uses near the northwest part of the City.

Materials: Response to comments memorandum and errata, Conceptual site plan for SMP 39, Revised engineering consideration, Letters received in advance of the meeting, and Development agreements signed by the applicant.

DISCUSSION

ATTACHMENTS

1. Supplemental Materials

Prepared by: Michele Donley
Division Clerk

SMP 39/SMP 40 Project
Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum

As mentioned in the memorandum entitled, "Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum", the City would be following up with a supplemental memorandum to provide responses to the "Attorneys for Carpenters Local 713" letter, dated February 14, 2024, which was received after the release of the Final Environmental Impact Report (EIR) for the SMP 39/SMP 40 Project (proposed project). This supplemental memorandum provides the responses to the above-referenced letter.

While CEQA does not require that written responses be provided for letters received after the close of the public review period, the comments are acknowledged by the City, and the City has chosen to prepare written responses to the comments for the decision-makers consideration in making an informed decision. Responses to the "Attorneys for Carpenters Local 713" comment letter, which is included as Attachment 1, are provided below. Where revisions to the EIR text are required in response to a comment, new text is double underlined and deleted text is ~~struck through~~.

The comments received did not identify any new significant impact, substantial increase in severity of a significant impact identified in the EIR, or any significant new information. Therefore, recirculation of the EIR is not required.

Response to Stephanie Papayanis, Attorneys for Carpenters Local 713
The majority of the comment letter, including the entirety of Comment I and Comment II(A) of the comment letter, is identical to the comment letter submitted by Attorneys for Carpenters Local 713 during the Draft EIR comment period. As such, with regard to Comment I and Comment II(A) included in the comment letter, please see Responses to Comments 5-3 and 5-5 included in the Final EIR.

The new concerns brought forth in the comment letter are limited to Comment II(B) and Comment II(C) related to biological resources and construction noise. Thus, responses to Comment II(B) and Comment II(C) are provided below.

Comment II(B) Related to Biological Resources
Responses to the commenter's concerns regarding biological resources are provided below, as informed by Monk & Associates (M&A), who prepared the project-specific Biological Resources Assessments (BRAs) used within the Draft EIR analysis. It should be noted that Comment II(B) is a summary of the comments provided in Exhibit D to the Attorneys for Carpenters Local 713 comment letter, which is a letter authored by Shawn Smallwood, PhD. As such, the following responses are organized based on the comments presented in Exhibit D of the Attorneys for Carpenters Local 713 comment letter.

Environmental Setting Informed by Field Surveys
Page 16 of the Exhibit D comment letter states: "The results of the Monk and Associates (2021, 2023) surveys have been misinterpreted in the reports, resulting in inaccurate characterizations of the existing environmental settings of SMP 39 and SMP 40." The commenter is referring to the fact that M&A biologists recorded fewer bird species on-site and flying overhead than the commenter did during a reconnaissance visit. The environmental setting or environmental

baseline of a project site is informed by much more than the number of birds and mammals one sees in a certain amount of time.

The CEQA Guidelines Section 15125(a) requires that the CEQA document prepared for a project discuss the "baseline" environmental conditions at and in the vicinity of the project sites. CEQA Guidelines Section 15125 (see also Section 15126.6(e)(2)) states the following regarding the environmental setting as it relates to baseline:

> (a) [the CEQA review document] must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to understanding the significant effects of the proposed project.

M&A conducted several surveys on each of the project sites. As explained in the SMP 39 BRA included as Appendix D to the Draft EIR, M&A survey work in the project area dates to the year 2000. However, because CEQA requires current baseline conditions, none of the plants or wildlife observed in the early 2000s were reported in the BRAs. The 2021 surveys are the baseline surveys that were conducted to record existing biological resources and to assess the likelihood of resource agency regulated areas on the project sites. The surveys involved searching all habitats on the sites and recording all plant and wildlife species observed. M&A cross-referenced the habitats found on the project sites against the habitat requirements of local or regionally known special-status species to determine if the proposed project could directly or indirectly impact such species and if additional protocol level surveys would be necessary to assess potential impacts to special status species.

CEQA does not require an exhaustive list of all bird species that could occur on a project site, nor does CEQA require a discussion of what each species is doing at the time the species is observed. Rather, CEQA requires an analysis of potential impacts to special-status birds and/or nesting habitat for common birds that rise to the level of significance pursuant to CEQA as determined by an expert, based on database searches, field surveys, etc. M&A's BRAs provide that analysis and recommend pre-construction surveys to address potentially significant impacts. Overall, the BRAs meet the standards of care warranted under CEQA.

Habitat Loss

The commenter's estimate on the number of birds "denied to California" is primarily based on two studies. The commenter states that the two study sites have grassland/wetland/woodland complexes within agricultural matrices, and found total bird nesting densities of 32.8 and 35.8 nests per acre. The commenter uses one-third of such estimates for the project sites' calculation due to the annual discing that occurs on the project sites. However, the estimation is likely still an overestimate, as one study was conducted in a five-acre, undisturbed, unfragmented and preserved area within the over-500-acre University of Wisconsin Arboretum dedicated in 1934, adjacent to a 321-acre lake (Lake Wingra). The SMP 39 and SMP 40 project sites are not surrounded by hundreds of acres of preserved natural lands but rather the relatively small project sites are fragmented from natural areas by surrounding, existing development (busy roads, an airport, and active industrial uses).

The other study mentioned by the commenter was conducted within farmstead shelterbelts, or "man-made habitats consisting of parallel rows of trees and shrubs designed to protect farmsteads from damaging winds, drifting snow and blowing soil…" referred to as "wooded

islands." The study determined that the wooded islands are important for avifauna in regions of intensive agriculture and found many nests within the wooded region. The SMP 40 project site has a similar "wooded island," in that the wooded area that is a riparian corridor along Arroyo Mocho is being preserved within a riparian set back and will provide high-quality habitat for many nesting birds post-development. The preservation of Arroyo Mocho's riparian habitat was not considered in the commenter's calculations.

Further, the commenter's comparison of development of the proposed project to the high avian mortality rate by wind turbine collision in the Altamont Pass Wind Resource Area is not an appropriate comparison. The commenter is comparing 50-foot-tall buildings on the project sites to 430-foot-tall wind turbines with active, moving blades in a known avian migration zone; an area that supports the highest number of nesting Golden Eagles in the world.[1]

Regardless of the commenter's inappropriate comparison and overestimate of the number of birds "denied to California" due the loss of nesting habitat by the proposed projects, CEQA requires an analysis of potential impacts to special-status birds and/or nesting habitat for common birds that raise to the level of significance. Therefore, impacts to nesting birds were regarded as significant pursuant to CEQA in the Draft EIR. However, mitigation measures to protect special-status birds and all nesting birds have been prescribed in the Draft EIR (see Mitigation Measures 4.3-2[a] through 4.3-2[d] in the Draft EIR). The mitigation measures included therein reduce impacts to nesting birds to a less-than-significant level pursuant to the CEQA. Thus, the commenter's concerns about the projects' impacts to nesting birds have been sufficiently addressed.

Interference with Wildlife Movement
The commenter is correct that the Essential Habitat Connectivity Area mapped by the California Department of Fish and Wildlife (CDFW) is focused on connecting very large blocks of mostly protected natural lands. While the Draft EIR does state that the project sites are not located in this mapped area, that is only one sentence of the three-paragraph description under the Wildlife Movement Corridor section of the Draft EIR (see pages 4.3-14 to 4.3-15 of the Draft EIR). The comment implies that sufficient research and in-person assessments were not conducted accordingly, and that the determination that the project sites will not impact significant wildlife corridors was solely based on using the CDFW's Essential Habitat Connectivity Area map, which simply is not true.

For example, M&A conducted online research and project-specific field surveys to become informed about the project sites' habitats and the potential for any impacts to regional wildlife corridors based on development of the proposed projects. M&A recorded wildlife observed during site visits, in addition to extensively noting the habitat types and surrounding land uses during their visits and how the surrounding land uses would affect wildlife movement. As such, the commenter's statement that the conclusions of the Draft EIR regarding wildlife movement on the project site are speculative and conclusory is untrue.

Wildlife corridors are linear and/or regional habitats that provide connectivity to other natural vegetation communities within a landscape fractured by urbanization and other development. Wildlife corridors are extremely important habitats to preserve and are valuable for wildlife. While local wildlife may use the undeveloped sites in their current state, neither of the project sites currently provide a significant regional wildlife corridor that may be impacted by the proposed project. The project sites are regularly disced or disturbed for agriculture. For SMP 40, an

[1] National Audubon Society. *National Audubon Society Sues California County to Improve Bird Protections in Controversial Wind Energy Project.* Available at: https://www.audubon.org/news/national-audubon-society-sues-california-county-improve-bird-protections#:~:text=17%2C%202021)%2D%2DThe%20National,turbine%20facility%20at%20Altamont%20Pass%2C. Accessed February 2024.

industrial development, Oaks Business Park, is located to the north of the project site, east of the project site is Isabel Avenue, a heavily-trafficked road, south is an active railroad track and Stanley Boulevard, another heavily-trafficked road, and west of the project site are quarry ponds. SMP 39 is bordered by West Jack London Boulevard, a well-trafficked road, the Livermore Municipal Airport, the Oaks Business Park, and quarry ponds. The quarry ponds were excavated in uplands and, thus, are not associated with a creek or drainage, and have nearly vertical slopes, preventing wildlife from traversing the ponds easily or using the quarry area as a corridor. As mentioned in M&A's BRAs, both SMP 39 and SMP 40 are isolated from regional open spaces, and, as such, do not have regional wildlife corridor value for terrestrial mammals and contain minimal habitat that could be used by some migrating avian species.

The commenter states: "On the other hand, the coyote I saw on site got there somehow, and so did the ground squirrels and pocket gophers, and so did all of the birds I saw on and over SMP 39." One might infer from this statement that M&A's reports and the Draft EIR implied that wildlife do not use, or could not be found on the project sites, which is incorrect. Each of M&A's BRAs included a table of wildlife species observed on the project sites during site visits, which, as described in the BRAs, is not intended to be exhaustive or to describe the only species that could be found on the project sites. Rather, the focus was, as required by CEQA and as appropriate, on the assessment of biological resources with regard to suitable habitat and potential for the occurrence of any special-status species, as determined by a qualified biologist for the purposes of an impact analysis. Movement of a species through an area or an area's incidental use does not necessarily imply importance to the species, the characteristics of the habitat are more relevant.

For example, Figure 3 of the commenter's report shows the fly over and resting locations of Golden Eagles, which provides an example of how local wildlife may use the project sites as well as all surrounding areas, including properties completely developed with warehouses and surrounded by busy roads. However, while species such as the Golden Eagle may use the project site for foraging or resting on occasion, or may flyover, it is clear that the project sites are not the main sites that are relied upon by these large raptors for any of the above functions, or for nesting, as the existing trees are too small and in close proximity to disturbance.

The SMP 40 riparian area may provide significantly more suitable rest, foraging and nesting habitat for many bird species than the open and disturbed grassland does. However, as previously described, the riparian area on SMP 40 will be completely preserved within a riparian setback and will continue to connect local wildlife within the riparian corridor along the Arroyo Mocho.

The commenter also mentions that 19 special-status species so far have been documented on the project site, as further detailed in Table 1 of the commenter's report. However, the commenter's list includes species that do not meet the definition of "rare" pursuant to the CEQA. For example, Table 1 includes Red-tailed Hawk (*Buteo jamaicensis*), California Gull (*Laus californicus*), Double-crested Cormorant (*Phalacrocorax auritus*), Nuttall's Woodpecker (*Picoides nuttallii*), and Oak Titmouse (*Baeolophus inornatus*), which are designated as Birds of Prey (BOP), Birds of Conservation Concern (BCC) by U.S. Fish and Wildlife Service, and Taxa to Watch List. However, the aforementioned listings are not considered special-status under the California or Federal Endangered Species Acts (CESA and FESA), by other regulations, or by the scientific community pursuant to the CEQA. Nonetheless, it should be noted that these species, their nests, eggs and/or young are provided protection pursuant to other resource agency regulations such as the Migratory Bird Treaty Act (MTBA) and the California Fish and Game Code Sections 3503, 3503.5, 3511, and 3513C, which are both fully accounted for and discussed in M&A's BRAs and the Draft EIR.

In addition, the commenter does not specify which of the 19 species were observed during his site visit, or which were taken as observations from eBird. While many experienced birders may use eBird, anyone can report incidental bird sightings to eBird without any way to confirm the qualifications of the observer. As such, relying only on eBird data to say confidently that a special-status species is present on a property is not sufficient and would need to be confirmed by a qualified biologist. As mentioned by the commenter, several of the species sightings are birds flying over the project sites. As discussed in sections above, observing sensitive birds flying over a property, foraging over the site, or using the habitat on the sites during the non-nesting season does not warrant reporting to the California Natural Diversity Database (CNDDB), as such sightings are not of permanent breeding/nesting/larval development habitat (dependent on what type of animal it is) that warrant protection. The types of "incidental" sightings of common bird species do not necessarily translate into a "potentially significant biological impact" pursuant to CEQA Guidelines and regulations.

Further, while the project sites in their current state may be used by local wildlife, they provide very low value for foraging, resting or nesting, as the project sites are mainly comprised of non-native ruderal herbaceous habitats and are highly disturbed due to agricultural practices. The project sites are not one of the last remaining stopover and staging opportunities in the region, as stated by the commenter, as acres of undeveloped land similar to the project sites is located within the very immediate area, as well as dozens of local parks. The 80-acre Shadow Cliffs Regional Recreation Area is less than two miles from the project sites and the 160-acre Doolan Canyon Regional Preserve beyond provides more undeveloped land to the north. All of the aforementioned habitats in the region provide habitat for the species listed in the table of wildlife observed included in Exhibit D of the comment letter, and have far greater wildlife corridor habitat value than the project sites. The commenter's concerns about the loss of the ruderal habitats on-site should be assuaged by the fact that more trees and shrubs will be planted on the project sites post-development than are currently on site, which will provide additional stopover opportunities for birds.

Finally, as previously mentioned, the Arroyo Mocho runs along the southern project site boundary of SMP 40. Arroyo Mocho may serve as a local movement corridor for mammals, amphibians, and reptiles to move unobtrusively through the general geographic area. Animals moving along Arroyo Mocho could leave the Arroyo and enter the project site to move across the landscape. Such animals expected to migrate along the Arroyo and possibly enter the upland areas of the project site are common species such as coyote, raccoons, skunks, deer, and rodents, and would be able to navigate their way around SMP 40 even after the site was developed. The Arroyo Mocho would remain unchanged by the proposed project and as such, the wildlife corridor values of the channel would remain intact. Under all circumstances, any disruption to the very localized use of the project sites by common wildlife species would not be regarded as a potentially significant impact pursuant to CEQA.

Traffic Impacts to Wildlife

Common wildlife associated with humans and urban development such as Virginia opossum (*Didelphis virginiana*), striped skunk (*Mephitis mephitis*) and raccoon (*Procyon lotor*) are often involved in vehicle collisions. However, the aforementioned species and other common wildlife species, including Mourning Dove (*Zenaida macroura*) and northern pacific rattlesnake (*Crotalus oreganus*), are not considered special-status or rare. In addition, while roadkill is present in the vicinity of the project sites, as is the case at any area with road traffic, the approximation included in Exhibit D of the comment letter is likely an overestimate, as the numbers are based on another study that is not directly comparable to the project area. Vasco Road is the principal north-south route between eastern Alameda and Contra Costa Counties, traveled by approximately 22,000 vehicles per day. Increased traffic to the project sites on local roadways, Isabel Avenue and West

Jack London Boulevard, is not comparable to the heavily trafficked Vasco Road, which is a corridor in the middle of hundreds of acres of protected open space lands and significant wildlife habitat. By contrast, Stanley Boulevard and I-580, near the project sites, are already heavily trafficked roads in a developed region and the increase in vehicles associated with the project sites would not contribute significantly to the existing traffic volumes on these roads daily. Moreover, regulations that protect common wildlife species that could be killed by vehicular traffic do not exist. As such, vehicle collisions that result in the mortality of wildlife do not constitute a significant impact pursuant to CEQA.

Western Burrowing Owl Mitigation

The CDFW has not released an official statement that the avian breeding season has changed. In M&A's experience, when permits are acquired from the CDFW, the nesting season window can vary slightly. Some permits say February 1 through August 31, while others say February 15 through September 1. The variation in start and end dates could be based on geography, as different geographic regions have slightly different nesting windows. In fact, the CDFW acknowledges a certain amount of variation in the 2012 CDFW Staff Report on Burrowing Owl Mitigation, which states, "In California, the burrowing owl breeding season extends from 1 February to 31 August (Haug et al. 1993, Thompsen 1971) with some variances by geographic location and climatic conditions." Nonetheless, in response to the comment, Mitigation Measure 4.3-2(a) included in the Draft EIR is hereby revised as follows:

Western Burrowing Owl

4.3-2(a) *If project construction begins during the western burrowing owl nesting season (February 1~~5~~ to August 31), a qualified biologist shall conduct targeted burrowing owl nest surveys within 14 days prior to construction activities using seven- to 20-foot transects. A separate preconstruction survey shall be conducted for SMP 39 and SMP 40 (including the off-site trail connection area) if the components of the project are not constructed concurrently. The survey shall include the project site and all accessible areas within 500 feet of the project impact zone, and shall follow CDFW guidelines outlined in the 2012 Staff Report on Burrowing Owl Mitigation. The results of the survey shall be submitted to the City of Livermore Community Development Department within 30 days of the completed survey. The survey report shall be valid for one construction season.*

If western burrowing owls are not detected on-site during the survey, further mitigation shall not be required. If any western burrowing owls are detected on-site, pursuant to the CDFW's 2012 Staff Report on Burrowing Owl Mitigation, the following restricted activity dates and setback distances shall be implemented:

- *From April 1 through October 15, low disturbance activities shall have a 200-meter buffer while high disturbance activities shall have a 500-meter buffer from occupied nests.*
- *From April 1 through August 15, medium disturbance activities shall have a 500-meter buffer from occupied nests. Medium disturbance activities can have a reduced buffer of 200 meters starting August 16 through October 15.*
- *From October 16 through March 31, low disturbance activities shall have a 50-meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities shall have a 500-meter buffer from occupied nests.*
- *Earth-moving activities or other disturbance shall not occur within the aforementioned buffer zones of occupied burrows*

unless monitoring of the nest site by a qualified biologist determines that the owls are acclimated to the disturbance and would not be disturbed by a smaller buffer. The buffer zones shall be fenced.

- *A qualified biologist shall delineate the extent of burrowing owl habitat on the site.*
- *Owls may be passively relocated from the project site between October 1 and February 1. Passive removal shall be conducted by a qualified biologist with demonstrated experience with passive relocation.*
- *Credits shall be purchased from a mitigation bank in coordination with CDFW and the City of Livermore to offset the project's habitat loss on the burrowing owl.*

A report detailing compliance with the provisions set forth herein shall be prepared by the qualified biologist and submitted for review and approval to the City of Livermore Community Development Department.

Further, M&A biologists have conducted several surveys, some of which are dated October 2000; March 11, 2002; May 11 and 20, 2002; June 14 and 25, 2002; September 2003, November 2013, June 10, 2019, November 2019, September 10, 2021, November 13, 2021, and June 15, 2022. The aforementioned surveys conducted in May and June were focused Burrowing Owl breeding season surveys conducted in accordance with the CDFW 1995 Staff Report protocol. Burrowing owl, or signs of burrowing owl, were not observed during any of the M&A surveys. Thus, based upon M&A's multiple surveys of the project site spanning multiple years, evidence suggests that burrowing owls have not nested on-site for the following reasons: (1) the grass grows very tall on SMP 40 in between discing activities, which does not allow ground nesting birds, such as the burrowing owl, an opportunity to detect aerial predators, which likely discourages them from nesting; (2) discing activities may disrupt nesting attempts.

Based on habitat assessments and past negative survey results, M&A believes that burrowing owls are unlikely to nest on-site. However, given that the burrowing owl is a mobile species, a mitigation measure for preconstruction surveys was provided in the Draft EIR to ensure that "take" of burrowing owls does not occur. The prescribed preconstruction surveys, consistent with "take avoidance surveys" outlined in the CDFW's Staff Report 2012, are sufficient and appropriate to detect nesting owls should the species be present on-site in light of the prior surveys' negative results, including a year of protocol-level breeding season surveys. Burrowing owls residing in topographically flat areas are typically easy to detect if surveys consist of walking transects using high-powered binoculars. As such, the mitigation measure included in the Draft EIR is sufficient to reduce any potential project impacts on burrowing owl to a less-than-significant level.

Tricolored Blackbird Mitigation

As stated above, M&A biologists have been on both project sites multiple times over the last 20 years. Tricolored blackbirds have not been observed on-site and on-site habitat for the species is marginal, as the sites are routinely disturbed, water is not present on SMP 39, and Arroyo Mocho at SMP 40 is typically dry during the middle to end of the nesting season. The tricolored blackbird prefers nesting near water. The preconstruction surveys proposed in the Draft EIR to determine if tricolored blackbird is nesting on-site are sufficient to detect the species' presence. The species can also be looked for during the burrowing owl surveys, which will take place at the same time as tricolored blackbird nesting season.

Nesting Bird and Raptor Mitigation
As discussed above, the CDFW has not released an official statement that the avian breeding season has changed. In M&A's experience when permits are acquired from the CDFW, the nesting season window can vary slightly, as different geographic regions have slightly different nesting windows.

In addition, with regard to nest detection, while grassland nesting birds are difficult to detect, M&A biologists are experienced in surveying for ground-nesting and short grass nesting birds and have had success finding nests in the past. Typically, if pedestrian walking transect surveys are conducted by two or more people walking closely together, nests will be found. Further, if experienced consulting biologists are hired to conduct the nesting bird surveys, the biologists will know the appropriate methods to survey for nesting passerine birds, including the Loggerhead Shrike, and raptors. The most suitable habitat for Loggerhead Shrike on the project sites is along SMP 40's riparian corridor, which will be preserved by the project. Many trees along the riparian corridor and south of the project site could serve as a blind for the observer to hide behind and watch bird behavior to determine if birds are nesting. Finally, the qualified biologist making the nesting buffer determination would provide a report to the City of Livermore and communication between the City of Livermore, the applicant's biologist, and the construction team would be ongoing throughout the construction period. The biologist will ensure that the buffer is maintained throughout construction to ensure that the nesting attempt is protected.

While development does remove potential bird nesting habitat, the project applicant is avoiding the riparian corridor on the SMP 40 project site, which is the most valuable nesting habitat on-site. Additionally, in accordance with City of Livermore General Plan Policy OSC-1.3 P1, as presented on page 4.3-21 of the Draft EIR, the proposed project is required to landscape with native vegetation.

Based on the above, changes to the Draft EIR mitigation for nesting birds and raptors are not warranted.

<u>Comment II(C) Related to Construction Noise</u>
As discussed on page 4.6-21 of the Draft EIR, due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated, based on the professional judgment of the project noise consultant, that construction noise associated with SMP 39 would be below the City of Livermore's exterior noise level threshold at the nearest sensitive receptor locations. In response to the comments regarding construction noise impacts associated with SMP 39, Salter, the project noise consultant who prepared the project-specific Environmental Noise Studies used in the Draft EIR analysis, estimated the construction noise levels associated with SMP 39 at the nearest noise sensitive receptor to the site (see Attachment 2). In addition, in response to the comments regarding construction noise impacts associated with SMP 40, Salter provided an updated analysis of construction noise associated with SMP 40 (see Attachment 3). Because construction is not permitted during nighttime hours (pursuant to Section 9.36.080 of the Livermore Municipal Code), the applicable noise level threshold for construction noise levels associated with SMP 39 and SMP 40 would be 70 dBA L_{max}, as established by the City of Livermore (see Draft EIR page 4.6-14 and General Plan Policy N-1.5 P3).

The commenter alleges that Table 9-7, Land Use Compatibility Guidelines for Exterior Noise, of the General Plan applies to construction noise; this is not correct. As stated in General Plan Policy N-1.1 P4, presented on page 4.6-8 of the Draft EIR, the City shall use the Land Use Compatibility Guidelines for Exterior Noise (measured in dBA CNEL or L_{dn}) contained in Table 9-7 (i.e., the DNL 60 dBA exterior noise level standard referenced in the comment letter) to direct the siting, design, and insulation of new development to reduce exposure to excessive noise. Construction

noise standards are established in General Plan Policies N-1.5 P2, P3, and P4, as presented on page 4.6-12 of the Draft EIR, which do not include a DNL standard. In particular, General Plan Policy N-1.5 P3 states that in order to allow for temporary construction, demolition or maintenance noise and other necessary short-term noise events, the stationary noise standards in Policy N-1.5.P1 shall not be exceeded within the receiving land use by more than 15 dBA for any period of time. General Plan Policy N-1.5.P1 requires that industrial and commercial uses be designed and operated so as to avoid the generation of noise effects on surrounding sensitive land uses from exceeding 55 dBA L_{50} during the hours of 7:00 AM to 10:00 PM and 45 dBA L_{50} during the hours of 10:00 PM to 7:00 AM. Thus, for analysis purposes of project construction noise within the Draft EIR, the threshold of significance for the maximum allowable construction noise level at a sensitive receptor is 70 dB L_{max} during daytime hours and 60 dB L_{max} during nighttime hours (i.e., 15 dB above the numerical criteria listed in P1). Consequently, the DNL 60 dBA exterior noise level standard included in the comment letter would not apply to the temporary, intermittent construction noise associated with either SMP 39 or SMP 40.

Based on the comments regarding construction noise impacts associated with SMP 39 and SMP 40, pages 4.6-21 through 4.6-24 of the Draft EIR are hereby revised as follows. Such revisions are also reflected in the Revised Environmental Noise Studies for SMP 39 and SMP 40, included as Attachment 2 and Attachment 3 to this memo. It should be noted that all revisions to pages 4.6-22 through 4.6-24 of the Draft EIR previously included in the Final EIR are also shown in ~~strikethrough~~ and <u>double underlined</u> text below.

> ~~Due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated that~~ <u>The noise levels generated by construction equipment would vary greatly depending upon factors such as the type and specific model of the equipment, the operation being performed, the condition of the equipment and the prevailing wind direction. Table 4.6-6 shows maximum noise levels associated with each piece of construction equipment anticipated to be used during construction of SMP 39 at a reference level of 50 feet, as well as at 2,640 feet, which is the distance from Building 1 on the SMP 39 site to the nearest sensitive receptors (the residences located across Isabel Avenue to the east). Based on the project-specific construction schedule assumed in the air quality analysis conducted for SMP 39, Table 4.6-7 summarizes the anticipated construction equipment associated with each phase of project construction, and the relative sound levels at the nearest residential property (approximately 2,640 feet away), assuming that equipment is running simultaneously during each phase of construction. As shown in Table 4.6-7,</u> construction noise associated with SMP 39 <u>would range between 59 and 61 dBA L_{max},</u> ~~be~~ <u>which would be</u> below the City of Livermore's exterior noise level threshold of ~~60~~ <u>70</u> dBA ~~DNL~~ <u>L_{max}</u> at the nearest sensitive receptor locations. ~~Thus, construction noise levels for SMP 39 were not evaluated as part of the Environmental Noise Study prepared for SMP 39. Therefore, the following discussion focuses on SMP 40 and the off-site trail connections.~~

Table 4.6-6
Typical Construction Equipment Noise at SMP 39

Source: Salter, 2024.

As shown in ~~the table~~ Table 4.6-7, construction of SMP 40 is predicted to generate noise levels ranging between ~~16~~ 70 to ~~32~~ 73 dBA L_{max} at the nearest noise-sensitive receptors. As discussed in detail above, for analysis purposes of project construction noise within this EIR, a threshold of significance for the maximum allowable construction noise level at a sensitive receptor has been assumed to be 70 dB L_{max} during daytime hours ~~and 60 dB L_{max} during nighttime hours~~. Because construction is not permitted during nighttime hours (pursuant to Section 9.36.080 of the Livermore Municipal Code), the 60 dB L_{max} noise level standard for nighttime hours would not apply to the proposed project. ~~Accordingly~~ Nonetheless, the maximum predicted construction noise level of ~~32~~ 73 dBA L_{max} associated with SMP 40 would be ~~below~~ above the threshold~~s~~ of significance being applied.

The three potential off-site trail connection options would be located approximately 160 feet, 150 feet, and 200 feet, respectively, west of the nearest single-family residences. The anticipated construction activities required for the trail connection options would use construction equipment anticipated to generate maximum noise levels of up to 85 dB at a distance of 50 feet. As previously noted, stationary noise sources lessen at a rate of approximately six dB per doubling of distance from the source. Therefore, at a distance of 160 feet, construction equipment associated with Trail Connection Option 1 would generate maximum noise levels of up to 75 dB L_{max}; at a distance of 150 feet, construction equipment associated with Trail Connection Option 2 would generate maximum noise levels of up to 76 dB L_{max}; and at a distance of 200 feet, construction equipment associated with Trail Connection Option 3 would generate maximum noise levels of up to 73 dB L_{max}. Thus, construction activities associated with development of the off-site trail connection options would exceed the thresholds of significance being applied of 70 dB L_{max} during daytime hours ~~and 60 dB L_{max} during nighttime hours~~.

Based on the above, construction-related noise associated with SMP 39 ~~and SMP 40~~ would not result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local

general plan or noise ordinance, or applicable standards of other agencies. However, while construction activities are temporary in nature and would be exempt during the hours of 7:00 AM to 8:00 PM, construction-related noise associated with SMP 40 and the off-site trail connection could result in disturbance to existing noise-sensitive land uses in the project vicinity.

Therefore, construction-related noise associated with the proposed project could be considered to result in generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, and impacts would be considered ***significant***.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

4.6-1(a) *Prior to issuance of a grading permit for SMP 40, the project applicant shall prepare a construction noise management plan that identifies measures to be taken to minimize construction noise on surrounding sensitive land uses and include specific noise management measures to be included within the plans and specifications for SMP 40, subject to review and approval by the City of Livermore Community Development Department. The project applicant shall demonstrate, to the satisfaction of the City that the project complies with the following:*

- *Consistent with the Livermore Municipal Code, construction shall be limited to weekdays between the hours of 7:00 AM and 8:00 PM and Saturdays through Sunday between the hours of 9:00 AM and 6:00 PM.*
- *Either a temporary noise barrier shall be built prior to development of the planned berm on the east side of the project site, or the berm shall be built prior to construction activities. The barrier/berm shall be a minimum of 10 feet tall. The barrier can be field-built provided it meets the following criteria:*
    - *The barrier shall be constructed to have a minimum surface density of four pounds per square foot (psf). For example, a stud wall with exterior-grade plywood sheathing and a stucco finish (or two layers of 5/8-inch thick plywood).*
    - *The barrier shall be free of cracks, and drainage holes/slots along the bottom of the barrier shall be kept to a minimum. Where needed, drainage holes/slots shall be covered by one psf mass-loaded vinyl flaps (e.g., Kinetics KNM-100) so water can flow around the vinyl and still drain.*
    - *Joints between sheathing layers shall be offset by 16 inches minimum.*
- *Contractors shall use "quiet" models of air compressors and other stationary noise sources, where technology exists.*
- *Internal combustion engine-driven equipment shall be equipped with mufflers which are in good condition and appropriate for the equipment.*
- *Stationary noise-generating equipment, such as air compressors and portable power generators, shall be located as far away as possible from adjacent property lines.*

- *Staging areas and construction material areas shall be located as far away as feasible from adjacent residences.*
- *All unnecessary idling of internal combustion engines should be prohibited.*
- *The contractor shall designate a "noise disturbance construction superintendent" who will be responsible for tracking and responding to any complaints about construction noise. The noise disturbance construction superintendent shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall require that reasonable measures are implemented to correct the problem. The telephone number for the noise disturbance construction superintendent shall be posted at the construction site and included in any construction notices sent to neighbors.*

4.6-1(b) *Prior to issuance of a grading permit for the chosen off-site trail connection option, the project applicant shall prepare a construction noise management plan that identifies measures to be taken to minimize construction noise on surrounding sensitive land uses and include specific noise management measures to be included within the plans and specifications for the trail connection option, subject to review and approval by the City of Livermore Community Development Department. The project applicant shall demonstrate, to the satisfaction of the City that the project complies with the following:*

- *All heavy construction equipment used on the proposed project shall be maintained in good operating condition, with all internal combustion, engine-driven equipment fitted with intake and exhaust mufflers that are in good condition.*
- *All mobile or fixed noise producing equipment used on the proposed project that is regulated for noise output by a local, state, or federal agency shall comply with such regulations while ~~in the source of~~ involved with a project activity.*
- *Where feasible, electrically-powered equipment shall be used instead of pneumatic or internal combustion powered equipment.*
- *All stationary noise-generating equipment shall be located as far away as possible from the nearest residential uses.*
- *Signs prohibiting unnecessary idling of internal combustion engines shall be posted at entrances to construction sites and at construction equipment staging areas.*
- *The use of noise-producing signals, including horns, whistles, alarms and bells shall be for safety warning purposes only.*
- *The use of temporary sound barriers shall be incorporated along the outer work area of the construction site, east of Isabel Avenue/SR 84. Barrier height and location(s) shall be determined by a qualified acoustical engineer to ensure that the resultant construction noise levels at the nearest residence would meet the applicable standard. The sound barrier fencing shall consist of 0.5-inch plywood or minimum STC 27 sound curtains placed to shield nearby sensitive receptors. The plywood barrier shall be free from gaps, openings, or penetrations to ensure maximum performance.*

Due to the addition of Table 4.6-7, all subsequent tables included in Chapter 4.6, Noise, of the Draft EIR are hereby renumbered accordingly.

While a new mitigation measure (Mitigation Measure 4.6-1[a]) has been added as part of the text revisions above, under *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1993) 6 C4th 1112 (*Laurel Heights II*) and Section 15088.5 of the State CEQA Guidelines,[2] a lead agency is only required to recirculate a draft EIR when "significant new information" is added to the document after public notice is given of the availability of the Draft EIR for public review under Section 15087 but before certification. Pursuant to CEQA Guidelines Section 15088.5, the term "information" can include changes in the project or environmental setting, as well as additional data or other information. New information added to an EIR is not considered "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the City has decided not to implement. "Significant new information" requiring recirculation includes any of the following:

1. A new significant environmental impact would result from the project or for a new mitigation measure proposed to be implemented.
2. A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
3. A feasible project alternative or mitigation measure considerably different from other previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
4. The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

In the case of the proposed project, the Draft EIR already determined that the proposed project would result in a significant temporary construction noise impact (see page 4.6-23 of the Draft EIR). Thus, a new noise impact has not been identified in response to public comments. Rather, in response to public comments, a new construction noise mitigation measure (Mitigation Measure 4.6-1[a]) has been added that would clearly lessen the potential environmental impact to a less-than-significant level, and the applicant has agreed to adopt Mitigation Measure 4.6-1(a). In addition, the requirements of Mitigation Measure 4.6-1(a) are similar to the requirements already included in Mitigation Measure 4.6-1 of the Draft EIR. Thus, according to Section 15188.5(a)(3), recirculation is not required.

The Mitigation Monitoring and Reporting Program, as well as the Findings, Facts in Support Of Findings, and Statement Of Overriding Considerations, will be updated in accordance with the changes shown above and included in the staff report packet for the City Council hearing on the proposed project.

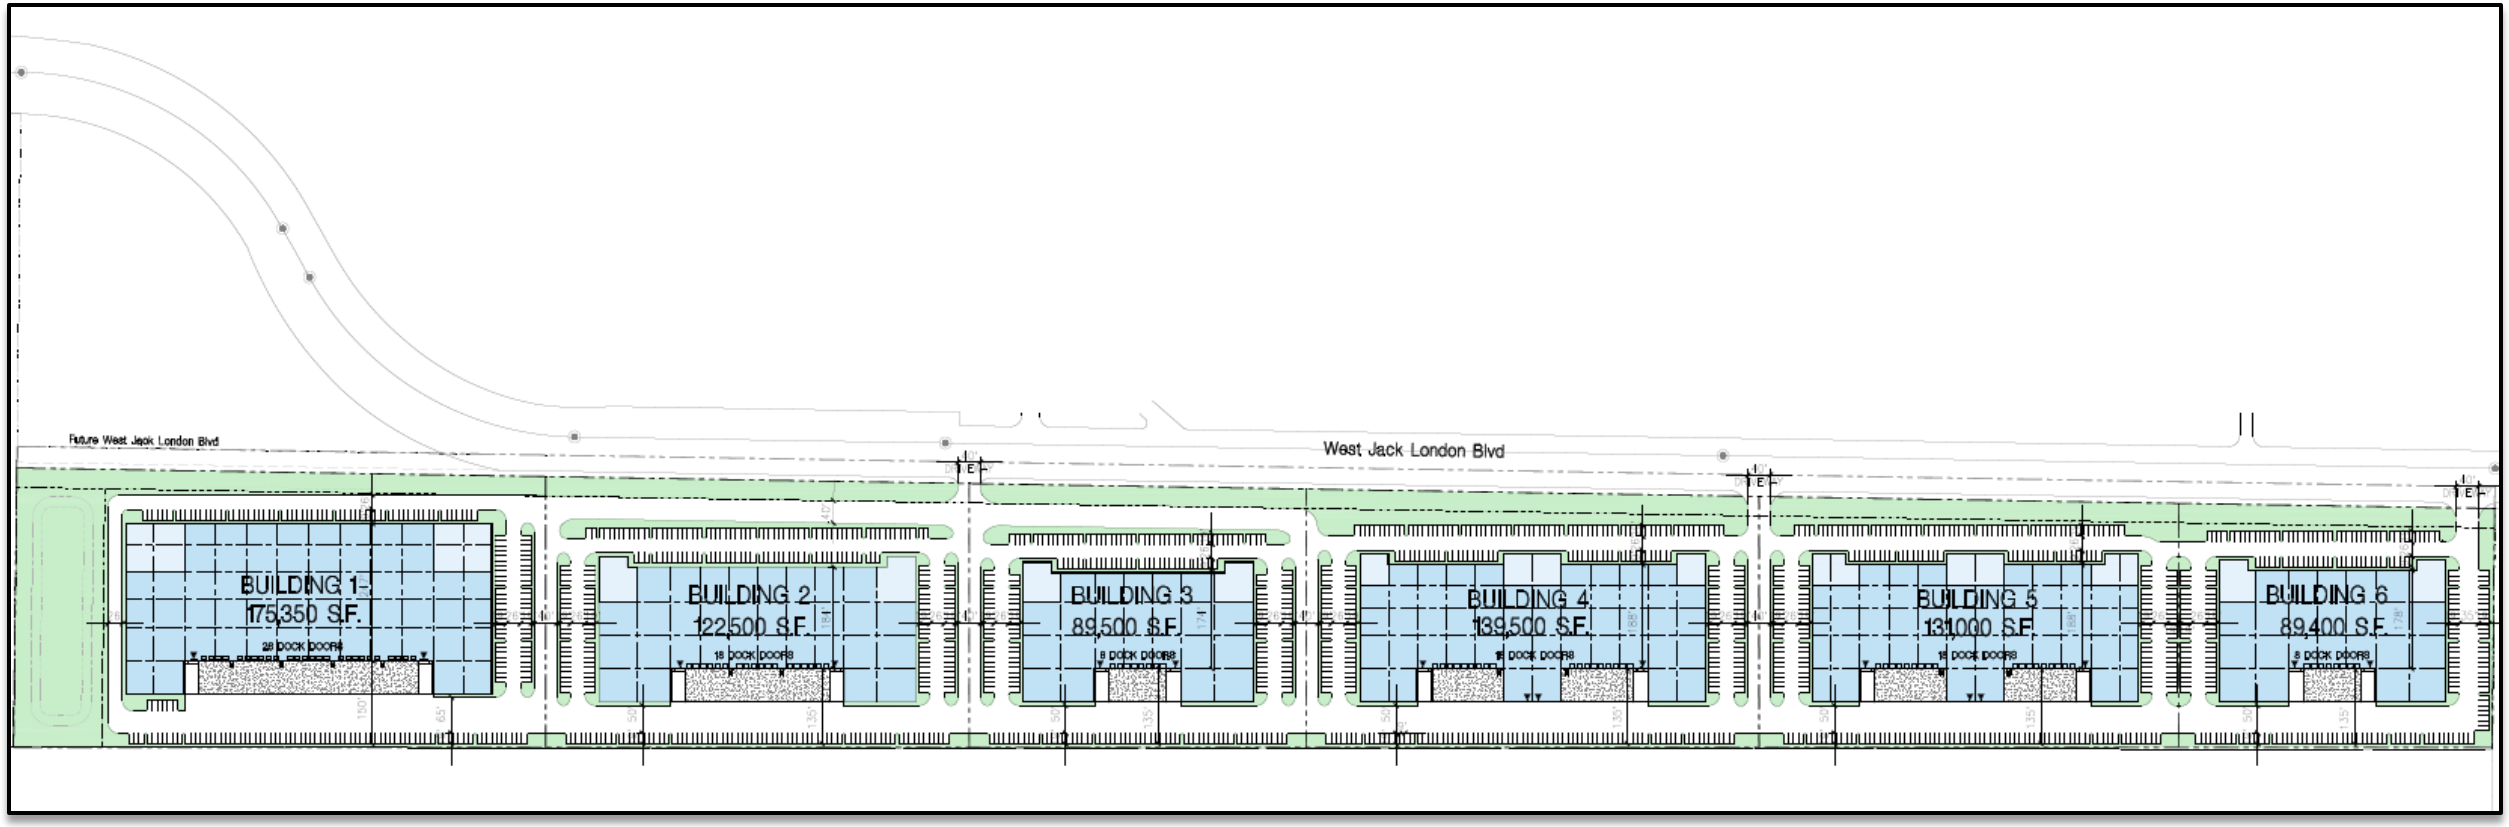
Surface Mining Permit (SMP) 39/40 Project
Planning Commission

Presented by Ashley Vera

March 5, 2024

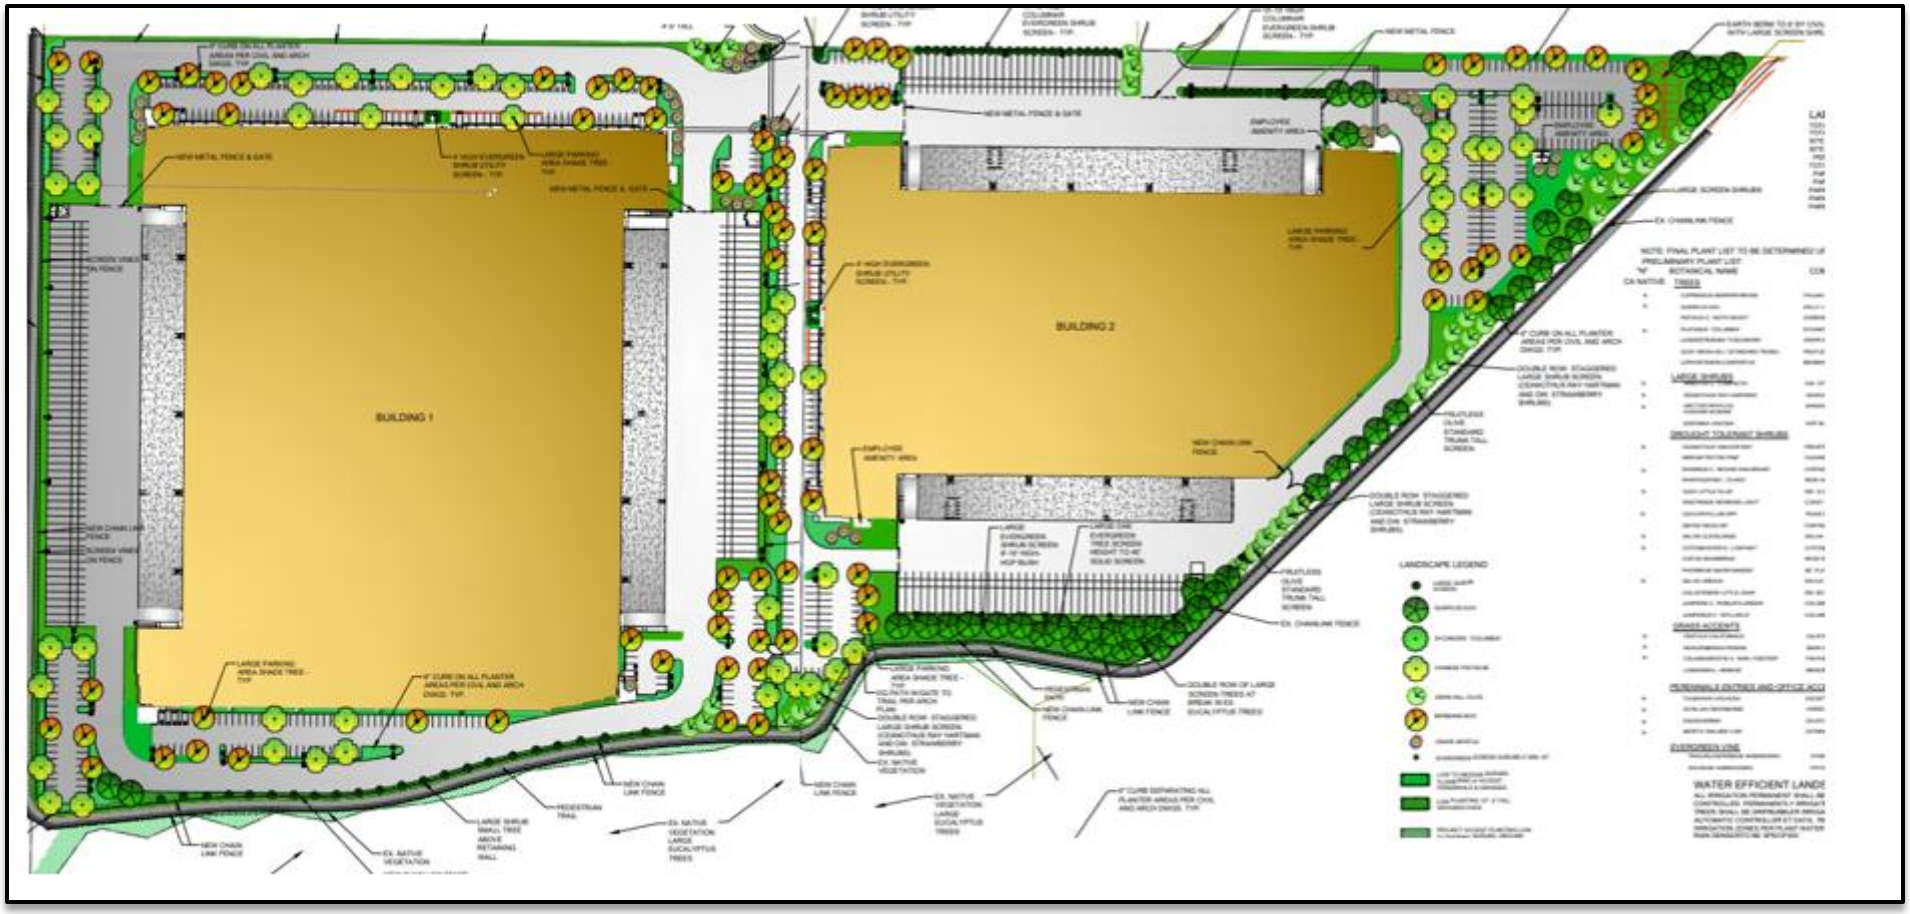
LIVERMORE



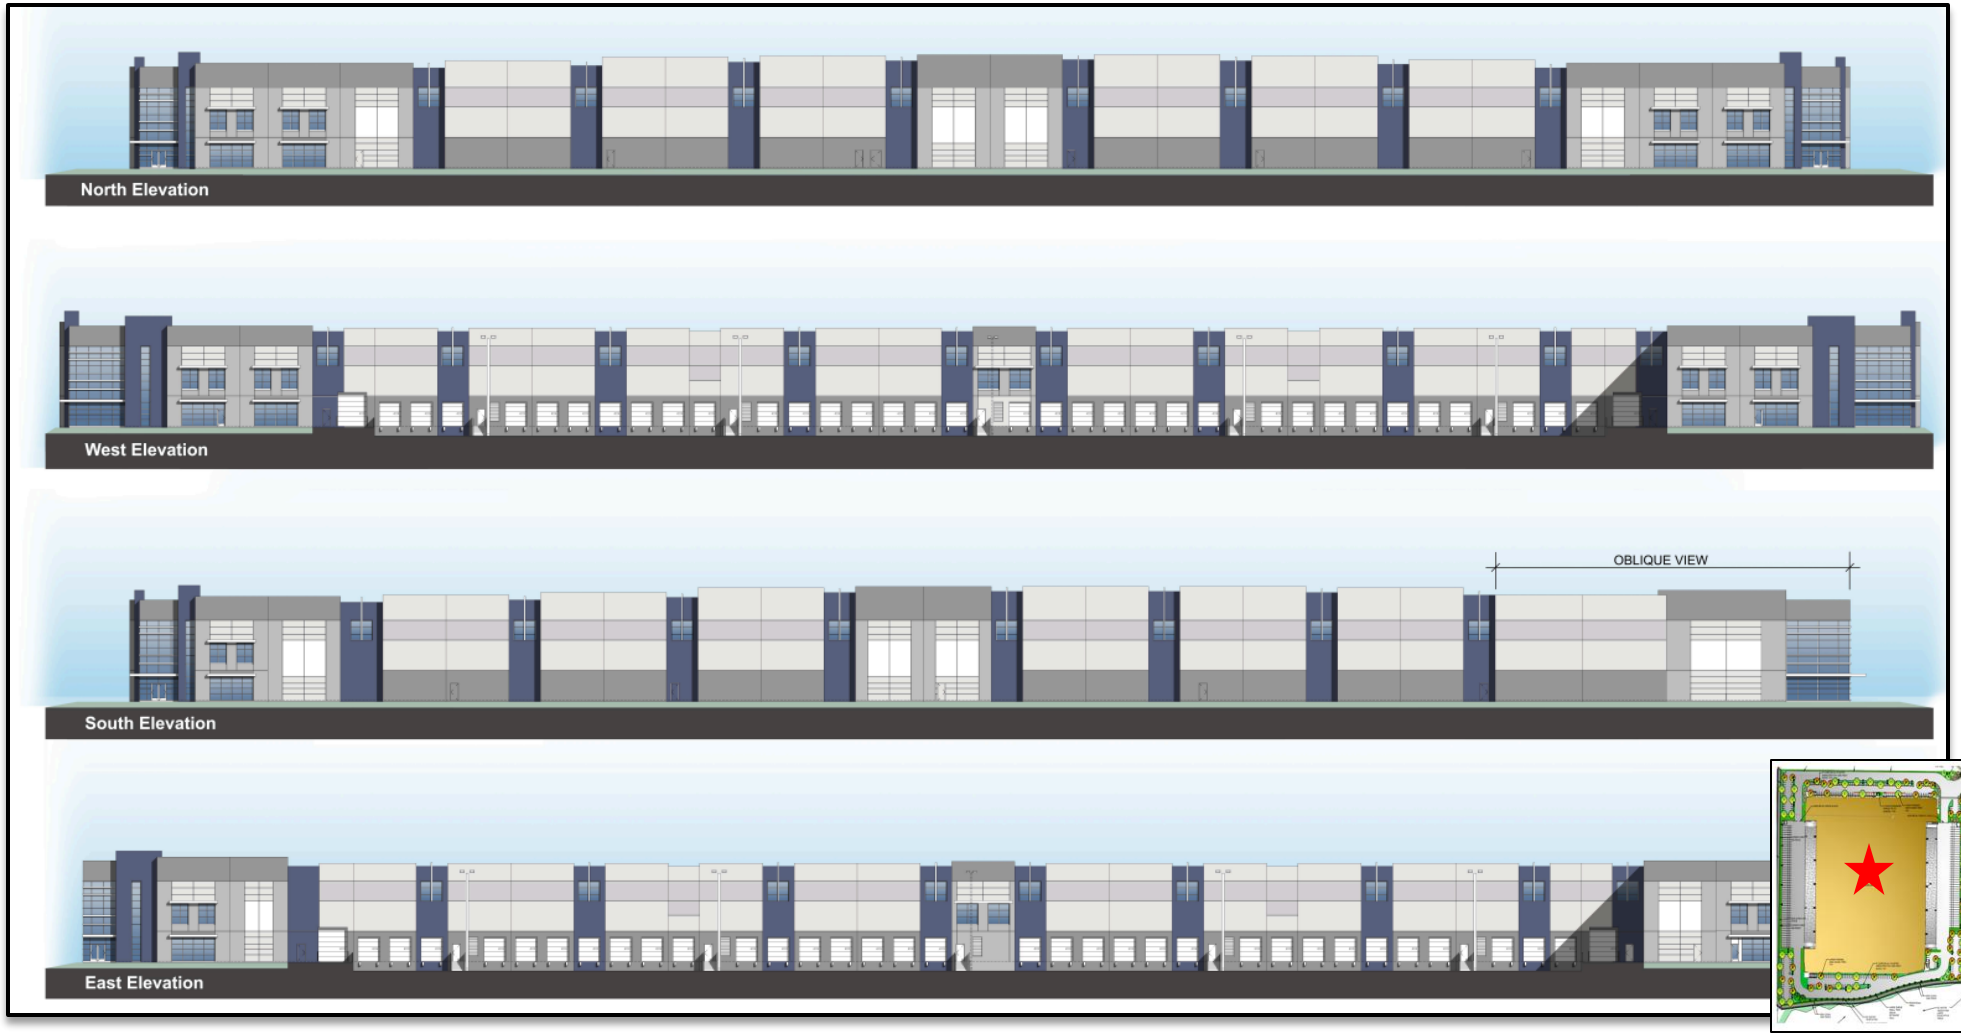
Project Location

Entitlement/Action Summary

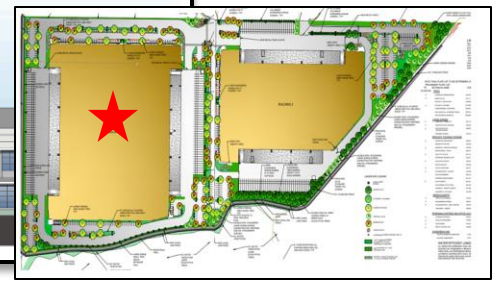
- General Plan Amendment
- Annexation/Prezoning
- Zoning Map Amendment/Planned Development District/Development Code Amendment
- Vesting Tentative Subdivision Map (2)
- Development Agreement (2)
- Site Plan Design Review (1)
- EIR Certification
- LAFCo application submittal



SMP 39 Conceptual Site Plan



Revised Engineering Consideration

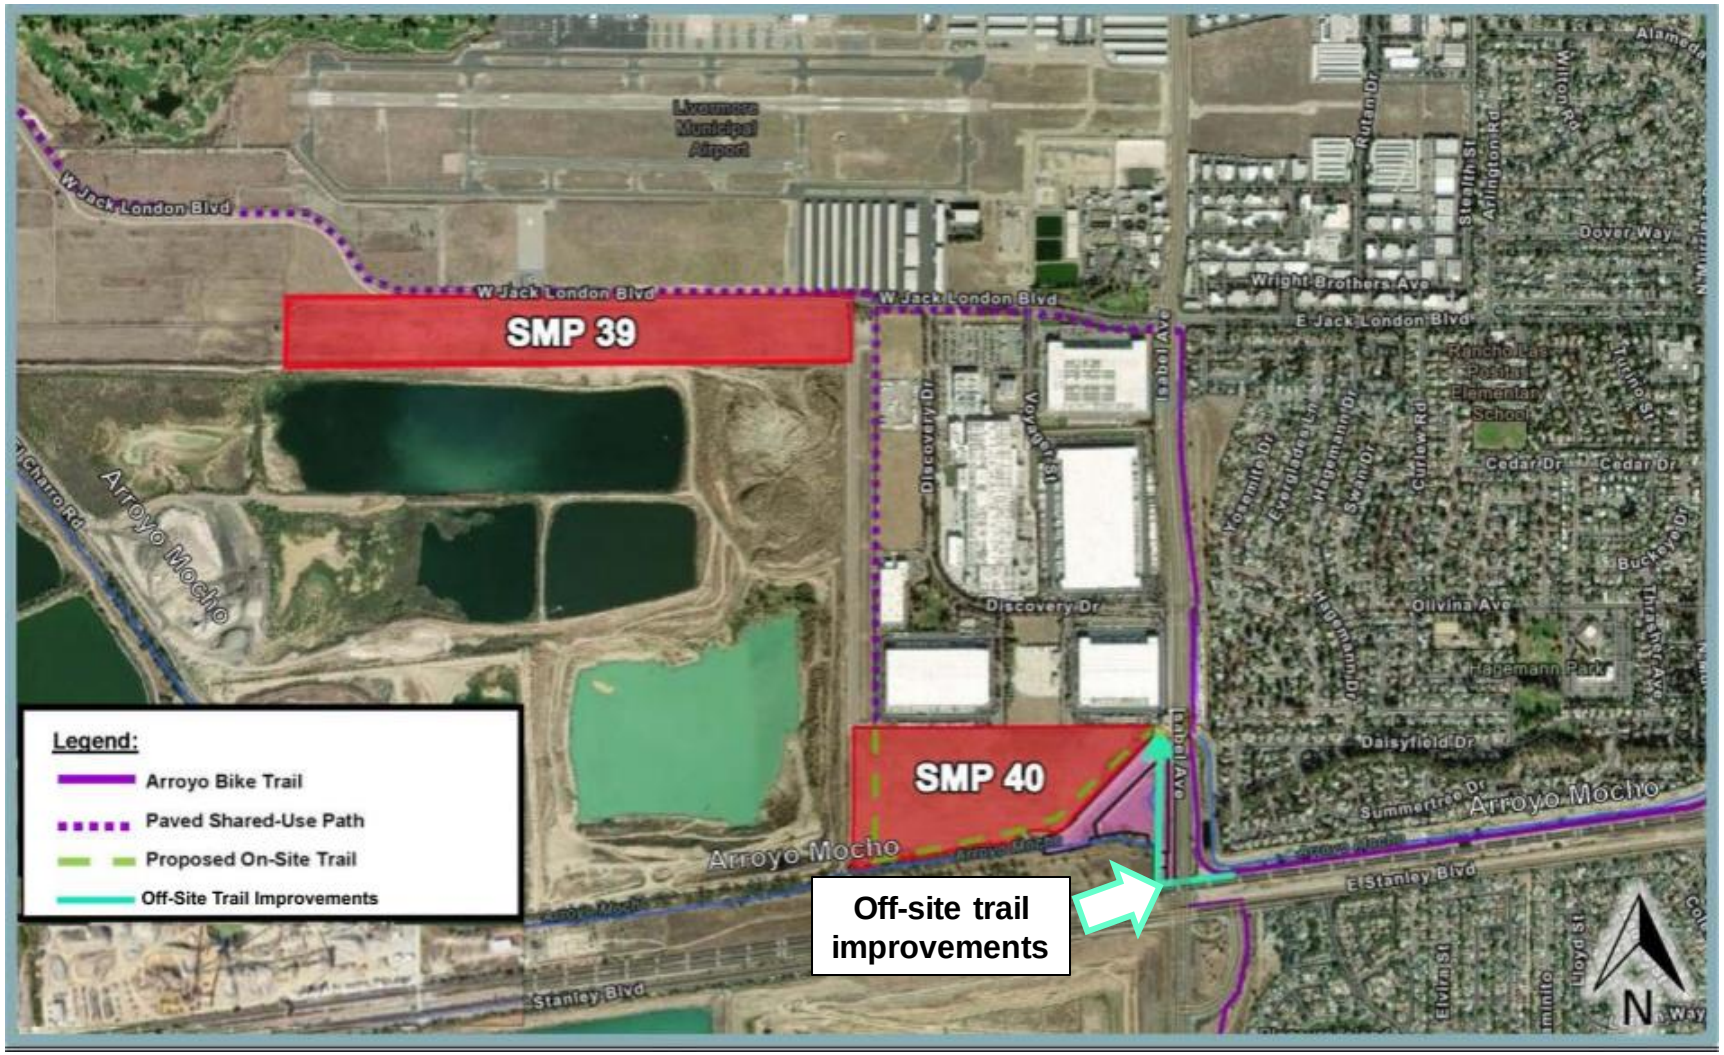


The widening of West Jack London Boulevard shall include the installation of streetlights. The final layout of the streetlights will be determined by the City Engineer during the development of improvement plans for the street widening.

SMP 40 Site Plan

SMP 40 Elevations – Western Building

SMP 40 Elevations – Eastern Building



LIVERMORE CALIFORNIA

Planned Development Zoning

Light industrial uses including:

- Research and development facilities
- Professional and administrative offices
- Experimental and testing laboratories
- Manufacturing uses
- Warehouse and distribution – permitted on SMP 40, conditionally permitted on SMP 39 and limited to 20% of buildable area

Trail Improvements

Development Agreement

- Developer financial contribution toward marketing SMP 39 towards desired uses in PD-I 22-001
- Developer financial contribution and construction of off-site trail improvements
- Forfeiture of mining rights

EIR Topics Analyzed

- Agricultural Resources
- Air Quality, Greenhouse Gas Emissions, and Energy
- Biological Resources
- Cultural and Tribal Cultural Resources
- Hydrology and Water Quality
- Noise
- Public Services, Utilities, and Service Systems
- Transportation

EIR Impact Summary

Less than Significant with Mitigation:

- Air Quality, Greenhouse Gases and Energy
- Biological Resources
- Cultural and Tribal Cultural Resources
- Hydrology and Water Quality
- Public Services, Utilities and Service Systems
- Noise
- Transportation

Significant and Unavoidable:

- Agricultural Resources

Statement of Overriding Considerations

- Revitalizes underutilized lands appropriate for infill development and which are compatible with surrounding development
- Promotes industrial development consistent with the General Plan
- Provides opportunity for local jobs with competitive salaries
- Creates logical boundaries which align with the City's UGB
- Includes improvements to West Jack London Boulevard and on and off-site trail improvements
- Generates long-term sustainable property and potential sales tax revenue

Next Steps

- City Council – March 25
- LAFCo – Spring 2024

Staff Recommendation

Staff recommends the Planning Commission recommend City Council:

1. Adopt a resolution certifying the Final Environmental Impact Report (including the Supplemental Response to Comments and Errata) pursuant to the California Environmental Quality Act (CEQA); and

2. Adopt a resolution approving Annexation/Prezoning (APZ) 21-003, Pre-Annexation and Development Agreement (DA) 21-001, Pre-Annexation and Development Agreement (DA) 23-002, General Plan Amendment (GPA) 21-001, Zoning Map Amendment (ZMA) 21-002, Development Code Amendment (DCA) 21-005, Planned Development Industrial (PD-I) 22-001, Vesting Tentative Parcel Map (SUB) 21-008, Vesting Tentative Tract Map (SUB) 21-009, and Site Plan Design Review (SPDR) 21-008, subject to conditions of approval as modified by staff.

OMP OAKS BUSINESS PARK

LIVERMORE CALIFORNIA

SITE HISTORY

- SMP-39 AND SMP-40 owned by Pleasanton Gravel Company in excess of 50 years
- Vacant grassland with Surface Mining Permits
- PCG Acquired these properties with the intention of mining these properties
- PGC-OMP Introduction and agreement since 2019
- OMP working on this project with City of Livermore over 3 years

PROJECT BENEFITS

ATTACHMENT 3

- Hundreds of new high quality jobs and tens of millions of dollars in annual salaries and wages
- Annex property into the City of Livermore. Long term tax revenue
- Combination of warehouse/Dist. and Advance Mfg. jobs
- Hundreds of new construction jobs- Sheet Metals Workers Local 104, IBEW, Sprinkler Fitters, Ironworkers, UA P&S

PROJECT BENEFITS

ATTACHMENT 3

- Additional Revenue for the City of Livermore, MUSD, and other agencies
- Improved Jobs – Housing Balance- reduce commute times
- Expansion Opportunities for a new or existing companies in Livermore- Building 1
- Support for Livermore retail and restaurants
- Arroyo Mucho Trail Connection- get bikes off Isabel/Jack London

ECONOMIC BENEFITS SMP 40 ONLY

(Source Kosmont & Assoc)

Over $14 million in one-time development fees	→	Development Impact and City Fees
One time $ 792,000 in LVJUSD Fees + $280,000/yr.	→	Funding Local Schools
$180,000/yr. of $3.6 million over 20 years in direct revenues to support resident services. $79,000/yr. for LARPD	→	Police and Fire Services Parks and Recreation

PLANNING COMMISSION
MARCH 5, 2024

REGULAR MEETING

1. CALL TO ORDER – The meeting of the Planning Commission was called to order by Chairperson Jacob Anderson at 7:00 pm, held in person at 1016 S. Livermore Avenue.

ROLL CALL – Present: Chairperson Jacob Anderson, Vice-Chairperson Yolanda Fintschenko, Commissioner Steven Dunbar, Commissioner Daniel Leary, Commissioner Tracy Kronzak.

PLEDGE OF ALLEGIANCE

3. OPEN FORUM

Chairperson Anderson opened the public comment period.

Weng Tam, provided a comment.

There were no more speakers, and the public comment period was closed.

4. CONSENT CALENDAR - NONE

5. PUBLIC HEARINGS

5.1 Hearing to consider a request for an Annexation/Prezoning, Pre-Annexation and Development Agreements, General Plan Amendment, Zoning Map Amendment, Development Code Amendment, Vesting Tentative Parcel Map, Vesting Tentative Tract Map, Planned Development, and Site Plan Design Review for the SMP 39 and 40 Project to zone for and develop light industrial uses near the northwest part of the City.

Recommendation:

Staff recommends the Planning Commission recommend the City Council take the following actions to authorize the future development of light industrial buildings on the SMP 39 and SMP 40 properties:

1. Adopt a resolution certifying the Final Environmental Impact Report pursuant to the California Environmental Quality Act (CEQA); and
2. Adopt a resolution approving Annexation/Prezoning (APZ) 21-003, Pre-Annexation and Development Agreement (DA) 21-001, Pre-Annexation and Development Agreement (DA) 23-002, General Plan Amendment (GPA) 21-001, Zoning Map Amendment (ZMA) 21-002, Development Code Amendment (DCA) 21-005, Planned Development-Industrial (PD-I) 22-001, Vesting Tentative Parcel Map (SUB) 21-008, Vesting Tentative

Senior Planner Ashley Vera presented the staff report.

The Developer, Timur Tecimer, Managing Partner, CEO, Overton Moore Properties, presented an overview of the project

Chairperson Anderson opened the public comment period.

Jason Camara, provided a comment in support of the project.

Jean King, provided a comment in support of the project.

Brian Werner, provided a comment in support of the project.

Joel Toscano, provided a comment in opposition of the project.

Ruhama Tereda, provided a comment in opposition of the project.

There were no more speakers, and the public comment period was closed.

In response to Commissioner Leary, Senior Planner Vera explained that the noise levels were consistent with those allowed in the General Plan, except for construction noise which required mitigation. She clarified that the Planning Commission could require reporting for more than three years under Mitigation Measure 4.8-3. Ms. Vera explained that the City of Pleasanton was taking a resolution to its Council on March 19, 2024, to support SMP 39 going to Livermore and that Surface Mining Permit (SMP) 38 was no longer part of the project. Commissioner Leary discussed the letter from the Regional Water Quality Control Board regarding storm water quality or hydromodification controls. Senior Civil Engineer Debbie Salgado clarified that the issues had been clarified with the Water Board. Civil Engineer Adam Mahony explained removal of the 100-year overflow and that flows could drain towards the Oaks Business Park retention basin and would be overland release.

In response Commissioner Kronzak, Senior Planner Vera explained that CEQA evaluated the likelihood of habitat occurrence on a site and the impact of development. She stated the 884-foot noise measurement was from the northeast side of the building. She discussed the necessary coordination and permits from Caltrans, PGE and Zone 7 required for the overpass crossing; timelines in the

Development Agreement for construction of the trail; and timeline for Alameda County Local Agency Formation Commission (LAFCO) required consent letters for annexation in advance of the construction.

In response to Commissioner Dunbar, Senior Planner Vera confirmed that it was not the responsibility of an EIR to mitigate Vehicle Miles Travelled (VMT) beyond that required to mitigate significant impact; nor the responsibility of the developer to mitigate VMT beyond the City's determination of their fair share of mitigation set by the development impact fees. She stated onsite trail improvements would be part of the Citywide Community Facilities District and the Citywide Benefit Fund was not fully developed.

In response to Commissioner Dunbar, Timur Tecimer, Managing Partner, CEO, Overton Moore Properties, Developer, explained that both buildings would have secured yards and there would be bike racks around the building.

Commissioner Dunbar concurred with the idea of a longer review period for the Transportation Demand Management Program (TDM), which includes an employee carpool program,

In response to Vice-Chairperson Fintschenko, Senior Planner Vera explained the difference between a tentative tract map and tentative parcel map. She discussed costs associated with reporting on the carpooling program. Mr. Tecimer stated the cost would be borne by the tenant and that they were not opposed to extending the TDM reporting requirement but would request reporting be ended if the third year showed mitigation was performed. Senior Planner Vera explained that CEQA covered transportation related impacts to both construction and operation of the project. She stated she did not know why the Golden State Environmental Justice Organization in Southern California was interested in development in Northern California. She explained coordination between all agencies to ensure mitigation measures were met; and confirmed that no agricultural uses were proposed and no agriculture uses were occurring on the project site. She stated it was unlikely that the number of agricultural jobs would be greater than jobs created for industrial development. Ms. Vera clarified that fast food, banks and personal uses would be considered conditional uses and other uses providing goods for the convenience and support of the surrounding occupants would also require a CUP and be brought to the Planning Commission for review and approval.

Chairperson Anderson expressed appreciation for site lines in the development plan and appreciation to the applicant for making changes to reduce noise impacts. He suggested a better shading tree for the employee amenities area.

Commissioner Leary indicated he could make the required findings. Mr. Tecimer confirmed that Kosmont and Associates had conducted an economic analysis for both SMP 39 and 40 and determined the benefits to the City.

In response to Commissioner Kronzak, Acting Planning Manager Steve Riley stated, in the past, there had been noise complaints from loading at Tesla building north of the project site but there were very few complaints over the last few years.

Commissioner Kronzak discussed the need to ensure the EIR met the full requirements of the State of California. In response to Commissioner Kronzak, Senior Planner Vera confirmed that zoning to Open Space Floodplain was appropriate for the Annexation-Only parcels just east of SMP 40.

Commissioner Dunbar confirmed that, with mitigations, the project complied with Level of Service (LOS) standards and that Airway Boulevard intersection was exempt. Senior Planner Vera stated staff was open to looking into fencing and access in coordination with Zone 7. She discussed the trail to the parking lot. Commissioner Dunbar suggested it be concrete with ramp to parking lot. Mr. Tecimer indicated they would look into it. Commissioner Dunbar confirmed that the design of Jack London Boulevard was prescribed by the General Plan and suggested consideration of the long-term asset management plan for the street. He discussed the jobs - housing balance and match and stated the findings could be made. He expressed concern about the grade on the proposed trail options and suggested Option 3. He urged careful attention to the trail crossing on Jack London for safety and indicated he could make all the required findings.

Vice-Chairperson Fintschenko indicated and provided reasons for being able to make the required findings and indicated support for Trail Option 3.

The Commission discussed the suggestion to increase VMT reporting beyond three years and determined to defer to staff to amend the three-year reporting requirement between 3-8 years.

In response to Commissioner Leary, Mr. Tecimer explained that the proposed buildings were not ideal for e-commerce facilities.

ON THE MOTION OF COMMISSIONER LEARY, SECONDED BY VICE-CHAIR FINTSCHENKO AND CARRIED ON A 5-0 VOTE, THE PLANNING COMMISSION ADOPTED THE FOLLOWING RESOLUTIONS:

Resolution 02-24 certifying the Final Environmental Impact Report

Resolution 03-24 approving Annexation/Prezoning (APZ) 21-003, Pre-Annexation and Development Agreement (DA) 21-001, Pre-Annexation and Development Agreement (DA) 23-002, General Plan Amendment (GPA) 21-001, Zoning Map Amendment (ZMA) 21-002, Development Code Amendment (DCA) 21-005, Planned Development-Industrial (PD-I) 22-001, Vesting Tentative Parcel Map (SUB) 21-008, Vesting Tentative Tract Map (SUB) 21-009, and Site Plan Design Review (SPDR) 21-008, with the condition that paved ramps be provided from each building connecting to their respective parking lots at the access gates to the on-site trail.

6. MATTERS FOR CONSIDERATION - NONE

7. MATTERS INITIATED BY PLANNING COMMISSION AND STAFF

Commissioner Kronzak reemphasized the City's success with its Climate Action Plan and Urban Forestry goals and encouraged planting and replanting native species.

Commissioner Dunbar suggested discussion of a policy on preferred VMT mitigation.

8. ADJOURNMENT – at 9:03pm to a Regular Planning Commission Meeting on Tuesday, March 19, 2024, at 7:00 pm, Civic Center Meeting Hall, City Council Chambers, 1016 S. Livermore Avenue.

SEE CIVIL PLANS

PROJECT DATA

BUILDING OCCUPANCY:	B, F-1 & S-1
CONSTRUCTION TYPE:	III – B
FIRE SPRINKLERS:	YES (ESFR)
ACTUAL ROOF HEIGHT:	43'-11"(MAX)
ALLOWABLE PARAPET HEIGHT:	75'-0"
ACTUAL STORIES:	1 STORY
ALLOWABLE STORIES:	2 STORIES
ACTUAL AREA:	
BUILDING 1:	470,526 S.F.
BUILDING 2:	288,747 S.F.
ALLOWABLE AREA (BASIC):	B = 76,000 S.F.
	S1= 70,000 S.F.
	F1= 48,000 S.F.
ACTUAL AREA INCREASED ALLOWABLE	UNLIMITED PER CBC. 507.1 60' MIN. YARD ON 4 SIDES

TABULATION

SITE AREA	BLDG 1	BLDG 2	TOTAL
	1,047,195	737,664	1,784,748 s.f.
	24.04	16.93	40.97 ac
BUILDING AREA			
Office	10,000	13,000	23,000 s.f.
Warehouse	460,526	273,747	736,273 s.f.
TOTAL	470,526	288,747	759,273 s.f.
COVERAGE (45% Max.)	44.9%	39.1%	42.5%
AUTO PARKING REQUIRED			
Office 1/300 s.f.	34	44	78 stalls
Others 1/1,200 s.f.	384	230	614 stalls
TOTAL	418	274	692 stalls
EV REQUIRED			
EV Capable + EVCS (20% of total)	96	64	160 stalls
- EV Capable w/ conduits only (10% of total)	[48]	[32]	
- EVCS (10% of total)	[48]	[32]	
- Standard EVCS	45	29	
- ADA EV Parking w/ EVCS (9' x 20' + 5' Aisle)	1*	1*	
- ADA EV Van Parking w/ EVCS (12' x 20' + 5' Aisle)	1	1	
- Ambulatory	1	1	
AUTO PARKING PROVIDED			
Standard (9'x 18')	162	179	341 stalls
Compact (9'x 16') 30% of total max.	115	0	115 stalls
Accessible parking (9' x 18')	5	5	10 stalls
Accessible Van (9' x 18' +8 aisle)	4	3	7 stalls
EV Capable + EVCS (20% of total)	96	64	160 stalls

Drawn by: TSP
Date: 09/19/2023
Revision:

Sheet: DAB-A0.1

MASTER SITE PLAN
scale: 1" = 80'-0"

SCALE: 1" = 80'-0"
0 80' 160' 240'
PLAN NORTH

SITE PLAN GENERAL NOTES

1. THE SITE PLAN BASED ON THE SOILS REPORT PREPARED BY CORNERSTONE, NOVEMBER 23, 2021, PROJECT NUMBER 681-7-1
2. IF SOILS ARE EXPANSIVE IN NATURE, USE STEEL REINFORCING FOR ALL SITE CONCRETE
3. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE WALL, FACE OF CONCRETE CURB OR GRID LINE U.N.O.
4. SEE "C" PLANS FOR ALL CONCRETE CURBS, GUTTERS AND SWALES
5. PROVIDE STRUCTURAL CALCULATION AND CONSTRUCTION ANCHORAGE DETAIL FOR TRANSFORMER PRIOR TO INSTALLATION.
6. SEE "C" DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR SHALL VERIFY ACTUAL UTILITY LOCATIONS.
7. PROVIDE POSITIVE DRAINAGE AWAY FROM BLDG. SEE "C" DRAWINGS.
8. CONTRACTOR TO REFER TO "C" DRAWINGS FOR ALL HORIZONTAL CONTROL DIMENSIONS. SITE PLANS ARE FOR GUIDANCE AND STARTING LAYOUT POINTS.
9. SEE "C" DRAWINGS FOR FINISH GRADE ELEVATIONS.
10. CONCRETE SIDEWALKS TO BE A MINIMUM OF 4" THICK W/ TOOLED JOINTS AT 6' O.C. EXPANSION/CONSTRUCTION JOINTS SHALL BE A MAXIMUM 12' EA. WAY W/ 1/20 MAX. SLOPE. EXPANSION JOINTS TO HAVE COMPRESSIVE EXPANSION FILLER MATERIAL OF 1/4". FINISH TO BE A MEDIUM BROOM FINISH
11. U.N.O. PROVIDE KNOX BOXES AT ALL OFFICE ENTRANCES.
12. PAINT CURBS AND PROVIDE SIGNS TO INFORM OF FIRE LANES AS REQUIRED BY FIRE DEPARTMENT.
13. ON-SITE FIRE MAIN, FIRE SPRINKLER, AND SPRINKLER MONITORING SYSTEM SHALL BE SUBMITTED SEPARATELY TO THE FIRE DEPARTMENT FOR REVIEW AND PERMITTING.
14. ALL VERTICAL MOUNTING POLES OF FENCING SHALL BE CAPPED.
15. LANDSCAPED AREAS SHALL BE DELINEATED WITH A MINIMUM SIX INCHES (6") HIGH CURB
16. ALL INTERIOR AND EXTERIOR WALK SURFACES TO BE NON-SLIP TYPE

SITE PLAN GENERAL NOTES

- CONCRETE PAVING. SEE "C" DRWGS. FOR THICKNESS
- STANDARD PARKING STALL 9' X 18' (16' WITH 2' OVERHANG)
- STANDARD PARKING STALL W/ EVCS INSTALLED
- STANDARD PARKING STALL W/ CONDUITS ONLY
- TRAILER PARKING (10' X 53')
- LANDSCAPED AREA
- NON-ACCESSIBLE PATH
- COMPACT PARKING STALL 9' X 16' (14' WITH 2' OVERHANG)
- ACCESSIBLE PARKING STALL (9' X 18') ACCESSIBLE AISLE SEE DETAIL 11/A0.1
- ACCESSIBLE PARKING (VAN) STALL (9' X 18') + 8' W/ ACCESSIBLE AISLE
- PATH OF TRAVEL. MINIMUM WIDTH TO BE 4'. SLOPE NOT TO EXCEED 5% IN THE DIRECTION OF TRAVEL AND CROSS SLOPE NOT TO EXCEED 2%. SEE CIVIL

VICINITY MAP

Project Number:	19177
Drawn by:	TSP
Date:	09/19/2023

Revision:

Sheet:
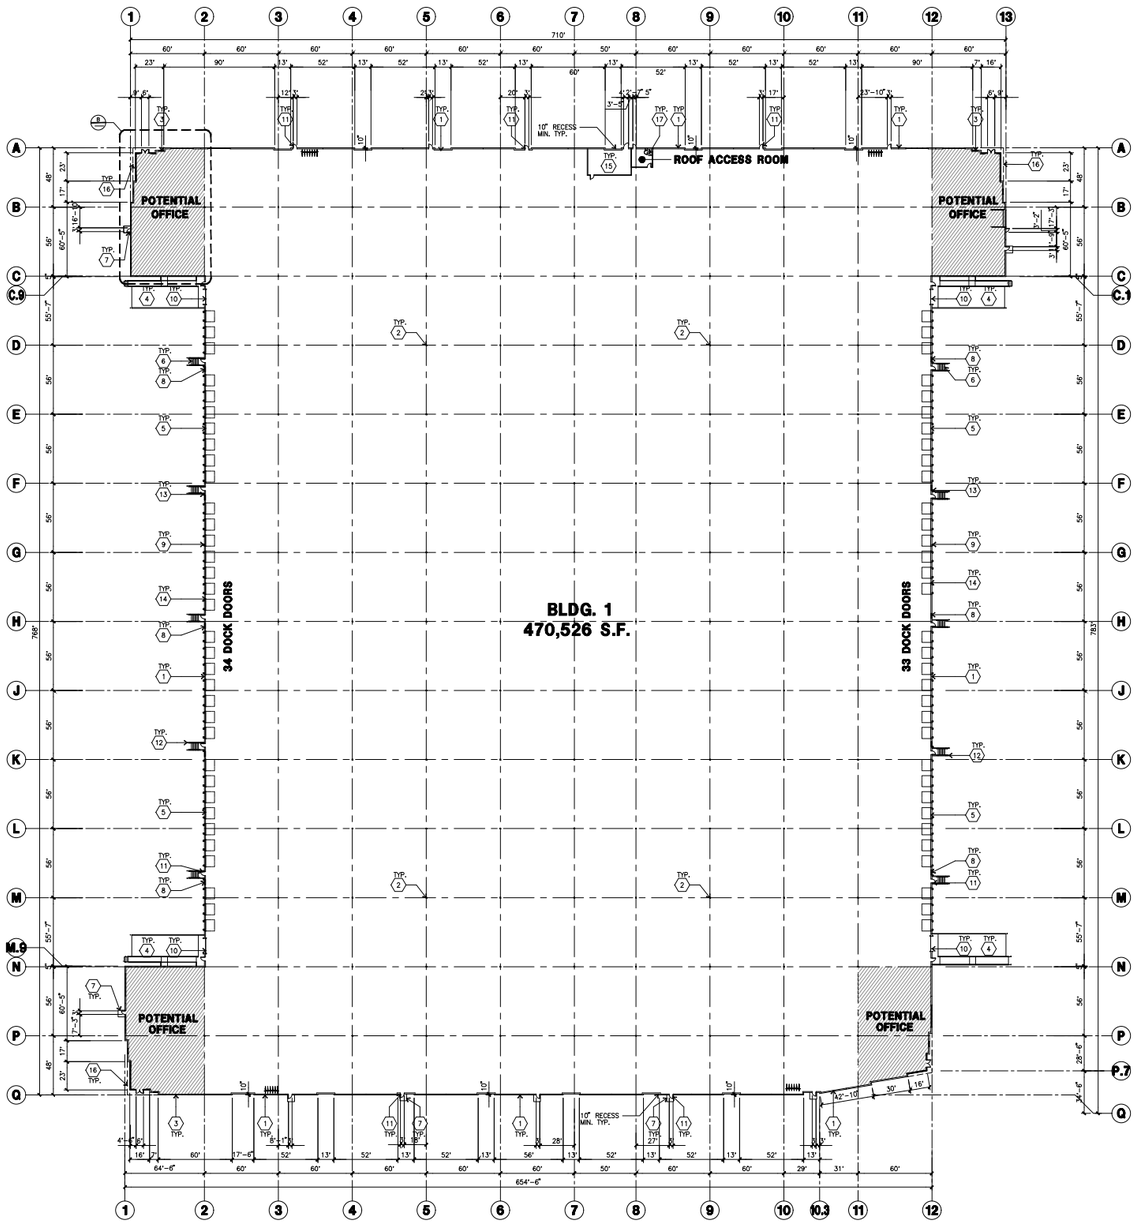
1-DAB-A1.2

KEYNOTES - FLOOR PLAN

1. CONCRETE TILT-UP PANEL.
2. STRUCTURAL STEEL COLUMN.
3. TYPICAL STOREFRONT SYSTEM WITH GLAZING. SEE ENLARGED PLANS AND ELEVATIONS FOR SIZE, COLOR AND LOCATIONS.
4. CONCRETE RAMP W/ 42" HIGH CONC TILT-UP GUARD WALL OR BUILDING WALL ON BOTH SIDES OF RAMP.
5. 9' X 10' DOCK DOOR, SECTIONAL O.H., STANDARD GRADE. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
6. EXTERIOR METAL STEEL STAIR.
7. 5'-6"X5'-6"X4" THICK CONCRETE EXTERIOR LANDING PAD TYPICAL AT ALL EXTERIOR MAN DOORS TO LANDSCAPED AREA. FINISH TO BE MEDIUM BLOOM FINISH. SLOPE TO BE 1/4 : 12" MAX.
8. 4'X8' METAL LOUVER.
9. DOCK DOOR BUMPER.
10. 12' X 14' DRIVE THRU. SECTIONAL O.H., STANDARD GRADE. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
11. 3'-X 7' HOLLOW METAL EXTERIOR MAN DOOR. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
12. CONC. FILLED GUARD POST. 6" DIA. U.N.O.. 48"H.
13. EXTERIOR DOWNSPOUT WITH OVERFLOW SCUPPER.
14. Z GUARD.
15. ELECTRICAL ROOM.
16. METAL CANOPY ABOVE.
17. ROOF ACCESS LADDER.



GENERAL NOTES - FLOOR PLAN

1. THIS BUILDING IS DESIGNED FOR HIGH PILE STORAGE WITH FIRE ACCESS MAN DOORS AT 125' +/-. A SEPARATE PERMIT WILL BE REQUIRED FOR ANY RACKING/CONVEYER SYSTEMS. INSURE HEAT AND SMOKE VENTS AS REQ'D COMPLY WITH TABLE 910.3 CBC
2. FIRE HOSE LOCATIONS SHALL BE APPROVED PER FIRE DEPARTMENT.
3. SEE "C" DRAWINGS FOR FINISH SURFACE ELEVATIONS.
4. WAREHOUSE INTERIOR CONCRETE WALLS ARE PAINTED WHITE. COLUMNS ARE TO RECEIVE PRIMER ONLY. ALL CYP. BD. WALLS IN WAREHOUSE TO RECEIVE 1 COAT OF WHITE TO COVER.
5. THE BUILDING FLOOR SLAB IS FLAT/SLOPED, SEE CIVIL.
6. SLOPE POUR STRIP 1/2" TO EXTERIOR AT ALL MANDOOR EXITS. SEE "S" DRAWINGS FOR POUR STRIP LOCATION.
7. PROVIDE 6" DIA. CONCRETE BOLLARD AT ALL FIRE RISER AND UNPROTECTED INTERIOR ROOF DRAIN.
8. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE PANEL WALL, GRIDLINE, OR FACE OF STUD U.N.O.
9. SEE CIVIL DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR TO VERIFY ACTUAL UTILITY LOCATIONS. PLUMBING/ELECTRICAL COORDINATION.
10. FOR DOOR TYPES AND SIZES, SEE DETAIL SHEET A5.1. NOTE: ALL DOORS PER DOOR SCHEDULE ARE FINISH OPENINGS.
11. CONTRACTOR TO PROTECT AND KEEP THE FLOOR SLAB CLEAN. ALL EQUIPMENT TO BE DIAPERED INCLUDING CARS AND TRUCKS.
12. ALL EXIT MAN DOORS IN WAREHOUSE TO HAVE ILLUMINATED EXIT SIGN HARDWARE.
13. HIGHLY FLAMMABLE AND COMBUSTIBLE MATERIAL SHALL NOT BE USED OR STORED IN THIS BUILDING.
14. PROVIDE FIRE EXTINGUISHERS AT LOCATIONS DETERMINED BY FIRE DEPARTMENT.
15. EACH EXTERIOR EXIT DOOR SHALL BE IDENTIFIED BY A TACTILE EXIT SIGN WITH THE WORDS "EXIT". THE MOUNTING HEIGHT FOR SUCH SIGNAGE SHALL BE 60" FROM FINISH FLOOR LEVEL TO THE CENTER OF THE SIGN.
16. AFFIX AN INTERNATIONAL ACCESSIBILITY SYMBOL ON ALL ACCESSIBLE ENTRANCES PER CBC 11B-216.6
17. ALL INTERIOR AND EXTERIOR WALKING SURFACES TO BE NON-SLIP TYPE

KEYNOTES - ELEVATIONS

1. CONCRETE TILT-UP PANEL(PAINTED). FINISH GRADE VARIES. SEE 'C' DRAWINGS. WATERPROOF ALL WALLS WHERE EXTERIOR GRADE IS HIGHER THAN FINISH FLOOR AND EXPOSED TO THE WEATHER. WATERPROOFING TO BE PROTECTED WITH PROTECTION BOARD AND A MIN. OF 6" OF GRAVEL. PROVIDE TRENCH DRAIN AT BOTTOM AND DAYLIGHT TO CURB OR TAKE TO STORM DRAIN.
2. PANEL JOINT.
3. PANEL REVEAL. ALL REVEALS TO HAVE A MAX. OF 3/4" CHAMFER. REVEAL COLOR TO MATCH ADJACENT BUILDING FIELD COLOR. U.N.O.
4. OVERHEAD DOOR @ DRIVE THRU. PROVIDE COMPLETE WEATHER-STRIPPING PROTECTION ALL AROUND.
5. OVERHEAD DOOR @ DOCK HIGH. PROVIDE COMPLETE WEATHER-STRIPPING PROTECTION ALL AROUND.
6. EXTERIOR METAL STEEL STAIR.
7. METAL LOUVER. PAINT TO MATCH BUILDING COLOR.
8. HOLLOW METAL DOORS. PROVIDE COMPLETE WEATHER STRIPING ALL AROUND DOOR. PROVIDE FOR RAIN DIVERTER ABOVE DOOR.
9. EXTERIOR DOWNSPOUT WITH OVERFLOW SCUPPERS.
10. DOCK BUMPER.
11. ALUMINUM STOREFRONT FRAMING WITH TEMPERED GLAZING.
12. METAL CANOPY
13. FUTURE ROOF EQUIPMENT
14. PARAPET RETURN

GENERAL NOTES - ELEVATIONS

1. ALL PAINT COLOR CHANGES TO OCCUR AT INSIDE CORNERS UNLESS NOTED OTHERWISE.
2. ALL PAINT FINISHES ARE TO BE SLAT UNLESS NOTED OTHERWISE.
3. T.O.P. EL.= TOP OF PARAPET ELEVATION.
4. F.F.= FINISH FLOOR ELEVATION.
5. STOREFRONT CONSTRUCTION: GLASS, METAL ATTACHMENTS AND LINTELS SHALL BE DESIGNED TO RESIST – MPH. EXPOSURE "C" WINDS. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS PRIOR TO INSTALLATION.
6. CONTRACTOR SHALL FULLY PAINT ONE CONCRETE PANEL W/SELECTED COLORS. ARCHITECT AND OWNER SHALL APPROVE PRIOR TO PAINTING REMAINDER OF BUILDING.
7. BACK SIDE OF PARAPETS TO HAVE SMOOTH FINISH AND BE PAINTED WITH ELASTOMERIC PAINT.
8. FOR SPANDREL GLAZING, ALLOW SPACE BEHIND SPANDREL TO BREATH. PROVIDE 1" DIAMETER HOLES AT CONCRETE WALL.
9. USE ADHESIVE BACK WOOD STRIPS FOR ALL REVEAL FORMS.
10. THE FIRST COAT OF PAINT TO BE ROLLED-ON AND THE SECOND COAT TO BE SPRAYED-ON
11. ALL ROLL-UP DOORS AND SERVICE DOORS TO BE PAINTED TO MATCH BUILDING COLOR
12. WHERE GLAZING CROSSES THE PANEL JOINT AND A SINGLE MULLION SHALL BE PROVIDED, DOUBLE MULLIONS ARE NOT AN ACCEPTABLE ALTERNATE.

ELEVATION COLOR LEGEND/SCHED.

1. CONCRETE TILT-UP PANEL. COLOR : SW 7006 EXTRA WHITE
2. CONCRETE TILT-UP PANEL. COLOR : SW 7058 MAGNETIC GRAY
3. CONCRETE TILT-UP PANEL. COLOR : SW 7067 CITY SCAPE
4. CONCRETE TILT-UP PANEL. COLOR : SW 7067 CITY SCAPE

SITE PLAN KEYNOTES

1. HEAVY BROOM FINISH CONCRETE PAVEMENT.
2. ASPHALT CONCRETE (AC) PAVING
3. ACCESSIBLE PATH OF TRAVEL
4. DRIVEWAY APRONS
5. 5'-6"X5'-6"X4" THICK CONCRETE EXTERIOR LANDING PAD TYP. AT ALL EXTERIOR MAN DOORS TO LANDSCAPED AREAS. FINISH TO BE MEDIUM BROOM FINISH SLOPE TO BE 1/4" : 12" MAX.
6. INTERIOR PUMP ROOM/EXTERIOR PUMP HOUSE, SEE SITE PLAN
7. 8' HIGH METAL FENCE.
8. CONCRETE WALKWAY, MEDIUM BROOM FINISH.
9. CONCRETE RAMP WITH CONCRETE GUARD WALL.
10. 8' HIGH METAL GATE.
11. ELECTRIC VEHICLE CHARGER.
12. EXTERIOR METAL STEEL STAIR.
13. 12' x 14' DRIVE-IN DOOR
14. LANDSCAPE.
15. CONC. FILLED GUARD POST 6" DIA U.N.O. 48" H.
16. PRE-CAST CONC. WHEEL STOP.
17. TRUNCATED DOMES.
18. ACCESSIBLE PARKING STALL SIGN.
19. HARDSCAPE AT ENTRANCE. SEE "L" DRAWINGS.
20. ACCESSIBLE ENTRY SIGN.
21. TRASH ENCLOSURE, SEE DAB-AD.1.
22. ELECTRICAL ROOM.
23. CONCRETE DOLLY PAD. SEE SITE PLAN FOR WIDTH AND "C" DRAWINGS.
24. TRAIL.
25. EXTERIOR EMPLOYEE BREAK ROOM.
26. APPROXIMATE LOCATION OF TRANSFORMER. CONTRACTOR TO VERIFY
27. BIKE RACKS.
28. OUTDOOR BREAK AREA.
29. 10' HIGH SCREENING WALL.
30. 8' HIGH CHAIN LINK FENCE.
31. 8' HIGH CHAIN LINK GATE.
32. EXISTING CHAIN LINK FENCE.
33. DG PAVING PATH WITH MAN GATE

SITE PLAN GENERAL NOTES

1. THE SITE PLAN BASED ON THE SOILS REPORT PREPARED BY CORNERSTONE, NOVEMBER 23, 2021, PROJECT NUMBER 681-7-1
2. IF SOILS ARE EXPANSIVE IN NATURE, USE STEEL REINFORCING FOR ALL SITE CONCRETE.
3. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE WALL, FACE OF CONCRETE CURB OR GRID LINE U.N.O.
4. SEE "C" PLANS FOR ALL CONCRETE CURBS, GUTTERS AND SWALES
5. PROVIDE STRUCTURAL CALCULATION AND CONSTRUCTION ANCHORAGE DETAIL FOR TRANSFORMER PRIOR TO INSTALLATION.
6. SEE "C" DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR SHALL VERIFY ACTUAL UTILITY LOCATIONS.
7. PROVIDE POSITIVE DRAINAGE AWAY FROM BLDG. SEE "C" DRAWINGS.
8. CONTRACTOR TO REFER TO "C" DRAWINGS FOR ALL HORIZONTAL CONTROL DIMENSIONS. SITE PLANS ARE FOR GUIDANCE AND STARTING LAYOUT POINTS.
9. SEE "C" DRAWINGS FOR FINISH GRADE ELEVATIONS.
10. CONCRETE SIDEWALKS TO BE A MINIMUM OF 4" THICK W/ TOOLED JOINTS AT 6' O.C. EXPANSION/CONSTRUCTION JOINTS SHALL BE A MAXIMUM 12' EA. WAY W/ 1:20 MAX. SLOPE. EXPANSION JOINTS TO HAVE COMPRESSIVE EXPANSION FILLER MATERIAL OF 1/4", FINISH TO BE A MEDIUM BROOM FINISH
11. U.N.O. PROVIDE KNOX BOXES AT ALL OFFICE ENTRANCES.
12. PAINT CURBS AND PROVIDE SIGNS TO INFORM OF FIRE LANES AS REQUIRED BY FIRE DEPARTMENT.
13. ON-SITE FIRE MAIN, FIRE SPRINKLER, AND SPRINKLER MONITORING SYSTEM SHALL BE SUBMITTED SEPARATELY TO THE FIRE DEPARTMENT FOR REVIEW AND PERMITTING.
14. ALL VERTICAL MOUNTING POLES OF FENCING SHALL BE CAPPED.
15. LANDSCAPED AREAS SHALL BE DELINEATED WITH A MINIMUM SIX INCHES (6") HIGH CURB
16. ALL INTERIOR AND EXTERIOR WALK SURFACES TO BE NON-SLIP TYPE

SITE PLAN GENERAL NOTES

- CONCRETE PAVING. SEE "C" DRWGS. FOR THICKNESS
- STANDARD PARKING STALL 9' X 18' (16' WITH 2' OVERHANG)
- STANDARD PARKING STALL W/ EVCS INSTALLED
- STANDARD PARKING STALL W/ CONDUITS ONLY
- TRAILER PARKING (10' X 53')
- LANDSCAPED AREA
- NON-ACCESSIBLE PATH
- COMPACT PARKING STALL 9' X 16' (14' WITH 2' OVERHANG)
- ACCESSIBLE PARKING STALL (9' X 18') ACCESSIBLE AISLE SEE DETAIL 11/AD.1
- ACCESSIBLE PARKING (VAN) STALL (9' X 18') + 8' W/ ACCESSIBLE AISLE
- PATH OF TRAVEL, MINIMUM WIDTH TO BE 4', SLOPE NOT TO EXCEED 5% IN THE DIRECTION OF TRAVEL AND CROSS SLOPE NOT TO EXCEED 2%, SEE CIVIL FOR GRADING PLAN

scale: 1" = 40'-0"

SCALE: 1" = 40'-0"
0 40' 80' 120'
TRUE NORTH

ENLARGED FLOOR PLAN B
scale: 1/8" = 1'-0"

SCALE: 1/8" = 1'-0"
0 8' 16' 24'
TRUE NORTH

KEYNOTES - FLOOR PLAN

1. CONCRETE TILT-UP PANEL.
2. STRUCTURAL STEEL COLUMN.
3. TYPICAL STOREFRONT SYSTEM WITH GLAZING. SEE ENLARGED PLANS AND ELEVATIONS FOR SIZE, COLOR AND LOCATIONS.
4. CONCRETE RAMP W/ 42" HIGH CONC TILT-UP GUARD WALL OR BUILDING WALL ON BOTH SIDES OF RAMP.
5. 9' X 10' DOCK DOOR, SECTIONAL O.H., STANDARD GRADE. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
6. EXTERIOR METAL STEEL STAIR.
7. 5'-6"x5'-6"x4" THICK CONCRETE EXTERIOR LANDING PAD TYPICAL AT ALL EXTERIOR MAN DOORS TO LANDSCAPED AREA. FINISH TO BE MEDIUM BLOOM FINISH. SLOPE TO BE 1/4" : 12" MAX.
8. 4'X8' METAL LOUVER.
9. DOCK DOOR BUMPER.
10. 12' X 14' DRIVE THRU, SECTIONAL O.H., STANDARD GRADE. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
11. 3' X 7' HOLLOW METAL EXTERIOR MAN DOOR. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
12. CONC. FILLED GUARD POST. 6" DIA. U.N.O., 48"H.
13. EXTERIOR DOWNSPOUT WITH OVERFLOW SCUPPER.
14. Z GUARD.
15. ELECTRICAL ROOM.
16. METAL CANOPY ABOVE.
17. ROOF ACCESS LADDER.

GENERAL NOTES - FLOOR PLAN

1. THIS BUILDING IS DESIGNED FOR HIGH PILE STORAGE WITH FIRE ACCESS MAN DOORS AT 125' +/-. A SEPARATE PERMIT WILL BE REQUIRED FOR ANY RACKING/CONVEYER SYSTEMS. INSURE HEAT AND SMOKE VENTS AS REQ'D COMPLY WITH TABLE 910.3 CBC
2. FIRE HOSE LOCATIONS SHALL BE APPROVED PER FIRE DEPARTMENT.
3. SEE "C" DRAWINGS FOR FINISH SURFACE ELEVATIONS.
4. WAREHOUSE INTERIOR CONCRETE WALLS ARE PAINTED WHITE. COLUMNS ARE TO RECEIVE PRIMER ONLY. ALL CIP, BD. WALLS IN WAREHOUSE TO RECEIVE 1 COAT OF WHITE TO COVER.
5. THE BUILDING FLOOR SLAB IS FLAT/SLOPED, SEE CIVIL.
6. SLOPE POUR STRIP 1/2" TO EXTERIOR AT ALL MANDOOR EXITS. SEE "S" DRAWINGS FOR POUR STRIP LOCATION.
7. PROVIDE 6" DIA. CONCRETE BOLLARD AT ALL FIRE RISER AND UNPROTECTED INTERIOR ROOF DRAIN.
8. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE PANEL WALL, GRIDLINE, OR FACE OF STUD U.N.O.
9. SEE CIVIL DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR TO VERIFY ACTUAL UTILITY LOCATIONS. PLUMBING/ELECTRICAL COORDINATION.
10. FOR DOOR TYPES AND SIZES, SEE DETAIL SHEET A5.1. NOTE: ALL DOORS PER DOOR SCHEDULE ARE FINISH OPENINGS.
11. CONTRACTOR TO PROTECT AND KEEP THE FLOOR SLAB CLEAN. ALL EQUIPMENT TO BE DIAPERED INCLUDING CARS AND TRUCKS.
12. ALL EXIT MAN DOORS IN WAREHOUSE TO HAVE ILLUMINATED EXIT SIGN HARDWARE.
13. HIGHLY FLAMMABLE AND COMBUSTIBLE MATERIAL SHALL NOT BE USED OR STORED IN THIS BUILDING.
14. PROVIDE FIRE EXTINGUISHERS AT LOCATIONS DETERMINED BY FIRE DEPARTMENT.
15. EACH EXTERIOR EXIT DOOR SHALL BE IDENTIFIED BY A TACTILE EXIT SIGN WITH THE WORDS "EXIT". THE MOUNTING HEIGHT FOR SUCH SIGNAGE SHALL BE 60" FROM FINISH FLOOR LEVEL TO THE CENTER OF THE SIGN.
16. AFFIX AN INTERNATIONAL ACCESSIBILITY SYMBOL ON ALL ACCESSIBLE ENTRANCES PER CBC 11B-216.6
17. ALL INTERIOR AND EXTERIOR WALKING SURFACES TO BE NON-SLIP TYPE

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN A PRELIMINARY TITLE REPORT, PREPARED BY CHICAGO TITLE INSURANCE COMPANY, DATED MARCH, 28, 2019, ORDER NUMBER 36201446-363-LB-KD. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR ALAMEDA COUNTY, CALIFORNIA, MAP NUMBER 06001C0341G FOR COMMUNITY NUMBER 060001 (UNINCORPORATED AREAS), WITH AN EFFECTIVE DATE OF AUGUST 3, 2009, AS BEING LOCATED IN FLOOD ZONES "X-UNSHADED", "X-SHADED", & "AE".

   ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREAS DETERMINED TO BE OUTSIDE THE 0.2% ANNUAL FLOOD CHANCE

   ACCORDING TO FEMA THE DEFINITION OF ZONE "X-SHADED" IS: AREAS OF 0.2% ANNUAL CHANCE FLOOD; AREAS OF 1% ANNUAL CHANCE FLOOD WITH AVERAGE DEPTHS OF LESS THAN 1 FOOT OR WITH DRAINAGE AREAS LESS THAN 1 SQUARE MILE; AND AREAS PROTECTED BY LEVEES FROM 1% ANNUAL CHANCE FLOOD.

   ACCORDING TO FEMA THE DEFINITION OF ZONE "AE" IS: BASE FLOOD ELEVATIONS DETERMINED

   INFORMATION WAS OBTAINED FROM THE COUNTY OF ALAMEDA, PUBLIC WORKS DEPARTMENT ON MAY 2, 2019. FEMA BASE FLOOD ELEVATIONS ARE BASED ON NAVD88 DATUM. SEE BENCHMARK NOTE FOR DATUM CONVERSIONS.

6. BENCHMARK:
   BM 1971, 3" BRASS DISK: "CALIF. DEPT OF TRANSPORTATION 1990 HPGN-CALIF. STA 04-07" (PID HS5408) [1991.35] -LEV
   ELEVATION: 361.556 CITY OF LIVERMORE 2K (NGVD29 DATUM)
   ELEVATIONS SHOWN HEREON ARE BASED ON NGVD29. TO CONVERT TO NAVD88 ADD 2.638' TO THE ELEVATIONS SHOWN. DATUM CONVERSAION WAS OBTAINED FROM THE NGS VERTCON WEBSITE

7. BASIS OF BEARINGS:
   THE BEARING OF NORTH 89° 25' 04" WEST TAKEN ON THE MONUMENT LINE OF DISCOVERY DRIVE AS SHOWN ON THAT CERTAIN PARCEL MAP NUMBER 10266 FILED FOR RECORD ON DECEMBER 30, 2014, IN BOOK 328 OF MAPS AT PAGES 37-41, OFFICIAL RECORDS OF ALAMEDA COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 19040316. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 04-03-2019, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

TREATMENT DESCRIPTION

THE PROPOSED TREATMENT MEASURES UTILIZE 100% CAPTURE AND INFILTRATION OF THE WATER QUALITY STORM. INLET FILTERS AT EACH CATCH BASIN PROVIDE PRE-TREATMENT WITH UNDERGROUND PIPING DIRECTING STORM WATER TO AN UNDERGROUND STORAGE VAULT CONSISTING OF 3 - 96" DIAMETER CORRUGATED METAL PIPES THAT ARE 960' LONG SPACED 12' ON CENTER. PIPES ARE BEDDED AND BACKFILLED WITH ¾" CLASS II PERMEABLE ROCK 6" ABOVE AND BELOW PIPE AND 2' ON EACH SIDE. FLOW CONTROL USES AN 6" AND 8" ORIFICES WITH A 5' WIDE SHARP CRESTED WEIR. STORM WATER IS DISCHARGED VIA PIPE TO THE EXISTING ZONE 7 CHANNEL/DETENTION BASIN LOCATED ON THE WEST SIDE OF THE OAKS BUSINESS PARK.

PER SOIL SURVEY MAP, EXISTING SOIL IS CONSISTENT WITH TYPE 'B' SOIL. IN PLAC INFILTRATION TESTING BY CORNERSTONE EARTH GROUP YIELDED RESULTS OF 4.4"-10" PER HOUR.

AREA TABULATION

PERVIOUS	5.80 ACRES
IMPERVIOUS	32.7 ACRES
TOTAL	38.5 ACRES
EFFECTIVE IMPERVIOUS	33.28 ACRES

STORM WATER QUALITY VOLUME

MAP = 16"

MAP ADJUSTMENT
16/18.35 = 0.87

UNIT BASIN STORAGE VOLUME
0.67x0.87 = 0.58" = 0.0483'

EFFECTIVE IMPERVIOUS SURFACE
32.7 + (0.1) x (5.8) = 33.28

WATER QUALITY STORAGE VOLUME
33.28 x 0.0483 = 1.6 AC.FT.

INFILTRATION CALCULATIONS

TOTAL DEPTH TO BE INFILTRATED = 394.5' - 389.3' = 5.2' = 62.4"

REQUIRED DRAW DOWN TIME = 48 HR

MINIMUM INFILTRATION RATE REQUIRED = 62.4" / 48 HR = 1.3 IN/HR

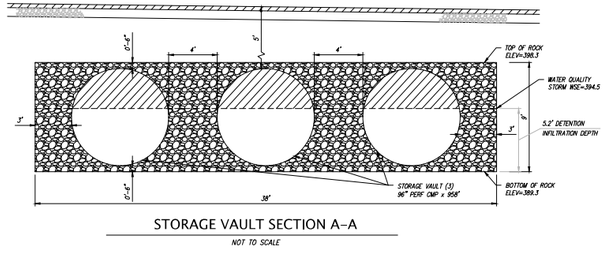
MEASURED INFILTRATION RATE = 4.4 IN/HR

FACTOR OF SAFETY 4.4 IN/HR / 1.3 IN/HR = 3.3

STORAGE CALCULATIONS

CROSS SECTION AREAS

PIPE AREA
96" PIPE @ 4.7' DEPTH = 30.7 SF
3 x 30.7 SF = 92.1 SF (TOTAL PIPE AREA)



ROCK AREA
H x W (TOTAL PIPE AREA)
(5.2' x 38') - 92.1 SF = 105.5 SF

EFFECTIVE ROCK AREA @ 35% VOIDS = 36.9 SF

TOTAL EFFECTIVE CROSS SECTION AREA
92.1 SF + 36.9 SF = 129 SF

TOTAL SECTION LENGTH = 960'

TOTAL VOLUME = 123, 840 CF or 2.8 AC.FT.

STORAGE VAULT SECTION A–A

OF	12 SHEETS

LANDSCAPE CALCULATIONS BUILDING 1

TOTAL SITE AREA: 24.1 ACRES
TOTAL BUILDING PAD AREA =470,721 S.F.
SITE AREA LANDSCAPE REQUIRED EQUAL TO 5% OF BLDG. PAD AREA = 23,536 S.F.
SITE AREA LANDSCAPE PROVIDED: 85,810 S.F. (2,771 S.F. NON IRRIGATED BIO-SWALE)
BUILDING FACADE FACING STREET LANDSCAPE REQUIRED 7' WIDE (PROVIDED)
PERIMETER LANDSCAPE REQUIRED 5' WIDE (PROVIDED)
TOTAL PARKING AREA = 124,118 S.F.
PARKING AREA LANDSCAPE REQUIRED 16% OF PARKING AREA = 19,858 S.F.
PARKING LOT AREA LANDSCAPE PROVIDED = 22,440 S.F. (18%)
PARKING SPACES PROVIDED = 382
PARKING AREA TREES REQUIRED 1/6 SPACES = 64
PARKING AREA TREES PROVIDED = 64

LANDSCAPE LEGEND

- LARGE SHRUB SCREEN
- QUERCUS ILEX
- SYCAMORE 'COLUMBIA'
- CHINESE PISTACHE
- SWAN HILL OLIVE
- BRISBANE BOX
- CRAPE MYRTLE
- EVERGREEN SCREEN SHRUBS 5' MIN. HT.
- LOW TO MEDIUM SHRUBS FLOWERING w/ ACCENT PERENNIALS & GRASSES
- LOW PLANTING 12"- 4" TALL GROUNDCOVER
- PROJECT ACCENT PLANTING LOW FLOWERING SHRUBS, GROUND COVER AND PERENNIAL ACCENTS W/BARK MULCH
- SCREEN PLANTING TALL SCREEN SHRUBS 5'-8'
- SEEDED PER NATIVE SHRUBS & GRASSES HYDROSEED MIX

SEE SHEET LC1.2 FOR PRELIMINARY PLANT LIST

WATER EFFICIENT LANDSCAPE REQUIREMENTS

ALL IRRIGATION PERMANENT SHALL BE AUTOMATIC TIMER CONTROLLED, PERMANENTLY IRRIGATED SHRUBS AND TREES SHALL BE DRIPBUBBLER IRRIGATED.
AUTOMATIC CONTROLLER ET DATA, REPEAT CYCLING
IRRIGATION ZONES PER PLANT WATER REQUIREMENTS
RAIN SENSORITO BE SPECIFIED
SLOPES LESS THAN 5' IN HEIGHT
SOIL AMENDMENTS TO BE INCORPORATED
PLANTER SURFACE AREAS TO BE MULCHED
WATER USAGE TO MEET STATE WATER EFFICIENT LANDSCAPE STANDARD

PRELIMINARY LANDSCAPE AREA PER HYDROZONE BUILDING 6(SEE ATTACHED MWELO CALCULATIONS)

1 BIO-SWALES	2,771 S.F.	VL (.1)	ROTOR IRRIGATION (RECLAIMED)
2 NEW TREES	7,160 S.F.	L (.3)	DEEP ROOT BUBBLERS (RECLAIMED)
3 NEW SHRUB AREA	56,909 S.F.	L (.3)	DRIP IRRIGATION (RECLAIMED)
4 NEW SHRUB AREA	18,970 S.F.	L (.2)	DRIP IRRIGATION (RECLAIMED)
TOTAL LANDSCAPE AREA:.	85,810 S.F.		

Preliminary Water Use: IRRIGATED AREAS ONLY (85,810 S.F.)
Maximum Applied Water Allowance (MAWA) = 1,035,986
Estimated Total Water Use (ETWU) = 772,209
ETWU complies with MAWA

NOTE: 82% OF THE PLANTS PER LEGEND ARE LOW WATER USING PLANTS. MEDIUM WATER USING PLANTS SHALL BE UTILIZED IN PROJECT ACCENT AREAS AND OVERALL SHALL NOT EXCEED 25% OF THE TOTAL PLANT COUNTS. PLANTS SHALL BE SPACED PER THEIR MATURE HABIT (SEE LEGEND) TO MINIMIZE PRUNING AND TO AVOID IMPACTS TO SITE ELEMENTS.

INSTALL 2" X 6' RECYCLED PLASTIC HEADER AT EDGE OF ALL SEEDED AREAS NOT ADJACENT TO BACK OF CURB. HEADER STAKED. SHALL BE EARTHTONE COLORING AND FLEXIBLE TO MAKE SWEEPING CURVES AS SHOWN ON THE PLANS. HEADER SHALL BE INSTALLED ½" ABOVE FINISHED GRADE. FEATHER BARK MULCH AT EDGE TO MATCH HEADER HEIGHT.

NOTE:
LANDSCAPED AREAS BORDERING VEHICLE AREAS ARE SEPARATED BY A SIX-INCH CURB
SEE CIVIL SHEETS C3.0 AND C3.1

REPAIR

ALL EXISTING AND OR NEW LANDSCAPE SHALL BE PROTECTED DURING CONSTRUCTION. THE CONTRACTOR OR THE OWNER WILL BE RESPONSIBLE FOR REPAIR AND/OR REPLACEMENT OF LANDSCAPING IMPROVEMENTS DAMAGED BY CONTRACTORS.

MAINTENANCE

1. ALL LANDSCAPING SHALL BE MAINTAINED IN A NEAT, CLEAN, AND HEALTHY CONDITION. THIS SHALL INCLUDE PROPER PRUNING, MOWING OF LAWNS, WEEDING, REMOVAL OF LITTER, FERTILIZING, REPLACEMENT OF PLANTS WHEN NECESSARY, AND THE REGULAR WATERING OF ALL PLANTINGS
2. LOT OWNERS SHALL REQUIRE SIXTY (60) DAY-0CONTRACTOR-MAINTENANCDE CLAUSE IN ALL LANDSCAPING CONTRACTS
3. LOT OWNERS SHALL REQUIRE A ONE (1) YEAR CONTRACTOR GUARANTEE ON TREE WATERING AND IRRIGATION EQUIPMENT IN ALL LANDSCAPE CONTRACTS

IN THE CITY COUNCIL OF THE CITY OF LIVERMORE, CALIFORNIA

A RESOLUTION CERTIFYING THE FINAL ENVIRONMENTAL IMPACT REPORT FOR THE SMP 39/SMP 40 PROJECT AND ADOPTING CALIFORNIA ENVIRONMENTAL QUALITY ACT FINDINGS, A STATEMENT OF OVERRIDING CONSIDERATIONS, AND A MITIGATION MONITORING AND REPORTING PROGRAM

The City of Livermore ("City") is considering an Annexation/Prezoning (APZ) 21-003, Pre-Annexation and Development Agreement (DA) 21-001, Pre-Annexation and Development Agreement (DA) 23-002, General Plan Amendment (GPA) 21-001, Zoning Map Amendment (ZMA) 21-002, Planned Development Industrial (PD-I) 22-001, Development Code Amendment (DCA) 21-005, Vesting Tentative Parcel Map (SUB) 21-008, Vesting Tentative Tract Map (SUB) 21-009, and Site Plan Design Review (SPDR) 21-008 for the SMP 39/SMP 40 Project ("Project") to develop approximately 1.51 million square feet of industrial development and associated parking, lighting, landscaping, and other improvements.

The City determined that the Project is subject to the California Environmental Quality Act ("CEQA") and that an Environmental Impact Report ("EIR") is required.

On January 6, 2023, the City issued a Notice of Preparation pursuant to CEQA to obtain comments on the proposed scope of the EIR for the Project.

On August 30, 2023, the Draft EIR was distributed to the Planning Commission, the City Council, responsible agencies, trustee agencies and federal agencies involved in funding or approval of a project, State Clearinghouse, state, regional and local agencies and special districts, and interested groups and individuals for a 45-day public comment period.

On October 3, 2023, the Planning Commission held a duly noticed public hearing to consider the adequacy of the Draft EIR at which time oral and written comments were presented to the Planning Commission. Members of the public and other interested parties were invited by formal public notice to testify on the adequacy of the Draft EIR at the public hearing.

On October 13, 2023, at 5:00 p.m. the public comment period on the Draft EIR was closed. The City received six written comment letters.

On January 16, 2024, the Final EIR was distributed consisting of copies of all written and oral comments, a list of commenters, and all responses to oral and written comments and minor corrections to the Draft EIR. A copy of the written responses to comments received after the release of the Final EIR are attached hereto as Exhibit E.

On March 5, 2024, the Planning Commission held a public hearing to consider its recommendation to the City Council, and upon review and consideration of the information in the Final EIR and administrative record, adopted Resolution No. 02-24, attached hereto as Exhibit A, recommending that the City Council certify the Final EIR.

On March 25, 2024, the City Council held a duly noticed public hearing to consider the Project, Planning Commission and staff recommendations, all public comments and testimony, and findings.

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Livermore that prior to taking action on the Project, and at a properly noticed public hearing, the City Council reviewed written and oral staff reports, conducted a public hearing on the Project and took testimony, and received into the record all pertinent documents related to the Project (collectively, the "Record Evidence"). The City Council's determination is based on the Record Evidence, which is incorporated into this Resolution by reference.

BE IT FURTHER RESOLVED that the City Council of the City of Livermore, has considered the findings made in Planning Commission Resolution No. 02-24, attached hereto as Exhibit A, and hereby adopts the same findings by this reference and incorporates them as their own findings as part of this resolution. Based upon the City Council's own independent review of the Record Evidence and considerations, the City Council hereby finds that the Final EIR has been completed in compliance with the intent and requirements of the California Environmental Quality Act ("CEQA"), CEQA Guidelines, and the City's local CEQA requirements and has considered the information contained in the Final EIR and the record prior to taking any action on the Project, other related Project actions, or any of the alternatives. The City Council hereby certifies the Final EIR, attached hereto as Exhibit B, as amended by the Responses to Comments Received After the Close of the Final Environmental Impact Report Public Review Period and Erratum, attached hereto as Exhibit E, and approves and adopts the Findings, Facts in Support of Findings and Statement of Overriding Considerations Regarding the Environmental Impact Report, attached hereto as Exhibit C.

BE IT FURTHER RESOLVED that the City Council of the City of Livermore hereby adopts the Mitigation Monitoring and Reporting Program, attached hereto as Exhibit D, which is incorporated into the conditions of approval for the project.

BE IT FURTHER RESOLVED that the City Council of the City of Livermore directs the Planning Manager to file a Notice of Determination with the Alameda County Clerk, if the project is approved.

The documents that constitute the record of proceedings upon which this decision is based can be found in the City Clerk's Office, 1052 S. Livermore Avenue, in Livermore, California. This resolution shall be effective upon adoption by the City Council.

On motion of Council Member _____, seconded by Council Member _____, the foregoing resolution was passed and adopted on March 25, 2024, by the following vote:

AYES: COUNCIL MEMBERS:
NOES: COUNCIL MEMBERS:

IN THE PLANNING COMMISSION OF THE CITY OF LIVERMORE, CALIFORNIA

A RESOLUTION RECOMMENDING THAT THE CITY COUNCIL CERTIFY THE FINAL ENVIRONMENTAL IMPACT REPORT FOR THE SMP 39/SMP 40 PROJECT AND ADOPT CALIFORNIA ENVIRONMENTAL QUALITY ACT FINDINGS, A STATEMENT OF OVERRIDING CONSIDERATIONS, AND A MITIGATION MONITORING AND REPORTING PROGRAM

The City of Livermore is considering an Annexation/Prezoning (APZ) 21-003, Pre-Annexation and Development Agreement (DA) 21-001, Pre-Annexation and Development Agreement (DA) 23-002, General Plan Amendment (GPA) 21-001, Zoning Map Amendment (ZMA) 21-002, Planned Development Industrial (PD-I) 22-001, Development Code Amendment (DCA) 21-005, Vesting Tentative Parcel Map (SUB) 21-008, Vesting Tentative Tract Map (SUB) 21-009, and Site Plan Design Review (SPDR) 21-008 for the SMP 39/SMP 40 Project ("Project") to develop approximately 1.51 million square feet of industrial development and associated parking, lighting, landscaping, and other improvements.

The City determined that the Project, is subject to the California Environmental Quality Act ("CEQA") and that an Environmental Impact Report ("EIR") is required.

On January 6, 2023, the City issued a Notice of Preparation pursuant to CEQA to obtain comments on the proposed scope of the EIR for the Project.

On August 30, 2023, the Draft EIR was distributed to the Planning Commission, the City Council, responsible agencies, and federal agencies responsible for approving the project, State Clearinghouse, state, regional and local agencies and special districts, and interested groups and individuals for a 45-day public comment period.

On October 3, 2023, the Planning Commission held a duly noticed public hearing to consider the adequacy of the Draft EIR at which time oral and written comments were presented to the Planning Commission. Members of the public and other interested parties were invited by formal public notice to testify on the adequacy of the Draft EIR at the public hearing.

On October 13, 2023, at 5:00 p.m. the public comment period on the Draft EIR was closed. The City received six written comment letters from various agencies and organizations and three verbal comments from members of the public.

On January 16, 2024, the Final EIR was distributed consisting of copies of all written and oral comments, a list of commenters, and all responses to oral and written comments and minor corrections to the Draft EIR. A copy of the written responses to comments received after the release of the Final EIR are attached hereto as Exhibit D.

On March 5, 2024, the Planning Commission held a duly noticed public meeting to consider the Project and staff recommendations, all public comments and testimony, and

findings.

NOW, THEREFORE, BE IT RESOLVED by the Planning Commission of the City of Livermore that prior to taking action on the Project, and at a properly noticed public meeting, the Planning Commission reviewed written and oral staff reports, conducted a public hearing on the Project and took testimony, and received into the record all pertinent documents related to the Project (collectively, the "Record Evidence"). The Planning Commission's determination is based on the Record Evidence, which is incorporated into this Resolution by reference.

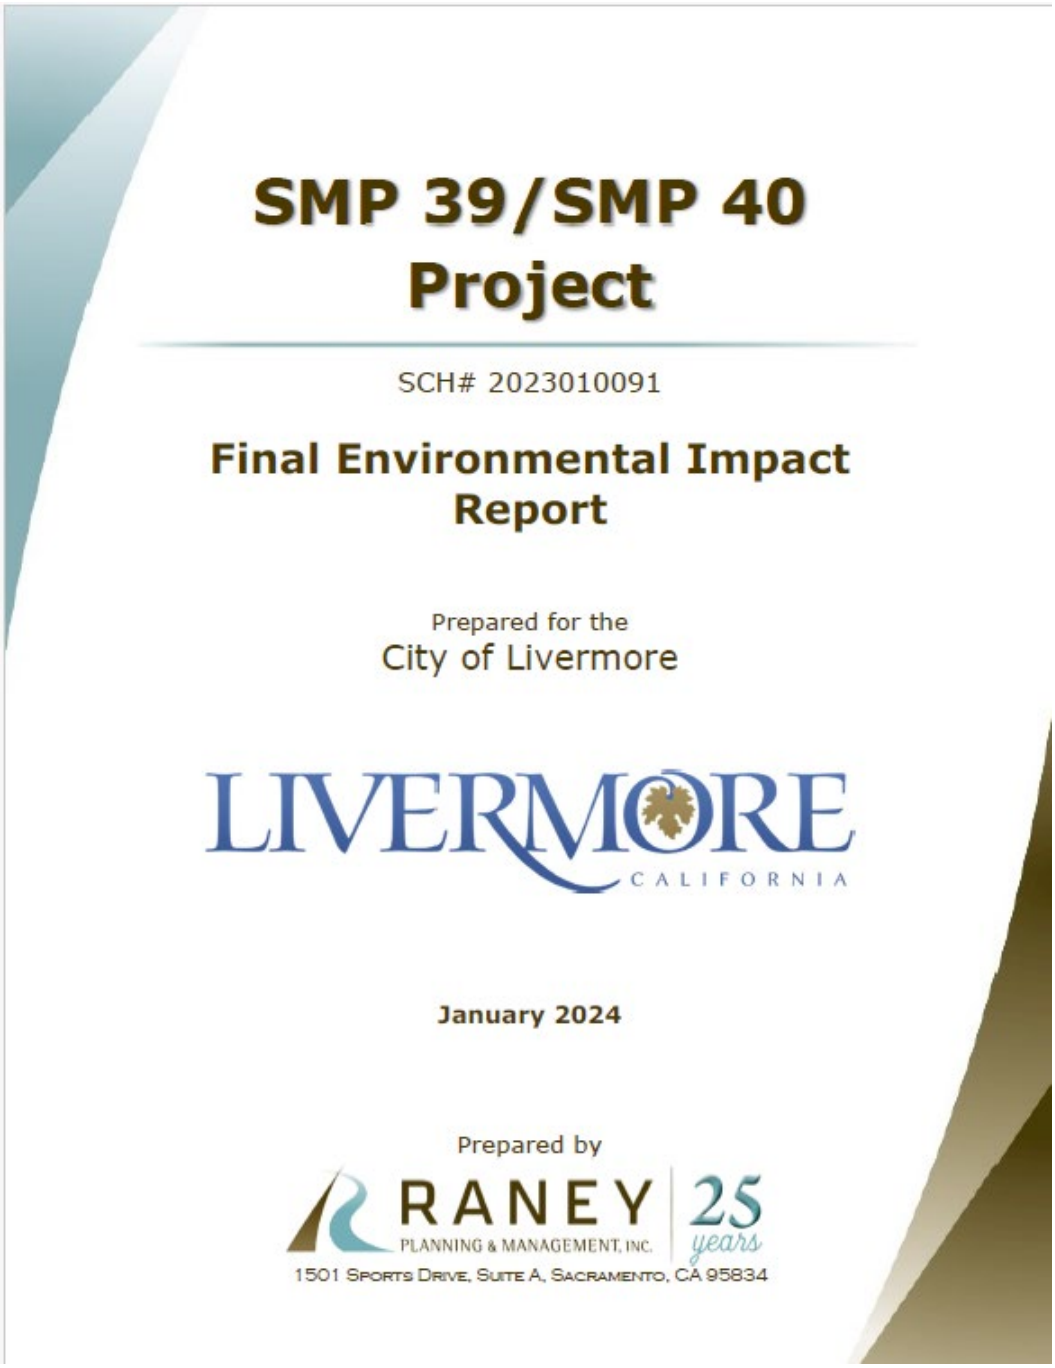
BE IT FURTHER RESOLVED that the Planning Commission of the City of Livermore, based upon its own independent review of the Record Evidence and considerations, finds that the Final EIR has been completed in compliance with the intent and requirements of the CEQA Guidelines, and the City's local CEQA requirements and has considered the information contained in the Final EIR and the record prior to taking any action on the Project, other related Project actions, or any of the alternatives. The Planning Commission hereby recommends the City Council certify the Final EIR, attached hereto as Exhibit A, and approve and adopt the Findings, Facts in Support of Findings and Statement of Overriding Considerations Regarding the Environmental Impact Report, attached hereto as Exhibit B.

BE IT FURTHER RESOLVED that the Planning Commission of the City of Livermore hereby recommends the City Council adopt the Mitigation Monitoring and Reporting Program, attached hereto as Exhibit C, which is incorporated into the conditions of approval for the project.

BE IT FURTHER RESOLVED, the Planning Commission of the City of Livermore recommends that the City Council direct the Planning Manager to file a Notice of Determination with the Alameda County Clerk, if the project is approved.

The documents that constitute the record of proceedings upon which this decision is based can be found in the Community Development Department, 1052 S. Livermore Avenue, in Livermore, California.

On the motion by Commissioner Leary, seconded by Commissioner Fintschenko, the foregoing Resolution was passed and adopted at the Planning Commission meeting of March 5, 2024, by the following vote:



AYES: ANDERSON, DUNBAR, FINTSCHENKO, KRONZAK, LEARY.
NOES: NONE.
ABSENT: NONE.

FINDINGS, FACTS IN SUPPORT OF FINDINGS AND STATEMENT OF OVERRIDING CONSIDERATIONS REGARDING THE ENVIRONMENTAL IMPACT REPORT FOR THE SMP 39/SMP 40 PROJECT (SCH NO. 2023010091)

The following Findings, the mitigation measures specified herein, and the Mitigation Monitoring and Reporting Program attached hereto are hereby adopted by the Livermore City Council in accordance with California Environmental Quality Act ("CEQA"), Public Resources Code Section 21081, 21081.5 and 21081.6, and the CEQA Guidelines, Title 14, California Code of Regulations, Sections 15091 through 15093 for the SMP 39/SMP 40 Project ("Project").

A. ENVIRONMENTAL REVIEW PROCESS

On January 6, 2023, the City issued a Notice of Preparation pursuant to CEQA to obtain comments on the proposed scope of the Environmental Impact Report (EIR) for the Project. The City released the Draft EIR on August 30, 2023, for a 45-day public comment period. The City made available the Draft EIR to the Planning Commission, the City Council, State Clearinghouse, state, regional and local agencies and special districts, and interested groups and individuals. On October 3, 2023, the Planning Commission conducted a public hearing on the Draft EIR. Members of the public and other interested parties were invited by formal public notice to provide comments on the scope and content of the Draft EIR at the public hearing. On October 13, 2023, at 5:00 PM, the public comment period on the Draft EIR closed. Nine written and oral comments were received during the public comment period.

The City released the Final EIR for public review on January 16, 2024. Subsequent to the Final EIR, a number of additional comment letters were received from the public regarding the Project. While CEQA does not require that written responses be provided for letters received after the close of the Draft EIR public review period, the comments were acknowledged by the City, and the City chose to prepare written responses to the comments and associated errata for the decision-makers consideration in making an informed decision. The Final EIR consists of copies of all written or oral comments received on the Draft EIR, a list of commenters, all responses to written and oral comments, and proposed revisions to the Draft EIR. The Final EIR, Draft EIR, Mitigation Monitoring and Reporting Program (MMRP), and the written responses to comments and associated errata prepared subsequent to the Final EIR that were included with the Planning Commission and City Council staff reports together comprise the EIR for the Project. The analysis and conclusions contained in the EIR reflect the independent judgment of the City.

B. PROJECT DESCRIPTION

Chapter 3 of the Draft EIR includes a detailed description of the Project. The Project, as described in the Draft EIR, has been revised as described in the Final EIR. The revisions make only minor technical changes, clarifications or additions to the Draft EIR.

The approximately 105.34-acre project site consists of six separate parcels identified by Assessor's Parcel Numbers (APNs) 904-3-1-4; 904-10-2-2, -3, -5, -7, and -8 located in

unincorporated Alameda County. The Project site is located adjacent to the existing Oaks Business Park, which consists of eight light industrial warehouse buildings, in the northwestern corner of the City of Livermore. The parcels are currently undeveloped, with the exception of a few structures located on the Additional Annexation Only Parcels. The Project site is generally located west of Isabel Avenue/State Route (SR) 84, north of Stanley Boulevard, south of West Jack London Boulevard, and east of El Charro Road. APN 904-3-1-4 is also known as SMP 39; and 904-10-2-2 is also known as SMP 40. The aforementioned SMP numbers are due to the Surface Mining Permit (SMP) numbers applicable to each site. The Surface Mining Permits for each of the sites were approved by Alameda County in 2004 to allow for the extraction of sand and gravel (i.e., aggregate) within the sites; however, aggregate mining has not occurred within any of the sites. Four additional parcels (APNs 904-10-2-3, -5, -7, and -8) located east of SMP 40 are included in the overall Project area.

SMP 39, SMP 40, and the Additional Annexation Only Parcels are within the City of Livermore South Livermore Urban Growth Boundary (UGB); however, SMP 39 is also within the City of Pleasanton's Sphere of Influence (SOI). Accordingly, an SOI Amendment for SMP 39 is proposed in order to modify City of Pleasanton SOI, align the SOI and South Livermore UGB boundaries to be consistent with one another, and provide a contiguous division of land between the cities of Livermore and Pleasanton. It should be noted that the likelihood for any future development on the Additional Annexation Only Parcels is low due to physical constraints to development present on the parcels and their small size. Thus, the analysis of the Draft EIR assumed that any development on the Additional Annexation Only Parcels would be limited to cooperating with the Project applicant regarding development of the proposed trail and trail connection.

On the SMP 39 site, the Project would include development of a total of up to six light industrial buildings, consisting of up to approximately 755,500 square feet (sf) total of new building space, and associated internal roadways, parking, landscaping, utilities, and other improvements. On the SMP 40 site, the Project would include development of two industrial buildings containing up to approximately 759,275 sf of new building space with related internal roadways, parking, landscaping, utilities, and other improvements. The Project would include frontage improvements along SMP 39 and right-of-way dedication for the ultimate buildout of West Jack London Boulevard, which would include an at-grade, paved shared-use path along the Project frontage, consistent with the City's Active Transportation Plan (ATP). Similarly, a paved at-grade, on-site trail would be provided along the boundaries of the SMP 40 site, consistent with the City's ATP. The proposed on-site trails would provide connection between SMP 39 to the existing path along the western boundary of the Oaks Business Park, SMP 40, and eventually to the Arroyo Mocho Trail, as the Project would include a new off-site trail connection to the existing Arroyo Mocho Trail, located on the east side of Isabel Avenue/SR 84. Three alternatives for the proposed off-site trail crossing to the existing Arroyo Mocho Trail are being considered and evaluated in the Draft EIR, including an at-grade crossing at Discovery Drive, an undercrossing at the existing Isabel Bridge, and an overcrossing of Isabel Avenue/SR 84 just north of the existing railroad tracks and associated crossing (north of Stanley Boulevard).

A detailed description of the Project's entitlements can be found in Chapter 3 of the Draft EIR. Overall, the Project includes approval of the following entitlements and agreements by the City of Livermore and Responsible Agencies, including Alameda County and the City of Pleasanton:

SMP 39

- Resolution authorizing submittal of an annexation and SOI Amendment application to the Alameda LAFCo;
    - Property tax exchange agreement between Alameda County and the City of Livermore;
- General Plan Amendment to modify the City's land use designation for SMP 39 from Open Space/Sand and Gravel to Low Intensity Industrial (LII);
    - Pre-zone the site as Planned Development-Industrial (PDI-22-001);
    - Zoning Map Amendment;
    - Vesting Tentative Subdivision Map;
    - Development Agreement; and
    - Pre-Annexation Agreement.

SMP 40

- Resolution authorizing submittal of an annexation application to the Alameda LAFCo;
    - Property tax exchange agreement between Alameda County and the City of Livermore;
- General Plan Amendment to modify the City's land use designation for SMP 40 from Open Space/Sand and Gravel to LII;
    - Pre-zone the site as PDI-22-001;
    - Zoning Map Amendment;
    - Vesting Tentative Subdivision Map;
    - Site Plan and Design Review;
    - Development Agreement; and
    - Pre-Annexation Agreement.

Additional Annexation Only Parcels (APNs 904-10-2-3, -5, -7, and -8)

- Resolution authorizing submittal of an annexation application to the Alameda LAFCo;
    - Property tax exchange agreement between Alameda County and the City of Livermore;
- General Plan Amendment to modify the City's land use designation from Open Space/Sand and Gravel to Parks, Trailways and Recreation Areas (OSP); and
    - Pre-zone the sites to Open Space Flood Plain (OS-F).

A number of other agencies, such as Alameda LAFCo, would serve as Responsible and Trustee Agencies, pursuant to CEQA Guidelines Section 15381 and Section 15386, respectively. The Draft EIR provided environmental information, which may be required to grant approvals or coordinate with other agencies, to the agencies as part of Project implementation. These agencies could include, but may not be limited to, the following:

- Alameda LAFCo;
- Alameda County Airport Land Use Commission (ALUC);
- Alameda County;
- City of Pleasanton;
- Pacific Gas and Electric Company (PG&E);
- Federal Aviation Administration (FAA);

- Federal Emergency Management Agency (FEMA);
- Bay Area Air Quality Management District (BAAQMD);
- California State Water Resources Control Board (SWRCB);
- San Francisco Regional Water Quality Control Board (RWQCB);
- Zone 7 Water Agency;
- Caltrans;
- California Department of Fish and Wildlife (CDFW); and
- U.S. Army Corps of Engineers (USACE).

C. SIGNIFICANT UNAVOIDABLE ADVERSE IMPACTS AND DISPOSITION OF RELATED MITIGATION MEASURES

The Final EIR identifies the following significant and unavoidable adverse impacts associated with the approval of the Project and identifies related mitigation measures. It is hereby determined that these significant unavoidable adverse impacts are acceptable for the reasons specified in Section J below.

The impacts and related mitigation measures identified below are presented in summary form. For a detailed description of impacts and mitigation measures, see the MMRP in the Final EIR.

1. Agricultural Resources Impact 4.1-2: Implementation of the Project would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Buildout of the Project has the potential to result in impacts to agricultural resources, specifically the conversion of farmland to non-agricultural uses. SMP 39 and SMP 40 have on-site soils that result in the land being considered prime agricultural land by Alameda LAFCo.

According to the Alameda LAFCo's General Proposal Policies, the LAFCo shall discourage City annexations of prime agricultural land, as defined by Government Code Section 56064, if such areas are not needed for urbanization within five years. The City has identified a need for additional industrial uses within the City of Livermore, and vacant land that would be viable for development of industrial uses similar to the Project does not exist within current Livermore city limits. Further, given the existing surrounding land uses, the project site is generally a suitable location for the Project, and a reasonable assumption can be made that other properties within the City may not be as well suited for the Project as the project site. Therefore, urbanization of the project site within the next five years would be needed to allow for the development of additional light industrial uses within the City. It should be noted, however, that annexation is ultimately subject to approval by Alameda LAFCo.

Potential mitigation for impacts analyzed in the Draft EIR related to the conversion of prime agricultural land to non-agricultural uses included purchasing agricultural conservation easements outside the Project area. However, this mitigation would not create new agricultural land; rather, the mitigation would preserve existing agricultural land elsewhere. Feasible mitigation measures do not exist to reduce the above impact to a less-than-significant level. Therefore, the impact would remain significant and unavoidable.

2. Agricultural Resources Impact 4.1-3: Implementation of the proposed Project would result in impacts related to the cumulative loss of agricultural land.

As discussed above, SMP 39 and SMP 40 have on-site soils that are considered prime agricultural land by Alameda LAFCo. Therefore, implementation of the Project would convert prime agricultural land to non-agricultural uses, which would conflict with Alameda LAFCo policies related to prime agricultural land. Accordingly, the Project would prevent further use of the site for agricultural uses, and the Project-specific impact would be considered significant and unavoidable. Feasible mitigation measures do not exist to reduce the impact to a less-than-significant level. Therefore, the impact would remain significant and unavoidable.

D. SIGNIFICANT IMPACTS IDENTIFIED IN THE EIR THAT ARE REDUCED TO A LEVEL OF "LESS THAN SIGNIFICANT" BY THE MITIGATION MEASURES INCORPORATED INTO THE PROJECT

The Final EIR identifies the following significant impacts associated with the Project that are reduced to a level of less than significant by mitigation measures identified in the Draft EIR. It is hereby determined that the following environmental impacts will be mitigated to a less-than-significant level or avoided by incorporation of the mitigation measures into the Project (for a detailed description of impacts and mitigation measures, see the appropriate text in the EIR):

1. Air Quality Impact 4.2-1: Implementation of the proposed Project would not conflict with or obstruct implementation of the applicable air quality plan during Project construction, with incorporation of the following mitigation measures: MM 4.2-1(a) and MM 4.2-1(b).

2. Air Quality Impact 4.2-2: Implementation of the proposed Project would not conflict with or obstruct implementation of the applicable air quality plan during Project operation, with incorporation of MM 4.2-2.

3. Biological Resources Impact 4.3-2: Implementation of the proposed Project would not have a substantial adverse effect, either directly or through habitat modifications, on special-status wildlife species, with incorporation of the following mitigation measures: MM 4.3-2(a), MM 4.3-2(b), MM 4.3-2(c), and MM 4.3-2(d).

4. Biological Resources Impact 4.3-3: Implementation of the proposed Project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or the U.S. Fish and Wildlife Service (USFWS), or State or Federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means, with incorporation of the following mitigation measures: MM 4.3-3(a), MM 4.3-3(b), MM 4.3-3(c), MM 4.3-3(d), and MM 4.3-3(e).

5. Cultural and Tribal Cultural Resources Impact 4.4-2: Implementation of the proposed Project would not cause a substantial adverse change in the significance of a unique archeological resource pursuant to CEQA Guidelines, Section 15064.5, with implementation of MM 4.4-2.

6. Cultural and Tribal Cultural Resources Impact 4.4-3: Implementation of the proposed Project would not disturb any human remains, including those interred outside of dedicated cemeteries, with incorporation of MM 4.4-3.

7. Cultural and Tribal Cultural Resources Impact 4.4-4: Implementation of the proposed Project would not cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074, with incorporation of MM 4.4-4.

8. Hydrology and Water Quality Impact 4.5-1: Implementation of the proposed Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality during construction, with incorporation of MM 4.5-1.

9. Hydrology and Water Quality Impact 4.5-2: Implementation of the proposed Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade water quality during operations, with incorporation of the following mitigation measures: MM 4.5-2(a) and MM 4.5-2(b).

10. Hydrology and Water Quality Impact 4.5-4: Implementation of the proposed Project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or result in substantial erosion or siltation on- or off-site, with incorporation of MM 4.5-4.

11. Hydrology and Water Quality Impact 4.5-5: Implementation of the proposed Project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows, or in flood hazard, tsunami, or seiche zone, risk release of pollutants due to Project inundation, with incorporation of MM 4.5-5.

12. Noise Impact 4.6-1: Implementation of the proposed Project would not result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, with incorporation of MM 4.6-1(a) and MM 4.6-1(b).

13. Public Services, Utilities, and Service Systems Impact 4.7-8: Implementation of the proposed Project would not result in an increase in demand for utilities and service systems associated with the proposed Project, in combination with future buildout of the Livermore General Plan, with incorporation of the following mitigation measures: MM 4.7-8(a) and MM 4.7-8(b).

14. Transportation Impact 4.8-1: Implementation of the proposed Project would not conflict with a program, plan, ordinance, or policy addressing the circulation system during construction activities, with incorporation of MM 4.8-1.

15. Transportation Impact 4.8-3: Implementation of the proposed Project would not conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b), with incorporation of MM 4.8-3.

E. LESS THAN SIGNIFICANT IMPACTS IDENTIFIED IN THE EIR

The Draft EIR identified the following less-than-significant impacts (for a detailed description of the less-than-significant impacts, see the appropriate text in the Draft EIR):

1. Agricultural Resources Impact 4.1-1: Implementation of the proposed Project would not conflict with existing zoning for agricultural use, or a Williamson Act contract.

2. Air Quality Impact 4.2-3: Implementation of the proposed Project would not expose sensitive receptors to substantial pollutant concentrations.

3. Air Quality Impact 4.2-4: Implementation of the proposed Project would not result in other emissions (such as those leading to odors) affecting a substantial number of people.

4. Air Quality Impact 4.2-5: Implementation of the proposed Project would not result in the inefficient or wasteful use of energy or conflict with a State or local plan for renewable energy or energy efficiency.

5. Air Quality Impact 4.2-6: Implementation of the proposed Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

6. Air Quality Impact 4.2-7: Implementation of the proposed Project would not generate greenhouse gas (GHG) emissions, either directly or indirectly, that may have a significant impact on the environment, or conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

7. Air Quality Impact 4.2-8: Implementation of the proposed Project would not result in a cumulatively considerable inefficient or wasteful use of energy or conflict with a State or local plan for renewable energy or energy efficiency.

8. Biological Resources Impact 4.3-1: Implementation of the proposed Project would not have a substantial adverse effect, either directly or through habitat modifications, on special-status plant species.

9. Biological Resources Impact 4.3-4: Implementation of the proposed Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

10. Biological Resources Impact 4.3-5: Implementation of the proposed Project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

11. Biological Resources Impact 4.3-6: Implementation of the proposed Project would not conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or State habitat conservation plan.

12. Biological Resources Impact 4.3-7: Implementation of the proposed Project would not cause cumulative loss of habitat for special-status species.

13. Cultural and Tribal Cultural Resources Impact 4.4-1: Implementation of the proposed Project would not cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines, Section 15064.5.

14. Cultural and Tribal Cultural Resources Impact 4.4-5: Implementation of the proposed Project would not cause a cumulative loss of cultural and tribal cultural resources.

15. Hydrology and Water Quality Impact 4.5-3: Implementation of the proposed Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

16. Hydrology and Water Quality Impact 4.5-6: Implementation of the proposed Project would not result in cumulative impacts related to the violation of water quality standards or waste discharge requirements, and impacts resulting from the alteration of existing drainage patterns.

17. Noise Impact 4.6-2: Implementation of the proposed Project would not result in the generation of a substantial permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

18. Noise Impact 4.6-3: Implementation of the proposed Project would not result in the exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.

19. Noise Impact 4.6-4: Implementation of the proposed Project would not, for a Project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose persons residing or working in the project area to excessive noise levels.

20. Noise Impact 4.6-5: Implementation of the proposed Project would not result in the generation of a substantial permanent increase in ambient noise levels associated with development of the proposed Project in combination with buildout of the City of Livermore General Plan.

21. Public Services, Utilities, and Service Systems Impact 4.7-1: Implementation of the proposed Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain

acceptable service ratios, response times, or other performance objectives for fire protection services.

22. Public Services, Utilities, and Service Systems Impact 4.7-2: Implementation of the proposed Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental services and/or facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection services.

23. Public Services, Utilities, and Service Systems Impact 4.7-3: Implementation of the proposed Project would not require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.

24. Public Services, Utilities, and Service Systems Impact 4.7-4: Implementation of the proposed Project would continue to have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry, and multiple dry years.

25. Public Services, Utilities, and Service Systems Impact 4.7-5: Implementation of the proposed Project would not result in a determination by the wastewater treatment provider which serves or may serve the Project that it does not have adequate capacity to serve the Project's projected demand in addition to the provider's existing commitments.

26. Public Services, Utilities, and Service Systems Impact 4.7-6: Implementation of the proposed Project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, or conflict with federal, State, and local management and reduction statutes and regulations related to solid waste.

27. Public Services, Utilities, and Service Systems Impact 4.7-7: Implementation of the proposed Project would not result in cumulative impacts to public services.

28. Transportation Impact 4.8-2: Implementation of the proposed Project would not conflict with a program, plan, ordinance or policy addressing the circulation system during operations.

29. Transportation Impact 4.8-4: Implementation of the proposed Project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment), or result in inadequate emergency access.

F. SIGNIFICANT IMPACTS IDENTIFIED IN THE INITIAL STUDY THAT ARE REDUCED TO A LEVEL OF "LESS THAN SIGNIFICANT" BY THE MITIGATION MEASURES INCORPORATED INTO THE PROJECT

The mitigation measures contained in the Initial Study are designed to avoid or mitigate significant environmental impacts whenever possible. Implementation of the mitigation measures contained in the Initial Study will result the following less-than-significant impacts (for a detailed description of the less than significant impacts, see the appropriate text in the Initial Study):

1. Aesthetics Impacts I-a and I-b: The proposed Project would not have a substantial adverse effect on a scenic vista and would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway, with incorporation of MM I-1.

2. Geology and Soils Impacts VII-a-iii and -iv, VII-c, and VII-d: The proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: seismic-related ground failure, including liquefaction, or landslides; be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse; or be located on expansive soil, as defined in Table 18-1B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property, with incorporation of MMs VII-1 and VII-2.

3. Geology and Soils Impact VII-f: The proposed Project would not directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, with incorporation of MM VII-3.

4. Hazards and Hazardous Materials Impact IX-b: The proposed Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment, with incorporation of MM IX-1 and IX-2.

G. LESS THAN SIGNIFICANT IMPACTS IDENTIFIED IN THE INITIAL STUDY

The Initial Study identified the following impacts at a level of less than significant or no impact (for a detailed description of the impacts, see the appropriate text in the Initial Study):

1. Aesthetics Impacts I-c and I-d.

2. Agriculture and Forest Resources Impacts II-a, II-c, and II-d.

3. Geology and Soils Impacts VII-a-i and -ii, as well as VII-e.

4. Hazards and Hazardous Materials Impacts IX-a, IX-c, IX-d, IX-e, IX-f, and IX-g.

5. Land Use and Planning Impact XI-a.

6. Mineral Resources Impacts XII-a and XII-b.

7. Population and Housing Impacts XIV-a and XIV-b.

8. Public Services Impacts XV-c, XV-d, and XV-e.

9. Recreation Impacts XVI-a and XVI-b.

10. Wildfire Impacts XX-a, XX-b, XX-c, and XX-d.

H. MITIGATION MONITORING AND REPORTING PROGRAM

When making findings, the lead agency must adopt a reporting or monitoring program for the mitigation measures it has adopted or made a condition of Project approval in order to mitigate or avoid significant effects on the environment. The City hereby adopts the MMRP for the Project, included as Exhibit A to these findings. The mitigation measures identified in the EIR to reduce significant impacts and adopted and incorporated into the Project will be monitored pursuant to the MMRP.

I. ALTERNATIVES

The Draft EIR evaluated three alternatives to the proposed Project. The City Council has reviewed the significant unavoidable impacts associated with each alternative as compared with the proposed Project, and has also considered each alternative's feasibility, considering a range of economic, environmental, social, and legal factors. Overall, the City Council concludes that each of the three alternatives to the proposed Project is infeasible and less desirable than the proposed Project. The City Council's analysis and conclusions are described below.

1. No Project (No Build) Alternative: The No Project (No Build) Alternative does not involve changes to the current conditions of the Project site would remain, and the site would not be developed. The significant and unavoidable impact associated with agricultural resources would not occur as part of the Alternative. Because the alternative fails to meet multiple Project objectives and failure to meet even a single objective would be sufficient for rejection of the alternative, the alternative is considered infeasible and undesirable.

2. No Project (Maximum Allowable Operations) Alternative: The No Project (Maximum Allowable Operations) Alternative assumes SMP 39 and SMP 40 would be mined as allowed under the current surface mining permits previously approved for the sites by Alameda County, though not on the Additional Annexation Only Parcels. The significant and unavoidable impact associated with agricultural resources would not occur as part of the Alternative. The Alternative would not meet any of the objectives for the Project, as the sites would not be annexed into the City, industrial uses would not be developed on the sites, and off-site improvements, such as the widening of West Jack London Boulevard and the construction of an off-site trail connection, would not occur.

3. Reduced Intensity Alternative: The Reduced Intensity Alternative would involve development of the Project at a reduced scale. The overall building square footage would be reduced from a total of 1,514,775 sf to a total of approximately 1,226,025 sf. The eastern building on SMP 40 would not be developed, so the disturbance area would be reduced by 16.93 acres. All other aspects of the Project, including building heights, vehicle access,

required entitlements, and the off-site improvements, would be similar under the Alternative.

While the eastern building on SMP 40 would not be developed under the Reduced Intensity Alternative, the Alternative would generally meet all the objectives of the Project. For instance, the project objectives refer to developing industrial uses on-site, to the annexation of the sites into the City, and to the development of off-site improvements that would occur under both the Project and the Alternative, including dedicating, widening, and improving West Jack London Boulevard and the construction of off-site trail improvements.

However, under the Reduced Intensity Alternative, the significant and unavoidable impact related to agricultural resources, which was identified for the Project, would still occur. As such, the number of significant and unavoidable impacts under the Reduced Intensity Alternative would be the same as the Project. Therefore, the alternative is considered undesirable and is rejected.

J. STATEMENT OF OVERRIDING CONSIDERATIONS

As set forth above, there is a significant adverse environmental impact to agricultural resources, which was identified in the Final EIR, but is not mitigated to a less-than-significant level. CEQA requires the decision-makers to balance the benefits of the Project against its unavoidable environmental risks in determining to approve the Project. Entirely avoiding many of the significant unavoidable impacts would require undermining key Project objectives (see Section 3.4 of the Draft EIR for the list of Project objectives). Therefore, the City of Livermore finds that the benefits of the Project described below outweigh the unavoidable adverse environmental impact as identified above, and that the adverse environmental impact of the Project is, therefore, considered acceptable. These social, economic, and other benefits constitute overriding considerations justifying Project approval:

1. Approval of the Project advances key Project objectives to revitalize underutilized lands that are appropriate for infill development in which workers can enjoy an environment comprised of modern professional and administrative facilities, research institutions, manufacturing operations, warehouse and distribution facilities, experimental and testing laboratory and related uses compatible with surrounding land uses in the area, the City's General Plan, and the Alameda County Airport Land Use Compatibility Plan (Objectives 2 and 5).

2. Approval of the Project supports the key Project objective to promote industrial development consistent with the goals, policies, and objectives set forth in both the existing City of Livermore General Plan and General Plan update, including facilities with high-quality architectural design, landscaping, and signage that are consistent with the City's design standards and guidelines. Such facilities would provide jobs with competitive salaries, reduce vehicle miles traveled, and provide necessary off-site and on-site improvements to the area roadway system, public works, power, and telecommunications infrastructure consistent with planned infrastructure systems (Objectives 1 and 3).

3. Approval of the Project advances key Citywide goals (Objectives 4, 6, and 8). The proposed project would create logical and future City boundaries in cooperation with the City of Pleasanton and Alameda County that align with the City of Livermore's General Plan and

Urban Growth Boundary (UBG). In addition, as envisioned by the City, the Project would dedicate, widen, and improve West Jack London Boulevard and construct on- and off-site trail improvements and connections to the existing trail network.

4. Approval of the Project would generate long-term sustainable property tax and sales tax revenue for the City of Livermore by way of the annexation of SMP 39 and SMP 40 (Objective 7). The proposed project would also generate funding for local school services through payment of the City's School Impact Mitigation Development Fees.

K. RECIRCULATION NOT REQUIRED

New or substantial changes to the Draft EIR were not proposed as a result of the public comment process. The Final EIR and the responses to comments memoranda and errata prepared as part of the Planning Commission and City Council staff reports responds to comments and makes only minor technical changes, clarifications, or additions to the Draft EIR. The minor revisions to the Draft EIR do not identify any new significant impacts or substantial increase in the severity of any environmental impacts. The revisions are for clarification purposes only and do not change the conclusions of the Draft EIR. Therefore, recirculation of the Draft EIR is not required.

L. RECORD OF PROCEEDINGS

Various documents and other materials constitute the record of proceedings upon which the City Council base their findings and decisions contained herein. Documents related to this Project are located in the Livermore Community Development Department, Planning Division, 1052 South Livermore Avenue, Livermore, CA.

M. SUMMARY

1. Based on the foregoing Findings and the information contained in the record, the City has made one or more other following findings with respect to each of the significant effects of the Project:

    - Changes or alternations have been required in, or incorporated into, the Project, which mitigate or avoid the significant effects on the environment.

    - Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that agency.

    - Specific economic, legal, social, technological, economic or other considerations made infeasible the mitigation measures or alternatives identified in the Final EIR.

2. Based on the foregoing Findings and the information contained in the record, it is determined that:

- All significant effects on the environmental due to the approval of the SMP 39/SMP 40 Project have been eliminated or substantially lessened where feasible.
- Any remaining significant effects on the environment found to be unavoidable are acceptable due to the factors described in the Statement of Overriding Considerations in Section J, above.

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
4.2 Air Quality and Greenhouse Gas Emissions					
4.2-1	Conflict with or obstruct implementation of the applicable air quality plan during project construction.	*4.2-1(a)* *Prior to approval of any Improvement Plans, the project applicant shall provide proof of compliance with the following to the satisfaction of the City of Livermore Community Development Department:* *The project applicant shall show on the plans via notation that the contractor shall ensure that the heavy-duty off-road vehicles (50 horsepower or more) to be used in the construction of all project components (i.e., construction of SMP 39, SMP 40, and the chosen off-site trail connection option), including owned, leased, and subcontractor vehicles, shall be a combination of engine Tier 3 or Tier 4 off-road construction equipment, or hybrid, electric, or alternatively fueled equipment (or any combination of the above), sufficient to achieve a fleet-wide average reduction in construction-related ROG and NOX emissions to below the applicable BAAQMD thresholds of significance (54 lbs/day). For instance, the emissions presented in Table 4.2-8 were achieved by requiring all equipment used during construction to be engine Tier 4 final.*	City of Livermore Community Development Department	Prior to approval of any Improvement Plans	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		In addition, all off-road equipment operating at the construction site must be maintained in proper working condition according to manufacturer's specifications. Idling shall be limited to five minutes or less in accordance with the In-Use Off-Road Diesel Vehicle Regulation as required by CARB. Clear signage regarding idling restrictions shall be placed at the entrances to the construction site. *Portable equipment over 50 horsepower must have either a valid BAAQMD Permit to Operate (PTO) or a valid statewide Portable Equipment Registration Program (PERP) placard and sticker issued by CARB.* *Conformance with the foregoing requirements shall be included as notes and be confirmed through review and approval of grading plans by the City of Livermore Community Development Department.*			
		4.2-1(b) *The project applicant shall show on Improvement Plans via notation that the project contractor shall restrict the building construction and architectural coating phases of construction for SMP 39 from occurring simultaneously with the building construction and architectural coating phases of construction for SMP 40.*	City of Livermore Community Development Department	Prior to approval of any Improvement Plans	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project

		Conformance with this requirement shall be confirmed through review and approval of plans by the City of Livermore Community Development Department.			
4.2-2	Conflict with or obstruct implementation of the applicable air quality plan during project operation.	*4.2-2 Prior to approval of any Improvement Plans, the project applicant shall provide proof of compliance with the following to the satisfaction of the City of Livermore Community Development Department:* • *The project applicant shall show on the Improvement Plans via notation that all off-road equipment (i.e., forklifts) to be used during operations of the proposed project shall be a combination of propane and electric, sufficient to achieve a fleet-wide average reduction in operational-related NOX emissions to below the applicable BAAQMD threshold of significance (54 lbs/day). For instance, the emissions presented in Table 4.2-10 were achieved by requiring that 27 percent of the forklifts used during operations on both SMP 39 and SMP 40 are electric.*	City of Livermore Community Development Department	Prior to approval of any Improvement Plans	
4.3 Biological Resources					
4.3-2	Have a substantial adverse effect, either directly or through habitat modifications, on special-status wildlife species.	*Western Burrowing Owl* *4.3-2(a) If project construction begins during the western burrowing owl nesting season (February 1 to August 31), a qualified biologist shall conduct targeted burrowing owl nest surveys within 14 days prior to*	City of Livermore Community Development Department	Within 14 days prior to construction activities if project construction begins during the western	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		construction activities using seven- to 20-foot transects. A separate preconstruction survey shall be conducted for SMP 39 and SMP 40 (including the off-site trail connection area) if the components of the project are not constructed concurrently. The survey shall include the project site and all accessible areas within 500 feet of the project impact zone, and shall follow CDFW guidelines outlined in the 2012 Staff Report on Burrowing Owl Mitigation. The results of the survey shall be submitted to the City of Livermore Community Development Department within 30 days of the completed survey. The survey report shall be valid for one construction season. *If western burrowing owls are not detected on-site during the survey, further mitigation shall not be required. If any western burrowing owls are detected on-site, pursuant to the CDFW's 2012 Staff Report on Burrowing Owl Mitigation, the following restricted activity dates and setback distances shall be implemented:* • *From April 1 through October 15, low disturbance activities shall have a 200-meter buffer while high disturbance activities shall have a 500-meter buffer from occupied nests.* • *From April 1 through August 15, medium disturbance activities shall have a 500-meter buffer from*		burrowing owl nesting season (February 15 to August 31)	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project

		occupied nests. Medium disturbance activities can have a reduced buffer of 200 meters starting August 16 through October 15. • *From October 16 through March 31, low disturbance activities shall have a 50-meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities shall have a 500-meter buffer from occupied nests.* • *Earth-moving activities or other disturbance shall not occur within the aforementioned buffer zones of occupied burrows unless monitoring of the nest site by a qualified biologist determines that the owls are acclimated to the disturbance and would not be disturbed by a smaller buffer. The buffer zones shall be fenced.* • *A qualified biologist shall delineate the extent of burrowing owl habitat on the site.* • *Owls may be passively relocated from the project site between October 1 and February 1. Passive removal shall be conducted by a qualified biologist with demonstrated experience with passive relocation.* • *Credits shall be purchased from a mitigation bank in coordination with CDFW and the City of Livermore to*			

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		offset the project's habitat loss on the burrowing owl. *A report detailing compliance with the provisions set forth herein shall be prepared by the qualified biologist and submitted for review and approval to the City of Livermore Community Development Department.*			
		Western Burrowing Owl (Trail Connection Options 2 and 3) *4.3-2(b) In the event that Trail Connection Option 2 – Undercrossing at Isabel Bridge or Trail Connection Option 3 – Overcrossing of Isabel Avenue/SR 84 is the selected trail connection option for the proposed project, the requirements of Mitigation Measure 4.3-2(a) shall be implemented for the disturbance area associated with the trail connection option.*	City of Livermore Community Development Department	Within 14 days prior to construction activities if project construction begins during the western burrowing owl nesting season (February 15 to August 31)	
		Tricolored Blackbird *4.3-2(c) Prior to any ground disturbance on SMP 40, a qualified biologist shall conduct a preconstruction survey in all accessible areas identified as supporting potential tricolored blackbird nesting habitat. The survey shall document the current, and to the extent possible, historical presence or absence of nesting colonies of tricolored blackbird. Surveys shall conclude no more than two calendar days prior to construction. If a tricolored blackbird nesting colony is present, a 250-foot buffer shall be applied*	City of Livermore Community Development Department	Prior to any ground disturbance on SMP 40	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		from the outer edge of all hydrophytic vegetation associated with the site and the site plus buffer shall be avoided. The Wildlife Agencies shall be notified immediately of nest locations. All survey results shall be submitted to the City of Livermore Community Development Department prior to the start of construction. If current or recent tricolored blackbird nesting colonies are not identified, further action is not required. *If construction takes place during the breeding season when an active colony is present, a qualified biologist shall monitor construction to ensure that the 250-foot buffer zone is enforced. If monitoring indicates that construction outside of the buffer is affecting a breeding colony, the buffer shall be increased if space allows (e.g., move staging areas farther away). If space does not allow, construction shall cease until the colony abandons the site or until the end of the breeding season, whichever occurs first. The biological monitor shall also conduct training of construction personnel on the avoidance procedures, buffer zones, and protocols in the event that tricolored blackbirds fly into an active construction zone (i.e., outside the buffer zone).* *Nesting Birds and Raptors (Including Loggerhead Shrike)*			

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		4.3-2(d) *If project construction begins during the nesting season (February 1 to August 31), a qualified biologist shall conduct a nesting bird survey within 7 days prior to construction activities. A separate preconstruction survey shall be conducted for SMP 39 and SMP 40 (including the off-site trail connection area) if the components of the project are not constructed concurrently. The nesting bird survey shall include walking transects to search for ground nesting birds, and an examination of all trees on-site and within all accessible areas within 200 feet of the entire project site and off-site improvement areas (i.e., within a zone of influence of nesting birds). If nesting birds are not found within the project site or off-site improvement areas, further mitigation shall not be required.* *If migratory birds are identified nesting on or within the zone of influence, the Wildlife Agencies shall be notified immediately of nest locations. A qualified biologist shall establish a temporary protective nest buffer around the nest(s). The nest buffer shall be staked with orange construction fencing. The buffer must be of sufficient size to protect the nesting site from construction-related disturbance and shall be established by a qualified ornithologist or biologist with extensive experience working with nesting birds near and on construction sites. Typically, adequate nesting buffers are 75*	City of Livermore Community Development Department	Within seven days prior to construction activities, if project construction begins during the nesting season (February 1 to August 31)	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		feet from the nest site or nest tree dripline for small birds and up to 300 feet for sensitive nesting birds that include several raptor species known in the region of the project site but that are not expected to occur on the project site. Upon completion of nesting surveys, if nesting birds are identified on or within a zone of influence of the project site, a qualified ornithologist/biologist that frequently works with nesting birds shall prescribe adequate nesting buffers to protect the nesting birds from harm while the project is constructed. *Construction or earth-moving activity shall not occur within any established nest protection buffer prior to September 1 unless a qualified ornithologist/biologist determines that the young have fledged and have attained sufficient flight skills to avoid project construction zones, or that the nesting cycle is otherwise completed. In the region of the project site, most species complete nesting by mid-July; however, the date may be significantly earlier or later, and would have to be determined by the qualified biologist. At the end of the nesting cycle, and fledging from the nest by its occupants, as determined by a qualified biologist, temporary nesting buffers may be removed and construction may commence in established nesting buffers without further regard for the nest site. If active nesting buffers are established and a biologist does*			

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		not confirm that the nesting cycle is completed, then the nesting buffers must be maintained until the end of the CDFW recognized nesting season (September 1). *Should construction activities cause a nesting bird to do any of the following in a way that would be considered a result of construction activities, then the exclusionary buffer shall be increased such that activities are far enough from the nest to stop the following agitated behavior: vocalize, make defensive flights at intruders, get up from a brooding position, or fly off the nest. The revised non-disturbance buffer shall remain in place until the chicks have fledged or as otherwise determined by a qualified biologist in consultation with the City of Livermore.* *A report detailing compliance with the provisions set forth herein shall be prepared by the qualified biologist and submitted for review and approval to the City of Livermore Community Development Department.*			
4.3-3	Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS, or State or Federally protected wetlands	*Trail Connection Option 2 – Undercrossing at Isabel Bridge* *4.3-3(a)* *Prior to the initiation of ground-disturbing activities, the project applicant shall submit a formal wetland delineation to the USACE for Trail Connection Option 2 for verification to determine the extent of all hydrological features, their jurisdictional status, and the extent of any impacts resulting from the proposed project. 		Resources Assessments prepared for SMP 40 by Monk & Associates. Impacts for each activity shall be broken down by temporary and permanent impacts. A description of the proposed mitigation for biological resource impacts shall be outlined per activity and then by temporary and permanent impact. Information regarding project-specific drainage and hydrology changes resulting from project implementation shall be provided, as well as a description of stormwater treatment methods. Minimization and avoidance measures shall be proposed, as appropriate, and may include the following: • *To avoid fuels, lubricants, soils and other pollutants from entering Arroyo Mocho, wildlife friendly hay wattles (that is, no mono-filament netting) and silt fencing shall be installed at the top of bank. The use of mulch or any other substitute that may enter into the creek shall be prohibited.* • *Staging, operation and maintenance of heavy duty construction equipment shall be located away from Arroyo Mocho at all times and well outside of the riparian corridor unless the equipment is needed to specifically work on the realignment of Arroyo Mocho or the outfalls for the project.* • *To mitigate for any impacts to the riparian corridor of Arroyo Mocho,*			

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		disturbed areas shall be revegetated with native riparian plant species. Replacement of riparian trees to be removed shall be planted near the creek as feasible and/or adjacent to the existing limits of the riparian corridor to contribute to the existing riparian canopy. Riparian plantings shall be maintained for a minimum of 5 years to ensure that the canopy is enhanced and the understory restored. • *Non-native and invasive ornamental landscaping shall be precluded from use proximate to Arroyo Mocho.* • *To avoid debris from entering Arroyo Mocho, the final project design shall provide for enclosed and accessible trash receptacles (located outside of the riparian corridor).* • *New lighting introduced by the project shall be downcast and precluded from spilling over to the riparian corridor as direct lighting along creek corridors has a negative impact on nocturnal wildlife.* *Mitigation shall not result in a net loss of a Sensitive Natural Community. Written verification of Section 1600 of the LSAA shall be submitted to the City of Livermore Community Development Department.*

		permanent treatment, which may include avoidance of cultural resources, in-place preservation, and/or reburial on the project site so the resource(s) are not subject to further disturbance in perpetuity. In addition, The Confederated Villages of Lisjan shall be notified of the discovery. If avoidance is determined to be infeasible, pursuant to CEQA Guidelines Section 15126.4(b)(3)(C), a data recovery plan, which makes provisions for adequately recovering the scientifically consequential information from and about the historical resource, shall be prepared and adopted prior to any excavation being undertaken. If necessary, excavation and evaluation of the finds shall comply with Section 15064.5 of the CEQA Guidelines. *Potentially significant archaeological site indicators include obsidian and chert flakes and chipped stone tools; grinding and mashing implements (e.g., slabs and handstones and mortars and pestles); bedrock outcrops and boulders with mortar cups; and locally darkened midden soils. Midden soils may contain a combination of any of the previously listed items with the possible addition of bone and shell remains, and fire-affected stones. Any previously undiscovered resources found during construction within the project site shall be recorded on appropriate Department of Parks and Recreation (DPR) 523 forms and*	Preservation Office (SHPO)

			will be submitted to the City of Livermore, the Northwest Information Center (NWIC), and the State Historic Preservation Office (SHPO), as required.			
4.4-3	Disturb any human remains, including those interred outside of dedicated cemeteries.	*4.4-3*	*In the event of the accidental discovery or recognition of any human remains, further excavation or disturbance of the find or any nearby area reasonably suspected to overlie adjacent human remains shall not occur until compliance with the provisions of CEQA Guidelines Section 15064.5(e)(1) and (2) has occurred. The Guidelines specify that in the event of the discovery of human remains other than in a dedicated cemetery, no further excavation at the site or any nearby area suspected to contain human remains shall occur until the Alameda County Coroner has been notified to determine if an investigation into the cause of death is required. If the County Coroner determines that the remains are Native American, then, within 24 hours, the Coroner must notify the Native American Heritage Commission (NAHC), which in turn will notify the most likely descendants who may recommend treatment of the remains and any grave goods. The potential exists that the NAHC may be unable to identify a most likely descendant, the most likely descendant fails to make a recommendation within 48 hours after notification by the NAHC, or the landowner or his authorized agent rejects the recommendation by the most likely descendant and mediation by the NAHC fails*	Alameda County Coroner Native American Heritage Commission (NAHC) City of Livermore Community Development Department	In the event of the accidental discovery or recognition of any human remains

		major truck trips and deliveries to avoid peak hours; lane closure proceedings; signs, cones and other warning devices for drivers; and designation of construction access routes; • *Provisions for maintaining adequate emergency access to the project site;* • *Permitted construction hours, per City of Livermore standards;* • *Designated locations for construction staging areas;* • *Identification of parking areas for construction employees, site visitors, and inspectors, including on-site locations;* • *Signs posted at the entrances to the construction sites noting who to contact if there are questions or concerns, along with a contact phone number; and* • *Provisions for street sweeping to remove construction-related debris on public streets.*			
4.8-3	Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b).	*4.8-3* *Prior to the issuance of the first building permit, the project applicant shall be required to develop a Transportation Demand Management (TDM) Program for SMP 39 and SMP 40. The TDM Program shall be monitored by the project applicant/operator on an annual basis to determine the efficacy of the selected TDM strategies in achieving the reduction below the regional average VMT per employee of*	City of Livermore Engineering Division Chief Building Official	Prior to the issuance of the first building permit	

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		three percent (i.e., the performance target). An Annual Status Report on the TDM Program shall be submitted to the City of Livermore Engineering Division beginning a year after the issuance of any certificate of occupancy and shall include details on the TDM strategies, including an Employer Carpool Program which has a goal to reduce VMT per employee by approximately four percent and, thus, would meet and exceed the performance target. The Employer Carpool Program shall implement a ridesharing program and establish a permanent transportation management association with funding requirements for employers. Data shall be collected in October of each year and the Annual Status Report shall be submitted by December 31st of each year. The report shall be prepared in the form and format designated by the City. The data shall include project-generated VMT estimates compatible with the methodology used to estimate the benchmark VMT so that performance comparisons can be made. If the Annual Status Report demonstrates that the project is not in compliance with the performance target set forth in this mitigation measure, the project must incorporate additional TDM strategies to meet the performance target in coordination with City staff. The project applicant/operator may propose new TDM strategies that develop over time to further reduce project-generated VMT if substantial			

MITIGATION MONITORING AND REPORTING PROGRAM SMP 39/SMP 40 Project					
Impact Number	**Impact**	**Mitigation Measure**	**Monitoring Agency**	**Implementation Schedule**	**Sign-off**
		evidence is provided to support the efficacy of the strategy. If the Annual Status Reports demonstrate that the performance target has been achieved for five consecutive years once SMP 39 and SMP 40 are both fully occupied and operational, the project shall no longer need to provide annual reporting. The five-year reporting requirement shall reset when a new use occupies any portion of the SMP 39 or SMP 40 property.			
Initial Study

All recommendations set forth in the Phase I Environmental Site Assessment (ESA) shall be appropriately incorporated into the project and shall be subject to review and approval by the City of Livermore Community Development Department.		submittal of improvement plans associated with the proposed above-grade crossing	

SMP 39/SMP 40 Project
Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum

Since the release of the Final Environmental Impact Report (EIR) for the SMP 39/SMP 40 Project (proposed project), the City received three additional comment letters in regard to the proposed project. Written comments were received from the following entities:

Date	Commenter
1/28/2024	Brian Wines, San Francisco Bay Regional Water Quality Control Board
1/31/2024	Dean Wallraff, Advocates for the Environment
2/14/2024	Stephanie Papayanis, Attorneys for Carpenters Local 713

The comment letters are provided as Attachment 1. While CEQA does not require that written responses be provided for letters received after the close of the public review period, the comments are acknowledged by the City, and the City has chosen to prepare written responses to the comments for the decision-makers consideration in making an informed decision. Responses to the first two letters are provided below. Where revisions to the EIR text are required in response to a comment, new text is double underlined and deleted ~~text is struck~~ through. Responses to the third letter (Attorneys for Carpenters Local 713) were provided in a supplemental memo (attached) provided in advance of the Planning Commission public hearing. Responses to additional letters received after the Planning Commission staff report was published are also attached as a separate Supplemental Responses to Comments document.

The comments received did not identify any new significant effect, substantial increase in severity of an impact identified in the EIR, or any significant new information. Therefore, recirculation of the EIR is not required.

It should also be noted that the figures included in the Draft and Final EIR show that the SMP 40 site erroneously includes a parcel between the SMP 40 parcel and the parcels containing the quarries adjacent to the west. The SMP 40 site does not include this parcel and the City is not annexing this parcel. Therefore, all figures included in the Draft EIR have been revised, as shown at the end of this document, to accurately reflect the boundaries of the SMP 40 site accordingly. It should be noted that the written descriptions of the SMP 40 site, as well as the associated SOI amendment and annexation areas, are accurate in the Draft and Final EIR, and, therefore, further revisions to the Draft EIR text beyond what is presented in the Final EIR are not warranted. The changes to the figures as presented herein do not change the analysis or conclusions set forth within the Draft EIR.

Response to Brian Wines, San Francisco Bay Regional Water Quality Control Board

As stated in Response to Comment 3-3, included in the Final EIR, the proposed project does not include the use of pumps for stormwater treatment associated with SMP 40. All storm drainage operates by gravity alone and incorporates hydromodification and low impact development controls, described in more detail below.

As stated in Response to Comment 3-2 of the Final EIR, "…the western detention pond is intended for detaining high-flow runoff and would not provide stormwater quality or hydromodification controls."

In response to the comment and for clarification purposes, page 4.5-25 of the Draft EIR is hereby revised as follows:

SMP 40

As shown on the Preliminary Stormwater Quality Control Plan prepared for SMP 40 (see Figure 4.5-5), stormwater ~~on the SMP 40 site would~~ will be collected and treated for quality and hydromodification through an on-site storm drainage system, which ~~would include~~ includes an underground ~~detention storage~~ infiltration and hydromodification control system comprised of three parallel 96-inch-~~wide~~ diameter, 1,000-foot-long corrugated metal pipes. ~~The underground detention storage system would connect to the existing Oak Detention Basin, located to the north of the site, where water would be treated in accordance with the regional C.3 standards.~~ This system is designed to retain and infiltrate the site's storm water quality volume. Stormwater in excess of this volume will be metered from the treatment system via gravity to the existing Oak's Business Park detention basin. The underground infiltration system is designed to meet BAHM/C.3/stormwater requirements and the existing Oak's Business Park Detention Basin is not taken into account for BAHM/C.3/stormwater treatment purposes.

In addition, the SMP 40 storm drainage system would include installation of at least two Contech Engineered Solutions Vortech Systems Hydrodynamic Separators to provide pretreatment and trash capture, prior to conveyance of flows to the corrugated metal pipes. The Vortech Systems Hydrodynamic Separators meet emerging stormwater treatment technologies (TAPE) certification standards and would be installed in areas proposed for disturbance as part of development of SMP 40.

Outflow from the Oak's Business Park Detention Basin would flow north through an existing 24-inch storm drain line to West Jack London Boulevard, where runoff would be conveyed north into the existing modified channels at the Livermore Municipal Airport, before ultimately discharging at the existing large drop structure under West Jack London Boulevard, west of the Livermore Municipal Airport.

The proposed ~~detention~~ on-site infiltration system as described above would include an overflow connection to Arroyo Mocho to the south. A flap gate would be installed on the outlet to prevent water from Arroyo Mocho to backflow into the underground storage system.

Similarly, in response to the comment and for clarification purposes, page 3-17 of the Draft EIR is hereby revised as follows:

~~According to the Stormwater Quality Control Plan that has been prepared for the SMP 40 site, stormwater from impervious areas within SMP 40 would flow to a number of catch basin filtration inserts located throughout the SMP 40 site. The catch basins would connect a new network of stormwater lines to three 96-inch underground storage vaults located west of Building 1, within the internal drive aisle, between the dock doors and trailer parking. The storage vaults would be placed five feet underground and surrounded by rock. Stormwater from the storage vaults would be routed north and west to the existing detention basin located northwest of Building 1, within the Oaks Business Park, before being ultimately directed into a portion of the Arroyo Mocho Bypass Channel.~~

As shown on the Preliminary Stormwater Quality Control Plan prepared for SMP 40 (see Figure 4.5-5), stormwater will be collected and treated for quality and hydromodification through an on-site storm drainage system, which includes an underground infiltration and hydromodification control system comprised of three parallel 96-inch-diameter, 1,000-foot-long corrugated metal pipes. This system is designed to retain and infiltrate the site's storm water quality volume. Stormwater in excess of this volume will be metered from the treatment system via gravity to the existing Oak's Business Park detention basin. The underground infiltration system is designed to meet BAHM/C.3/stormwater requirements and the existing Oak's basin is not taken into account for BAHM/C.3/stormwater treatment purposes.

> In addition, the SMP 40 storm drainage system would include installation of at least two Contech Engineered Solutions Vortech Systems Hydrodynamic Separators to provide pretreatment and trash capture, prior to conveyance of flows to the corrugated metal pipes. The Vortech Systems Hydrodynamic Separators meet emerging stormwater treatment technologies (TAPE) certification standards and would be installed in areas proposed for disturbance as part of development of SMP 40.

The above revisions amplify the analyses contained in the Draft EIR and do not change the conclusions of the Draft EIR.

In addition to stormwater treatment, the proposed infiltration system is designed to provide hydromodification controls. It should be noted that as part of the project application process, Bay Area Hydrology Model (BAHM) calculations showing the proposed infiltration system's compliance with applicable hydromodification requirements were provided to the City of Livermore Engineering Division. Based on the above, the design of the SMP 40 stormwater system would be MRP-compliant. Furthermore, Mitigation Measure 4.5-2(a) requires that the final Stormwater Control Plan and Maintenance Plan prepared for the proposed project comply with all applicable provisions of the Alameda Countywide Clean Water Program C.3 Stormwater Technical Guidance publication and meet the standards of the CASQA Stormwater BMP Handbook for New Development and Redevelopment. Please see Response to Comment 3-2 above. In addition, the City would require pretreatment measures with TAPE certification as a condition of approval for the proposed project in response to the comment.

The City is actively coordinating with Zone 7 regarding the commenter's concerns with respect to groundwater quality.

Response to Dean Wallraff, Advocates for the Environment

Advocates for the Environment did not provide a comment letter on the Draft EIR during the 45-day public review period, which closed on October 13, 2023. Nonetheless, the following are responses to the comments received by Advocates for the Environment, which are organized to correspond with the headers included in the comment letter.

The City Should Require the Project to be Net-Zero

Neither the City, nor the Bay Area Air Quality Management District (BAAQMD), or any other regulatory agency with approval authority over the proposed project has a specific requirement that the project be net zero. Thus, a nexus for the City to require the proposed project to be net zero does not exist. Any obligation for the proposed project to be net zero would be voluntary by the applicant, and the project applicant has not indicated such voluntary measures would be implemented. Nonetheless, the comment is noted for the record and will be forwarded to the decision-makers for their consideration.

GHG Significance Analysis

Responses to the specific comments related to the greenhouse gas (GHG) analysis included in the Draft EIR are provided below.

Mischaracterization of the BAAQMD's Recommended Threshold

The BAAQMD has direct and indirect regulatory authority over sources of air pollution in the San Francisco Bay Area Air Basin (SFBAAB). The BAAQMD has adopted CEQA Thresholds for

Evaluating the Significance of Climate Impacts Justification Report (Justification Report),[1] which is included as Appendix B to their CEQA Air Quality Guidelines (BAAQMD Guidelines).[2] The Justification Report provides substantial evidence in support of the thresholds of significance developed by the BAAQMD. BAAQMD has recommended that lead agencies within the nine counties of the BAAQMD's jurisdiction use the thresholds of significance when considering the air quality impacts of projects under their consideration. As such, consistent with standard industry practice, the City of Livermore has elected to use the BAAQMD's thresholds of significance, which are supported by substantial evidence included in the Justification Report, in order to assess GHG emissions within the City.

The language quoted in the comment letter from pages 3.5 and 3.6 of the BAAQMD Guidelines is incomplete. The quoted paragraph in the BAAQMD Guidelines goes on to say, "Alternatively, a project for which these design elements are not implemented could still be determined to make a less-than-significant contribution of GHG emissions by demonstrating consistency with a local GHG reduction strategy that is consistent with state guidance (State CEQA Guidelines Section 15183.5[b])." In other words, as noted on pages 4.2-10 and 4.2-11 of the Draft EIR, the BAAQMD Guidelines either require that a project meets the minimum project design elements (i.e., the prohibition of natural gas, energy efficiency, the provision of on-site EV infrastructure, and VMT reductions), or the project is required to show consistency with a local GHG reduction strategy that meets the criteria under State CEQA Guidelines Section 15183.5(b).

According to CEQA Guidelines Section 15183.5(b), a local GHG reduction strategy is required to:

- Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
- Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
- Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels; and
- Be adopted in a public process following environmental review.

The City of Livermore Climate Action Plan (CAP)[3] is a local GHG reduction strategy that meets the criteria under State CEQA Guidelines Section 15183.5(b). Therefore, the City of Livermore CAP is consistent with the BAAQMD Guidelines and is compliant with State GHG reduction requirements.

Consistency with the CAP Checklist

The City of Livermore CAP lays out a comprehensive approach to meeting the City's climate goals through a range of strategies and actions. The strategies are organized by adaptation and mitigation topic (e.g., Wildfire, Flooding, Buildings and Energy, Transportation and Land Use,

---

1 Bay Area Air Quality Management District. *California Environmental Quality Act Air Quality Guidelines, Appendix B: CEQA Thresholds for Evaluating the Significance of Climate Impacts From Land Use Projects and Plans.* April 2022.

2 Bay Area Air Quality Management District. *California Environmental Quality Act Air Quality Guidelines.* April 2023.

3 City of Livermore. *2022 Climate Action Plan.* Adopted November 28, 2022

etc.). Each topic identifies primary objectives the City will use to measure success. The City has aimed to complete the primary objectives before 2030. However, the primary objectives are not required to be met by each individual development project; rather, the primary objectives are intended as an overall goal for the City to meet through implementation of the specific strategies and actions included in the CAP.

For example, the primary objectives noted by the comment letter (i.e., adding 1,284 publicly accessible electric vehicle chargers by 2030; reducing Vehicle Miles Traveled [VMT] by two percent by 2030; achieving 10 percent bike mode share by 2030; supporting sustainable land use practices; improving local re-use and repair programs; and expanding the use of low-carbon and recycled building materials) are implemented through the Transportation and Land Use and Waste and Materials strategies and actions included in the CAP. However, not all strategies and actions are applicable to the proposed project, as they are aimed at reducing emissions generated by existing development, municipal operations, or other land uses that are not proposed by the project (i.e., residential, commercial, etc.). The strategies and actions applicable to the proposed project were included in Table 4.2-15 of the Draft EIR. Specifically, Transportation and Land Use and Waste and Materials strategies and actions applicable to the proposed project include Action T-1.1, Strategy W-1, and Action W-1.5.

The overall waste reduction goal included in strategy W-1 is intended to ensure the City's compliance with Senate Bill (SB) 1383, which requires all jurisdictions in California to reduce organic waste disposal by 75 percent and increase edible food recovery by 20 percent relative to 2014 levels by 2025. As discussed in Table 4.2-15 of the Draft EIR, to address this goal on a project level, the proposed project would be required to comply with all applicable provisions of Chapter 8.08, Solid Waste Management, of the City's Municipal Code. According to Section 8.08.1030(G) of the City's Municipal Code, Article XII, Reduction of Organic and Recyclable Materials Deposited in Landfills, of Chapter 8.08 is adopted pursuant to the California Department of Resources Recycling and Recovery's (CalRecycle's) SB 1383 regulations, and the activities to be carried out under Article XII are entirely within the scope of the SB 1383 regulations. Therefore, compliance with such requirements would ensure that the proposed project would be consistent with strategy W-1 and is helping the City to meet the diversion goals established by SB 1383.

In addition, the Community Activation Guide included in the CAP is a list of voluntary measures that individuals (i.e., residents, businesses, etc.) can implement to help reduce emissions, and is not required to be implemented by development projects.

Overall, project consistency with all applicable strategies and actions set forth within the City of Livermore CAP was addressed in Table 4.2-15 of the Draft EIR, and, thus, the conclusion included in the Draft EIR that the proposed project is consistent with the City's CAP remains adequate.

Confusing GHG Analysis

The Standards of Significance listed on pages 4.2-38 and 4.2-39 of the Draft EIR are the required checklist questions included in Appendix G of the CEQA Guidelines related to air quality, GHG emissions, and energy. Based on Appendix G of the CEQA Guidelines, a significant impact related to air quality, GHG emissions, or energy would occur if the proposed project would result in any of the listed criteria included on pages 4.2-38 and 4.2-39 of the Draft EIR.

In order to assess the proposed project's impacts under each Standard of Significance, the lead agency (in this case, the City of Livermore) may elect to use certain thresholds of significance. In the case of the proposed project, the City of Livermore has elected to use both the BAAQMD's approved thresholds of significance as set forth in the BAAQMD Guidelines and consistency with

the City's CAP to assess the project under the Standards of Significance listed on pages 4.2-38 and 4.2-39 of the Draft EIR.

Inconsistency with Applicable Plans
As discussed on page 6-2 of the BAAQMD Guidelines, as well as within the Justification Report, the BAAQMD's GHG emissions thresholds were established in compliance with California's climate goals as set forth in SB 32, Executive Order (EO) B-55-18, and EO S-03-05.3, as well as the State's Climate Change Scoping Plan. Similarly, the City of Livermore CAP has taken into consideration emissions reduction strategies set forth in Assembly Bill (AB) 32, SB 32, EO B-55-18, the State's Climate Change Scoping Plan. As such, the project's compliance with the BAAQMD thresholds and City of Livermore CAP would also be considered compliance with the plans noted in the comment letter.

<u>The DEIR's Reported Overall Emissions Differs from the CalEEMod Overall Outputs</u>
The project's quantified GHG emissions are presented for disclosure purposes only, consistent with BAAQMD recommendations.

When modeling using CalEEMod, Version 2020.4.0, the model produces a summer report, a winter report, and an annual report. GHG emissions in the summer and winter reports are presented in pounds per day (lbs/day), while GHG emissions from the annual report are presented in metric tons of carbon dioxide equivalent units per year ($MTCO_2e$/yr). The summer and winter CalEEMod reports are used to estimate the project's average daily criteria pollutant emissions in units comparable to the applicable thresholds of significance for such pollutants (i.e., lbs/day). However, standard industry practice is to present GHG emissions on an annual basis, in $MTCO_2e$/yr, as an individual project's daily GHG emissions are at a micro-scale level relative to global GHG emissions, and short-term generation of GHG emissions is not typically expected to generate a significant contribution to global climate change. The GHG emissions presented for SMP 39 and SMP 40 in the Draft EIR represent the maximum annual GHG emissions that would be generated during project construction and operations. Neither the State, the City, nor BAAQMD have a requirement that the maximum daily GHG emissions of a project be specifically disclosed within a CEQA document. Even if such emissions were presented within the Draft EIR, the conclusions identified within the Draft EIR would not change, as the applicable threshold of significance for GHG emissions is qualitative. Furthermore, the modeling results were not omitted from the Draft EIR; rather, the modeling results were provided as Appendix C to the Draft EIR, which was available to the public during the public review period for the Draft EIR.

While CalEEMod has the capability to calculate GHG emissions associated with changes in vegetation, which can provide a more complete picture of GHG emissions, such estimations are not required by BAAQMD to be included in project modeling. In addition, as noted above, because the applicable threshold of significance for GHG emissions is qualitative, application of vegetation changes in the project modeling would not change the conclusions within the Draft EIR. Nevertheless, as discussed on page 4.3-35 of the Draft EIR, existing trees are not located within SMP 39. While trees are located along the southern boundary of SMP 40 associated with Arroyo Mocho, all construction activity associated with the development of SMP 40 would remain more than 25 feet from the bank of Arroyo Mocho, and all grading and construction activities would occur outside of the Arroyo Mocho's tree dripline. Thus, the trees located within SMP 40 would not be impacted by the proposed project, and the proposed project would not result in a decrease in carbon sequestration on-site related to the removal of existing trees.

Furthermore, as shown on Figures 3-13 and 3-14 of the Draft EIR, a total of 132 trees are proposed to be planted on SMP 40, and a total of 210,016 sf of the SMP 40 site would be

landscaped. While the exact number of trees or total amount of landscape area proposed for SMP 39 is not known at this time, all landscaping improvements would be required to be consistent with the City's Development Code and Design Standards and Guidelines, which require landscaping on-site to be equal to five percent of the building pad area and 16 percent of the parking area, as well as one tree be planted for every six parking spaces. As such, the number of trees on-site would substantially increase with development of SMP 39 and SMP 40 as compared to current conditions. Therefore, the provision of on-site trees and landscaping within SMP 39 and SMP 40 would ensure continued carbon sequestration following development of the proposed project.

Conclusion

Based on the responses provided above, the Draft EIR is in conformance with CEQA requirements. With regard to the reference to comments provided by SWAPE on the Draft EIR, please see Responses to Comments 6-22 through 6-29 included in Chapter 2 of the Final EIR. As explained therein, the analyses and conclusions included within the Draft EIR are adequate and recirculation of the Draft EIR is not required.

Hi Ashley

The discussion of proposed C.3-compliant water quality treatment for SMP 40 is contradictory.

In one paragraph, it is stated that runoff from SMP 40 will be collected in 3 96-inch diameter, gravel packed subteranean pipes and that these pipes will be perforated so that the colleced runoff infiltrates into the ground. In another paragraph, it is stated that runoff collected in the 3 pipes will be pumped to the existing detention basin located northwest of Building 1 in the Oaks Business Park. Please resolve this discrepancy.

Detention ponds are not considered LID treatment. Runoff must be routed to properly-sized bioretention areas for C.3 compliance.

If runoff will actually be infiltrated into the ground below the 3 pipes, please confirm that Zone 7 has no concerns with respect to groundwater quality in the aquifer that Zone 7 manages.

The text describing stormwater treatment for SMP 40 also refers to a number of catch basin filtration inserts located throughout the SMP 40 site. Catch basin filtration inserts do not provide MRP-compliant water quality treatment.

re: Comments on the Environmental Impact Report for the SMP 39/SMP 40 Project, SCH No. 2023010091

Dear Ms. Vera:

Advocates for the Environment submits the comments in this letter regarding the Draft Environmental Impact Report (**DEIR**), as amended by the Final Environmental Impact Report (**FEIR**) for the SMP 39/SMP 40 Project (**Project**). The Project Site is located north of Stanley Boulevard, south of West Jack London Boulevard, east of El Charro Road, and west of Isabel Avenue in the City of Livermore (**City**), Alameda County. On the 105.34-acre site, the Project proposes to construct six industrial warehouse buildings totaling 755,500 square feet on assessor parcel numbers (**APN**) 904-3-1-4, known as Surface Mining Permit 39 (**SMP 39**), and construct two industrial warehouse buildings totaling 759,275 square feet on APN 904-10-2-2 (**SMP 40**).

Advocates for the Environment is a public interest law firm and advocacy organization with the mission to educate the public about the law as it pertains to the environment and provide legal services in support of environmental causes. We have reviewed the EIR and submit comments regarding the sufficiency of the EIR's Greenhouse-Gas (**GHG**) analysis under the California Environmental Quality Act (**CEQA**).

The City Should Require the Project to be Net-Zero

Given the current regulatory context and technological advancements, a net-zero significance threshold is feasible and extensively supportable. GHG emissions from buildings, including indirect emissions from offsite generation of electricity, direct emissions produced onsite, and from construction with cement and steel, amounted to 21% of global GHG emissions in 2019. (IPCC Sixth Assessment Report, Climate Change 2022, WGIII, Mitigation of Climate Change, p. 9-4.) This is a considerable portion of global GHG emissions. It is much more affordable to construct new building projects to be net-zero than to obtain the same level of GHG reductions by expensively retrofitting older buildings to comply with climate change regulations. Climate damages will keep increasing until

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

we reach net zero GHG emissions, and there is a California state policy requiring the state to be net-zero by 2045. It therefore is economically unsound to construct new buildings that are not net-zero.

Environmental groups have achieved tremendous outcomes by litigation under CEQA. Two of the largest mixed-use development projects in the history of California, Newhall Ranch (now FivePoint Valencia), and Centennial (part of Tejon Ranch) decided to move forward as net-zero communities after losing CEQA lawsuits to environmental groups. The ability for these large projects to become net-zero indicates that it is achievable, even for large-scale developments. The Applicant for this Project should do the same.

We urge the City to adopt net-zero as the GHG significance threshold for this project. This threshold is well-supported by plans for the reduction of GHG emissions in California, and particularly the CARB Climate Change Scoping Plans. The CARB 2017 Scoping Plan states that "achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development." (CARB 2017 Scoping Plan, p. 101.) Additionally, the CARB 2022 Scoping Plan reaffirms the necessity of a net zero target by expressing: "it is clear that California must transition away from fossil fuels to zero-emission technologies with all possible speed … in order to meet our GHG and air quality targets." (CARB 2022 Scoping Plan, p. 184.) CARB further encourages a net-zero threshold in its strategies for local actions in Appendix D to the 2022 Scoping Plan. (CARB 2022 Scoping Plan, Appendix D p. 24-26.)

Moving this Project forward as a net-zero project would not only be the right thing for the City to do, but also would also help protect the City and the Applicant from CEQA GHG litigation.

GHG Significance Analysis

The DEIR analyzed GHG impact in the same section alongside air quality and energy impact. Although the City estimated operational emissions for SMP 39 independently of SMP 40, the total Project emissions would amount to approximately 6,308 metric tons carbon dioxide equivalent (**MTCO2e**) per year based on the estimates in the DEIR.[1] The City ultimately concluded that the impact was less than significant after briefly discussing the Bay Area Air Quality Management District (**BAAQMD**) recommended threshold and the City of Livermore Climate Action Plan (the **CAP**). (DEIR, p. 4.2-69—70.) The EIR's analysis of the Project's consistency with the BAAQMD guidelines and the CAP is flawed, as discussed below.

[1] 3,221 *MTCO2e SMP* 39 *overall operational emissions* +
3,087 *MTCO2e SMP* 40 *overall operational emissions* = 6,308 *MTCO2e project operational emissions*

Mischaracterization of the BAAQMD's Recommended Threshold

The BAAQMD's CEQA Guidelines provide non-binding, advisory information to lead agencies. As such, in order to rely on the Thresholds, the City still needs to provide substantial evidence in support of relying on any guidance from the BAAQMD. The DEIR presumed that the BAAQMD recommendation was mandatory, as indicated by the mandatory language of what the project "must" include, and altogether did not provide any independent rationale for why the BAAQMD recommendation is appropriate here. (DEIR, p. 4.2-69.)

Further, the DEIR did not include an important aspect of the BAAQMD guidelines, thereby taking the recommended threshold out of context from how it was presented in the BAAQMD CEQA Guidelines:

> The Air District's approach to developing thresholds of significance for climate impacts is to use a "fair share" approach for determining whether an individual project's GHG emissions would be cumulatively considerable. If a project would contribute its "fair share" of what is needed to achieve the State's long-term GHG reduction goals, then the lead agency can find that the project is adequately contributing to solving the problem of global climate change and that project's impact is not significant. Using this approach, the Air District has identified the necessary design elements required of new land use projects and plans being built today in order to achieve California's long-term climate goal of carbon neutrality by 2045. If these design elements are incorporated into the design and construction of a project, then the project would contribute its portion of what is necessary to achieve California's long-term climate goals—its "fair share"—and a lead agency reviewing the project under CEQA can conclude that the project would not make a cumulatively considerable contribution to global climate change.
>
> (Bay Area Air Quality Management District 2022 CEQA Guidelines, Chapter 3 "Thresholds of Significance," p. 3.5-3.6.)

Due to the 2045 carbon neutrality goal, which is within the Project's expected lifespan, the Project's fair share of emissions is the entirety of its GHG impact, and the specific design elements as presented in the BAAQMD as well as an appropriate GHG reduction strategy that meets CEQA Guidelines Section 15183.5(b), as the City notes in the DEIR, are merely a proxy for the determination of a Project's contribution to its fair share of GHG reductions.

To comply with the BAAQMD recommended threshold, the DEIR indicated that the Project would conform with the City of Livermore CAP. However, the City of Livermore CAP is contradictory to the basis of the BAAQMD recommendation, because it indicates that even following the CAP, Livermore will not be able to meet the goal of carbon neutrality by 2045, stating: "the strategies reasonably available to the city and included in this CAP do

not provide enough GHG emissions reduction to meet the long term 2045 GHG emissions goal." (Livermore CAP, p. 2.) This is not only contrary to the BAAQMD guidelines' emphasis on carbon neutrality by 2045, but also directly contradicts the DEIR's statement that the CAP's mitigation strategies are consistent with the State's GHG reduction targets. (DEIR, p. 4.2-70.)

CEQA requires environmental analysis that is supported by substantial evidence, including current scientific understandings and updated policy in California. Because the CAP Checklist is not in conformance with State policy, and the BAAQMD guidelines suggests it would be appropriate to use such an instrument (as long as it conforms with CEQA Guidelines Section 15183.5(b)) to demonstrate less-than-significant GHG impact, this framework of analysis is contrary to California's climate policy and therefore not supported by substantial evidence.

Consistency with the CAP Checklist

The City bases its evaluation under the first threshold on consistency with the City of Livermore's Climate Action Plan (the **CAP**). The Project is inconsistent with the CAP, and thus cannot use it to demonstrate compliance with the BAAQMD recommended threshold even if it was substantially supported.

First, the DEIR did not fully and adequately present the "Strategies and Actions" that would be required for consistency with the CAP, primarily avoiding the CAP's quantitative goals. For example, the DEIR included strategy W-1 which focuses on reducing landfill waste, but the DEIR did not mention the quantitative goal of 75% diversion by 2030, to be maintained each year. The City did not state how the Project would comply with this goal. Accordingly, the analysis of CAP consistency is erroneous and misleading to decision-makers and the public, contrary to the purpose of CEQA.

Second, the Project does not comply with certain strategies, actions, and goals that were set out in the CAP. The DEIR only listed eight strategies and actions that ignored the following objectives set out by the CAP (p. 31):

- Add 1,284 publicly accessible electric vehicle chargers by 2030;
- Reduce Vehicle Miles Traveled (**VMT**) by 2% by 2030;
- Achieve 10% bike mode share by 2030;
- Support sustainable land use practices;
- Improve local re-use and repair programs; and
- Expand the use of low-carbon and recycled building materials.

The DEIR did not analyze how the Project would achieve any of these goals and strategies and accordingly did not demonstrate CAP compliance by substantial evidence. In particular, the Project would not be consistent with a 2% reduction in VMT because the Project's estimated VMT per capita of 16.73 miles is above the current average VMT per Livermore employee of 16.20 miles.

Additionally, the CAP includes a Community Activation Guide which urges Livermore "individuals, businesses, and community groups" to purchase renewable energy, install solar panels and batteries, weatherize buildings, install a heat pump and electric appliances, use water-wise, fire resistant and permeable hardscape landscaping, among other measures. The DEIR did not assess how the Project would aim to comply with this portion of the CAP.

Overall, the failure to include, analyze, or account for these CAP strategies, actions, and goals invalidates the City's claim that the Project would be consistent with the CAP. The items listed in Table 4.2-15 are an incomplete account of the requirements under the CAP. Therefore, the City cannot rely on its inadequate discussion of CAP consistency to demonstrate that the Project would have a less-than-significant impact on GHGs.

Confusing GHG Analysis

The DEIR lists "Standards of Significance" for air-quality and GHG emissions (pp. 4.2-38, -39) and analyzes the Project's air-quality and GHG impacts under those standards (pp. 4.2-40-4.2-72), even though the DEIR states that "for the analysis within this EIR, the City has elected to use the BAAQMD's thresholds of significance and the City's 2022 CAP" (p. 4.2-39). This contradiction is a violation of CEQA, because it is misleading and confusing as to which thresholds of significance the DEIR uses for analysis of GHG impacts.

Inconsistency with Applicable Plans

The City did not appropriately apply part of the threshold that asked whether the Project would "[c]onflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs." (DEIR, p. 4.2-68.) This language requires that the EIR analyze the Project's consistency with *all* other applicable plans, not just the plans that the City prefers to analyze. However, the City solely analyzed consistency with the CAP, ignoring all other applicable plans, policies, and regulations for the reduction of GHGs, including, but not limited to, the 2022 Scoping Plan for Achieving Carbon Neutrality from the California Air Resources Board (**2022 Scoping Plan**), Senate Bill 32, which requires statewide GHG emissions to be reduced to 40% below 1990 levels by 2030, and Executive Order B-55-18 to achieve carbon neutrality by 2045—within the Project's projected lifespan. The Project is also inconsistent with CARB 2017 Scoping Plan, which sets as a goal the reduction of GHG emissions to 6 MTCO2e per capita by 2030 and 2 MTCO2e per capita by 2050.

Not only did the EIR not include any analysis for how the Project would be consistent with these measures, but the use of diesel and other GHG-emitting fossil fuels would prevent the achievement of at least some of these applicable plans and policies. Therefore, the Project would not only have a significant impact under the CAP, but also under the framework that the City adopted when it specified a review focused on conflicts with applicable plans, policies, and regulations.

The DEIR's Reported Overall Emissions Differs from the CalEEMod Overall Outputs

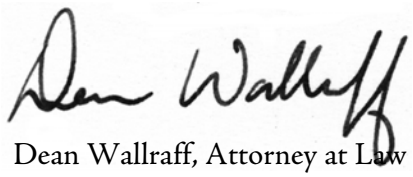
CalEEMod was used as a model to estimate anticipated Project emissions. The CalEEMod analysis was included as Appendix C to the DEIR and was inconsistent with the DEIR itself, resulting in inaccurate and misleading information for the public and decision-makers. These inconsistencies could have resulted in erroneous or underreported GHG emissions quantifications which undermine the EIR's usefulness as an informational document.

When a lead agency makes an estimate for project emissions, it should carefully and completely demonstrate the that the emissions outputs from the model are consistent with the analysis in the DEIR, to be accurate and not misleading about the GHG impact of the Project. Here, however, the CalEEMod overall outputs do not fully align with the information in the EIR. CalEEMod was run in six different runs for unmitigated GHG emissions: (1) Annual SMP 39, (Operational emissions of approximately 3,221); (2) Summer SMP 39 (Operational emissions of approximately 15,849 MTCO2e); (3) Winter SMP 39 (Operational emissions of approximately 15,387 MTCO2e); (4) Annual SMP 40 (Operational emissions of approximately 3,087 MTCO2e); (5) Summer SMP 40 (Operational emissions of approximately 15,066 MTCO2e); and (6) Winter SMP 40 (Operational emissions of approximately 14,608 MTCO2e). (DEIR, Appendix C.)

Notably, the operational emissions estimate included in the EIR only represented the annual outputs for SMP 39 and SMP 40, ignoring several of the CalEEMod runs. The "Winter" and "Summer" CalEEMod runs were not included in the totals or mentioned in the DEIR at all. There is also no indication of why the CalEEMod outputs for Winter and Summer are nearly five times the amount of the estimate reported in the DEIR. Nor did the City discuss why it omitted these outputs from the EIR, which are much higher than the estimate that the City used for its significance analysis. This is confusing, misleading, and not supported by substantial evidence.-If the DEIR had accurately relied upon the CalEEMod outputs that were given, it would have found an even larger quantity of GHG emissions.

Additionally, the vegetation section was missing entirely from the operational CalEEMod outputs. Removing all vegetation prevents reduces the ability for the land to act as a sink to sequester carbon and may even become a source of GHG emissions. CalEEMod Vegetation analysis also accounts for variation in soil type for carbon sequestration, so the types of vegetation that will remain

on the Project site during operation, if any, is important to include. The extent to which vegetation makes a difference in the quantification of GHG emissions should be known to the public and the decision-makers by including it in the CalEEMod report.



Conclusion

For the reasons given in this letter, the EIR is not in conformance with CEQA requirements. Notably, the significance analysis was incorrect, and the City should have concluded that the Project would contribute to a significant GHG impact because it is inconsistent with California's climate policy, including the 2022 Scoping Plan and Senate Bill 32, as well as the Livermore CAP that the Project inadequately analyzed.

The Final EIR did not include any modifications to address any GHG concerns as stated in this letter or other comments the City received. The City dismissed the suggestion to recirculate the DEIR based on many necessary changes including fixing erroneous CalEEMod runs—as determined by Soil/Water/Air Protection Enterprise (**SWAPE**), even though the current CalEEMod calculations have an impact on several areas of the DEIR, including air quality and GHG emissions.

Please put Advocates for the Environment on the interest list to receive notice about the progress of this Project. We make this request under Public Resources Code, section 21092.2.

Sincerely,

Dean Wallraff, Attorney at Law
Executive Director, Advocates for the Environment

RE: City of Livermore's SMP 39 and 40 Planning Commission Meeting

Dear Ashley Vera,

On behalf of "**Carpenters Local 713**", my Office is submitting these comments for the City of Livermore's ("**City**") Draft Environmental Impact Report ("**Draft EIR**" or "**DEIR**") and Final Environmental Impact Report ("**Final EIR**" or "**FEIR**") for the **February 20, 2024 Planning Commission Meeting** for the SMP 39 and 40 Project ("**Project**").

According to the Project's Notice of Availability ("**NOA**") of a Draft EIR Project Description:

> "On **SMP 38**, the proposed project includes a Sphere of Influence (SOI) Amendment to **include** SMP 38 within the **City of Livermore** SOI and **remove** it from the **City of Pleasanton's** SOI. The City of Livermore General Plan land use designation for SMP 38 would remain Limited Agriculture and Open Space/Sand and Gravel and the Alameda County zoning designation would remain Agriculture. **Development of SMP 38** is **not proposed**.
>
> For **SMP 39**, the proposed project would include development of a total of **up to six light industrial buildings**, consisting of **up to approximately 755,500 square feet** (sf) of new building space, and associated **internal roadways** and **other** improvements. **For SMP 40**, the proposed project would include development of **two industrial**

buildings containing up to **759,275 sf of new building space** with related **internal roadways** and **other** improvements. A number of approvals would be required for development of SMP 39 and SMP 40, including a **SOI Amendment for SMP 39**, **General Plan Amendment**, **Pre-zoning** and **Annexation**, **Zoning Map Amendment**/Planned Development, Vesting Tentative Subdivision **Maps**, a **Pre-Annexation Agreement**, and **Development Agreement**. A **Site Plan Design Review** entitlement is required for SMP 39 and SMP 40, which would include a review of the site plan, building, and landscape design; however, the entitlement is **only proposed for SMP 40 at this time**. A Site Plan Design Review entitlement will be required **at a later date** for the future development of **SMP 39**. In addition, the proposed project would include **annexation of four additional parcels** (APNs 904-10-2-3, -5, -7, and -8) located **east of SMP 40**. Development is **not proposed** on the additional parcels **as part** of the proposed project.

The project would include a **paved at-grade, on-site trail along the boundaries** of the SMP 40 site, consistent with the City's Active Transportation Plan. Specifically, the on-site trail would extend from the northeastern corner of the site, along the project site's eastern, southern, and western boundaries, before connecting to an existing off-site paved shared-use path at the northwestern corner of site, which extends along the west side of the Oaks Business Park to the north and connects to West Jack London Boulevard.

In addition, the project would include a **new off-site connection to the existing Arroyo Mocho Trail**, located on the east side of Isabel Avenue/SR 84. For the purposes of the Draft EIR analysis, three alternatives for the proposed off-site Isabel Avenue/SR 84 crossing to the existing Arroyo Mocho Trail are considered and evaluated in the Draft EIR, including the following, and described in more detail in the Draft EIR:

- Trail Connection Option 1 – **At-Grade** Crossing at **Discovery Drive**;
- Trail Connection Option 2 – **Undercrossing** at **Isabel** Bridge; and

- Trail Connection Option 3 – **Overcrossing** of **Isabel** Avenue/SR 84."

NOA of Draft EIR, pp. 1-2, emph. added.

The concurrently circulated Draft EIR contains the same project description. DEIR, pp. 1-2—1-4.

Carpenters Local 713 is a labor union representing union carpenters in Alameda County , and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Local 713 members live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Carpenters Local 713 expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

Carpenters Local 713 incorporates by reference all comments related to the Project or its CEQA review, including the Environmental Impact Report. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, Carpenters Local 713 requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**) (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). California Public Resources Code Sections 21092.2, and 21167(f) and California Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT

The City should require the Project to be built using local workers who have graduated from a Joint Labor-Management Apprenticeship Program and make a commitment to hiring a local workforce.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf.

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas (GHG) emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.[2]

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[3]

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.[4] Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is

[4] Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? Journal of the American Planning Association 72 (4), 475-490, 482, *available at* http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf.

> voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("**AB2011**"). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

II. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

The California Environmental Quality Act is a California statute designed to inform decision-makers and the public about the potential significant environmental effects of a project. 14 California Code of Regulations ("**CEQA Guidelines**"), § 15002, subd. (a)(1).[5] At its core, its purpose is to "inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made." *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.

1. Background Concerning Environmental Impact Reports

CEQA directs public agencies to avoid or reduce environmental damage, when possible, by requiring alternatives or mitigation measures. CEQA Guidelines, § 15002, subds. (a)(2)-(3); see also *Berkeley Keep Jets Over the Bay Committee v. Board of Port Comes* (2001) 91 Cal.App.4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553; *Laurel Heights Improvement Assn.*, 47 Cal.3d at p. 400. The EIR

[5] The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 et seq., are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. Cal. Pub. Res. Code, § 21083. The CEQA Guidelines are given "great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous." *Center for Biological Diversity v. Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 217.

serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines, § 15002, subd. (a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in Public Resources Code section 21081. See CEQA Guidelines, § 15092, subds. (b)(2)(A)-(B).

While the courts review an EIR using an 'abuse of discretion' standard, the reviewing court is not to *uncritically* rely on every study or analysis presented by a project proponent in support of its position. *Berkeley Jets*, 91 Cal.App.4th at p. 1355 (quoting *Laurel Heights Improvement Assn.*, 47 Cal.3d at pp. 391, 409 fn. 12) (internal quotations omitted). A clearly inadequate or unsupported study is entitled to no judicial deference. *Id.* Drawing this line and determining whether the EIR complies with CEQA's information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal.App.4th 48, 102, 131. As the court stated in *Berkeley Jets*, prejudicial abuse of discretion occurs if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process. 91 Cal.App.4th at p. 1355 (internal quotations omitted).

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. *Communities for a Better Environment v. Richmond* (2010) 184 Cal.App.4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449-450). The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. *Id.* For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Id.*

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the "fair argument" standard under which an EIR must be prepared whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1602; *Friends of "B" St.* v. *City of Hayward* (1980) 106 Cal.3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that "may have a significant effect on the environment." PRC, § 21151; see *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.App.3d 68, 75; accord *Jensen v. City of Santa Rosa* (2018) 23 Cal.App.5th 877, 884. Under this test, if a proposed project is not exempt and may cause a significant effect on the environment, the lead agency must prepare an EIR. PRC, §§ 21100 (a), 21151; CEQA Guidelines, § 15064 (a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 785. In such a situation, the agency must adopt a negative declaration. PRC, § 21080, subd. (c)(1); CEQA Guidelines, §§ 15063 (b)(2), 15064(f)(3).

"Significant effect upon the environment" is defined as "a substantial or potentially substantial adverse change in the environment." PRC, § 21068; CEQA Guidelines, § 15382. A project may have a significant effect on the environment if there is a reasonable probability that it will result in a significant impact. *No Oil, Inc.*, 13 Cal.3d at p. 83 fn. 16; see *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 309. If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. CEQA Guidelines, § 15063(b)(1); see *County Sanitation Dist. No. 2 v. County of Kern* (2005) 127 Cal.App.4th 1544, 1580.

This standard sets a "low threshold" for preparation of an EIR. *Consolidated Irrigation Dist. v. City of Selma* (2012) 204 Cal.App.4th 187, 207; *Nelson v. County of Kern* (2010) 190 Cal.App.4th 252; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 928; *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 580; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal.App.3d 748, 754; *Sundstrom*, 202 Cal.App.3d at p. 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an EIR

even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen,* 23 Cal.App.5th at p. 886; *Clews Land & Livestock v. City of San Diego* (2017) 19 Cal.App.5th 161, 183; *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150; *Brentwood Assn. for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal.App.3d 491; *Friends of "B" St.*, 106 Cal.App.3d 988; CEQA Guidelines, § 15064(f)(1).

B. The Project May Have a Significant Impact on Biological Resources

There is substantial evidence the Project will have a significant impact on biological resources. As discussed in further detail in a comment letter from biological resources expert Shawn Smallwood, PhD with regards to the proposed Project, incorporated by reference herein, "the existing environmental setting has not been accurately characterized, and several important types of potential project impacts have been inadequately analyzed. These types of impacts include habitat loss, interference with wildlife movement, and wildlife-automobile collision mortality." (See **Exhibit D** [December 12, 2023 comment letter from Shawn Smallwood, PhD regarding SMP 38, SMP 39, and SMP 40 biological resources analysis].)

First, for example, with regards to the potential for habitat loss, Dr. Smallwood predicts:

> SMP 38 (111.7 acres), SMP 39 (51.9 acres) and SMP 40 (41 acres) support 11.4 bird nests/acre/year. Based on this assumption, the combined projects, SMP 39 and SMP 40, on 92.9 acres would eliminate 1,059 nest sites, and assuming SMP 38 is also later developed, then the combined projects, SMP 38, SMP 39, ad SMP 40, on 204.6 would eliminate 2,332 nest sites.

(**Exhibit D**, p. 28.)

Accordingly, Dr. Smallwood points out that this loss in nest sites would constitute a significant impact from the Project that was not quantitatively addressed in the Draft EIR. (**Exhibit D**, p. 28.) Further, Dr. Smallwood notes that the loss in nests would lead to a loss in the reproductive capacity of the site, thus decreasing the number of birds at the Site over time. (*Id.*)

Second, Dr. Smallwood discusses the Projects impacts on interference with wildlife movement, highlighting that the DEIR's analysis of whether the Project will interfere with wildlife movement in the Project Site area is "flawed and misleading." (**Exhibit D**, p. 29.) Specifically, Dr. Smallwood states that:

> According to the DEIR, "The project area does not fall within an Essential Habitat Connectivity area mapped by the CDFW." However, at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18486, the California Essential Habitat Connectivity Project specifically points out that it is not: "A California Department of Fish and Game or US Fish and Wildlife Service response to potential impacts to a habitat or species from a project subject to the California Environmental Quality Act (CEQA)," nor "Fine scale, with every important piece of habitat identified" nor ""Essential", meaning the only places of importance" nor "A solution by itself for how to provide necessary linkages for any given species of plant or animal... Linkage designs will vary depending on focal species chosen and the goal of providing connected habitat for a chosen species might be met several different ways" nor "The final word on connectivity for California." With analytical grid cells of 2,000 acres, the spatial grain of the California Essential Habitat Connectivity Project is much too coarse for the conclusion the DEIR draws from it.

(**Exhibit D**, p. 29.)

Moreover, Dr. Smallwood points out that the DEIR contains a flawed "argument that SMP 39 is cut off from open areas by well-trafficked roads, the airport, the gravel quarries, and therefore cannot function as a wildlife movement corridor" and notes that the same argument is used for SMP 40. (*Id.*) However, as Dr. Smallwood notes, the DEIR simply uses speculation here and provides no supporting evidence to this assertion. (*Id.*)

Third, Dr. Smallwood discusses the Project's traffic impacts to wildlife, noting that traffic generated from the Project will endanger wildlife that must cross roads used by traffic getting to and from the Project Site. (**Exhibit D**, p. 30.) Dr. Smallwood discusses traffic-caused wildlife mortality and highlights various traffic mortality numbers collected from a wildlife mortality study performed only eleven (11) miles from the Project Site in the County of Contra Costa. (*Id.*) Dr. Smallwood concludes an analysis should be done on "whether increased traffic generated by the project site would similarly result in local impacts on wildlife." (*Id.* at p. 31.)

In addition, the biological impact analysis of the EIR is legally flawed for the following reasons.

First, the DEIR's biological resources impact analysis relies on multiple inadequate biological field surveys outlined in Appendices D and E of the DEIR prepared by Monk & Associates that are described in insufficient detail.

For example, with regards to the field surveys, the DEIR states that:

> "SMP 39 and SMP 40 were both first surveyed in 2000, with follow-up surveys over the years, including in November 2013, for various development proposals. In addition, a **project-specific field survey** was conducted on SMP 39 on **October 14, 2021**, and on SMP 40 on **June 10, 2019** to record biological resources within the sites, and to assess the likelihood of resource agency regulated areas to be located within the sites. An **additional survey** was conducted for SMP 40 on **June 21, 2019** to flag the Arroyo Mocho's riparian drip line to allow for the project engineers to survey the limits of the riparian vegetation and overlay the area on the project site plan, and **another general survey** of SMP 40 was conducted on **September 10, 2021.**"

DEIR, p. 4.3-24. [Emphasis added.']

However, the DEIR's reliance on these biological resources field surveys is improper for several reasons.

First, the DEIR and its accompanying Appendices D and E leave out crucial information about the site surveys.

In summarizing the various site surveys that occurred in 2013, 2019, and 2021, DEIR Appendix D's Biological Resources Analysis ("**SMP-39 BRA**") states that "[e]ach site survey involved searching all habitats on the site and recording all plant and wildlife species observed. . . ." and that the "evaluation included an examination of the site to determine if there could be potential areas within the project site that would be regulated as waters of the United States and/or State . . ." DEIR Appendix D, p. 2. Thus, the SMP-39 BRA field surveys seem to indicate that visual inspections were done during these site visits. However, SMP-39 BRA is insufficient for numerous reasons as it leaves out crucial information about the site surveys while relying on the surveys to form conclusions about the Project's potential biological resources impacts.

As a preliminary matter, *one* (1) single field survey alone for just the SMP-39 Project Site is insufficient to adequately identify all of the potential habitats and plant and wildlife species occurring within the Project Site, as the site surveys purport to have

looked for. In the City's Final EIR Responses to Comments, Response No. 5-12, the City counters our office's prior comment that "[o]ne single field survey is sufficient to get a baseline description of a project site's pant communities and wildlife habitats and to determine if additional surveys for special-status species are necessary." (FEIR Response to Comments, p. 2-75.) However, as Dr. Smallwood notes in his comment letter on the Project, "[m]ore surveys are needed than my two surveys [sic] to inventory use of the project site by wildlife" (**Exhibit D**, pp. 14-15), that the appropriate detection surveys have not been completed at SMP 39 and SMP 40," (*id.* at p. 17), that "[r]econnaissance surveys for wildlife are not designed to detect special-status species" indicating that protocol-level detection surveys are appropriate but that Monk & Associates did not perform such detection surveys here, thus rendering the Draft EIR's "characterization of the existing environmental setting . . . therefore incomplete and inaccurate." (*Id.* at p. 19.) Therefore, it is clear that the single survey conducted for SMP-39 is inadequate.

Moreover, the SMP-39 BRA does not specify what time of the day the surveys were conducted during, (DEIR Appendix D, p. 2) which, again, leaves open the possibility that certain species, for example, nocturnal species, could present themselves at different times of the day. This is further highlighted in Dr. Smallwood's comment letter, where he notes that:

> For none of the above surveys was there reporting of what time the surveys began, or how long the surveys lasted. No checklist is shared of habitat elements that the biologists might have used during their survey to later crosscheck against documented habitats of each special-status species. No explanation is provided of whether or how animal behavior data or other evidence contributed to the biologist's assessment of the site for its importance to animal movement. It is therefore difficult to assess survey outcomes relative to survey effort and methods.

(**Exhibit D**, p. 16.)

Even further, in one (1) single survey, the surveyor may fail to identify species that would only present themselves during certain times of the *year*. According to the SMP-39 BRA in Appendix D, for example, the most recent surveys were conducted in June 2019 (a summer month) and October 2021 (a fall month), while failing to account for the spring and winter months. DEIR Appendix D, p. 2. However, there may be certain plant or animal species that would not be identifiable to an observer during the summer or fall months but that could nevertheless be present at the

Project Site and be identifiable during other seasons of the year. For example, and as noted by Dr. Smallwood, in response to the DEIR's assertion that no special-status plants were observed during some of the surveys at the Project Sites during various months over the years, Dr. Smallwood responds that this reporting is misleading "because only one of the several surveys was conducted during the plant blooming season. Monk and Associates (2021, 2023) did not meet the minimum standards of [California Department of Fish and Wildlife's ("**CDFW**")] (2018) plant survey guidelines. While the FEIR's Responses to Comments counters our office's prior comments, asserting that the CDFW's survey guidelines cited are guidelines for conducting floristic surveys for rare and endangered or other special-status species, the site surveys still failed to meet the CDFW's minimum plant survey guidelines standards. Thus, new surveys must be conducted that meet these standards.

Therefore, the DEIR's reliance on surveys not in compliance with California Department of Fish and Wildlife's survey guidelines[6] and its misuse of the California Natural Diversity Database ("**CNDD**") resulted in potentially inaccurate determinations. For example, with regards to botanical field surveys, the CDFW's survey guidelines state that such field surveys should be conducted in a way that will maximize the likelihood of identifying special status plants and sensitive natural communities that may be present at a site.[7] Specifically, the guidelines state that "[m]ore than one field visit is usually necessary to adequately capture the floristic diversity of a project area."[8]

For each of the foregoing reasons, the Project may have a significant impact on biological resources. Accordingly, the DEIR's findings as to the Project's biological impacts are not supported with substantial evidence that is of verifiable or credible value and the DEIR must be revised and recirculated to reassess those impacts, including on the wildlife species with potential to occur on the Project Site using protocol-level detection surveys and describing those surveys with sufficient detail.

C. The Project May Have Significant Noise Impacts.

There is substantial evidence that the Project will have significant traffic impacts. As discussed by Principal Steve Rogers of Steve Rogers Acoustics, "the evaluation of noise impacts during the construction phases is incomplete and contains a significant calculation error." (**Exhibit E**, p. 3 [December 12, 2023 comment letter re City of Livermore SMP 38/SMP 39/SMP 40 Project Review of DEIR Noise Section & Appendices]), fully incorporated herein.

First, as noted by Mr. Rogers for the DEIR's construction noise impacts, the DEIR concludes there will be a less than significant impact for on-site construction, but per the DEIR's analysis, the DEIR fails to adequately support this conclusion for multiple reasons. (**Exhibit E**, p. 2.) For example, the DEIR fails to include SMP 39's construction noise impacts in its section 4.6 analysis. (*Id.*) Second, Mr. Rogers notes that the noise analysis for SMP 40 is incomplete. Specifically,

> The noise impact analysis for construction on the SMP 40 site compares Salter's noise level predictions with instantaneous maximum noise level (Lmax) limits of 70 dBA during the day and 60 dBA at night, which are taken from Policy N-1.5.P3 of the City of Livermore General Plan.
>
> However, these Lmax noise limits are not the only local regulations that would apply to construction noise on the SMP 40 site.
>
> . . .
>
> Similarly, the DEIR does not include an DNL analysis for construction noise from SMP 40 to show that it will be below the 60 dBA exterior noise standard taken from land-use compatibility table (Table 9-7) in the General Plan. This will be particularly important if any construction work is to occur at night.

(**Exhibit E**, pp. 2-3.)

Third, Mr. Rogers highlights that there was an error in the calculations for SMP 40 with regards to various construction equipment pieces at a 50-foot distance. (*Id.*) Lastly, Mr. Rogers states that the construction noise analysis on the east side of the SMP 40 site is overlooked, as it assumes receivers 884 feet away from the equipment, while during other phases of construction, the noisy equipment may be operating closer than 884-feet from nearby residential uses. (*Id.*)

For each of the foregoing reasons, the Project may have a significant noise impact and the EIR should therefore be revised and recirculated.

III. **CONCLUSION**

Based on the foregoing, the City should deny the Project's proposed entitlements and require that the Environmental Impact Report be revised and recirculated pursuant to CEQA, consistent with the comments and issues identified in this comment letter.

Sincerely,

Stephanie Papayanis

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[4] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14-15.
[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.
[6] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin		
Air Basin	**Rural (miles)**	**Urban (miles)**
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	**16.47**	**11.17**
Minimum	**10.80**	**10.80**
Maximum	**19.80**	**14.70**
Range	**9.00**	**3.90**

[9] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

[11] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.
[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

[14] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

RE: SMP 38, SMP 39. SMP 40

Dear Ms. Vera,

I write to comment on potential impacts to biological resources that could result from the proposed SMP 38, SMP 39. SMP 40 Project, which I understand would add 1,514,275 square feet of floor space in eight speculative industrial buildings up to 55 feet tall on 217.04 acres located on APNs) 904-1-7-21; 904-1-2-12; 904-1-7-32; 904-3-1-4; 904-10-2-2, -3, -5, -7, and -8 west of Isabel Avenue, north of Stanley Boulevard, south of West Jack London Boulevard, and east of El Charro Road. I comment on the analyses of impacts to biological resources in the DEIR and in Monk & Associates (2021).

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I also worked as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, wildlife interactions with the anthrosphere, and conservation of rare and endangered species. I authored many papers on these and other topics. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and Raptor Research Foundation, and I've lectured part-time at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-seven years. My CV is attached.

SITE VISIT

I visited the SMP 40 for 2.22 hours from 14:43 to 16:35 hours on 28 November 2023, and SMP 38 and SMP 39 for 2.83 hours from 06:45 to 09:35 hours on 29 November 2023. At SMP 40, I surveyed from a cul-du-sac on the north edge of the site. At SMP 38 and SMP 39, I walked the northern perimeters, stopping to scan for wildlife with use of binoculars. I recorded all species of vertebrate wildlife I detected, including those whose members flew over the sites or were seen nearby, off the sites. Animals of uncertain species identity were either omitted or, if possible, recorded to the Genus or higher taxonomic level.

Conditions were mostly cloudy still with temperatures of 62-55° F on the 28th and 46-50° F on the 29th. The sites have been previously disked, and at the time of the surveys they were covered by annual grasses and ruderal vegetation (Photos 1—2).

Photos 1–2. Views of SMP 40 (top) and SMP 39 with a flock of Canada goose (bottom), 28-29 November 2023.

I detected 46 species of vertebrate wildlife at or adjacent to the project site, including 10 species with special status (Table 1). I saw Botta's pocket gopher (Photo 3) and California ground squirrel (Photo 4), both species of which are ecological keystone species. I saw loggerhead shrike (Photo 5), Cooper's hawk and American kestrel (Photos 6 and 7), western meadowlark (Photo 8), house finch and killdeer (Photos 9 and 10), black phoebe and white-crowned sparrow (Photos 11 and 12), mourning dove (Photo 13), Say's phoebe and yellow-rumped warbler (Photos 14 and 15), savannah sparrow (Photo 16), and lesser goldfinch and bushtit (Photos 17 and 18), among the other species listed in Table 1. Many of the species actively foraged on the site, including coyote, Cooper's hawk, red-tailed hawk, horned lark, Canada goose and Aleutian cackling goose, killdeer, western meadowlark, house finch and others. I observed Some species in high abundance, including western meadowlark and mourning dove. California ground squirrels occupied all three sites, but were particularly abundant on SMP 40.

Table 1. Species of wildlife I observed during 5.05 hours of survey on 28-29 November 2023.

Common name	*Species name*	Status[1]	Notes	SMP			Just offsite
				38	39	40

I fit nonlinear regression models to the cumulative numbers of vertebrate species I detected with time into my surveys to predict the number of species that I would have detected with a longer survey or perhaps with additional biologists available to assist. The models are logistic growth models which reach asymptotes that correspond with the maximum numbers of vertebrate wildlife species that could have been detected during each survey. In this case, the models predict 46 and 118 species of vertebrate wildlife were available to be detected on the evening of the 28th and the morning of the 29th, respectively, the difference likely due to the onset of darkness during the evening survey of the 28th. Compared to models fit to data I collected from 18 other sites in the region between 2019 and 2023, the data from this project site exceeds the upper bound of the 95% confidence interval of the rate of accumulated species detections with time into the survey (Figure 1). Importantly, however, the species I detected on November 28-29 composed only a fraction of the species that would occur at the project site over the period of a year or longer. This is because many species are seasonal in their occurrence.

Figure 1. Actual and predicted relationships between the number of vertebrate wildlife species detected and the elapsed survey time based on visual-scan surveys on 28-29 November 2023. Note that the relationships would differ if the surveys were based on another method or during another season.

At least a year's worth of surveys would be needed to more accurately report the number of vertebrate species that occur at the project site, but I only have Noriko's one survey. However, by use of an analytical bridge, a modeling effort applied to a large, robust data set from a research site can predict the number of vertebrate wildlife species that likely make use of the site over the longer term. As part of my research, I completed a much larger survey effort across 167 km² of annual grasslands of the Altamont Pass Wind Resource Area, where from 2015 through 2019 I performed 721 1-hour visual-scan surveys, or 721 hours of surveys, at 46 stations. I used binoculars and otherwise the methods were the same as the methods I and other consulting biologists use for surveys at proposed project sites. At each of the 46 survey stations, I tallied new species detected with each sequential survey at that station, and then related the cumulative species detected to the hours (number of surveys, as each survey lasted 1 hour) used to accumulate my counts of species detected. I used combined quadratic and simplex methods of estimation in Statistica to estimate least-squares, best-fit nonlinear models of the number of cumulative species detected regressed on hours of survey (number of surveys) at the station: $\hat{R} = \frac{1}{1/a+b\times(Hours)^c}$, where $\hat{R}$ represented cumulative species

richness detected. The coefficients of determination, r^2, of the models ranged 0.88 to 1.00, with a mean of 0.97 (95% CI: 0.96, 0.98); or in other words, the models were excellent fits to the data.

I projected the predictions of each model to thousands of hours to find predicted asymptotes of wildlife species richness. The mean model-predicted asymptote of species richness was 57 after 11,857 hours of visual-scan surveys among the 46 stations of my research site. I also averaged model predictions of species richness at each incremental increase of number of surveys, i.e., number of hours (Figure 2). On average I would have detected 17.5 species over my first 5.05 hours of surveys at my research site in the Altamont Pass (5.05 hours to match the 5.05 hours I surveyed at the project site), which composed 30.7% of the predicted total number of species I would detect with a much larger survey effort at the research site. Given the example illustrated in Figure 2, the 46 species I detected after my 5.05 hours of survey at the project site likely represented 30.7% of the species to be detected after many more visual-scan surveys over another year or longer. With many more repeat surveys through the year, I would likely detect $^{46}/_{0.307} = 150$ species of vertebrate wildlife at the site. Assuming my ratio of special-status to non-special-status species was to hold through the detections of all 150 predicted species, then continued surveys would eventually detect 33 special-status species of vertebrate wildlife.

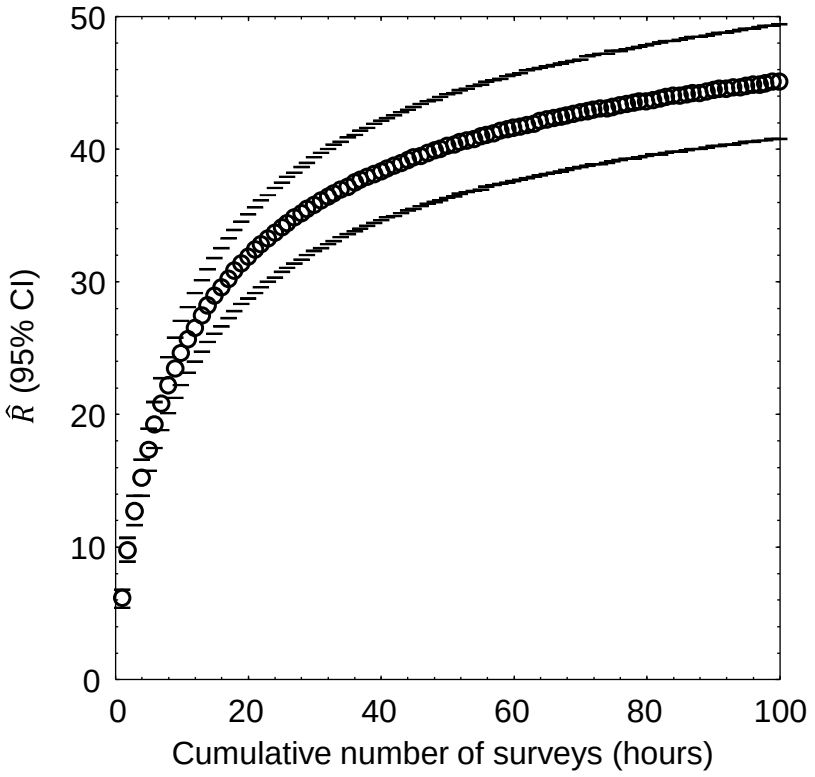

Figure 2. Mean (95% CI) predicted wildlife species richness, $\hat{R}$, as a nonlinear function of hour-long survey increments across 46 visual-scan survey stations across the Altamont Pass Wind Resource Area, Alameda and Contra Costa Counties, 2015–2019. Note that the location of the study is largely irrelevant to the utility of the graph to the interpretation of survey outcomes at the project site. It is the pattern in the data that is relevant, because the pattern is typical of the pattern seen elsewhere.

Because my prediction of 150 species of vertebrate wildlife, including 33 special-status species of vertebrate wildlife, is derived from daytime visual-scan surveys, and would detect few nocturnal mammals such as bats, the true number of species composing the wildlife community of the site must be larger. My reconnaissance surveys should serve

only as a starting point toward characterization of the site's wildlife community, but they certainly cannot alone inform of the inventory of species that use the site. More surveys are needed than my two survey to inventory use of the project site by wildlife. Nevertheless, the large number of species I predict at the project site is indicative of a relatively species-rich wildlife community that warrants a serious survey effort.

EXISTING ENVIRNMENTAL SETTING

The first step in analysis of potential project impacts to biological resources is to accurately characterize the existing environmental setting, including the biological species that use the site, their relative abundances, how they use the site, key ecological relationships, and known and ongoing threats to those species with special status. A reasonably accurate characterization of the environmental setting can provide the basis for determining whether the site holds habitat value to wildlife, as well as a baseline against which to analyze potential project impacts. For these reasons, characterization of the environmental setting, including the project site's regional setting, is one of CEQA's essential analytical steps. Methods to achieve this first step typically include (1) surveys of the site for biological resources, and (2) reviews of literature, databases and local experts for documented occurrences of special-status species. In the case of the proposed project, these needed steps have been inadequate.

Environmental Setting informed by Field Surveys

To CEQA's primary objective to disclose potential environmental impacts of a proposed project, the analysis should be informed of which biological species are known to occur at the proposed project site, which special-status species are likely to occur, as well as the limitations of the survey effort directed to the site. Analysts need this information to characterize the environmental setting as a basis for opining on, or predicting, potential project impacts to biological resources.

Herein I discuss several types of surveys, which are common to environmental review, but which are often misunderstood and misapplied. A *reconnaissance survey*, also often referred to as a general biological survey, is intended to (1) detect as many of the species as feasible during the time of the survey, (2) search for and map the locations of approximate boundaries of wetlands and coarse representations of vegetation cover, and (3) assess the likelihood of occurrences of special-status species. The latter objective is often referred to as habitat assessment. CDFW (2018) provides guidelines for reconnaissance surveys directed toward plant species, but there are no guidelines for reconnaissance-level wildlife surveys, other than the expected use of sound scientific methodology. A *protocol-level survey* is a survey guided by a written protocol, usually by a resource agency or professional group of biologists. Such surveys can be for various objectives, but in environmental review they are usually intended for detection surveys. *Detection surveys* are formulated by experts on a particular species to, at reasonable cost, give survey personnel the best chance at detecting members of a species if the species is indeed present. The additional purpose of detection surveys is to support absence determinations when the protocol was followed but the species was nevertheless not detected. Absence determinations made for special-status species are

supportable only if the results of detection surveys were negative, or when the site is outside the species' geographic range or clearly does not provide habitat.

Preconstruction surveys are take-avoidance surveys intended to be completed after reconnaissance surveys and detection surveys and just prior to construction ground-disturbance activities such as clearing and grubbing or grading. For some species, protocols for preconstruction surveys are included in mitigation guidelines. The preconstruction survey is a mitigation measure, and therefore not to be confused with other types of surveys. This type of survey will be discussed in the Mitigation section near the end of my comments.

Monk & Associates (2021) performed a reconnaissance survey of the SMP 39 project site on 5 November 2021 "to record biological resources and to assess the likelihood of resource agency regulated areas occurring on the project site," and "searching all habitats on the site and recording all plant and wildlife species observed," and "examination of the site to determine if there could be potential areas within the project site that would be regulated as waters of the United States and/or State." Monk & Associates (2023) performed two reconnaissance surveys of the SMP 40 project site on 10 June 2019 and 10 September 2021. The objectives of the surveys at SMP 40 were essentially the same as those for the survey of SMP 39. In all three of these surveys, Monk & Associates recorded all the species observed. A wetland delineation was alco completed at SMP 40.

For none of the above surveys was there reporting of what time the surveys began, or how long the surveys lasted. No checklist is shared of habitat elements that the biologists might have used during their survey to later crosscheck against documented habitats of each special-status species. No explanation is provided of whether or how animal behavior data or other evidence contributed to the biologist's assessment of the site for its importance to animal movement. It is therefore difficult to assess survey outcomes relative to survey effort and methods.

Monk & Associates (2021) detected 14 species of vertebrate wildlife on SMP 39, and Monk & Associates (2023) detected 22 species of vertebrate wildlife on SMP 40. In comparison, and even though I was unable to access either of the project sites, I detected 34 species in only 1.83 hours at SMP 39, and 29 species in only 2.22 hours at SMP 40. I also detected twice the number of special-status species at SMP 39 and 1.5 times the number of special-status species at SMP 40. Based on my surveys of the project sites, the existing environmental setting of each appears substantially different from the setting characterized by Monk & Associates (2021, 2023). Considering the differences between what Monk & Associates and what I found, I suggest that Monk & Associates must have either been distracted by other too many survey objectives, or lacked the skill needed to perform the surveys. The results of the Monk and Associates (2021, 2023) surveys have been misinterpreted in the reports, resulting in inaccurate characterizations of the existing environmental settings of SMP 39 and SMP 40.

Combining my survey results with those of Monk & Associates (2021, 2023), 38 species of vertebrate wildlife have been detected at SMP 39, and 44 species have been detected

at SMP 40. These combined results increase the documented number of species at SMP 39 by nearly 3-fold and they double the number of species at SMP 40. In other words, the combined survey outcomes support my modeling predictions of much larger numbers of species of wildlife making use of the project sites than can be demonstrated by one or two reconnaissance surveys. My modeling predicts at least 150 species of vertebrate wildlife make use of the two sites, and this prediction was based solely on diurnal visual-scan surveys, and not on live-trapping for small mammals and nocturnal surveys for nocturnally active animals. The wildlife communities of SMP 39 and SMP 40 are much richer than portrayed in the DEIR.

The DEIR (page 4.3-25) reports that "western burrowing owls have not been observed within SMP 39 or SMP 40." This is factually incorrect, as CNDDB includes a record of burrowing owl occurrence on SMP 39 (Monk & Associates 2023: Figure 4). Even if this reporting was correct, it would still qualify as pseudoscientific. The appropriate surveys for detecting burrowing owls are detailed in the survey guidelines of CDFW (2012). Lack of detections of burrowing owls during reconnaissance surveys would be meaningful only after completion of many reconnaissance surveys at the appropriate time of year and by qualified biologists. Considering that ground squirrels occur in abundance on SMP 39 and SMP 40, and considering that one of California's most significant populations of burrowing owls occurs within the nearby Altamont Pass (Smallwood et al. 2013), and considering that the appropriate detection surveys have not been completed at SMP 39 and SMP 40, it would be prudent to assume that burrowing owls occur on the project sites.

Regarding tricolored blackbird, the DEIR (page 4.3-26) reports that "the species has not been observed near SMP 39 in nearly 40 years." This is factually incorrect, as eBird includes a 2003 record of tricolored blackbird occurrence only 300 m north of SMP 39. The DEIR also reports that tricolored blackbird would not occur on SMP 9 because "aquatic habitat does not exist within SMP 39." But this is also factually incorrect. I have many times recorded tricolored blackbird occurrences on grasslands of the Altamont Pass far from bodies of water (Photos 19 and 20). Grassland environments is where tricolored blackbirds do most of their foraging in Alameda County, and it is where they sometimes nest within the Altamont Pass (Photo 20).

The DEIR reports that loggerhead shrikes do not occur on SMP 39. But again, the DEIR is factually inaccurate. I observed a loggerhead shrike on SMP 39 (Photo 21), which as it turned out, was near where a loggerhead shrike sighting was also reported to eBird in 2018. Loggerhead shrike does occur on SMP 39, as well as on SMP 40.

The DEIR reports that SMP 39 and SMP 40 contains potential habitat of raptors. However, the word "potential" insinuates uncertainty remains on the question of whether the sites provide raptor habitat. Of course, they do. Those portions of the environment used by raptors are considered raptor habitat. Between my surveys and those of Monk & Associates, and including CNDDB and eBird records, the following raptors have been seen on SMP 39 and SMP 40: turkey vulture, northern harrier, white-tailed kite, red-tailed hawk, ferruginous hawk, Cooper's hawk, American kestrel, merlin,

and burrowing owl. There should be no ambiguity around the question of whether raptor habitat occurs on SMP 39 and SMP 40; raptor habitat is present.

Photos 19 and 20. Top, tricolored blackbirds forage on grassland far from aquatic environments, and bottom, they breed on rapeseed and thistle in the Altamont Pass Wind Resource Area.

Photo 21. Loggerhead shrike on the SMP 39 portion of the project site, 29 November 2023.

Reconnaissance surveys for wildlife are not designed to detect special-status species. Special-status species can be detected during such surveys, as has been the case for 10 special-status species at the project site, but these surveys are not formulated to detect them, nor are there minimum standards to be met in these surveys to support absence determinations. For the latter purpose, protocol-level detection surveys have been formulated by species experts. Monk & Associates (2021, 2023) did not perform any detection surveys. Based on Monk & Associates (2021, 2023), the DEIR's characterization of the existing environmental setting is therefore incomplete and inaccurate.

The same is true for special-status species of plants. According to the DEIR (page 4.3-25), "special-status plants have not been observed during several surveys of the project sites conducted during various months over the years." However, this reporting is misleading, because only one of the several surveys was conducted during the plant blooming season. Monk and Associates (2021, 2023) did not meet the minimum standards of CDFW's (2018) plant survey guidelines.

Environmental Setting informed by Desktop Review

The purpose of literature and database review and of consulting with local experts is to inform the field survey, and to augment interpretation of its outcome. Analysts need this information to identify which species are known to have occurred at or near the project site, and to identify which other special-status species could conceivably occur at the site due to geographic range overlap and migration flight paths.

Monk & Associates (2021) did not reportedly review eBird (https://eBird.org) or iNaturalist (https://www.inaturalist.org) for documented occurrence records at or near the project site. Instead, Monk & Associates (2021, 2023) queried the California Natural Diversity Data Base (CNDDB) for documented occurrences of special-status species within the three miles of the project sites. By taking this approach, Monk & Associates (2021, 2023) and the DEIR screen out many special-status species from further consideration in the characterization of the wildlife community as part of the existing environmental setting. CNDDB is not designed to support absence determinations or to screen out species from characterization of a site's wildlife community. As noted by CNDDB, "*The CNDDB is a positive sighting database. It does not predict where something may be found. We map occurrences only where we have documentation that the species was found at the site. There are many areas of the state where no surveys have been conducted and therefore there is nothing on the map. That does not mean that there are no special status species present*." Monk & Associates (2021, 2023) and the DEIR misuse CNDDB.

According to Monk & Associates (2021:6), "No special-status animal records have ever been mapped on the project site." The word "ever" adds emphasis to the finding. However, by implication, Monk & Associates (2021) misrepresents CNDDB as a database with uniform representation of California properties, which is far from the case. CNDDB relies entirely on volunteer reporting from biologists who were allowed access to whatever properties they report from. Many properties have never been surveyed by biologists. Many properties have been surveyed, but the survey outcomes never reported to CNDDB. Many properties have been surveyed multiple times, but not all survey outcomes reported to CNDDB. Furthermore, CNDDB is interested only in the findings of special-status species, which means that species more recently assigned special status will have been reported many fewer times to CNDDB than were species assigned special status since the inception of CNDDB. The lack of many CNDDB records for species recently assigned special status had nothing to do with whether the species' geographic ranges overlapped the project site, but rather more to do with the brief time for records to have accumulated since the species were assigned special status. And because negative findings are not reported to CNDDB, CNDDB cannot provide the basis for estimating occurrence likelihoods, either.

In my assessment based on database reviews and site visits, 128 special-status species of wildlife are known to occur near enough to the site (SMP 38, SMP 39, SMP 40) to warrant analysis of occurrence potential (Table 2). Of these 128 species, 19 (15%) were recorded on the project site, and another 35 (27%) species have been documented within 1.5 miles of the site ('Very close'), another 13 (10%) within 1.5 and 4 miles

('Nearby'), and another 57 (45%) within 4 to 30 miles ('In region'). More than half (52%) of the species in Table 2 have been reportedly seen within 4 miles of the project site. The site therefore supports multiple special-status species of wildlife and carries the potential for supporting many more special-status species of wildlife based on proximity of recorded occurrences. The site is far richer in special-status species than is characterized in the DEIR.

Whereas Monk & Associates (2021, 2023) reportedly queried CNDDB for occurrence records within three miles of the project sites, the DEIR analyzes the occurrence likelihoods of only 6 (<5%) of the species in Table 2. That only 6 special-status species were identified from occurrence records within 3 miles strains credulity. As noted above, using eBird and iNaturalist, I found records of 54 special-status species of wildlife within only 1.5 miles of the project sites, and 67 within 4 miles of the sites.

Of the 6 species included in Monk & Associates (2021, 2023) analyses of occurrence likelihoods, the DEIR concludes that 4 have no chance of occurrence, 1 has low to no chance, and 1 has low to moderate chance of occurrence. Except for species whose habitat is compellingly absent from the site, absence determinations are inappropriate based on the evidence gathered by Monk & Associates (2021, 2023). Absence determinations are supportable only after species-specific protocol-level detection surveys have been completed to the standards of the protocols, and the species were nevertheless not detected. No such surveys have been completed. It is inappropriate to conclude that a species is absent simply by looking at a site, and it is especially inappropriate to do so for 125 species of wildlife. Important findings of Monk & Associates (2021, 2023) and the DEIR are not supportable.

Of the special-status species that Monk & Associates (2021, 2023)) claims to be absent from one or both of the project sites, two – burrowing owl and loggerhead shrike – have been seen where they were reported to be absent. Occurrence records of another 2 supposedly absent special-status species have been reported within only 1.5 miles of the site, and another has been reported within 1.5 and 4 miles of the project site. Important findings of Monk & Associates (2021, 2023) and the DEIR are not supportable.

Of the 122 special-status species in Table 2, but which the DEIR does not analyze for occurrence potential, some are unlikely to occur, whereas many *are* likely to occur. With ground squirrels known to be present on SMP 39 and SMP 40, there is reason to expect the occurrences of American badger, ferruginous hawk, bald eagle and golden eagle. I regularly observed these species in the Altamont Pass Wind Resource Areas while I performed various studies there from 1999 through 2019. Golden eagles, I continue to record both in the Altamont Pass and over and on the project sites (Figure 3). Of the 45 golden eagles that Douglas Bell captured and fit with GPS telemetry backpacks since 2013, 11 have flown to or perched in the areas of the project sites (Figure 3).

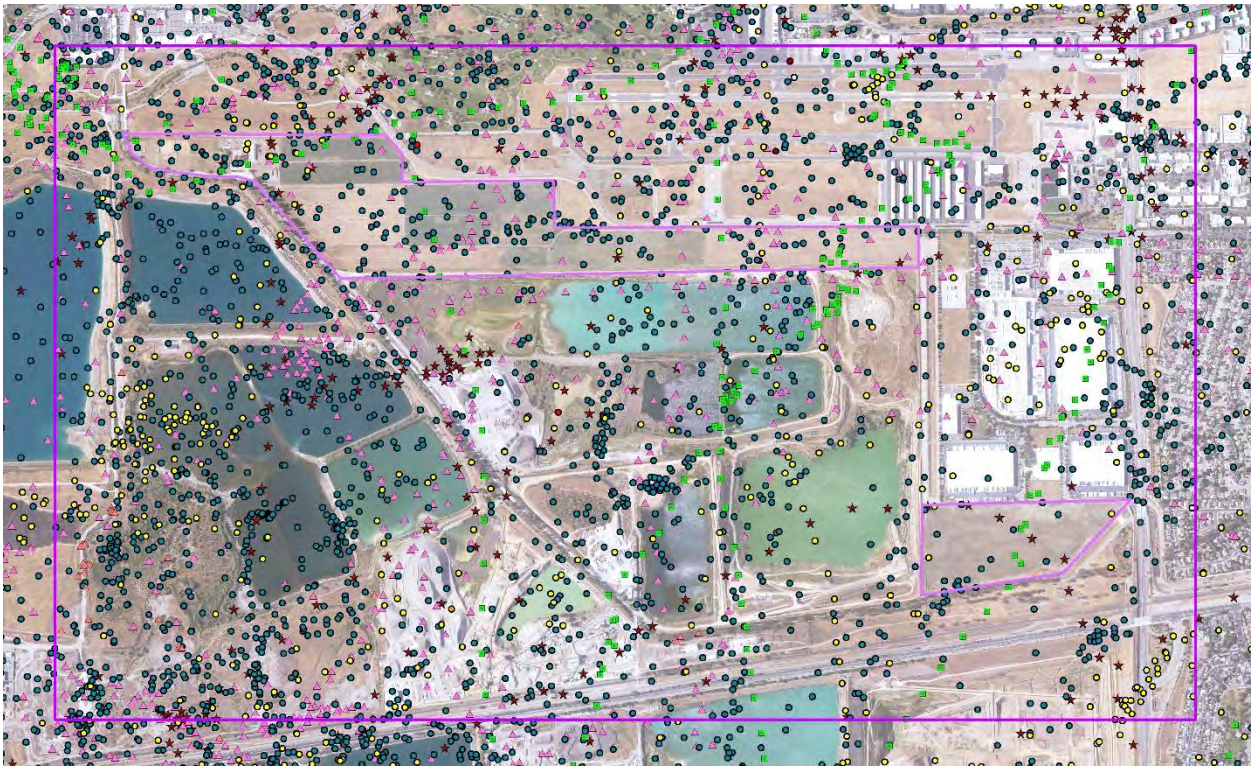

Figure 3. GPS telemetry positions (N = 3,478) of 11 golden eagles from 2014 through 2023, each distinct color-symbol combination representative of one golden eagle. Many of the positions are on SMP 38, SMP 39, and SMP 40. Many of the positions are of flying golden eagles, and some are of perched golden eagles.

Considering the inaccuracies of the DEIR's characterization of the existing environmental setting, the reasonable course of action would be to withdraw the current draft EUIR and prepare a new one to appropriately characterize the existing environmental setting. The public needs to understand the nature of the sensitive biological assets that exist on the project sites.

Table 2. Occurrence likelihoods of special-status bird species at or near the proposed project site, according to eBird/iNaturalist records (https://eBird.org, https://www.inaturalist.org) and on-site survey findings, where 'Very close' indicates within 1.5 miles of the site, "nearby" indicates within 1.5 and 4 miles, and "in region" indicates within 4 and 30 miles, and 'in range' means the species' geographic range overlaps the site. Entries in bold font indicate those species I detected during my reconnaissance surveys.

POTENTIAL BIOLOGICAL IMPACTS

An impacts analysis should consider whether and how a proposed project would affect members of a species, larger demographic units of the species, the whole of a species, and ecological communities. The accuracy of this analysis depends on an accurate characterization of the existing environmental setting. In the case of the proposed project, the existing environmental setting has not been accurately characterized, and several important types of potential project impacts have been inadequately analyzed. These types of impacts include habitat loss, interference with wildlife movement, and wildlife-automobile collision mortality.

HABITAT LOSS

Habitat loss results in a reduced productive capacity of affected wildlife species, but the DEIR offers no prediction of this lost capacity for any of the wildlife species potentially affected. In the case of birds, two methods exist for estimating the loss of productive capacity that would be caused by the project. One method would involve surveys to count the number of bird nests and chicks produced. The alternative method would be to infer productive capacity from estimates of total nest density elsewhere.

Because the project is located within an area that has undergone severe habitat fragmentation, the habitat that remains in fragmented patches probably no longer supports its original productive capacity of wildlife (Smallwood 2015, Smallwood and Smallwood 2023). However, several studies have estimated total avian nest density at locations that had likewise been highly fragmented. Two study sites in grassland/wetland/woodland complexes within agricultural matrices had total bird nesting densities of 32.8 and 35.8 nests per acre (Young 1948, Yahner 1982) for an average 34.3 nests per acre. Assuming total nest density at the project site is about a third of that of the above-cited study sites due to the annual disking of the project site's interior areas, I predict SMP 38 (111.7 acres), SMP 39 (51.9 acres) and SMP 40 (41 acres) support 11.4 bird nests/acre/year. Based on this assumption, the combined projects, SMP 39 and SMP 40, on 92.9 acres would eliminate 1,059 nest sites, and assuming SMP 38 is also later developed, then the combined projects, SMP 38, SMP 39, and SMP 40, on 204.6 would eliminate 2,332 nest sites.

The loss of 1059 to 2,332 nest sites would easily qualify as a significant project impact that has not been quantitatively addressed in the DEIR. But the impact would not end with the immediate loss of nest sites as nest substrate is removed and foraging grounds graded in preparation for impervious surfaces. The reproductive capacity of the site would be lost. The average number of fledglings per nest in Young's (1948) study was 2.9. Assuming Young's (1948) study site typifies bird productivity, the project would prevent the production of 3,071 to 6,763 fledglings per year, depending on whether SMP 38 is developed. Assuming an average bird generation time of 5 years, the lost capacity of both breeders and annual fledgling production can be estimated from an equation in Smallwood (2022): {(nests/year × chicks/nest × number of years) + (2 adults/nest × nests/year) × (number of years ÷ years/generation)} ÷ (number of years) = 3,495 to 7,696 birds per year denied to California, depending on whether SMP 38 is developed.

These losses of birds from California would be substantial, nearly equal to the annual loss of birds caused by wind turbine collision mortality in the nearby Altamont Pass Wind Resource Area (Adams Broadwell Joseph & Cardozo 8 January 2021 letter to Alameda County Planning Department regarding Comments on the Draft Subsequent Environmental Impact Report for the Mulqueeney Ranch Wind Repowering Project (SCH No. 2010082063), CUP Application No. PLN2019-00226). These losses would be highly significant.

INTERFERENCE WITH WILDLIFE MOVEMENT

One of CEQA's principal concerns regarding potential project impacts is whether a proposed project would interfere with wildlife movement in the region. Unfortunately, the DEIR's analysis of whether the project would interfere with wildlife movement in the region is flawed and misleading. According to the DEIR, "The project area does not fall within an Essential Habitat Connectivity area mapped by the CDFW." However, at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18486, the California Essential Habitat Connectivity Project specifically points out that it is not: "A California Department of Fish and Game or US Fish and Wildlife Service response to potential impacts to a habitat or species from a project subject to the California Environmental Quality Act (CEQA)," nor "Fine scale, with every important piece of habitat identified" nor ""Essential", meaning the only places of importance" nor "A solution by itself for how to provide necessary linkages for any given species of plant or animal... Linkage designs will vary depending on focal species chosen and the goal of providing connected habitat for a chosen species might be met several different ways" nor "The final word on connectivity for California." With analytical grid cells of 2,000 acres, the spatial grain of the California Essential Habitat Connectivity Project is much too coarse for the conclusion the DEIR draws from it.

The next flaw in the DEIR is in the argument that SMP 39 is cut off from open areas by well-trafficked roads, the airport, the gravel quarries, and therefore cannot function as a wildlife movement corridor. The same argument is made for SMP 40. On this point, the DEIR merely speculates, and offers no supporting evidence to its assertion. Monk & Associates (2021, 2023) report no survey methodology designed to determine whether wildlife rely on the site for movement in the region. They implemented no sampling regime nor a program of observation to record wildlife movement patterns. They failed to quantitatively or qualitatively analyze movement patterns of observed wildlife. Based on what is reported, Monk & Associates (2021, 2023) did not record or measure wildlife movement in any way. The conclusions of the DEIR regarding wildlife movement on the project site are speculative and conclusory.

On the other hand, the coyote I saw on site got there somehow, and so did the ground squirrels and pocket gophers, and so did all of the birds I saw on and over SMP 39. I observed hundreds if not thousands of gulls of multiple species flying in both easterly and westerly directions across SMP 38, SMP 39, and SMP 40. I observed Canada geese and Aleutian cackling geese flying to and from the quarry ponds and the project sites to forage. I saw a Cooper's hawk fly from the airport to SMP 39 to forage, crossing the well-trafficked road in about 2 seconds of flight time. Figure 3 illustrates that our telemetered

golden eagles from the Altamont Pass make frequent visits to the project site. That thousands of our golden eagle telemetry positions appear in the project area is consistent with the pattern that my co-investigators and I have noticed about golden eagle movement across California and beyond to other states and border nations, and that is that golden eagles carefully select open spaces as parts of their travel routes. The project area is important to golden eagle movement in the region, just as it is important to the 10 special-status species I observed on the project site, and to the 19 special-status species so far documented on the project site. Th evidence is overwhelming that the project site is important to wildlife movement in the region. Losing the open space of this site would be devastating to many species of wildlife, including to golden eagle.

Furthermore, whether the site includes or is within a wildlife movement corridor is not the only consideration when it comes to the standard CEQA Checklist question of whether the project would interfere with wildlife movement in the region. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. In fact, a site such as the project site is critically important for wildlife movement because it composes an increasingly diminishing area of open space within a growing expanse of anthropogenic uses, forcing more species of volant wildlife to use the site for stopover and staging during migration, dispersal, and home range patrol (Warnock 2010, Taylor et al. 2011, Runge et al. 2014). The project, due to its elimination of at least 92.9 acres of open space, and more realistically 204.6 acres of open space, and due to its insertion of multiple new buildings into the aerospace currently used by birds, bats and butterflies. would cut wildlife off from one of the last remaining stopover and staging opportunities in the region, forcing volant wildlife to travel even farther between remaining stopover sites. This impact would be significant, and as the project is currently proposed, it would be unmitigated.

TRAFFIC IMPACTS TO WILDLIFE

Project-generated traffic would endanger wildlife that must, for various reasons, cross roads used by the project's traffic to get to and from the project site (Photos 22—26), including along roads far from the project footprint. Vehicle collisions have accounted for the deaths of many thousands of amphibian, reptile, mammal, bird, and arthropod fauna, and the impacts have often been found to be significant at the population level (Forman et al. 2003). Across North America traffic impacts have taken devastating tolls on wildlife (Forman et al. 2003). In Canada, 3,562 birds were estimated killed per 100 km of road per year (Bishop and Brogan 2013), and the US estimate of avian mortality on roads is 2,200 to 8,405 deaths per 100 km per year, or 89 million to 340 million total per year (Loss et al. 2014). Local impacts can be more intense than nationally.

The nearest study of traffic-caused wildlife mortality was performed only 11 miles away, along a 2.5-mile stretch of Vasco Road in Contra Costa County, California. Fatality searches in this study found 1,275 carcasses of 49 species of mammals, birds, amphibians and reptiles over 15 months of searches (Mendelsohn et al. 2009). This fatality number needs to be adjusted for the proportion of fatalities that were not found due to scavenger removal and searcher error. This adjustment is typically made by placing carcasses for searchers to find (or not find) during their routine periodic fatality

searches. This step was not taken at Vasco Road (Mendelsohn et al. 2009), but it was taken as part of another study I completed next to Vasco Road concurrent to the Mendelsohn et al. study (Brown et al. 2016). Brown et al.'s (2016) adjustment factors for carcass persistence resembled those of Santos et al. (2011), which were derived from carcasses placed along roads. Applying searcher detection rates from Brown et al. (2016), the adjusted total number of fatalities was estimated at 12,187 animals killed by traffic on the reach of road that was studied. This fatality number over 1.25 years and 2.5 miles of road translates to 3,900 wild animals per mile per year. In terms comparable to the national estimates, the estimates from the Mendelsohn et al. (2009) study would translate to 243,740 animals killed per 100 km of road per year, or 29 times that of Loss et al.'s (2014) upper bound estimate and 68 times the Canadian estimate. An analysis is needed of whether increased traffic generated by the project site would similarly result in local impacts on wildlife.

Photo 22. A Gambel's quail dashes across a road on *3 April 2021. Such road crossings are usually successful, but too often prove fatal to the animal. Photo by Noriko Smallwood*.

Photo 23. California ground squirrel in the middle of an eastern Alameda County road on 13 March 2014.

Photo 24. Western Pacific rattlesnake on an eastern Alameda County road, 23 August 2011. Photo by Shawn Smallwood.

Photo 25. Mourning dove killed by vehicle on a California road. Photo by Noriko Smallwood, 21 June 2020.

Photo 26 Raccoon killed on Road 31 just east of Highway 505 in Solano County. Photo taken on 10 November 2018.

For wildlife vulnerable to front-end collisions and crushing under tires, road mortality can be predicted from the study of Mendelsohn et al. (2009) as a basis, although it would be helpful to have the availability of more studies like that of Mendelsohn et al. (2009) at additional locations. My analysis of the Mendelsohn et al. (2009) data resulted in an estimated 3,900 animals killed per mile along a county road in Contra Costa County. Two percent of the estimated number of fatalities were birds, and the balance was composed of 34% mammals (many mice and pocket mice, but also ground squirrels, desert cottontails, striped skunks, American badgers, raccoons, and others), 52.3% amphibians (large numbers of California tiger salamanders and California red-legged frogs, but also Sierran treefrogs, western toads, arboreal salamanders, slender salamanders and others), and 11.7% reptiles (many western fence lizards, but also skinks, alligator lizards, and snakes of various species). VMT is useful for predicting wildlife mortality because I was able to quantify miles traveled along the studied reach of Vasco Road during the time period of the Mendelsohn et al. (2009), hence enabling a

rate of fatalities per VMT that can be projected to other sites, assuming similar collision fatality rates.

From October 2016 through December 2019, I maintained my own database of wildlife mortality I encountered on Vasco Road between Marsh Creek Road and Livermore, which encompassed the wildlife mortality study site of Mendelsohn et al. (2009). Table 3 includes the wildlife I found as fatalities, and it compares my crudely calculated ratio of observed fatalities per mile. From Table 3, it is apparent that mortality along the reach of road studied by Mendelsohn et al. (2009) was relatively low compared to the rest of Vasco Road: $^{19.178}/_{13.200} = 5{,}667$ fatalities per mile predicted for the 14.1 miles of Vasco Road that were not studies by Mendelsohn et al. (2009).

Table 3. Fatalities I found along Vasco Road from October 2016 though December 2019, and along 14.1 miles of road that was not studied by Mendelsohn et al. (2009) and 2.5 miles that were studied.

Predicting project-generated traffic impacts to wildlife

The DEIR predicts the project would generate 8,622,395 annual VMT. During the Mendelsohn et al. (2009) study, 19,500 cars traveled Vasco Road daily, so the vehicle miles that contributed to my estimate of non-volant fatalities was 19,500 cars and trucks × 2.5 miles × 365 days/year × 1.25 years = 22,242,187.5 vehicle miles per 12,187 wildlife fatalities, or 1,825 vehicle miles per fatality. This rate divided into the predicted annual VMT, above, would predict 4,725 vertebrate wildlife fatalities per year. My analysis of data in Table 3 suggests that the project-caused mortality along local roadways would be even higher.

Based on my analysis, the project-generated traffic would cause substantial, significant impacts to wildlife. The DEIR does not address this potential impact, let alone propose to mitigate it. Mitigation measures to improve wildlife safety along roads are available and are feasible, and they need exploration for their suitability with the proposed project. Given the predicted level of project-generated, traffic-caused mortality, and the lack of any proposed mitigation, it is my opinion that the proposed project would result in potentially significant adverse biological impacts. The DEIR should be withdrawn

from circulation and revised to appropriately analyze the potential impacts of project-generated automobile traffic on wildlife.

CUMULATIVE IMPACTS

The DEIR attempts to minimalize the project's contributions to cumulative impacts to biological resources by asserting that "ruderal herbaceous land is not considered sensitive wildlife habitat." However, CEQA does not require that the habitat that would be lost to a project be labeled as sensitive; no such standard exists.

The DEIR presents a flawed analysis of cumulative impacts, including to biological resources. The DEIR asserts that it "sets forth mitigation measures to ensure all potential project-specific impacts that would occur to biological resources are reduced to a less-than-significant level." And therefore, "the proposed project would not result in substantial adverse effects to biological resources protected by CEQA." The DEIR contrives the false standard that a given project impact is cumulatively considerable only when it has not been fully mitigated at the project level. The DEIR implies that cumulative impacts are really residual impacts left over by inadequate mitigation of project impacts. This notion of residual impacts being the source of cumulative impacts is inconsistent with CEQA's definition of cumulative effects. Individually mitigated projects do not negate the significance of cumulative impacts. If they did, then CEQA would not require a cumulative effects analysis. To summarize, the DEIR presents no cumulative effects analysis as defined in two ways by CEQA.

MITIGATION

Western Burrowing Owl

4.3-2(a) If project construction begins during the western burrowing owl nesting season (February 15 to August 31), a qualified biologist shall conduct targeted burrowing owl nest surveys within 14 days prior to construction activities using seven- to 20-foot transects. ... The survey shall ... follow CDFW guidelines outlined in the 2012 Staff Report on Burrowing Owl Mitigation.

The avian breeding season recognized by the CDFW is now 1 February through 15 September. The DEIR should be revised accordingly.

Whereas I concur that preconstruction, take-avoidance surveys should be completed, the DEIR falsely characterizes preconstruction surveys as detection surveys by insinuating that conducting preconstruction surveys without first having completed detection surveys would follow CDFW guidelines. Detection surveys are entirely different than preconstruction surveys, and are implemented to achieve a different set of objectives. Contrary to the DEIR's implication, preconstruction surveys are not designed to detect burrowing owls with anywhere close to the same likelihood as are protocol-level detection surveys that are designed for this purpose. It would be very easy for a preconstruction survey to fail to detect burrowing owls that are in fact present. Therefore, implementing a preconstruction survey as a surrogate for detection surveys would be reckless and would fail to meet the minimum standard of care for wildlife

protection. In any case, preconstruction surveys need to be implemented after completion of detection surveys per CDFW (2012).

Tricolored Blackbird

4.3-2(c) Prior to any ground disturbance on SMP 40, a qualified biologist shall conduct a preconstruction survey in all accessible areas identified as supporting potential tricolored blackbird nesting habitat. The survey shall document the current, and to the extent possible, historical presence or absence of nesting colonies of tricolored blackbird. …

Whereas I concur that preconstruction, take-avoidance surveys should be completed, a detection survey is needed first to inform the readers of the DEIR of whether and where tricolored blackbirds occur on or near the project sites. A detection survey would likely also improve the efficacy of the preconstruction survey.

Nesting Birds and Raptors (Including Loggerhead Shrike)

4.3-2(d) If project construction begins during the nesting season (February 1 to August 31), a qualified biologist shall conduct a nesting bird survey within 7 days prior to construction activities. … If migratory birds are identified nesting on or within the zone of influence, … A qualified biologist shall establish a temporary protective nest buffer around the nest(s). The nest buffer shall be staked with orange construction fencing. The buffer must be of sufficient size to protect the nesting site from construction-related disturbance and shall be established by a qualified ornithologist or biologist with extensive experience working with nesting birds near and on construction sites.

Typically, adequate nesting buffers are 75 feet from the nest site or nest tree dripline for small birds and up to 300 feet for sensitive nesting birds that include several raptor species known in the region of the project site but that are not expected to occur on the project site. Upon completion of nesting surveys, if nesting birds are identified on or within a zone of influence of the project site, a qualified ornithologist/biologist that frequently works with nesting birds shall prescribe adequate nesting buffers to protect the nesting birds from harm while the project is constructed.

First, the avian breeding season recognized by the CDFW is now 1 February through 15 September. The DEIR should be revised accordingly.

Second, whereas I concur that preconstruction, take-avoidance surveys should be completed, in my experience the majority of bird nests would not be found by biologists assigned to the survey. For instance, I surveyed for grassland nesters as part of an intensive survey effort that I performed from March through mid-August 2023 on a Central Valley site. I surveyed the site 30 times. I found that the nests of grassland birds are the most difficult to locate. Cavity nesters can more effectively defend their nests against predators, whereas ground nesters are highly vulnerable to predation, and thus the most cryptic of nesters. Ground nesters, which include bird species that occur at the project site, are highly adept at concealing their nests both physically and behaviorally. Based on my experience, it is highly likely that preconstruction survey would fail to find

any of the nests of ground-nesting birds that truly occur on the project site. The DEIR's implication that preconstruction survey would reduce potential impacts to nesting birds to less-than-significant is unsubstantiated by evidence in the DEIR.

The mitigation measure appears to be specifically directed toward loggerhead shrike, presumably because this special-status species was detected during a reconnaissance survey of SMP 40. Finding the nests of loggerhead shrikes is particularly difficult, as this species is expert at deceiving observers as to the whereabouts of their nests (Smallwood and Smallwood 2021). To adequately survey for nest sites of loggerhead shrike, many surveys are needed, and the survey methods need to include long sessions of visual-scans, preferably from blinds such as automobiles. Observers would need to be experienced in bird behavior, and capable of tracking the movements of individual loggerhead shrikes. A preconstruction survey for loggerhead shrike nest would be ineffective by having inexperienced biologists walk back and forth along transects.

Third, the mitigation language (second italicized paragraph above) allows a single individual to make a subjective decision, outside the public's view, to determine the buffer area for any given species. This measure lacks objective criteria, and is unenforceable.

Even assuming some or even all of the nests would be found and salvaged, this benefit to birds nesting on site would apply only to a single breeding season of nesters. The project would nevertheless eliminate the site's productive capacity to birds.

SMP 40 and Trail Connection Option 2
4.3-3(c) Prior to the commencement of ground-disturbing activities for SMP 40 or Trail Connection Option 2, … [Six minimization and mitigation measures follow, one of which is] *… the riparian corridor of Arroyo Mocho, disturbed areas shall be revegetated with native riparian plant species. Replacement of riparian trees to be removed shall be planted near the creek as feasible and/or adjacent to the existing limits of the riparian corridor to contribute to the existing riparian canopy. Riparian plantings shall be maintained for a minimum of 5 years to ensure that the canopy is enhanced and the understory restored.*

Trail Connection Option 2 – Undercrossing at Isabel Bridge
4.3-3(d) Prior to initiation of any groundbreaking activity associated with Trail Connection Option 2, … The project applicant shall ensure that the proposed project replaces, restores, or enhances on a "no net loss" basis (in accordance with the RWQCB) the acreage of all riparian habitat and waters of the State that would be removed, lost, and/or degraded due to project implementation by methods agreeable to the RWQCB and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 permitting processes. Methods include, but are not limited to implementation of a riparian enhancement planting plan and/or tree planting mitigation at a 1:1 ratio, or as otherwise prescribed by the RWQCB.

Trail Connection Option 2 – Undercrossing at Isabel Bridge

4.3-3(e) If it is determined that work below the OHWM cannot be avoided for Trail Connection Option 2, … Waters that would be lost or disturbed shall be restored, replaced, or rehabilitated on a "no-net-loss" basis. Habitat restoration, rehabilitation, and/or replacement, including the purchase of credits from a USACE approved mitigation bank at a 1:1 ratio, shall be at a location and by methods acceptable to the USACE.

I concur that all of the measures described above should be implemented if the project goes forward. However, these measure alone would be inadequate. Also needed is monitoring of wildlife that is integrated with thresholds of success and failure. If thresholds of failure are exceeded, then the City should be required to take additional steps to achieve success. To this end, an adequate performance bond should be provided by the applicant to the City.

RECOMMENDED MEASURES

Road Mortality: Compensatory mitigation is needed for the increased wildlife mortality that would be caused by bird-window collisions and the project-generated road traffic in the region. I suggest that this mitigation can be directed toward funding research to identify fatality patterns and effective impact reduction measures such as reduced speed limits and wildlife under-crossings or overcrossings of particularly dangerous road segments. Compensatory mitigation can also be provided in the form of donations to wildlife rehabilitation facilities (see below).

Fund Wildlife Rehabilitation Facilities: Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Many animals would likely be injured by collisions with automobiles traveling to and from the project's buildings.

Landscaping: If the project goes forward, California native plant landscaping (i.e., chaparral, grassland, and locally appropriate scrub plants) should be considered to be used as opposed to landscaping with lawn and exotic shrubs. Native plants offer more structure, cover, food resources, and nesting substrate for wildlife than landscaping with lawn. Native plant landscaping has been shown to increase the abundance of arthropods which act as importance sources of food for wildlife and are crucial for pollination and plant reproduction (Narango et al. 2017, Adams et al. 2020, Smallwood and Wood 2022.). Further, many endangered and threated insects require native host plants for reproduction and migration, e.g., monarch butterfly. Around the world, landscaping with native plants over exotic plants increases the abundance and diversity of birds, and is particularly valuable to native birds (Lerman and Warren 2011, Burghardt et al. 2008, Berthon et al. 2021, Smallwood and Wood 2022). Landscaping with native plants is a way to maintain or to bring back some of the natural habitat and lessen the footprint of urbanization by acting as interconnected patches of habitat for wildlife (Goddard et al. 2009, Tallamy 2020). Lastly, not only does native plant landscaping benefit wildlife, it requires less water and maintenance than traditional landscaping with lawn and hedges.

Thank you for your consideration,

_____

Subject: **City of Livermore SMP 38/SMP 39/SMP 40 Project**
Review of DEIR Noise Section & Appendices

Dear Stephanie:

We have completed a review of Section 4.6 (Noise), as well as Appendices J and K (Environmental Noise Assessments) of the Draft Environmental Impact Report for the City of Livermore SMP 38/SMP 39/SMP 40 Project, focusing on the adequacy of the noise impact analyses. Here are our findings:

OVERVIEW

Section 4.6 of the DEIR is based on environmental noise assessments prepared by Salter.

- Significance Standards

  The DEIR significance standards for noise and vibration impacts are based directly on Section XIII of the Environmental Checklist in Appendix G of the current CEQA Guidelines, which reads as follows:

  XIII. NOISE - Would the project result in:

  a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of the local general plan or noise ordinance, or applicable standards of other agencies?

  b) Generation of excessive groundborne vibration or groundborne noise levels?

  c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the area to excessive noise levels?

  Salter has proposed a 3 dBA increase in ambient noise levels as the threshold for a "substantial increase". We concur that this is a reasonable value for CEQA evaluation of this project.

- Operational Noise & Construction Vibration

  The analysis in Section 4.6 shows that noise impacts from operational noise (loading dock activity, HVAC, on-site vehicle movements) as well as vibration during on-site construction are less-than-significant. Generally, the analysis supporting this finding appears to be methodical and well done, consistent with current CEQA Guidelines, and we take no exception to it.

- Construction Noise Impacts

  Section 4.6 also includes an analysis of construction noise impacts on the nearest sensitive uses – i.e.: the single-family residential neighborhood to the east of the project sites. This analysis covers on-site construction activity for SMP 40 as well as the construction of off-site trail connections at three potential locations (each within 200-feet of the nearest residential use).

The impact of construction noise on the SMP 39 site is not covered in the DEIR.

For the off-site trail connection construction, the DEIR states that noise impacts are significant without mitigation and provides a list of mitigation measures (4.6-1) to reduce this impact to less-than-significant level. Generally, we agree with this finding and the proposed mitigation measures.

For on-site construction, the DEIR states that noise impacts will be less-than-significant. However, the analysis presented in the DEIR does not – in our opinion – adequately support this conclusion, for the reasons outlined below.

PROBLEMS WITH THE ON-SITE CONSTRUCTION NOISE IMPACT ANALYSIS

- <u>SMP 39 is Excluded</u>

  Construction noise from the SMP 39 site is not included in the analysis in Section 4.6 of the DEIR. An explanation for this omission is provided in the final paragraph on page 4.6-21, which reads in part:

  "Due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated that construction noise associated SMP 39 would be below the City of Livermore's exterior noise level threshold of 60 dBA DNL at the nearest sensitive receptor locations. Thus, construction noise levels for SMP 39 were not evaluated as part of the Environmental Noise Study for SMP 39."

  There are two problems with this explanation:

  First, CEQA requires an actual analysis to show whether a project impact is significant or less-than-significant. Simply "anticipating" that there will be no significant impact falls short of the standard required for a CEQA study.

  Second, the 60 dBA DNL exterior noise standard (which comes from the land-use compatibility table in the Noise Element of the City of Livermore General Plan) is only one of the applicable local regulations. The DEIR analysis should address all applicable regulations in both the General Plan and Municipal Code.

- <u>Analysis for SMP 40 is Incomplete</u>

  The noise impact analysis for construction on the SMP 40 site compares Salter's noise level predictions with instantaneous maximum noise level (Lmax) limits of 70 dBA during the day and 60 dBA at night, which are taken from Policy N-1.5.P3 of the City of Livermore General Plan.

  However, these Lmax noise limits are not the only local regulations that would apply to construction noise on the SMP 40 site.

  For example, the DEIR does not show how construction noise from SMP 40 would compare to Policy N-1.5.P2 of the General Plan, which prescribes the following noise limits, depending on the cumulative duration of the noise:

Daytime Noise Limit (7AM – 10PM)	Nighttime Noise Limit (10PM – 7AM)	Cumulative Duration
60 dBA	50 dBA	No more than 15-minutes in any hour.
65 dBA	55 dBA	No more than 5-minutes in any hour.
70 dBA	60 dBA	No more than 1-minute in any hour.

Similarly, the DEIR does not include an DNL analysis for construction noise from SMP 40 to show that it will be below the 60 dBA exterior noise standard taken from land-use compatibility table (Table 9-7) in the General Plan. This will be particularly important if any construction work is to occur at night.

- <u>There is an Error in the Calculations for SMP 40</u>

  Table 4.6-6 of the DEIR lists estimated Lmax noise levels for various pieces of construction equipment at a distance of 50-feet (these are standard reference values, taken from the FHWA Construction Noise Handbook) and extrapolates them to a distance of 884 feet.

  According to Table 4.6-6, the equipment noise levels received at a distance of 884 are 57 dBA lower than lower than those received at a distance of 50-feet. This is incorrect. According to the radiation equation for point sources (such as individual pieces of construction equipment) the reduction in noise level from 50-feet to 884 feet is:

  $10 \times LOG_{10}(884/50) = 25$ dBA

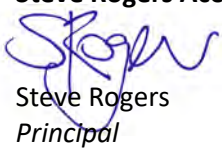
  So, the estimated Lmax noise levels provided in Table 4.6-6 are 32 dBA lower than they should be. Which means that noise from several of the pieces of equipment listed should be expected to produce a maximum level of noise at the nearest residences that is either right at the 60 dBA nighttime limit or, in the case of paving equipment, 4 dBA above it.

- <u>Construction on the East Side of the SMP 40 Site is Overlooked</u>

  The construction noise analysis in the DEIR for SMP 40 considers assumes receivers 884-feet away from the equipment – which is the distance between the location proposed for Building 2 and the nearest residences. However, there will be certain phases of construction – such as site preparation and paving/landscaping/site concrete – when noisy equipment could be operating closer than 884-feet from nearby residential uses.

  For example, the eastern corner of the SMP 40 site is within 600-feet of the nearest residential use. Received noise levels at a distance of 600-feet from the equipment would be 3 dBA higher than those received at 884-feet, which means that the expected noise level at the nearest residences when paving equipment is in use in the eastern corner of the site would be 67 dBA, Lmax and not 32 dBA, Lmax as reported in Table 4.6-6.

SUMMARY & RECOMMENDATIONS



We find that, while much of the noise analysis in the DEIR has been done to the standard expected of a CEQA study, the evaluation of noise impacts during the construction phases is incomplete and contains a significant calculation error. We therefore recommend that the preparers be requested to revise/correct the Noise Section (4.6) of the DEIR as follows:

- Include SMP 39 in the on-site construction noise impact analysis. The analysis should take account of the anticipated number of pieces of equipment in use at any one time during each phase as well as estimated usage factors, so that construction noise impacts can be evaluated in the in the context of the City of Livermore General Plan DNL 60 dBA exterior noise standard (from Table 9-7) and the time-dependent noise limits in Policy N-1.5.P2, as well as the Lmax noise limits in Policy N-1.5.P3.
- For on-site construction on the SMP 40 site, the noise impact analysis should be expanded to take account of the anticipated number of pieces of equipment in use at any one time during each phase as well as estimated usage factors, so that construction noise impacts can be evaluated in the in the

context of the City of Livermore General Plan DNL 60 dBA exterior noise standard (from Table 9-7) and the time-dependent noise limits in Policy N-1.5.P2, as well as the Lmax noise limits in Policy N-1.5.P3.

- Table 4.6-6 should be revised to show the correct (25 dBA) reduction in point-source noise levels from 50-feet to 884-feet.
- Provide additional analysis for any construction activity on the SMP 40 site (such as site preparation, paving/landscaping) that could occur closer than 884-feet from the nearest residential use.

Yours sincerely,
Steve Rogers Acoustics, LLC

MEMORANDUM

DATE: February 2, 2024
TO: Timur Tecimer
Overton Moore Properties
FROM: Dan Schaaf, PE
Sarah Weinberg, EIT
SUBJECT: SMP 40 Flood Study
JOB #: OMPC.01.22

Introduction

Schaaf & Wheeler has been contracted by Overton Moore Properties to analyze the Arroyo Mocho models and mapping to determine if the SMP 40 development has any impact on the floodplain or hydrologic impacts. The effective (2023) Zone 7 HEC-RAS models were utilized with the proposed development.

Hydraulic Analysis and Results

Comparing the existing and proposed conditions, the results show that there are no significant impacts by adding the SMP 40 development. Figures 1 and 2 show the 100-year base condition flow hydrographs for the downstream cross section and Figures 3 and 4 show the hydrographs for the cross section closest to the proposed development. Both cross section locations are called out on Figures 5 and 6. At the downstream cross section, near the confluence with Arroyo Las Positas, the maximum 100-year flow increased slightly from 2,222cfs to 2,223cfs with the proposed development. The maximum 100-year elevation at the cross section close to the site the maximum flow increased from 3,818cfs to 3,830cfs with the proposed development. The maximum 100-year elevation increased slightly from 401.7 feet to 401.8 feet. Figures 5 and 6 show the maximum depth of flooding for a 100-year event, which has no significant change. Figure 7 shows the difference in water surface elevation for the proposed and existing scenarios. The only change occurs at the corner of the proposed development and causes an increase of about 0.3 feet in water surface elevation.

Conclusion

There is no significant impact by adding the SMP 40 development. The results are comparable to the Zone 7 floodplain results.

SMP 39/SMP 40 Project
Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum

As mentioned in the memorandum entitled, "Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum", the City would be following up with a supplemental memorandum to provide responses to the "Attorneys for Carpenters Local 713" letter, dated February 14, 2024, which was received after the release of the Final Environmental Impact Report (EIR) for the SMP 39/SMP 40 Project (proposed project). This supplemental memorandum provides the responses to the above-referenced letter.

While CEQA does not require that written responses be provided for letters received after the close of the public review period, the comments are acknowledged by the City, and the City has chosen to prepare written responses to the comments for the decision-makers consideration in making an informed decision. Responses to the "Attorneys for Carpenters Local 713" comment letter, which is included as Attachment 1, are provided below. Where revisions to the EIR text are required in response to a comment, new text is double underlined and deleted text is ~~struck through~~.

The comments received did not identify any new significant impact, substantial increase in severity of a significant impact identified in the EIR, or any significant new information. Therefore, recirculation of the EIR is not required.

Response to Stephanie Papayanis, Attorneys for Carpenters Local 713
The majority of the comment letter, including the entirety of Comment I and Comment II(A) of the comment letter, is identical to the comment letter submitted by Attorneys for Carpenters Local 713 during the Draft EIR comment period. As such, with regard to Comment I and Comment II(A) included in the comment letter, please see Responses to Comments 5-3 and 5-5 included in the Final EIR.

The new concerns brought forth in the comment letter are limited to Comment II(B) and Comment II(C) related to biological resources and construction noise. Thus, responses to Comment II(B) and Comment II(C) are provided below.

Comment II(B) Related to Biological Resources
Responses to the commenter's concerns regarding biological resources are provided below, as informed by Monk & Associates (M&A), who prepared the project-specific Biological Resources Assessments (BRAs) used within the Draft EIR analysis. It should be noted that Comment II(B) is a summary of the comments provided in Exhibit D to the Attorneys for Carpenters Local 713 comment letter, which is a letter authored by Shawn Smallwood, PhD. As such, the following responses are organized based on the comments presented in Exhibit D of the Attorneys for Carpenters Local 713 comment letter.

Environmental Setting Informed by Field Surveys
Page 16 of the Exhibit D comment letter states: "The results of the Monk and Associates (2021, 2023) surveys have been misinterpreted in the reports, resulting in inaccurate characterizations of the existing environmental settings of SMP 39 and SMP 40." The commenter is referring to the fact that M&A biologists recorded fewer bird species on-site and flying overhead than the commenter did during a reconnaissance visit. The environmental setting or environmental

baseline of a project site is informed by much more than the number of birds and mammals one sees in a certain amount of time.

The CEQA Guidelines Section 15125(a) requires that the CEQA document prepared for a project discuss the "baseline" environmental conditions at and in the vicinity of the project sites. CEQA Guidelines Section 15125 (see also Section 15126.6(e)(2)) states the following regarding the environmental setting as it relates to baseline:

> (a) [the CEQA review document] must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to understanding the significant effects of the proposed project.

M&A conducted several surveys on each of the project sites. As explained in the SMP 39 BRA included as Appendix D to the Draft EIR, M&A survey work in the project area dates to the year 2000. However, because CEQA requires current baseline conditions, none of the plants or wildlife observed in the early 2000s were reported in the BRAs. The 2021 surveys are the baseline surveys that were conducted to record existing biological resources and to assess the likelihood of resource agency regulated areas on the project sites. The surveys involved searching all habitats on the sites and recording all plant and wildlife species observed. M&A cross-referenced the habitats found on the project sites against the habitat requirements of local or regionally known special-status species to determine if the proposed project could directly or indirectly impact such species and if additional protocol level surveys would be necessary to assess potential impacts to special status species.

CEQA does not require an exhaustive list of all bird species that could occur on a project site, nor does CEQA require a discussion of what each species is doing at the time the species is observed. Rather, CEQA requires an analysis of potential impacts to special-status birds and/or nesting habitat for common birds that rise to the level of significance pursuant to CEQA as determined by an expert, based on database searches, field surveys, etc. M&A's BRAs provide that analysis and recommend pre-construction surveys to address potentially significant impacts. Overall, the BRAs meet the standards of care warranted under CEQA.

Habitat Loss

The commenter's estimate on the number of birds "denied to California" is primarily based on two studies. The commenter states that the two study sites have grassland/wetland/woodland complexes within agricultural matrices, and found total bird nesting densities of 32.8 and 35.8 nests per acre. The commenter uses one-third of such estimates for the project sites' calculation due to the annual discing that occurs on the project sites. However, the estimation is likely still an overestimate, as one study was conducted in a five-acre, undisturbed, unfragmented and preserved area within the over-500-acre University of Wisconsin Arboretum dedicated in 1934, adjacent to a 321-acre lake (Lake Wingra). The SMP 39 and SMP 40 project sites are not surrounded by hundreds of acres of preserved natural lands but rather the relatively small project sites are fragmented from natural areas by surrounding, existing development (busy roads, an airport, and active industrial uses).

The other study mentioned by the commenter was conducted within farmstead shelterbelts, or "man-made habitats consisting of parallel rows of trees and shrubs designed to protect farmsteads from damaging winds, drifting snow and blowing soil…" referred to as "wooded

islands." The study determined that the wooded islands are important for avifauna in regions of intensive agriculture and found many nests within the wooded region. The SMP 40 project site has a similar "wooded island," in that the wooded area that is a riparian corridor along Arroyo Mocho is being preserved within a riparian set back and will provide high-quality habitat for many nesting birds post-development. The preservation of Arroyo Mocho's riparian habitat was not considered in the commenter's calculations.

Further, the commenter's comparison of development of the proposed project to the high avian mortality rate by wind turbine collision in the Altamont Pass Wind Resource Area is not an appropriate comparison. The commenter is comparing 50-foot-tall buildings on the project sites to 430-foot-tall wind turbines with active, moving blades in a known avian migration zone; an area that supports the highest number of nesting Golden Eagles in the world.[1]

Regardless of the commenter's inappropriate comparison and overestimate of the number of birds "denied to California" due the loss of nesting habitat by the proposed projects, CEQA requires an analysis of potential impacts to special-status birds and/or nesting habitat for common birds that raise to the level of significance. Therefore, impacts to nesting birds were regarded as significant pursuant to CEQA in the Draft EIR. However, mitigation measures to protect special-status birds and all nesting birds have been prescribed in the Draft EIR (see Mitigation Measures 4.3-2[a] through 4.3-2[d] in the Draft EIR). The mitigation measures included therein reduce impacts to nesting birds to a less-than-significant level pursuant to the CEQA. Thus, the commenter's concerns about the projects' impacts to nesting birds have been sufficiently addressed.

Interference with Wildlife Movement

The commenter is correct that the Essential Habitat Connectivity Area mapped by the California Department of Fish and Wildlife (CDFW) is focused on connecting very large blocks of mostly protected natural lands. While the Draft EIR does state that the project sites are not located in this mapped area, that is only one sentence of the three-paragraph description under the Wildlife Movement Corridor section of the Draft EIR (see pages 4.3-14 to 4.3-15 of the Draft EIR). The comment implies that sufficient research and in-person assessments were not conducted accordingly, and that the determination that the project sites will not impact significant wildlife corridors was solely based on using the CDFW's Essential Habitat Connectivity Area map, which simply is not true.

For example, M&A conducted online research and project-specific field surveys to become informed about the project sites' habitats and the potential for any impacts to regional wildlife corridors based on development of the proposed projects. M&A recorded wildlife observed during site visits, in addition to extensively noting the habitat types and surrounding land uses during their visits and how the surrounding land uses would affect wildlife movement. As such, the commenter's statement that the conclusions of the Draft EIR regarding wildlife movement on the project site are speculative and conclusory is untrue.

Wildlife corridors are linear and/or regional habitats that provide connectivity to other natural vegetation communities within a landscape fractured by urbanization and other development. Wildlife corridors are extremely important habitats to preserve and are valuable for wildlife. While local wildlife may use the undeveloped sites in their current state, neither of the project sites currently provide a significant regional wildlife corridor that may be impacted by the proposed project. The project sites are regularly disced or disturbed for agriculture. For SMP 40, an

[1] National Audubon Society. *National Audubon Society Sues California County to Improve Bird Protections in Controversial Wind Energy Project.* Available at: https://www.audubon.org/news/national-audubon-society-sues-california-county-improve-bird-protections#:~:text=17%2C%202021)%2D%2DThe%20National,turbine%20facility%20at%20Altamont%20Pass%2C. Accessed February 2024.

industrial development, Oaks Business Park, is located to the north of the project site, east of the project site is Isabel Avenue, a heavily-trafficked road, south is an active railroad track and Stanley Boulevard, another heavily-trafficked road, and west of the project site are quarry ponds. SMP 39 is bordered by West Jack London Boulevard, a well-trafficked road, the Livermore Municipal Airport, the Oaks Business Park, and quarry ponds. The quarry ponds were excavated in uplands and, thus, are not associated with a creek or drainage, and have nearly vertical slopes, preventing wildlife from traversing the ponds easily or using the quarry area as a corridor. As mentioned in M&A's BRAs, both SMP 39 and SMP 40 are isolated from regional open spaces, and, as such, do not have regional wildlife corridor value for terrestrial mammals and contain minimal habitat that could be used by some migrating avian species.

The commenter states: "On the other hand, the coyote I saw on site got there somehow, and so did the ground squirrels and pocket gophers, and so did all of the birds I saw on and over SMP 39." One might infer from this statement that M&A's reports and the Draft EIR implied that wildlife do not use, or could not be found on the project sites, which is incorrect. Each of M&A's BRAs included a table of wildlife species observed on the project sites during site visits, which, as described in the BRAs, is not intended to be exhaustive or to describe the only species that could be found on the project sites. Rather, the focus was, as required by CEQA and as appropriate, on the assessment of biological resources with regard to suitable habitat and potential for the occurrence of any special-status species, as determined by a qualified biologist for the purposes of an impact analysis. Movement of a species through an area or an area's incidental use does not necessarily imply importance to the species, the characteristics of the habitat are more relevant.

For example, Figure 3 of the commenter's report shows the fly over and resting locations of Golden Eagles, which provides an example of how local wildlife may use the project sites as well as all surrounding areas, including properties completely developed with warehouses and surrounded by busy roads. However, while species such as the Golden Eagle may use the project site for foraging or resting on occasion, or may flyover, it is clear that the project sites are not the main sites that are relied upon by these large raptors for any of the above functions, or for nesting, as the existing trees are too small and in close proximity to disturbance.

The SMP 40 riparian area may provide significantly more suitable rest, foraging and nesting habitat for many bird species than the open and disturbed grassland does. However, as previously described, the riparian area on SMP 40 will be completely preserved within a riparian setback and will continue to connect local wildlife within the riparian corridor along the Arroyo Mocho.

The commenter also mentions that 19 special-status species so far have been documented on the project site, as further detailed in Table 1 of the commenter's report. However, the commenter's list includes species that do not meet the definition of "rare" pursuant to the CEQA. For example, Table 1 includes Red-tailed Hawk (*Buteo jamaicensis*), California Gull (*Laus californicus*), Double-crested Cormorant (*Phalacrocorax auritus*), Nuttall's Woodpecker (*Picoides nuttallii*), and Oak Titmouse (*Baeolophus inornatus*), which are designated as Birds of Prey (BOP), Birds of Conservation Concern (BCC) by U.S. Fish and Wildlife Service, and Taxa to Watch List. However, the aforementioned listings are not considered special-status under the California or Federal Endangered Species Acts (CESA and FESA), by other regulations, or by the scientific community pursuant to the CEQA. Nonetheless, it should be noted that these species, their nests, eggs and/or young are provided protection pursuant to other resource agency regulations such as the Migratory Bird Treaty Act (MTBA) and the California Fish and Game Code Sections 3503, 3503.5, 3511, and 3513C, which are both fully accounted for and discussed in M&A's BRAs and the Draft EIR.

In addition, the commenter does not specify which of the 19 species were observed during his site visit, or which were taken as observations from eBird. While many experienced birders may use eBird, anyone can report incidental bird sightings to eBird without any way to confirm the qualifications of the observer. As such, relying only on eBird data to say confidently that a special-status species is present on a property is not sufficient and would need to be confirmed by a qualified biologist. As mentioned by the commenter, several of the species sightings are birds flying over the project sites. As discussed in sections above, observing sensitive birds flying over a property, foraging over the site, or using the habitat on the sites during the non-nesting season does not warrant reporting to the California Natural Diversity Database (CNDDB), as such sightings are not of permanent breeding/nesting/larval development habitat (dependent on what type of animal it is) that warrant protection. The types of "incidental" sightings of common bird species do not necessarily translate into a "potentially significant biological impact" pursuant to CEQA Guidelines and regulations.

Further, while the project sites in their current state may be used by local wildlife, they provide very low value for foraging, resting or nesting, as the project sites are mainly comprised of non-native ruderal herbaceous habitats and are highly disturbed due to agricultural practices. The project sites are not one of the last remaining stopover and staging opportunities in the region, as stated by the commenter, as acres of undeveloped land similar to the project sites is located within the very immediate area, as well as dozens of local parks. The 80-acre Shadow Cliffs Regional Recreation Area is less than two miles from the project sites and the 160-acre Doolan Canyon Regional Preserve beyond provides more undeveloped land to the north. All of the aforementioned habitats in the region provide habitat for the species listed in the table of wildlife observed included in Exhibit D of the comment letter, and have far greater wildlife corridor habitat value than the project sites. The commenter's concerns about the loss of the ruderal habitats on-site should be assuaged by the fact that more trees and shrubs will be planted on the project sites post-development than are currently on site, which will provide additional stopover opportunities for birds.

Finally, as previously mentioned, the Arroyo Mocho runs along the southern project site boundary of SMP 40. Arroyo Mocho may serve as a local movement corridor for mammals, amphibians, and reptiles to move unobtrusively through the general geographic area. Animals moving along Arroyo Mocho could leave the Arroyo and enter the project site to move across the landscape. Such animals expected to migrate along the Arroyo and possibly enter the upland areas of the project site are common species such as coyote, raccoons, skunks, deer, and rodents, and would be able to navigate their way around SMP 40 even after the site was developed. The Arroyo Mocho would remain unchanged by the proposed project and as such, the wildlife corridor values of the channel would remain intact. Under all circumstances, any disruption to the very localized use of the project sites by common wildlife species would not be regarded as a potentially significant impact pursuant to CEQA.

Traffic Impacts to Wildlife

Common wildlife associated with humans and urban development such as Virginia opossum (*Didelphis virginiana*), striped skunk (*Mephitis mephitis*) and raccoon (*Procyon lotor*) are often involved in vehicle collisions. However, the aforementioned species and other common wildlife species, including Mourning Dove (*Zenaida macroura*) and northern pacific rattlesnake (*Crotalus oreganus*), are not considered special-status or rare. In addition, while roadkill is present in the vicinity of the project sites, as is the case at any area with road traffic, the approximation included in Exhibit D of the comment letter is likely an overestimate, as the numbers are based on another study that is not directly comparable to the project area. Vasco Road is the principal north-south route between eastern Alameda and Contra Costa Counties, traveled by approximately 22,000 vehicles per day. Increased traffic to the project sites on local roadways, Isabel Avenue and West

Jack London Boulevard, is not comparable to the heavily trafficked Vasco Road, which is a corridor in the middle of hundreds of acres of protected open space lands and significant wildlife habitat. By contrast, Stanley Boulevard and I-580, near the project sites, are already heavily trafficked roads in a developed region and the increase in vehicles associated with the project sites would not contribute significantly to the existing traffic volumes on these roads daily. Moreover, regulations that protect common wildlife species that could be killed by vehicular traffic do not exist. As such, vehicle collisions that result in the mortality of wildlife do not constitute a significant impact pursuant to CEQA.

Western Burrowing Owl Mitigation

The CDFW has not released an official statement that the avian breeding season has changed. In M&A's experience, when permits are acquired from the CDFW, the nesting season window can vary slightly. Some permits say February 1 through August 31, while others say February 15 through September 1. The variation in start and end dates could be based on geography, as different geographic regions have slightly different nesting windows. In fact, the CDFW acknowledges a certain amount of variation in the 2012 CDFW Staff Report on Burrowing Owl Mitigation, which states, "In California, the burrowing owl breeding season extends from 1 February to 31 August (Haug et al. 1993, Thompsen 1971) with some variances by geographic location and climatic conditions." Nonetheless, in response to the comment, Mitigation Measure 4.3-2(a) included in the Draft EIR is hereby revised as follows:

Western Burrowing Owl

4.3-2(a) *If project construction begins during the western burrowing owl nesting season (February 1~~5~~ to August 31), a qualified biologist shall conduct targeted burrowing owl nest surveys within 14 days prior to construction activities using seven- to 20-foot transects. A separate preconstruction survey shall be conducted for SMP 39 and SMP 40 (including the off-site trail connection area) if the components of the project are not constructed concurrently. The survey shall include the project site and all accessible areas within 500 feet of the project impact zone, and shall follow CDFW guidelines outlined in the 2012 Staff Report on Burrowing Owl Mitigation. The results of the survey shall be submitted to the City of Livermore Community Development Department within 30 days of the completed survey. The survey report shall be valid for one construction season.*

If western burrowing owls are not detected on-site during the survey, further mitigation shall not be required. If any western burrowing owls are detected on-site, pursuant to the CDFW's 2012 Staff Report on Burrowing Owl Mitigation, the following restricted activity dates and setback distances shall be implemented:

- *From April 1 through October 15, low disturbance activities shall have a 200-meter buffer while high disturbance activities shall have a 500-meter buffer from occupied nests.*
- *From April 1 through August 15, medium disturbance activities shall have a 500-meter buffer from occupied nests. Medium disturbance activities can have a reduced buffer of 200 meters starting August 16 through October 15.*
- *From October 16 through March 31, low disturbance activities shall have a 50-meter buffer, medium disturbance activities shall have a 100-meter buffer, and high disturbance activities shall have a 500-meter buffer from occupied nests.*
- *Earth-moving activities or other disturbance shall not occur within the aforementioned buffer zones of occupied burrows*

unless monitoring of the nest site by a qualified biologist determines that the owls are acclimated to the disturbance and would not be disturbed by a smaller buffer. The buffer zones shall be fenced.

- *A qualified biologist shall delineate the extent of burrowing owl habitat on the site.*
- *Owls may be passively relocated from the project site between October 1 and February 1. Passive removal shall be conducted by a qualified biologist with demonstrated experience with passive relocation.*
- *Credits shall be purchased from a mitigation bank in coordination with CDFW and the City of Livermore to offset the project's habitat loss on the burrowing owl.*

A report detailing compliance with the provisions set forth herein shall be prepared by the qualified biologist and submitted for review and approval to the City of Livermore Community Development Department.

Further, M&A biologists have conducted several surveys, some of which are dated October 2000; March 11, 2002; May 11 and 20, 2002; June 14 and 25, 2002; September 2003, November 2013, June 10, 2019, November 2019, September 10, 2021, November 13, 2021, and June 15, 2022. The aforementioned surveys conducted in May and June were focused Burrowing Owl breeding season surveys conducted in accordance with the CDFW 1995 Staff Report protocol. Burrowing owl, or signs of burrowing owl, were not observed during any of the M&A surveys. Thus, based upon M&A's multiple surveys of the project site spanning multiple years, evidence suggests that burrowing owls have not nested on-site for the following reasons: (1) the grass grows very tall on SMP 40 in between discing activities, which does not allow ground nesting birds, such as the burrowing owl, an opportunity to detect aerial predators, which likely discourages them from nesting; (2) discing activities may disrupt nesting attempts.

Based on habitat assessments and past negative survey results, M&A believes that burrowing owls are unlikely to nest on-site. However, given that the burrowing owl is a mobile species, a mitigation measure for preconstruction surveys was provided in the Draft EIR to ensure that "take" of burrowing owls does not occur. The prescribed preconstruction surveys, consistent with "take avoidance surveys" outlined in the CDFW's Staff Report 2012, are sufficient and appropriate to detect nesting owls should the species be present on-site in light of the prior surveys' negative results, including a year of protocol-level breeding season surveys. Burrowing owls residing in topographically flat areas are typically easy to detect if surveys consist of walking transects using high-powered binoculars. As such, the mitigation measure included in the Draft EIR is sufficient to reduce any potential project impacts on burrowing owl to a less-than-significant level.

Tricolored Blackbird Mitigation

As stated above, M&A biologists have been on both project sites multiple times over the last 20 years. Tricolored blackbirds have not been observed on-site and on-site habitat for the species is marginal, as the sites are routinely disturbed, water is not present on SMP 39, and Arroyo Mocho at SMP 40 is typically dry during the middle to end of the nesting season. The tricolored blackbird prefers nesting near water. The preconstruction surveys proposed in the Draft EIR to determine if tricolored blackbird is nesting on-site are sufficient to detect the species' presence. The species can also be looked for during the burrowing owl surveys, which will take place at the same time as tricolored blackbird nesting season.

Nesting Bird and Raptor Mitigation
As discussed above, the CDFW has not released an official statement that the avian breeding season has changed. In M&A's experience when permits are acquired from the CDFW, the nesting season window can vary slightly, as different geographic regions have slightly different nesting windows.

In addition, with regard to nest detection, while grassland nesting birds are difficult to detect, M&A biologists are experienced in surveying for ground-nesting and short grass nesting birds and have had success finding nests in the past. Typically, if pedestrian walking transect surveys are conducted by two or more people walking closely together, nests will be found. Further, if experienced consulting biologists are hired to conduct the nesting bird surveys, the biologists will know the appropriate methods to survey for nesting passerine birds, including the Loggerhead Shrike, and raptors. The most suitable habitat for Loggerhead Shrike on the project sites is along SMP 40's riparian corridor, which will be preserved by the project. Many trees along the riparian corridor and south of the project site could serve as a blind for the observer to hide behind and watch bird behavior to determine if birds are nesting. Finally, the qualified biologist making the nesting buffer determination would provide a report to the City of Livermore and communication between the City of Livermore, the applicant's biologist, and the construction team would be ongoing throughout the construction period. The biologist will ensure that the buffer is maintained throughout construction to ensure that the nesting attempt is protected.

While development does remove potential bird nesting habitat, the project applicant is avoiding the riparian corridor on the SMP 40 project site, which is the most valuable nesting habitat on-site. Additionally, in accordance with City of Livermore General Plan Policy OSC-1.3 P1, as presented on page 4.3-21 of the Draft EIR, the proposed project is required to landscape with native vegetation.

Based on the above, changes to the Draft EIR mitigation for nesting birds and raptors are not warranted.

<u>Comment II(C) Related to Construction Noise</u>
As discussed on page 4.6-21 of the Draft EIR, due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated, based on the professional judgment of the project noise consultant, that construction noise associated with SMP 39 would be below the City of Livermore's exterior noise level threshold at the nearest sensitive receptor locations. In response to the comments regarding construction noise impacts associated with SMP 39, Salter, the project noise consultant who prepared the project-specific Environmental Noise Studies used in the Draft EIR analysis, estimated the construction noise levels associated with SMP 39 at the nearest noise sensitive receptor to the site (see Attachment 2). In addition, in response to the comments regarding construction noise impacts associated with SMP 40, Salter provided an updated analysis of construction noise associated with SMP 40 (see Attachment 3). Because construction is not permitted during nighttime hours (pursuant to Section 9.36.080 of the Livermore Municipal Code), the applicable noise level threshold for construction noise levels associated with SMP 39 and SMP 40 would be 70 dBA L_{max}, as established by the City of Livermore (see Draft EIR page 4.6-14 and General Plan Policy N-1.5 P3).

The commenter alleges that Table 9-7, Land Use Compatibility Guidelines for Exterior Noise, of the General Plan applies to construction noise; this is not correct. As stated in General Plan Policy N-1.1 P4, presented on page 4.6-8 of the Draft EIR, the City shall use the Land Use Compatibility Guidelines for Exterior Noise (measured in dBA CNEL or L_{dn}) contained in Table 9-7 (i.e., the DNL 60 dBA exterior noise level standard referenced in the comment letter) to direct the siting, design, and insulation of new development to reduce exposure to excessive noise. Construction

noise standards are established in General Plan Policies N-1.5 P2, P3, and P4, as presented on page 4.6-12 of the Draft EIR, which do not include a DNL standard. In particular, General Plan Policy N-1.5 P3 states that in order to allow for temporary construction, demolition or maintenance noise and other necessary short-term noise events, the stationary noise standards in Policy N-1.5.P1 shall not be exceeded within the receiving land use by more than 15 dBA for any period of time. General Plan Policy N-1.5.P1 requires that industrial and commercial uses be designed and operated so as to avoid the generation of noise effects on surrounding sensitive land uses from exceeding 55 dBA L_{50} during the hours of 7:00 AM to 10:00 PM and 45 dBA L_{50} during the hours of 10:00 PM to 7:00 AM. Thus, for analysis purposes of project construction noise within the Draft EIR, the threshold of significance for the maximum allowable construction noise level at a sensitive receptor is 70 dB L_{max} during daytime hours and 60 dB L_{max} during nighttime hours (i.e., 15 dB above the numerical criteria listed in P1). Consequently, the DNL 60 dBA exterior noise level standard included in the comment letter would not apply to the temporary, intermittent construction noise associated with either SMP 39 or SMP 40.

Based on the comments regarding construction noise impacts associated with SMP 39 and SMP 40, pages 4.6-21 through 4.6-24 of the Draft EIR are hereby revised as follows. Such revisions are also reflected in the Revised Environmental Noise Studies for SMP 39 and SMP 40, included as Attachment 2 and Attachment 3 to this memo. It should be noted that all revisions to pages 4.6-22 through 4.6-24 of the Draft EIR previously included in the Final EIR are also shown in ~~strikethrough~~ and <u>double underlined</u> text below.

> ~~Due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated that~~ <u>The noise levels generated by construction equipment would vary greatly depending upon factors such as the type and specific model of the equipment, the operation being performed, the condition of the equipment and the prevailing wind direction. Table 4.6-6 shows maximum noise levels associated with each piece of construction equipment anticipated to be used during construction of SMP 39 at a reference level of 50 feet, as well as at 2,640 feet, which is the distance from Building 1 on the SMP 39 site to the nearest sensitive receptors (the residences located across Isabel Avenue to the east). Based on the project-specific construction schedule assumed in the air quality analysis conducted for SMP 39, Table 4.6-7 summarizes the anticipated construction equipment associated with each phase of project construction, and the relative sound levels at the nearest residential property (approximately 2,640 feet away), assuming that equipment is running simultaneously during each phase of construction. As shown in Table 4.6-7,</u> construction noise associated with SMP 39 <u>would range between 59 and 61 dBA L_{max},</u> ~~be~~ <u>which would be</u> below the City of Livermore's exterior noise level threshold of ~~60~~ <u>70</u> dBA ~~DNL~~ <u>L_{max}</u> at the nearest sensitive receptor locations. ~~Thus, construction noise levels for SMP 39 were not evaluated as part of the Environmental Noise Study prepared for SMP 39. Therefore, the following discussion focuses on SMP 40 and the off-site trail connections.~~

Source: Salter, 2024.

As shown in ~~the table~~ Table 4.6-7, construction of SMP 40 is predicted to generate noise levels ranging between ~~16~~ 70 to ~~32~~ 73 dBA L_{max} at the nearest noise-sensitive receptors. As discussed in detail above, for analysis purposes of project construction noise within this EIR, a threshold of significance for the maximum allowable construction noise level at a sensitive receptor has been assumed to be 70 dB L_{max} during daytime hours ~~and 60 dB L_{max} during nighttime hours~~. Because construction is not permitted during nighttime hours (pursuant to Section 9.36.080 of the Livermore Municipal Code), the 60 dB L_{max} noise level standard for nighttime hours would not apply to the proposed project. ~~Accordingly~~ Nonetheless, the maximum predicted construction noise level of ~~32~~ 73 dBA L_{max} associated with SMP 40 would be ~~below~~ above the threshold~~s~~ of significance being applied.

The three potential off-site trail connection options would be located approximately 160 feet, 150 feet, and 200 feet, respectively, west of the nearest single-family residences. The anticipated construction activities required for the trail connection options would use construction equipment anticipated to generate maximum noise levels of up to 85 dB at a distance of 50 feet. As previously noted, stationary noise sources lessen at a rate of approximately six dB per doubling of distance from the source. Therefore, at a distance of 160 feet, construction equipment associated with Trail Connection Option 1 would generate maximum noise levels of up to 75 dB L_{max}; at a distance of 150 feet, construction equipment associated with Trail Connection Option 2 would generate maximum noise levels of up to 76 dB L_{max}; and at a distance of 200 feet, construction equipment associated with Trail Connection Option 3 would generate maximum noise levels of up to 73 dB L_{max}. Thus, construction activities associated with development of the off-site trail connection options would exceed the thresholds of significance being applied of 70 dB L_{max} during daytime hours ~~and 60 dB L_{max} during nighttime hours~~.

Based on the above, construction-related noise associated with SMP 39 ~~and SMP 40~~ would not result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local

general plan or noise ordinance, or applicable standards of other agencies. However, while construction activities are temporary in nature and would be exempt during the hours of 7:00 AM to 8:00 PM, construction-related noise associated with SMP 40 and the off-site trail connection could result in disturbance to existing noise-sensitive land uses in the project vicinity.

Therefore, construction-related noise associated with the proposed project could be considered to result in generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, and impacts would be considered ***significant***.

Mitigation Measure(s)

Implementation of the following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

4.6-1(a) *Prior to issuance of a grading permit for SMP 40, the project applicant shall prepare a construction noise management plan that identifies measures to be taken to minimize construction noise on surrounding sensitive land uses and include specific noise management measures to be included within the plans and specifications for SMP 40, subject to review and approval by the City of Livermore Community Development Department. The project applicant shall demonstrate, to the satisfaction of the City that the project complies with the following:*

- *Consistent with the Livermore Municipal Code, construction shall be limited to weekdays between the hours of 7:00 AM and 8:00 PM and Saturdays through Sunday between the hours of 9:00 AM and 6:00 PM.*
- *Either a temporary noise barrier shall be built prior to development of the planned berm on the east side of the project site, or the berm shall be built prior to construction activities. The barrier/berm shall be a minimum of 10 feet tall. The barrier can be field-built provided it meets the following criteria:*
  - *The barrier shall be constructed to have a minimum surface density of four pounds per square foot (psf). For example, a stud wall with exterior-grade plywood sheathing and a stucco finish (or two layers of 5/8-inch thick plywood).*
  - *The barrier shall be free of cracks, and drainage holes/slots along the bottom of the barrier shall be kept to a minimum. Where needed, drainage holes/slots shall be covered by one psf mass-loaded vinyl flaps (e.g., Kinetics KNM-100) so water can flow around the vinyl and still drain.*
  - *Joints between sheathing layers shall be offset by 16 inches minimum.*
- *Contractors shall use "quiet" models of air compressors and other stationary noise sources, where technology exists.*
- *Internal combustion engine-driven equipment shall be equipped with mufflers which are in good condition and appropriate for the equipment.*
- *Stationary noise-generating equipment, such as air compressors and portable power generators, shall be located as far away as possible from adjacent property lines.*

- *Staging areas and construction material areas shall be located as far away as feasible from adjacent residences.*
- *All unnecessary idling of internal combustion engines should be prohibited.*
- *The contractor shall designate a "noise disturbance construction superintendent" who will be responsible for tracking and responding to any complaints about construction noise. The noise disturbance construction superintendent shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall require that reasonable measures are implemented to correct the problem. The telephone number for the noise disturbance construction superintendent shall be posted at the construction site and included in any construction notices sent to neighbors.*

4.6-1(b) *Prior to issuance of a grading permit for the chosen off-site trail connection option, the project applicant shall prepare a construction noise management plan that identifies measures to be taken to minimize construction noise on surrounding sensitive land uses and include specific noise management measures to be included within the plans and specifications for the trail connection option, subject to review and approval by the City of Livermore Community Development Department. The project applicant shall demonstrate, to the satisfaction of the City that the project complies with the following:*

- *All heavy construction equipment used on the proposed project shall be maintained in good operating condition, with all internal combustion, engine-driven equipment fitted with intake and exhaust mufflers that are in good condition.*
- *All mobile or fixed noise producing equipment used on the proposed project that is regulated for noise output by a local, state, or federal agency shall comply with such regulations while ~~in the source of~~ involved with a project activity.*
- *Where feasible, electrically-powered equipment shall be used instead of pneumatic or internal combustion powered equipment.*
- *All stationary noise-generating equipment shall be located as far away as possible from the nearest residential uses.*
- *Signs prohibiting unnecessary idling of internal combustion engines shall be posted at entrances to construction sites and at construction equipment staging areas.*
- *The use of noise-producing signals, including horns, whistles, alarms and bells shall be for safety warning purposes only.*
- *The use of temporary sound barriers shall be incorporated along the outer work area of the construction site, east of Isabel Avenue/SR 84. Barrier height and location(s) shall be determined by a qualified acoustical engineer to ensure that the resultant construction noise levels at the nearest residence would meet the applicable standard. The sound barrier fencing shall consist of 0.5-inch plywood or minimum STC 27 sound curtains placed to shield nearby sensitive receptors. The plywood barrier shall be free from gaps, openings, or penetrations to ensure maximum performance.*

Due to the addition of Table 4.6-7, all subsequent tables included in Chapter 4.6, Noise, of the Draft EIR are hereby renumbered accordingly.

While a new mitigation measure (Mitigation Measure 4.6-1[a]) has been added as part of the text revisions above, under *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1993) 6 C4th 1112 (*Laurel Heights II*) and Section 15088.5 of the State CEQA Guidelines,[2] a lead agency is only required to recirculate a draft EIR when "significant new information" is added to the document after public notice is given of the availability of the Draft EIR for public review under Section 15087 but before certification. Pursuant to CEQA Guidelines Section 15088.5, the term "information" can include changes in the project or environmental setting, as well as additional data or other information. New information added to an EIR is not considered "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the City has decided not to implement. "Significant new information" requiring recirculation includes any of the following:

1. A new significant environmental impact would result from the project or for a new mitigation measure proposed to be implemented.
2. A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
3. A feasible project alternative or mitigation measure considerably different from other previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
4. The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

In the case of the proposed project, the Draft EIR already determined that the proposed project would result in a significant temporary construction noise impact (see page 4.6-23 of the Draft EIR). Thus, a new noise impact has not been identified in response to public comments. Rather, in response to public comments, a new construction noise mitigation measure (Mitigation Measure 4.6-1[a]) has been added that would clearly lessen the potential environmental impact to a less-than-significant level, and the applicant has agreed to adopt Mitigation Measure 4.6-1(a). In addition, the requirements of Mitigation Measure 4.6-1(a) are similar to the requirements already included in Mitigation Measure 4.6-1 of the Draft EIR. Thus, according to Section 15188.5(a)(3), recirculation is not required.

The Mitigation Monitoring and Reporting Program, as well as the Findings, Facts in Support Of Findings, and Statement Of Overriding Considerations, will be updated in accordance with the changes shown above and included in the staff report packet for the City Council hearing on the proposed project.

Attorneys for Carpenters Local 713 Comment Letter

VIA E-MAIL

February 14, 2024

Ashley Vera, Associate Planner
City of Livermore
1052 S. Livermore Avenue
Livermore, CA 94550
Em: Asvera@livermoreca.gov

RE: City of Livermore's SMP 39 and 40 Planning Commission Meeting

Dear Ashley Vera,

On behalf of "**Carpenters Local 713**", my Office is submitting these comments for the City of Livermore's ("**City**") Draft Environmental Impact Report ("**Draft EIR**" or "**DEIR**") and Final Environmental Impact Report ("**Final EIR**" or "**FEIR**") for the **February 20, 2024 Planning Commission Meeting** for the SMP 39 and 40 Project ("**Project**").

According to the Project's Notice of Availability ("**NOA**") of a Draft EIR Project Description:

> "On **SMP 38**, the proposed project includes a Sphere of Influence (SOI) Amendment to **include** SMP 38 within the **City of Livermore** SOI and **remove** it from the **City of Pleasanton's** SOI. The City of Livermore General Plan land use designation for SMP 38 would remain Limited Agriculture and Open Space/Sand and Gravel and the Alameda County zoning designation would remain Agriculture. **Development of SMP 38** is **not proposed**.
>
> For **SMP 39**, the proposed project would include development of a total of **up to six light industrial buildings**, consisting of **up to approximately 755,500 square feet** (sf) of new building space, and associated **internal roadways** and **other** improvements. **For SMP 40**, the proposed project would include development of **two industrial**

buildings containing up to **759,275 sf of new building space** with related **internal roadways** and **other** improvements. A number of approvals would be required for development of SMP 39 and SMP 40, including a **SOI Amendment for SMP 39**, **General Plan Amendment**, **Pre-zoning** and **Annexation**, **Zoning Map Amendment**/Planned Development, Vesting Tentative Subdivision **Maps**, a **Pre-Annexation Agreement**, and **Development Agreement**. A **Site Plan Design Review** entitlement is required for SMP 39 and SMP 40, which would include a review of the site plan, building, and landscape design; however, the entitlement is **only proposed for SMP 40 at this time**. A Site Plan Design Review entitlement will be required **at a later date** for the future development of **SMP 39**. In addition, the proposed project would include **annexation of four additional parcels** (APNs 904-10-2-3, -5, -7, and -8) located **east of SMP 40**. Development is **not proposed** on the additional parcels **as part** of the proposed project.

The project would include a **paved at-grade, on-site trail along the boundaries** of the SMP 40 site, consistent with the City's Active Transportation Plan. Specifically, the on-site trail would extend from the northeastern corner of the site, along the project site's eastern, southern, and western boundaries, before connecting to an existing off-site paved shared-use path at the northwestern corner of site, which extends along the west side of the Oaks Business Park to the north and connects to West Jack London Boulevard.

In addition, the project would include a **new off-site connection to the existing Arroyo Mocho Trail**, located on the east side of Isabel Avenue/SR 84. For the purposes of the Draft EIR analysis, three alternatives for the proposed off-site Isabel Avenue/SR 84 crossing to the existing Arroyo Mocho Trail are considered and evaluated in the Draft EIR, including the following, and described in more detail in the Draft EIR:

- Trail Connection Option 1 – **At-Grade** Crossing at **Discovery Drive**;
- Trail Connection Option 2 – **Undercrossing** at **Isabel** Bridge; and

- Trail Connection Option 3 – **Overcrossing** of **Isabel** Avenue/SR 84."

NOA of Draft EIR, pp. 1-2, emph. added.

The concurrently circulated Draft EIR contains the same project description. DEIR, pp. 1-2—1-4.

Carpenters Local 713 is a labor union representing union carpenters in Alameda County , and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Local 713 members live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Carpenters Local 713 expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

Carpenters Local 713 incorporates by reference all comments related to the Project or its CEQA review, including the Environmental Impact Report. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, Carpenters Local 713 requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**) (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). California Public Resources Code Sections 21092.2, and 21167(f) and California Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT

The City should require the Project to be built using local workers who have graduated from a Joint Labor-Management Apprenticeship Program and make a commitment to hiring a local workforce.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf.

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas (GHG) emissions. In fact, on May 7, 2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.[2]

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[3]

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.[4] Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is

[4] Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? Journal of the American Planning Association 72 (4), 475-490, 482, *available at* http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf.

> voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about negotiating corporate participation in First Source as a condition of approval for development permits.

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("**AB2011**"). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

II. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

The California Environmental Quality Act is a California statute designed to inform decision-makers and the public about the potential significant environmental effects of a project. 14 California Code of Regulations ("**CEQA Guidelines**"), § 15002, subd. (a)(1).[5] At its core, its purpose is to "inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made." *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.

1. Background Concerning Environmental Impact Reports

CEQA directs public agencies to avoid or reduce environmental damage, when possible, by requiring alternatives or mitigation measures. CEQA Guidelines, § 15002, subds. (a)(2)-(3); see also *Berkeley Keep Jets Over the Bay Committee v. Board of Port Comes* (2001) 91 Cal.App.4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553; *Laurel Heights Improvement Assn.*, 47 Cal.3d at p. 400. The EIR

[5] The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 et seq., are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. Cal. Pub. Res. Code, § 21083. The CEQA Guidelines are given "great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous." *Center for Biological Diversity v. Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 217.

serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA Guidelines, § 15002, subd. (a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in Public Resources Code section 21081. See CEQA Guidelines, § 15092, subds. (b)(2)(A)-(B).

While the courts review an EIR using an 'abuse of discretion' standard, the reviewing court is not to *uncritically* rely on every study or analysis presented by a project proponent in support of its position. *Berkeley Jets*, 91 Cal.App.4th at p. 1355 (quoting *Laurel Heights Improvement Assn.*, 47 Cal.3d at pp. 391, 409 fn. 12) (internal quotations omitted). A clearly inadequate or unsupported study is entitled to no judicial deference. *Id.* Drawing this line and determining whether the EIR complies with CEQA's information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal.App.4th 48, 102, 131. As the court stated in *Berkeley Jets*, prejudicial abuse of discretion occurs if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process. 91 Cal.App.4th at p. 1355 (internal quotations omitted).

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. *Communities for a Better Environment v. Richmond* (2010) 184 Cal.App.4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449-450). The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. *Id.* For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Id.*

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the "fair argument" standard under which an EIR must be prepared whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail Botanical Gardens Found., Inc. v. City of Encinitas* (1994) 29 Cal.App.4th 1597, 1602; *Friends of "B" St.* v. *City of Hayward* (1980) 106 Cal.3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that "may have a significant effect on the environment." PRC, § 21151; see *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.App.3d 68, 75; accord *Jensen v. City of Santa Rosa* (2018) 23 Cal.App.5th 877, 884. Under this test, if a proposed project is not exempt and may cause a significant effect on the environment, the lead agency must prepare an EIR. PRC, §§ 21100 (a), 21151; CEQA Guidelines, § 15064 (a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 785. In such a situation, the agency must adopt a negative declaration. PRC, § 21080, subd. (c)(1); CEQA Guidelines, §§ 15063 (b)(2), 15064(f)(3).

"Significant effect upon the environment" is defined as "a substantial or potentially substantial adverse change in the environment." PRC, § 21068; CEQA Guidelines, § 15382. A project may have a significant effect on the environment if there is a reasonable probability that it will result in a significant impact. *No Oil, Inc.*, 13 Cal.3d at p. 83 fn. 16; see *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 309. If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. CEQA Guidelines, § 15063(b)(1); see *County Sanitation Dist. No. 2 v. County of Kern* (2005) 127 Cal.App.4th 1544, 1580.

This standard sets a "low threshold" for preparation of an EIR. *Consolidated Irrigation Dist. v. City of Selma* (2012) 204 Cal.App.4th 187, 207; *Nelson v. County of Kern* (2010) 190 Cal.App.4th 252; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 928; *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 580; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal.App.3d 748, 754; *Sundstrom*, 202 Cal.App.3d at p. 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an EIR

even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen,* 23 Cal.App.5th at p. 886; *Clews Land & Livestock v. City of San Diego* (2017) 19 Cal.App.5th 161, 183; *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150; *Brentwood Assn. for No Drilling, Inc. v. City of Los Angeles* (1982) 134 Cal.App.3d 491; *Friends of "B" St.*, 106 Cal.App.3d 988; CEQA Guidelines, § 15064(f)(1).

B. The Project May Have a Significant Impact on Biological Resources

There is substantial evidence the Project will have a significant impact on biological resources. As discussed in further detail in a comment letter from biological resources expert Shawn Smallwood, PhD with regards to the proposed Project, incorporated by reference herein, "the existing environmental setting has not been accurately characterized, and several important types of potential project impacts have been inadequately analyzed. These types of impacts include habitat loss, interference with wildlife movement, and wildlife-automobile collision mortality." (See **Exhibit D** [December 12, 2023 comment letter from Shawn Smallwood, PhD regarding SMP 38, SMP 39, and SMP 40 biological resources analysis].)

First, for example, with regards to the potential for habitat loss, Dr. Smallwood predicts:

> SMP 38 (111.7 acres), SMP 39 (51.9 acres) and SMP 40 (41 acres) support 11.4 bird nests/acre/year. Based on this assumption, the combined projects, SMP 39 and SMP 40, on 92.9 acres would eliminate 1,059 nest sites, and assuming SMP 38 is also later developed, then the combined projects, SMP 38, SMP 39, ad SMP 40, on 204.6 would eliminate 2,332 nest sites.

(**Exhibit D**, p. 28.)

Accordingly, Dr. Smallwood points out that this loss in nest sites would constitute a significant impact from the Project that was not quantitatively addressed in the Draft EIR. (**Exhibit D**, p. 28.) Further, Dr. Smallwood notes that the loss in nests would lead to a loss in the reproductive capacity of the site, thus decreasing the number of birds at the Site over time. (*Id.*)

Second, Dr. Smallwood discusses the Projects impacts on interference with wildlife movement, highlighting that the DEIR's analysis of whether the Project will interfere with wildlife movement in the Project Site area is "flawed and misleading." (**Exhibit D**, p. 29.) Specifically, Dr. Smallwood states that:

> According to the DEIR, "The project area does not fall within an Essential Habitat Connectivity area mapped by the CDFW." However, at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18486, the California Essential Habitat Connectivity Project specifically points out that it is not: "A California Department of Fish and Game or US Fish and Wildlife Service response to potential impacts to a habitat or species from a project subject to the California Environmental Quality Act (CEQA)," nor "Fine scale, with every important piece of habitat identified" nor ""Essential", meaning the only places of importance" nor "A solution by itself for how to provide necessary linkages for any given species of plant or animal... Linkage designs will vary depending on focal species chosen and the goal of providing connected habitat for a chosen species might be met several different ways" nor "The final word on connectivity for California." With analytical grid cells of 2,000 acres, the spatial grain of the California Essential Habitat Connectivity Project is much too coarse for the conclusion the DEIR draws from it.

(**Exhibit D**, p. 29.)

Moreover, Dr. Smallwood points out that the DEIR contains a flawed "argument that SMP 39 is cut off from open areas by well-trafficked roads, the airport, the gravel quarries, and therefore cannot function as a wildlife movement corridor" and notes that the same argument is used for SMP 40. (*Id.*) However, as Dr. Smallwood notes, the DEIR simply uses speculation here and provides no supporting evidence to this assertion. (*Id.*)

Third, Dr. Smallwood discusses the Project's traffic impacts to wildlife, noting that traffic generated from the Project will endanger wildlife that must cross roads used by traffic getting to and from the Project Site. (**Exhibit D**, p. 30.) Dr. Smallwood discusses traffic-caused wildlife mortality and highlights various traffic mortality numbers collected from a wildlife mortality study performed only eleven (11) miles from the Project Site in the County of Contra Costa. (*Id.*) Dr. Smallwood concludes an analysis should be done on "whether increased traffic generated by the project site would similarly result in local impacts on wildlife." (*Id.* at p. 31.)

In addition, the biological impact analysis of the EIR is legally flawed for the following reasons.

First, the DEIR's biological resources impact analysis relies on multiple inadequate biological field surveys outlined in Appendices D and E of the DEIR prepared by Monk & Associates that are described in insufficient detail.

For example, with regards to the field surveys, the DEIR states that:

> "SMP 39 and SMP 40 were both first surveyed in 2000, with follow-up surveys over the years, including in November 2013, for various development proposals. In addition, a **project-specific field survey** was conducted on SMP 39 on **October 14, 2021**, and on SMP 40 on **June 10, 2019** to record biological resources within the sites, and to assess the likelihood of resource agency regulated areas to be located within the sites. An **additional survey** was conducted for SMP 40 on **June 21, 2019** to flag the Arroyo Mocho's riparian drip line to allow for the project engineers to survey the limits of the riparian vegetation and overlay the area on the project site plan, and **another general survey** of SMP 40 was conducted on **September 10, 2021.**"

DEIR, p. 4.3-24. [Emphasis added.']

However, the DEIR's reliance on these biological resources field surveys is improper for several reasons.

First, the DEIR and its accompanying Appendices D and E leave out crucial information about the site surveys.

In summarizing the various site surveys that occurred in 2013, 2019, and 2021, DEIR Appendix D's Biological Resources Analysis ("**SMP-39 BRA**") states that "[e]ach site survey involved searching all habitats on the site and recording all plant and wildlife species observed. . . ." and that the "evaluation included an examination of the site to determine if there could be potential areas within the project site that would be regulated as waters of the United States and/or State . . ." DEIR Appendix D, p. 2. Thus, the SMP-39 BRA field surveys seem to indicate that visual inspections were done during these site visits. However, SMP-39 BRA is insufficient for numerous reasons as it leaves out crucial information about the site surveys while relying on the surveys to form conclusions about the Project's potential biological resources impacts.

As a preliminary matter, *one* (1) single field survey alone for just the SMP-39 Project Site is insufficient to adequately identify all of the potential habitats and plant and wildlife species occurring within the Project Site, as the site surveys purport to have

looked for. In the City's Final EIR Responses to Comments, Response No. 5-12, the City counters our office's prior comment that "[o]ne single field survey is sufficient to get a baseline description of a project site's pant communities and wildlife habitats and to determine if additional surveys for special-status species are necessary." (FEIR Response to Comments, p. 2-75.) However, as Dr. Smallwood notes in his comment letter on the Project, "[m]ore surveys are needed than my two surveys [sic] to inventory use of the project site by wildlife" (**Exhibit D**, pp. 14-15), that the appropriate detection surveys have not been completed at SMP 39 and SMP 40," (*id.* at p. 17), that "[r]econnaissance surveys for wildlife are not designed to detect special-status species" indicating that protocol-level detection surveys are appropriate but that Monk & Associates did not perform such detection surveys here, thus rendering the Draft EIR's "characterization of the existing environmental setting . . . therefore incomplete and inaccurate." (*Id.* at p. 19.) Therefore, it is clear that the single survey conducted for SMP-39 is inadequate.

Moreover, the SMP-39 BRA does not specify what time of the day the surveys were conducted during, (DEIR Appendix D, p. 2) which, again, leaves open the possibility that certain species, for example, nocturnal species, could present themselves at different times of the day. This is further highlighted in Dr. Smallwood's comment letter, where he notes that:

> For none of the above surveys was there reporting of what time the surveys began, or how long the surveys lasted. No checklist is shared of habitat elements that the biologists might have used during their survey to later crosscheck against documented habitats of each special-status species. No explanation is provided of whether or how animal behavior data or other evidence contributed to the biologist's assessment of the site for its importance to animal movement. It is therefore difficult to assess survey outcomes relative to survey effort and methods.

(**Exhibit D**, p. 16.)

Even further, in one (1) single survey, the surveyor may fail to identify species that would only present themselves during certain times of the *year*. According to the SMP-39 BRA in Appendix D, for example, the most recent surveys were conducted in June 2019 (a summer month) and October 2021 (a fall month), while failing to account for the spring and winter months. DEIR Appendix D, p. 2. However, there may be certain plant or animal species that would not be identifiable to an observer during the summer or fall months but that could nevertheless be present at the

Project Site and be identifiable during other seasons of the year. For example, and as noted by Dr. Smallwood, in response to the DEIR's assertion that no special-status plants were observed during some of the surveys at the Project Sites during various months over the years, Dr. Smallwood responds that this reporting is misleading "because only one of the several surveys was conducted during the plant blooming season. Monk and Associates (2021, 2023) did not meet the minimum standards of [California Department of Fish and Wildlife's ("**CDFW**")] (2018) plant survey guidelines. While the FEIR's Responses to Comments counters our office's prior comments, asserting that the CDFW's survey guidelines cited are guidelines for conducting floristic surveys for rare and endangered or other special-status species, the site surveys still failed to meet the CDFW's minimum plant survey guidelines standards. Thus, new surveys must be conducted that meet these standards.

Therefore, the DEIR's reliance on surveys not in compliance with California Department of Fish and Wildlife's survey guidelines[6] and its misuse of the California Natural Diversity Database ("**CNDD**") resulted in potentially inaccurate determinations. For example, with regards to botanical field surveys, the CDFW's survey guidelines state that such field surveys should be conducted in a way that will maximize the likelihood of identifying special status plants and sensitive natural communities that may be present at a site.[7] Specifically, the guidelines state that "[m]ore than one field visit is usually necessary to adequately capture the floristic diversity of a project area."[8]

For each of the foregoing reasons, the Project may have a significant impact on biological resources. Accordingly, the DEIR's findings as to the Project's biological impacts are not supported with substantial evidence that is of verifiable or credible value and the DEIR must be revised and recirculated to reassess those impacts, including on the wildlife species with potential to occur on the Project Site using protocol-level detection surveys and describing those surveys with sufficient detail.

C. The Project May Have Significant Noise Impacts.

There is substantial evidence that the Project will have significant traffic impacts. As discussed by Principal Steve Rogers of Steve Rogers Acoustics, "the evaluation of noise impacts during the construction phases is incomplete and contains a significant calculation error." (**Exhibit E**, p. 3 [December 12, 2023 comment letter re City of Livermore SMP 38/SMP 39/SMP 40 Project Review of DEIR Noise Section & Appendices]), fully incorporated herein.

First, as noted by Mr. Rogers for the DEIR's construction noise impacts, the DEIR concludes there will be a less than significant impact for on-site construction, but per the DEIR's analysis, the DEIR fails to adequately support this conclusion for multiple reasons. (**Exhibit E**, p. 2.) For example, the DEIR fails to include SMP 39's construction noise impacts in its section 4.6 analysis. (*Id.*) Second, Mr. Rogers notes that the noise analysis for SMP 40 is incomplete. Specifically,

> The noise impact analysis for construction on the SMP 40 site compares Salter's noise level predictions with instantaneous maximum noise level (Lmax) limits of 70 dBA during the day and 60 dBA at night, which are taken from Policy N-1.5.P3 of the City of Livermore General Plan.
>
> However, these Lmax noise limits are not the only local regulations that would apply to construction noise on the SMP 40 site.
>
> . . .
>
> Similarly, the DEIR does not include an DNL analysis for construction noise from SMP 40 to show that it will be below the 60 dBA exterior noise standard taken from land-use compatibility table (Table 9-7) in the General Plan. This will be particularly important if any construction work is to occur at night.

(**Exhibit E**, pp. 2-3.)

Third, Mr. Rogers highlights that there was an error in the calculations for SMP 40 with regards to various construction equipment pieces at a 50-foot distance. (*Id.*) Lastly, Mr. Rogers states that the construction noise analysis on the east side of the SMP 40 site is overlooked, as it assumes receivers 884 feet away from the equipment, while during other phases of construction, the noisy equipment may be operating closer than 884-feet from nearby residential uses. (*Id.*)

For each of the foregoing reasons, the Project may have a significant noise impact and the EIR should therefore be revised and recirculated.

III. CONCLUSION

Based on the foregoing, the City should deny the Project's proposed entitlements and require that the Environmental Impact Report be revised and recirculated pursuant to CEQA, consistent with the comments and issues identified in this comment letter.

Sincerely,

Stephanie Papayanis

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.
[6] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin		
Air Basin	**Rural (miles)**	**Urban (miles)**
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	**16.47**	**11.17**
Minimum	**10.80**	**10.80**
Maximum	**19.80**	**14.70**
Range	**9.00**	**3.90**

[9] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[10] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[11] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.
[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

[14] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

Village South Specific Plan (Proposed)

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference.* Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants*.. Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conferenc*e. Lecture conducted from Indianapolis, Maryland.

Rosenfeld. P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation.* Lecture conducted from Anaheim California.

Rosenfeld. P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest.* Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell.* Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest.* Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal repesentatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Hagemann, M.F., 2001. Estimated Cleanup Cost for MTBE in Groundwater Used as Drinking Water. Unpublished report.

Hagemann, M.F., 2001. Estimated Costs to Address MTBE Releases from Leaking Underground Storage Tanks. Unpublished report.

RE: SMP 38, SMP 39. SMP 40

Dear Ms. Vera,

I write to comment on potential impacts to biological resources that could result from the proposed SMP 38, SMP 39. SMP 40 Project, which I understand would add 1,514,275 square feet of floor space in eight speculative industrial buildings up to 55 feet tall on 217.04 acres located on APNs) 904-1-7-21; 904-1-2-12; 904-1-7-32; 904-3-1-4; 904-10-2-2, -3, -5, -7, and -8 west of Isabel Avenue, north of Stanley Boulevard, south of West Jack London Boulevard, and east of El Charro Road. I comment on the analyses of impacts to biological resources in the DEIR and in Monk & Associates (2021).

My qualifications for preparing expert comments are the following. I hold a Ph.D. degree in Ecology from University of California at Davis, where I also worked as a post-graduate researcher in the Department of Agronomy and Range Sciences. My research has been on animal density and distribution, habitat selection, wildlife interactions with the anthrosphere, and conservation of rare and endangered species. I authored many papers on these and other topics. I served as Chair of the Conservation Affairs Committee for The Wildlife Society – Western Section. I am a member of The Wildlife Society and Raptor Research Foundation, and I've lectured part-time at California State University, Sacramento. I was Associate Editor of wildlife biology's premier scientific journal, The Journal of Wildlife Management, as well as of Biological Conservation, and I was on the Editorial Board of Environmental Management. I have performed wildlife surveys in California for thirty-seven years. My CV is attached.

SITE VISIT

I visited the SMP 40 for 2.22 hours from 14:43 to 16:35 hours on 28 November 2023, and SMP 38 and SMP 39 for 2.83 hours from 06:45 to 09:35 hours on 29 November 2023. At SMP 40, I surveyed from a cul-du-sac on the north edge of the site. At SMP 38 and SMP 39, I walked the northern perimeters, stopping to scan for wildlife with use of binoculars. I recorded all species of vertebrate wildlife I detected, including those whose members flew over the sites or were seen nearby, off the sites. Animals of uncertain species identity were either omitted or, if possible, recorded to the Genus or higher taxonomic level.

Conditions were mostly cloudy still with temperatures of 62-55° F on the 28th and 46-50° F on the 29th. The sites have been previously disked, and at the time of the surveys they were covered by annual grasses and ruderal vegetation (Photos 1—2).

Photos 1–2. Views of SMP 40 (top) and SMP 39 with a flock of Canada goose (bottom), 28-29 November 2023.

I detected 46 species of vertebrate wildlife at or adjacent to the project site, including 10 species with special status (Table 1). I saw Botta's pocket gopher (Photo 3) and California ground squirrel (Photo 4), both species of which are ecological keystone species. I saw loggerhead shrike (Photo 5), Cooper's hawk and American kestrel (Photos 6 and 7), western meadowlark (Photo 8), house finch and killdeer (Photos 9 and 10), black phoebe and white-crowned sparrow (Photos 11 and 12), mourning dove (Photo 13), Say's phoebe and yellow-rumped warbler (Photos 14 and 15), savannah sparrow (Photo 16), and lesser goldfinch and bushtit (Photos 17 and 18), among the other species listed in Table 1. Many of the species actively foraged on the site, including coyote, Cooper's hawk, red-tailed hawk, horned lark, Canada goose and Aleutian cackling goose, killdeer, western meadowlark, house finch and others. I observed Some species in high abundance, including western meadowlark and mourning dove. California ground squirrels occupied all three sites, but were particularly abundant on SMP 40.

Table 1. Species of wildlife I observed during 5.05 hours of survey on 28-29 November 2023.

Common name	*Species name*	Status[1]	Notes	SMP			Just offsite

I fit nonlinear regression models to the cumulative numbers of vertebrate species I detected with time into my surveys to predict the number of species that I would have detected with a longer survey or perhaps with additional biologists available to assist. The models are logistic growth models which reach asymptotes that correspond with the maximum numbers of vertebrate wildlife species that could have been detected during each survey. In this case, the models predict 46 and 118 species of vertebrate wildlife were available to be detected on the evening of the 28th and the morning of the 29th, respectively, the difference likely due to the onset of darkness during the evening survey of the 28th. Compared to models fit to data I collected from 18 other sites in the region between 2019 and 2023, the data from this project site exceeds the upper bound of the 95% confidence interval of the rate of accumulated species detections with time into the survey (Figure 1). Importantly, however, the species I detected on November 28-29 composed only a fraction of the species that would occur at the project site over the period of a year or longer. This is because many species are seasonal in their occurrence.

Figure 1. Actual and predicted relationships between the number of vertebrate wildlife species detected and the elapsed survey time based on visual-scan surveys on 28-29 November 2023. Note that the relationships would differ if the surveys were based on another method or during another season.

At least a year's worth of surveys would be needed to more accurately report the number of vertebrate species that occur at the project site, but I only have Noriko's one survey. However, by use of an analytical bridge, a modeling effort applied to a large, robust data set from a research site can predict the number of vertebrate wildlife species that likely make use of the site over the longer term. As part of my research, I completed a much larger survey effort across 167 km² of annual grasslands of the Altamont Pass Wind Resource Area, where from 2015 through 2019 I performed 721 1-hour visual-scan surveys, or 721 hours of surveys, at 46 stations. I used binoculars and otherwise the methods were the same as the methods I and other consulting biologists use for surveys at proposed project sites. At each of the 46 survey stations, I tallied new species detected with each sequential survey at that station, and then related the cumulative species detected to the hours (number of surveys, as each survey lasted 1 hour) used to accumulate my counts of species detected. I used combined quadratic and simplex methods of estimation in Statistica to estimate least-squares, best-fit nonlinear models of the number of cumulative species detected regressed on hours of survey (number of surveys) at the station: $\hat{R} = \frac{1}{1/a+b\times(Hours)^c}$, where $\hat{R}$ represented cumulative species

richness detected. The coefficients of determination, r^2, of the models ranged 0.88 to 1.00, with a mean of 0.97 (95% CI: 0.96, 0.98); or in other words, the models were excellent fits to the data.

I projected the predictions of each model to thousands of hours to find predicted asymptotes of wildlife species richness. The mean model-predicted asymptote of species richness was 57 after 11,857 hours of visual-scan surveys among the 46 stations of my research site. I also averaged model predictions of species richness at each incremental increase of number of surveys, i.e., number of hours (Figure 2). On average I would have detected 17.5 species over my first 5.05 hours of surveys at my research site in the Altamont Pass (5.05 hours to match the 5.05 hours I surveyed at the project site), which composed 30.7% of the predicted total number of species I would detect with a much larger survey effort at the research site. Given the example illustrated in Figure 2, the 46 species I detected after my 5.05 hours of survey at the project site likely represented 30.7% of the species to be detected after many more visual-scan surveys over another year or longer. With many more repeat surveys through the year, I would likely detect $^{46}/_{0.307} = 150$ species of vertebrate wildlife at the site. Assuming my ratio of special-status to non-special-status species was to hold through the detections of all 150 predicted species, then continued surveys would eventually detect 33 special-status species of vertebrate wildlife.

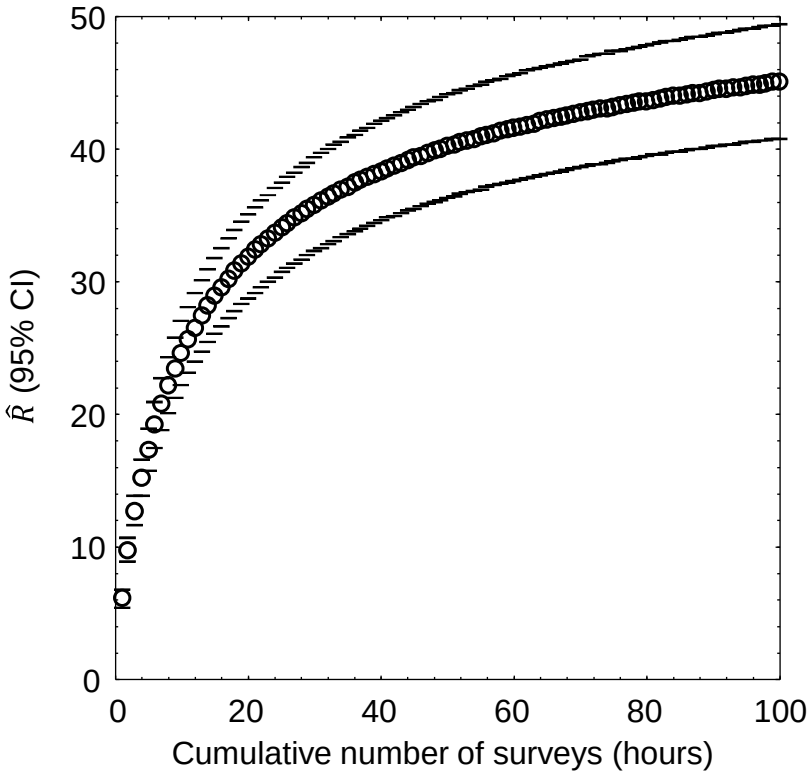

Figure 2. Mean (95% CI) predicted wildlife species richness, $\hat{R}$, as a nonlinear function of hour-long survey increments across 46 visual-scan survey stations across the Altamont Pass Wind Resource Area, Alameda and Contra Costa Counties, 2015–2019. Note that the location of the study is largely irrelevant to the utility of the graph to the interpretation of survey outcomes at the project site. It is the pattern in the data that is relevant, because the pattern is typical of the pattern seen elsewhere.

Because my prediction of 150 species of vertebrate wildlife, including 33 special-status species of vertebrate wildlife, is derived from daytime visual-scan surveys, and would detect few nocturnal mammals such as bats, the true number of species composing the wildlife community of the site must be larger. My reconnaissance surveys should serve

only as a starting point toward characterization of the site's wildlife community, but they certainly cannot alone inform of the inventory of species that use the site. More surveys are needed than my two survey to inventory use of the project site by wildlife. Nevertheless, the large number of species I predict at the project site is indicative of a relatively species-rich wildlife community that warrants a serious survey effort.

EXISTING ENVIRNMENTAL SETTING

The first step in analysis of potential project impacts to biological resources is to accurately characterize the existing environmental setting, including the biological species that use the site, their relative abundances, how they use the site, key ecological relationships, and known and ongoing threats to those species with special status. A reasonably accurate characterization of the environmental setting can provide the basis for determining whether the site holds habitat value to wildlife, as well as a baseline against which to analyze potential project impacts. For these reasons, characterization of the environmental setting, including the project site's regional setting, is one of CEQA's essential analytical steps. Methods to achieve this first step typically include (1) surveys of the site for biological resources, and (2) reviews of literature, databases and local experts for documented occurrences of special-status species. In the case of the proposed project, these needed steps have been inadequate.

Environmental Setting informed by Field Surveys

To CEQA's primary objective to disclose potential environmental impacts of a proposed project, the analysis should be informed of which biological species are known to occur at the proposed project site, which special-status species are likely to occur, as well as the limitations of the survey effort directed to the site. Analysts need this information to characterize the environmental setting as a basis for opining on, or predicting, potential project impacts to biological resources.

Herein I discuss several types of surveys, which are common to environmental review, but which are often misunderstood and misapplied. A *reconnaissance survey*, also often referred to as a general biological survey, is intended to (1) detect as many of the species as feasible during the time of the survey, (2) search for and map the locations of approximate boundaries of wetlands and coarse representations of vegetation cover, and (3) assess the likelihood of occurrences of special-status species. The latter objective is often referred to as habitat assessment. CDFW (2018) provides guidelines for reconnaissance surveys directed toward plant species, but there are no guidelines for reconnaissance-level wildlife surveys, other than the expected use of sound scientific methodology. A *protocol-level survey* is a survey guided by a written protocol, usually by a resource agency or professional group of biologists. Such surveys can be for various objectives, but in environmental review they are usually intended for detection surveys. *Detection surveys* are formulated by experts on a particular species to, at reasonable cost, give survey personnel the best chance at detecting members of a species if the species is indeed present. The additional purpose of detection surveys is to support absence determinations when the protocol was followed but the species was nevertheless not detected. Absence determinations made for special-status species are

supportable only if the results of detection surveys were negative, or when the site is outside the species' geographic range or clearly does not provide habitat.

Preconstruction surveys are take-avoidance surveys intended to be completed after reconnaissance surveys and detection surveys and just prior to construction ground-disturbance activities such as clearing and grubbing or grading. For some species, protocols for preconstruction surveys are included in mitigation guidelines. The preconstruction survey is a mitigation measure, and therefore not to be confused with other types of surveys. This type of survey will be discussed in the Mitigation section near the end of my comments.

Monk & Associates (2021) performed a reconnaissance survey of the SMP 39 project site on 5 November 2021 "to record biological resources and to assess the likelihood of resource agency regulated areas occurring on the project site," and "searching all habitats on the site and recording all plant and wildlife species observed," and "examination of the site to determine if there could be potential areas within the project site that would be regulated as waters of the United States and/or State." Monk & Associates (2023) performed two reconnaissance surveys of the SMP 40 project site on 10 June 2019 and 10 September 2021. The objectives of the surveys at SMP 40 were essentially the same as those for the survey of SMP 39. In all three of these surveys, Monk & Associates recorded all the species observed. A wetland delineation was alco completed at SMP 40.

For none of the above surveys was there reporting of what time the surveys began, or how long the surveys lasted. No checklist is shared of habitat elements that the biologists might have used during their survey to later crosscheck against documented habitats of each special-status species. No explanation is provided of whether or how animal behavior data or other evidence contributed to the biologist's assessment of the site for its importance to animal movement. It is therefore difficult to assess survey outcomes relative to survey effort and methods.

Monk & Associates (2021) detected 14 species of vertebrate wildlife on SMP 39, and Monk & Associates (2023) detected 22 species of vertebrate wildlife on SMP 40. In comparison, and even though I was unable to access either of the project sites, I detected 34 species in only 1.83 hours at SMP 39, and 29 species in only 2.22 hours at SMP 40. I also detected twice the number of special-status species at SMP 39 and 1.5 times the number of special-status species at SMP 40. Based on my surveys of the project sites, the existing environmental setting of each appears substantially different from the setting characterized by Monk & Associates (2021, 2023). Considering the differences between what Monk & Associates and what I found, I suggest that Monk & Associates must have either been distracted by other too many survey objectives, or lacked the skill needed to perform the surveys. The results of the Monk and Associates (2021, 2023) surveys have been misinterpreted in the reports, resulting in inaccurate characterizations of the existing environmental settings of SMP 39 and SMP 40.

Combining my survey results with those of Monk & Associates (2021, 2023), 38 species of vertebrate wildlife have been detected at SMP 39, and 44 species have been detected

at SMP 40. These combined results increase the documented number of species at SMP 39 by nearly 3-fold and they double the number of species at SMP 40. In other words, the combined survey outcomes support my modeling predictions of much larger numbers of species of wildlife making use of the project sites than can be demonstrated by one or two reconnaissance surveys. My modeling predicts at least 150 species of vertebrate wildlife make use of the two sites, and this prediction was based solely on diurnal visual-scan surveys, and not on live-trapping for small mammals and nocturnal surveys for nocturnally active animals. The wildlife communities of SMP 39 and SMP 40 are much richer than portrayed in the DEIR.

The DEIR (page 4.3-25) reports that "western burrowing owls have not been observed within SMP 39 or SMP 40." This is factually incorrect, as CNDDB includes a record of burrowing owl occurrence on SMP 39 (Monk & Associates 2023: Figure 4). Even if this reporting was correct, it would still qualify as pseudoscientific. The appropriate surveys for detecting burrowing owls are detailed in the survey guidelines of CDFW (2012). Lack of detections of burrowing owls during reconnaissance surveys would be meaningful only after completion of many reconnaissance surveys at the appropriate time of year and by qualified biologists. Considering that ground squirrels occur in abundance on SMP 39 and SMP 40, and considering that one of California's most significant populations of burrowing owls occurs within the nearby Altamont Pass (Smallwood et al. 2013), and considering that the appropriate detection surveys have not been completed at SMP 39 and SMP 40, it would be prudent to assume that burrowing owls occur on the project sites.

Regarding tricolored blackbird, the DEIR (page 4.3-26) reports that "the species has not been observed near SMP 39 in nearly 40 years." This is factually incorrect, as eBird includes a 2003 record of tricolored blackbird occurrence only 300 m north of SMP 39. The DEIR also reports that tricolored blackbird would not occur on SMP 9 because "aquatic habitat does not exist within SMP 39." But this is also factually incorrect. I have many times recorded tricolored blackbird occurrences on grasslands of the Altamont Pass far from bodies of water (Photos 19 and 20). Grassland environments is where tricolored blackbirds do most of their foraging in Alameda County, and it is where they sometimes nest within the Altamont Pass (Photo 20).

The DEIR reports that loggerhead shrikes do not occur on SMP 39. But again, the DEIR is factually inaccurate. I observed a loggerhead shrike on SMP 39 (Photo 21), which as it turned out, was near where a loggerhead shrike sighting was also reported to eBird in 2018. Loggerhead shrike does occur on SMP 39, as well as on SMP 40.

The DEIR reports that SMP 39 and SMP 40 contains potential habitat of raptors. However, the word "potential" insinuates uncertainty remains on the question of whether the sites provide raptor habitat. Of course, they do. Those portions of the environment used by raptors are considered raptor habitat. Between my surveys and those of Monk & Associates, and including CNDDB and eBird records, the following raptors have been seen on SMP 39 and SMP 40: turkey vulture, northern harrier, white-tailed kite, red-tailed hawk, ferruginous hawk, Cooper's hawk, American kestrel, merlin,

and burrowing owl. There should be no ambiguity around the question of whether raptor habitat occurs on SMP 39 and SMP 40; raptor habitat is present.

Photos 19 and 20. Top, tricolored blackbirds forage on grassland far from aquatic environments, and bottom, they breed on rapeseed and thistle in the Altamont Pass Wind Resource Area.

Photo 21. Loggerhead shrike on the SMP 39 portion of the project site, 29 November 2023.

Reconnaissance surveys for wildlife are not designed to detect special-status species. Special-status species can be detected during such surveys, as has been the case for 10 special-status species at the project site, but these surveys are not formulated to detect them, nor are there minimum standards to be met in these surveys to support absence determinations. For the latter purpose, protocol-level detection surveys have been formulated by species experts. Monk & Associates (2021, 2023) did not perform any detection surveys. Based on Monk & Associates (2021, 2023), the DEIR's characterization of the existing environmental setting is therefore incomplete and inaccurate.

The same is true for special-status species of plants. According to the DEIR (page 4.3-25), "special-status plants have not been observed during several surveys of the project sites conducted during various months over the years." However, this reporting is misleading, because only one of the several surveys was conducted during the plant blooming season. Monk and Associates (2021, 2023) did not meet the minimum standards of CDFW's (2018) plant survey guidelines.

Environmental Setting informed by Desktop Review

The purpose of literature and database review and of consulting with local experts is to inform the field survey, and to augment interpretation of its outcome. Analysts need this information to identify which species are known to have occurred at or near the project site, and to identify which other special-status species could conceivably occur at the site due to geographic range overlap and migration flight paths.

Monk & Associates (2021) did not reportedly review eBird (https://eBird.org) or iNaturalist (https://www.inaturalist.org) for documented occurrence records at or near the project site. Instead, Monk & Associates (2021, 2023) queried the California Natural Diversity Data Base (CNDDB) for documented occurrences of special-status species within the three miles of the project sites. By taking this approach, Monk & Associates (2021, 2023) and the DEIR screen out many special-status species from further consideration in the characterization of the wildlife community as part of the existing environmental setting. CNDDB is not designed to support absence determinations or to screen out species from characterization of a site's wildlife community. As noted by CNDDB, "*The CNDDB is a positive sighting database. It does not predict where something may be found. We map occurrences only where we have documentation that the species was found at the site. There are many areas of the state where no surveys have been conducted and therefore there is nothing on the map. That does not mean that there are no special status species present*." Monk & Associates (2021, 2023) and the DEIR misuse CNDDB.

According to Monk & Associates (2021:6), "No special-status animal records have ever been mapped on the project site." The word "ever" adds emphasis to the finding. However, by implication, Monk & Associates (2021) misrepresents CNDDB as a database with uniform representation of California properties, which is far from the case. CNDDB relies entirely on volunteer reporting from biologists who were allowed access to whatever properties they report from. Many properties have never been surveyed by biologists. Many properties have been surveyed, but the survey outcomes never reported to CNDDB. Many properties have been surveyed multiple times, but not all survey outcomes reported to CNDDB. Furthermore, CNDDB is interested only in the findings of special-status species, which means that species more recently assigned special status will have been reported many fewer times to CNDDB than were species assigned special status since the inception of CNDDB. The lack of many CNDDB records for species recently assigned special status had nothing to do with whether the species' geographic ranges overlapped the project site, but rather more to do with the brief time for records to have accumulated since the species were assigned special status. And because negative findings are not reported to CNDDB, CNDDB cannot provide the basis for estimating occurrence likelihoods, either.

In my assessment based on database reviews and site visits, 128 special-status species of wildlife are known to occur near enough to the site (SMP 38, SMP 39, SMP 40) to warrant analysis of occurrence potential (Table 2). Of these 128 species, 19 (15%) were recorded on the project site, and another 35 (27%) species have been documented within 1.5 miles of the site ('Very close'), another 13 (10%) within 1.5 and 4 miles

('Nearby'), and another 57 (45%) within 4 to 30 miles ('In region'). More than half (52%) of the species in Table 2 have been reportedly seen within 4 miles of the project site. The site therefore supports multiple special-status species of wildlife and carries the potential for supporting many more special-status species of wildlife based on proximity of recorded occurrences. The site is far richer in special-status species than is characterized in the DEIR.

Whereas Monk & Associates (2021, 2023) reportedly queried CNDDB for occurrence records within three miles of the project sites, the DEIR analyzes the occurrence likelihoods of only 6 (<5%) of the species in Table 2. That only 6 special-status species were identified from occurrence records within 3 miles strains credulity. As noted above, using eBird and iNaturalist, I found records of 54 special-status species of wildlife within only 1.5 miles of the project sites, and 67 within 4 miles of the sites.

Of the 6 species included in Monk & Associates (2021, 2023) analyses of occurrence likelihoods, the DEIR concludes that 4 have no chance of occurrence, 1 has low to no chance, and 1 has low to moderate chance of occurrence. Except for species whose habitat is compellingly absent from the site, absence determinations are inappropriate based on the evidence gathered by Monk & Associates (2021, 2023). Absence determinations are supportable only after species-specific protocol-level detection surveys have been completed to the standards of the protocols, and the species were nevertheless not detected. No such surveys have been completed. It is inappropriate to conclude that a species is absent simply by looking at a site, and it is especially inappropriate to do so for 125 species of wildlife. Important findings of Monk & Associates (2021, 2023) and the DEIR are not supportable.

Of the special-status species that Monk & Associates (2021, 2023)) claims to be absent from one or both of the project sites, two – burrowing owl and loggerhead shrike – have been seen where they were reported to be absent. Occurrence records of another 2 supposedly absent special-status species have been reported within only 1.5 miles of the site, and another has been reported within 1.5 and 4 miles of the project site. Important findings of Monk & Associates (2021, 2023) and the DEIR are not supportable.

Of the 122 special-status species in Table 2, but which the DEIR does not analyze for occurrence potential, some are unlikely to occur, whereas many *are* likely to occur. With ground squirrels known to be present on SMP 39 and SMP 40, there is reason to expect the occurrences of American badger, ferruginous hawk, bald eagle and golden eagle. I regularly observed these species in the Altamont Pass Wind Resource Areas while I performed various studies there from 1999 through 2019. Golden eagles, I continue to record both in the Altamont Pass and over and on the project sites (Figure 3). Of the 45 golden eagles that Douglas Bell captured and fit with GPS telemetry backpacks since 2013, 11 have flown to or perched in the areas of the project sites (Figure 3).

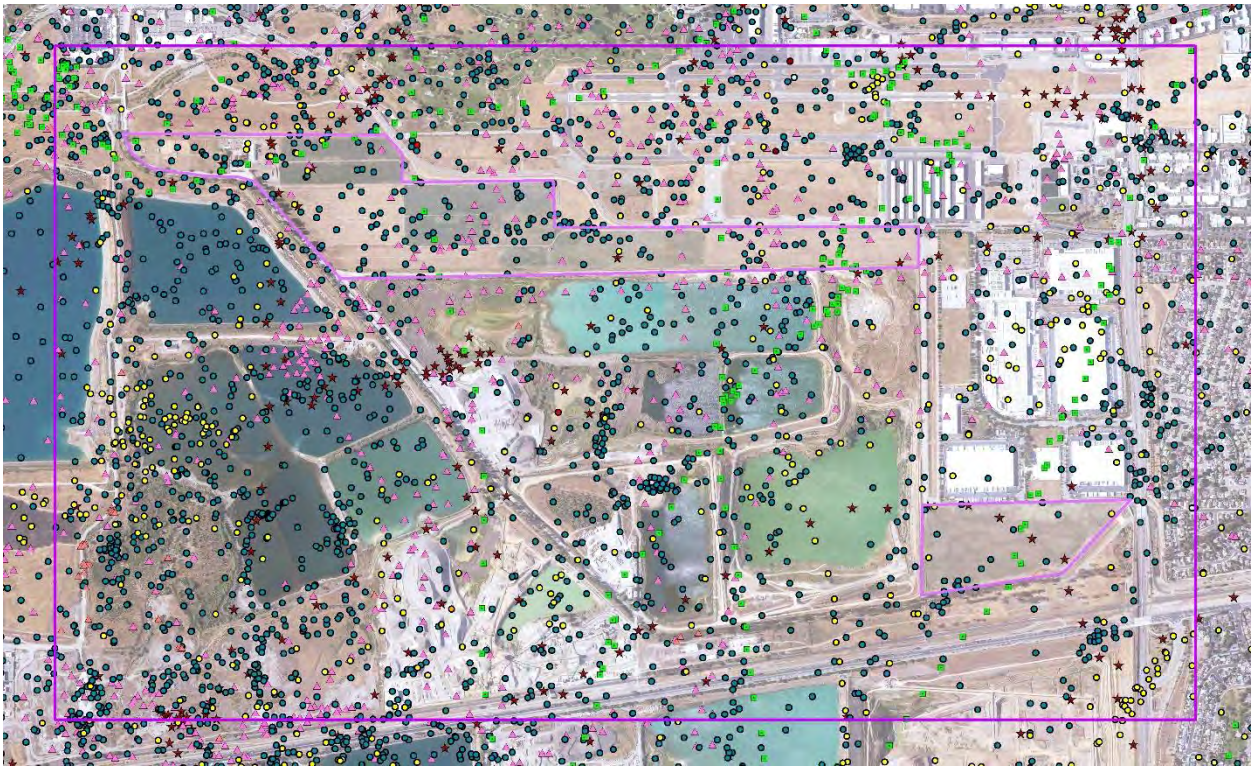

Figure 3. GPS telemetry positions (N = 3,478) of 11 golden eagles from 2014 through 2023, each distinct color-symbol combination representative of one golden eagle. Many of the positions are on SMP 38, SMP 39, and SMP 40. Many of the positions are of flying golden eagles, and some are of perched golden eagles.

Considering the inaccuracies of the DEIR's characterization of the existing environmental setting, the reasonable course of action would be to withdraw the current draft EUIR and prepare a new one to appropriately characterize the existing environmental setting. The public needs to understand the nature of the sensitive biological assets that exist on the project sites.

Table 2. Occurrence likelihoods of special-status bird species at or near the proposed project site, according to eBird/iNaturalist records (https://eBird.org, https://www.inaturalist.org) and on-site survey findings, where 'Very close' indicates within 1.5 miles of the site, "nearby" indicates within 1.5 and 4 miles, and "in region" indicates within 4 and 30 miles, and 'in range' means the species' geographic range overlaps the site. Entries in bold font indicate those species I detected during my reconnaissance surveys.

POTENTIAL BIOLOGICAL IMPACTS

An impacts analysis should consider whether and how a proposed project would affect members of a species, larger demographic units of the species, the whole of a species, and ecological communities. The accuracy of this analysis depends on an accurate characterization of the existing environmental setting. In the case of the proposed project, the existing environmental setting has not been accurately characterized, and several important types of potential project impacts have been inadequately analyzed. These types of impacts include habitat loss, interference with wildlife movement, and wildlife-automobile collision mortality.

HABITAT LOSS

Habitat loss results in a reduced productive capacity of affected wildlife species, but the DEIR offers no prediction of this lost capacity for any of the wildlife species potentially affected. In the case of birds, two methods exist for estimating the loss of productive capacity that would be caused by the project. One method would involve surveys to count the number of bird nests and chicks produced. The alternative method would be to infer productive capacity from estimates of total nest density elsewhere.

Because the project is located within an area that has undergone severe habitat fragmentation, the habitat that remains in fragmented patches probably no longer supports its original productive capacity of wildlife (Smallwood 2015, Smallwood and Smallwood 2023). However, several studies have estimated total avian nest density at locations that had likewise been highly fragmented. Two study sites in grassland/wetland/woodland complexes within agricultural matrices had total bird nesting densities of 32.8 and 35.8 nests per acre (Young 1948, Yahner 1982) for an average 34.3 nests per acre. Assuming total nest density at the project site is about a third of that of the above-cited study sites due to the annual disking of the project site's interior areas, I predict SMP 38 (111.7 acres), SMP 39 (51.9 acres) and SMP 40 (41 acres) support 11.4 bird nests/acre/year. Based on this assumption, the combined projects, SMP 39 and SMP 40, on 92.9 acres would eliminate 1,059 nest sites, and assuming SMP 38 is also later developed, then the combined projects, SMP 38, SMP 39, and SMP 40, on 204.6 would eliminate 2,332 nest sites.

The loss of 1059 to 2,332 nest sites would easily qualify as a significant project impact that has not been quantitatively addressed in the DEIR. But the impact would not end with the immediate loss of nest sites as nest substrate is removed and foraging grounds graded in preparation for impervious surfaces. The reproductive capacity of the site would be lost. The average number of fledglings per nest in Young's (1948) study was 2.9. Assuming Young's (1948) study site typifies bird productivity, the project would prevent the production of 3,071 to 6,763 fledglings per year, depending on whether SMP 38 is developed. Assuming an average bird generation time of 5 years, the lost capacity of both breeders and annual fledgling production can be estimated from an equation in Smallwood (2022): {(nests/year × chicks/nest × number of years) + (2 adults/nest × nests/year) × (number of years ÷ years/generation)} ÷ (number of years) = 3,495 to 7,696 birds per year denied to California, depending on whether SMP 38 is developed.

These losses of birds from California would be substantial, nearly equal to the annual loss of birds caused by wind turbine collision mortality in the nearby Altamont Pass Wind Resource Area (Adams Broadwell Joseph & Cardozo 8 January 2021 letter to Alameda County Planning Department regarding Comments on the Draft Subsequent Environmental Impact Report for the Mulqueeney Ranch Wind Repowering Project (SCH No. 2010082063), CUP Application No. PLN2019-00226). These losses would be highly significant.

INTERFERENCE WITH WILDLIFE MOVEMENT

One of CEQA's principal concerns regarding potential project impacts is whether a proposed project would interfere with wildlife movement in the region. Unfortunately, the DEIR's analysis of whether the project would interfere with wildlife movement in the region is flawed and misleading. According to the DEIR, "The project area does not fall within an Essential Habitat Connectivity area mapped by the CDFW." However, at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18486, the California Essential Habitat Connectivity Project specifically points out that it is not: "A California Department of Fish and Game or US Fish and Wildlife Service response to potential impacts to a habitat or species from a project subject to the California Environmental Quality Act (CEQA)," nor "Fine scale, with every important piece of habitat identified" nor ""Essential", meaning the only places of importance" nor "A solution by itself for how to provide necessary linkages for any given species of plant or animal... Linkage designs will vary depending on focal species chosen and the goal of providing connected habitat for a chosen species might be met several different ways" nor "The final word on connectivity for California." With analytical grid cells of 2,000 acres, the spatial grain of the California Essential Habitat Connectivity Project is much too coarse for the conclusion the DEIR draws from it.

The next flaw in the DEIR is in the argument that SMP 39 is cut off from open areas by well-trafficked roads, the airport, the gravel quarries, and therefore cannot function as a wildlife movement corridor. The same argument is made for SMP 40. On this point, the DEIR merely speculates, and offers no supporting evidence to its assertion. Monk & Associates (2021, 2023) report no survey methodology designed to determine whether wildlife rely on the site for movement in the region. They implemented no sampling regime nor a program of observation to record wildlife movement patterns. They failed to quantitatively or qualitatively analyze movement patterns of observed wildlife. Based on what is reported, Monk & Associates (2021, 2023) did not record or measure wildlife movement in any way. The conclusions of the DEIR regarding wildlife movement on the project site are speculative and conclusory.

On the other hand, the coyote I saw on site got there somehow, and so did the ground squirrels and pocket gophers, and so did all of the birds I saw on and over SMP 39. I observed hundreds if not thousands of gulls of multiple species flying in both easterly and westerly directions across SMP 38, SMP 39, and SMP 40. I observed Canada geese and Aleutian cackling geese flying to and from the quarry ponds and the project sites to forage. I saw a Cooper's hawk fly from the airport to SMP 39 to forage, crossing the well-trafficked road in about 2 seconds of flight time. Figure 3 illustrates that our telemetered

golden eagles from the Altamont Pass make frequent visits to the project site. That thousands of our golden eagle telemetry positions appear in the project area is consistent with the pattern that my co-investigators and I have noticed about golden eagle movement across California and beyond to other states and border nations, and that is that golden eagles carefully select open spaces as parts of their travel routes. The project area is important to golden eagle movement in the region, just as it is important to the 10 special-status species I observed on the project site, and to the 19 special-status species so far documented on the project site. Th evidence is overwhelming that the project site is important to wildlife movement in the region. Losing the open space of this site would be devastating to many species of wildlife, including to golden eagle.

Furthermore, whether the site includes or is within a wildlife movement corridor is not the only consideration when it comes to the standard CEQA Checklist question of whether the project would interfere with wildlife movement in the region. The primary phrase of the CEQA standard goes to wildlife movement regardless of whether the movement is channeled by a corridor. In fact, a site such as the project site is critically important for wildlife movement because it composes an increasingly diminishing area of open space within a growing expanse of anthropogenic uses, forcing more species of volant wildlife to use the site for stopover and staging during migration, dispersal, and home range patrol (Warnock 2010, Taylor et al. 2011, Runge et al. 2014). The project, due to its elimination of at least 92.9 acres of open space, and more realistically 204.6 acres of open space, and due to its insertion of multiple new buildings into the aerospace currently used by birds, bats and butterflies. would cut wildlife off from one of the last remaining stopover and staging opportunities in the region, forcing volant wildlife to travel even farther between remaining stopover sites. This impact would be significant, and as the project is currently proposed, it would be unmitigated.

TRAFFIC IMPACTS TO WILDLIFE

Project-generated traffic would endanger wildlife that must, for various reasons, cross roads used by the project's traffic to get to and from the project site (Photos 22—26), including along roads far from the project footprint. Vehicle collisions have accounted for the deaths of many thousands of amphibian, reptile, mammal, bird, and arthropod fauna, and the impacts have often been found to be significant at the population level (Forman et al. 2003). Across North America traffic impacts have taken devastating tolls on wildlife (Forman et al. 2003). In Canada, 3,562 birds were estimated killed per 100 km of road per year (Bishop and Brogan 2013), and the US estimate of avian mortality on roads is 2,200 to 8,405 deaths per 100 km per year, or 89 million to 340 million total per year (Loss et al. 2014). Local impacts can be more intense than nationally.

The nearest study of traffic-caused wildlife mortality was performed only 11 miles away, along a 2.5-mile stretch of Vasco Road in Contra Costa County, California. Fatality searches in this study found 1,275 carcasses of 49 species of mammals, birds, amphibians and reptiles over 15 months of searches (Mendelsohn et al. 2009). This fatality number needs to be adjusted for the proportion of fatalities that were not found due to scavenger removal and searcher error. This adjustment is typically made by placing carcasses for searchers to find (or not find) during their routine periodic fatality

searches. This step was not taken at Vasco Road (Mendelsohn et al. 2009), but it was taken as part of another study I completed next to Vasco Road concurrent to the Mendelsohn et al. study (Brown et al. 2016). Brown et al.'s (2016) adjustment factors for carcass persistence resembled those of Santos et al. (2011), which were derived from carcasses placed along roads. Applying searcher detection rates from Brown et al. (2016), the adjusted total number of fatalities was estimated at 12,187 animals killed by traffic on the reach of road that was studied. This fatality number over 1.25 years and 2.5 miles of road translates to 3,900 wild animals per mile per year. In terms comparable to the national estimates, the estimates from the Mendelsohn et al. (2009) study would translate to 243,740 animals killed per 100 km of road per year, or 29 times that of Loss et al.'s (2014) upper bound estimate and 68 times the Canadian estimate. An analysis is needed of whether increased traffic generated by the project site would similarly result in local impacts on wildlife.

Photo 22. A Gambel's quail dashes across a road on *3 April 2021. Such road crossings are usually successful, but too often prove fatal to the animal. Photo by Noriko Smallwood*.

Photo 23. California ground squirrel in the middle of an eastern Alameda County road on 13 March 2014.

Photo 24. Western Pacific rattlesnake on an eastern Alameda County road, 23 August 2011. Photo by Shawn Smallwood.

Photo 25. Mourning dove killed by vehicle on a California road. Photo by Noriko Smallwood, 21 June 2020.

Photo 26 Raccoon killed on Road 31 just east of Highway 505 in Solano County. Photo taken on 10 November 2018.

For wildlife vulnerable to front-end collisions and crushing under tires, road mortality can be predicted from the study of Mendelsohn et al. (2009) as a basis, although it would be helpful to have the availability of more studies like that of Mendelsohn et al. (2009) at additional locations. My analysis of the Mendelsohn et al. (2009) data resulted in an estimated 3,900 animals killed per mile along a county road in Contra Costa County. Two percent of the estimated number of fatalities were birds, and the balance was composed of 34% mammals (many mice and pocket mice, but also ground squirrels, desert cottontails, striped skunks, American badgers, raccoons, and others), 52.3% amphibians (large numbers of California tiger salamanders and California red-legged frogs, but also Sierran treefrogs, western toads, arboreal salamanders, slender salamanders and others), and 11.7% reptiles (many western fence lizards, but also skinks, alligator lizards, and snakes of various species). VMT is useful for predicting wildlife mortality because I was able to quantify miles traveled along the studied reach of Vasco Road during the time period of the Mendelsohn et al. (2009), hence enabling a

rate of fatalities per VMT that can be projected to other sites, assuming similar collision fatality rates.

From October 2016 through December 2019, I maintained my own database of wildlife mortality I encountered on Vasco Road between Marsh Creek Road and Livermore, which encompassed the wildlife mortality study site of Mendelsohn et al. (2009). Table 3 includes the wildlife I found as fatalities, and it compares my crudely calculated ratio of observed fatalities per mile. From Table 3, it is apparent that mortality along the reach of road studied by Mendelsohn et al. (2009) was relatively low compared to the rest of Vasco Road: $^{19.178}/_{13.200} = 5{,}667$ fatalities per mile predicted for the 14.1 miles of Vasco Road that were not studies by Mendelsohn et al. (2009).

Table 3. Fatalities I found along Vasco Road from October 2016 though December 2019, and along 14.1 miles of road that was not studied by Mendelsohn et al. (2009) and 2.5 miles that were studied.

Predicting project-generated traffic impacts to wildlife

The DEIR predicts the project would generate 8,622,395 annual VMT. During the Mendelsohn et al. (2009) study, 19,500 cars traveled Vasco Road daily, so the vehicle miles that contributed to my estimate of non-volant fatalities was 19,500 cars and trucks × 2.5 miles × 365 days/year × 1.25 years = 22,242,187.5 vehicle miles per 12,187 wildlife fatalities, or 1,825 vehicle miles per fatality. This rate divided into the predicted annual VMT, above, would predict 4,725 vertebrate wildlife fatalities per year. My analysis of data in Table 3 suggests that the project-caused mortality along local roadways would be even higher.

Based on my analysis, the project-generated traffic would cause substantial, significant impacts to wildlife. The DEIR does not address this potential impact, let alone propose to mitigate it. Mitigation measures to improve wildlife safety along roads are available and are feasible, and they need exploration for their suitability with the proposed project. Given the predicted level of project-generated, traffic-caused mortality, and the lack of any proposed mitigation, it is my opinion that the proposed project would result in potentially significant adverse biological impacts. The DEIR should be withdrawn

from circulation and revised to appropriately analyze the potential impacts of project-generated automobile traffic on wildlife.

CUMULATIVE IMPACTS

The DEIR attempts to minimalize the project's contributions to cumulative impacts to biological resources by asserting that "ruderal herbaceous land is not considered sensitive wildlife habitat." However, CEQA does not require that the habitat that would be lost to a project be labeled as sensitive; no such standard exists.

The DEIR presents a flawed analysis of cumulative impacts, including to biological resources. The DEIR asserts that it "sets forth mitigation measures to ensure all potential project-specific impacts that would occur to biological resources are reduced to a less-than-significant level." And therefore, "the proposed project would not result in substantial adverse effects to biological resources protected by CEQA." The DEIR contrives the false standard that a given project impact is cumulatively considerable only when it has not been fully mitigated at the project level. The DEIR implies that cumulative impacts are really residual impacts left over by inadequate mitigation of project impacts. This notion of residual impacts being the source of cumulative impacts is inconsistent with CEQA's definition of cumulative effects. Individually mitigated projects do not negate the significance of cumulative impacts. If they did, then CEQA would not require a cumulative effects analysis. To summarize, the DEIR presents no cumulative effects analysis as defined in two ways by CEQA.

MITIGATION

Western Burrowing Owl

4.3-2(a) If project construction begins during the western burrowing owl nesting season (February 15 to August 31), a qualified biologist shall conduct targeted burrowing owl nest surveys within 14 days prior to construction activities using seven- to 20-foot transects. ... The survey shall ... follow CDFW guidelines outlined in the 2012 Staff Report on Burrowing Owl Mitigation.

The avian breeding season recognized by the CDFW is now 1 February through 15 September. The DEIR should be revised accordingly.

Whereas I concur that preconstruction, take-avoidance surveys should be completed, the DEIR falsely characterizes preconstruction surveys as detection surveys by insinuating that conducting preconstruction surveys without first having completed detection surveys would follow CDFW guidelines. Detection surveys are entirely different than preconstruction surveys, and are implemented to achieve a different set of objectives. Contrary to the DEIR's implication, preconstruction surveys are not designed to detect burrowing owls with anywhere close to the same likelihood as are protocol-level detection surveys that are designed for this purpose. It would be very easy for a preconstruction survey to fail to detect burrowing owls that are in fact present. Therefore, implementing a preconstruction survey as a surrogate for detection surveys would be reckless and would fail to meet the minimum standard of care for wildlife

protection. In any case, preconstruction surveys need to be implemented after completion of detection surveys per CDFW (2012).

Tricolored Blackbird

4.3-2(c) Prior to any ground disturbance on SMP 40, a qualified biologist shall conduct a preconstruction survey in all accessible areas identified as supporting potential tricolored blackbird nesting habitat. The survey shall document the current, and to the extent possible, historical presence or absence of nesting colonies of tricolored blackbird. …

Whereas I concur that preconstruction, take-avoidance surveys should be completed, a detection survey is needed first to inform the readers of the DEIR of whether and where tricolored blackbirds occur on or near the project sites. A detection survey would likely also improve the efficacy of the preconstruction survey.

Nesting Birds and Raptors (Including Loggerhead Shrike)

4.3-2(d) If project construction begins during the nesting season (February 1 to August 31), a qualified biologist shall conduct a nesting bird survey within 7 days prior to construction activities. … If migratory birds are identified nesting on or within the zone of influence, … A qualified biologist shall establish a temporary protective nest buffer around the nest(s). The nest buffer shall be staked with orange construction fencing. The buffer must be of sufficient size to protect the nesting site from construction-related disturbance and shall be established by a qualified ornithologist or biologist with extensive experience working with nesting birds near and on construction sites.

Typically, adequate nesting buffers are 75 feet from the nest site or nest tree dripline for small birds and up to 300 feet for sensitive nesting birds that include several raptor species known in the region of the project site but that are not expected to occur on the project site. Upon completion of nesting surveys, if nesting birds are identified on or within a zone of influence of the project site, a qualified ornithologist/biologist that frequently works with nesting birds shall prescribe adequate nesting buffers to protect the nesting birds from harm while the project is constructed.

First, the avian breeding season recognized by the CDFW is now 1 February through 15 September. The DEIR should be revised accordingly.

Second, whereas I concur that preconstruction, take-avoidance surveys should be completed, in my experience the majority of bird nests would not be found by biologists assigned to the survey. For instance, I surveyed for grassland nesters as part of an intensive survey effort that I performed from March through mid-August 2023 on a Central Valley site. I surveyed the site 30 times. I found that the nests of grassland birds are the most difficult to locate. Cavity nesters can more effectively defend their nests against predators, whereas ground nesters are highly vulnerable to predation, and thus the most cryptic of nesters. Ground nesters, which include bird species that occur at the project site, are highly adept at concealing their nests both physically and behaviorally. Based on my experience, it is highly likely that preconstruction survey would fail to find

any of the nests of ground-nesting birds that truly occur on the project site. The DEIR's implication that preconstruction survey would reduce potential impacts to nesting birds to less-than-significant is unsubstantiated by evidence in the DEIR.

The mitigation measure appears to be specifically directed toward loggerhead shrike, presumably because this special-status species was detected during a reconnaissance survey of SMP 40. Finding the nests of loggerhead shrikes is particularly difficult, as this species is expert at deceiving observers as to the whereabouts of their nests (Smallwood and Smallwood 2021). To adequately survey for nest sites of loggerhead shrike, many surveys are needed, and the survey methods need to include long sessions of visual-scans, preferably from blinds such as automobiles. Observers would need to be experienced in bird behavior, and capable of tracking the movements of individual loggerhead shrikes. A preconstruction survey for loggerhead shrike nest would be ineffective by having inexperienced biologists walk back and forth along transects.

Third, the mitigation language (second italicized paragraph above) allows a single individual to make a subjective decision, outside the public's view, to determine the buffer area for any given species. This measure lacks objective criteria, and is unenforceable.

Even assuming some or even all of the nests would be found and salvaged, this benefit to birds nesting on site would apply only to a single breeding season of nesters. The project would nevertheless eliminate the site's productive capacity to birds.

SMP 40 and Trail Connection Option 2
4.3-3(c) Prior to the commencement of ground-disturbing activities for SMP 40 or Trail Connection Option 2, … [Six minimization and mitigation measures follow, one of which is] *… the riparian corridor of Arroyo Mocho, disturbed areas shall be revegetated with native riparian plant species. Replacement of riparian trees to be removed shall be planted near the creek as feasible and/or adjacent to the existing limits of the riparian corridor to contribute to the existing riparian canopy. Riparian plantings shall be maintained for a minimum of 5 years to ensure that the canopy is enhanced and the understory restored.*

Trail Connection Option 2 – Undercrossing at Isabel Bridge
4.3-3(d) Prior to initiation of any groundbreaking activity associated with Trail Connection Option 2, … The project applicant shall ensure that the proposed project replaces, restores, or enhances on a "no net loss" basis (in accordance with the RWQCB) the acreage of all riparian habitat and waters of the State that would be removed, lost, and/or degraded due to project implementation by methods agreeable to the RWQCB and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 permitting processes. Methods include, but are not limited to implementation of a riparian enhancement planting plan and/or tree planting mitigation at a 1:1 ratio, or as otherwise prescribed by the RWQCB.

Trail Connection Option 2 – Undercrossing at Isabel Bridge

4.3-3(e) If it is determined that work below the OHWM cannot be avoided for Trail Connection Option 2, … Waters that would be lost or disturbed shall be restored, replaced, or rehabilitated on a "no-net-loss" basis. Habitat restoration, rehabilitation, and/or replacement, including the purchase of credits from a USACE approved mitigation bank at a 1:1 ratio, shall be at a location and by methods acceptable to the USACE.

I concur that all of the measures described above should be implemented if the project goes forward. However, these measure alone would be inadequate. Also needed is monitoring of wildlife that is integrated with thresholds of success and failure. If thresholds of failure are exceeded, then the City should be required to take additional steps to achieve success. To this end, an adequate performance bond should be provided by the applicant to the City.

RECOMMENDED MEASURES

Road Mortality: Compensatory mitigation is needed for the increased wildlife mortality that would be caused by bird-window collisions and the project-generated road traffic in the region. I suggest that this mitigation can be directed toward funding research to identify fatality patterns and effective impact reduction measures such as reduced speed limits and wildlife under-crossings or overcrossings of particularly dangerous road segments. Compensatory mitigation can also be provided in the form of donations to wildlife rehabilitation facilities (see below).

Fund Wildlife Rehabilitation Facilities: Compensatory mitigation ought also to include funding contributions to wildlife rehabilitation facilities to cover the costs of injured animals that will be delivered to these facilities for care. Many animals would likely be injured by collisions with automobiles traveling to and from the project's buildings.

Landscaping: If the project goes forward, California native plant landscaping (i.e., chaparral, grassland, and locally appropriate scrub plants) should be considered to be used as opposed to landscaping with lawn and exotic shrubs. Native plants offer more structure, cover, food resources, and nesting substrate for wildlife than landscaping with lawn. Native plant landscaping has been shown to increase the abundance of arthropods which act as importance sources of food for wildlife and are crucial for pollination and plant reproduction (Narango et al. 2017, Adams et al. 2020, Smallwood and Wood 2022.). Further, many endangered and threated insects require native host plants for reproduction and migration, e.g., monarch butterfly. Around the world, landscaping with native plants over exotic plants increases the abundance and diversity of birds, and is particularly valuable to native birds (Lerman and Warren 2011, Burghardt et al. 2008, Berthon et al. 2021, Smallwood and Wood 2022). Landscaping with native plants is a way to maintain or to bring back some of the natural habitat and lessen the footprint of urbanization by acting as interconnected patches of habitat for wildlife (Goddard et al. 2009, Tallamy 2020). Lastly, not only does native plant landscaping benefit wildlife, it requires less water and maintenance than traditional landscaping with lawn and hedges.

Thank you for your consideration,

_____

Subject: **City of Livermore SMP 38/SMP 39/SMP 40 Project**
Review of DEIR Noise Section & Appendices

Dear Stephanie:

We have completed a review of Section 4.6 (Noise), as well as Appendices J and K (Environmental Noise Assessments) of the Draft Environmental Impact Report for the City of Livermore SMP 38/SMP 39/SMP 40 Project, focusing on the adequacy of the noise impact analyses. Here are our findings:

OVERVIEW

Section 4.6 of the DEIR is based on environmental noise assessments prepared by Salter.

- Significance Standards

  The DEIR significance standards for noise and vibration impacts are based directly on Section XIII of the Environmental Checklist in Appendix G of the current CEQA Guidelines, which reads as follows:

  XIII. NOISE - Would the project result in:

  a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of the local general plan or noise ordinance, or applicable standards of other agencies?

  b) Generation of excessive groundborne vibration or groundborne noise levels?

  c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the area to excessive noise levels?

  Salter has proposed a 3 dBA increase in ambient noise levels as the threshold for a "substantial increase". We concur that this is a reasonable value for CEQA evaluation of this project.

- Operational Noise & Construction Vibration

  The analysis in Section 4.6 shows that noise impacts from operational noise (loading dock activity, HVAC, on-site vehicle movements) as well as vibration during on-site construction are less-than-significant. Generally, the analysis supporting this finding appears to be methodical and well done, consistent with current CEQA Guidelines, and we take no exception to it.

- Construction Noise Impacts

  Section 4.6 also includes an analysis of construction noise impacts on the nearest sensitive uses – i.e.: the single-family residential neighborhood to the east of the project sites. This analysis covers on-site construction activity for SMP 40 as well as the construction of off-site trail connections at three potential locations (each within 200-feet of the nearest residential use).

The impact of construction noise on the SMP 39 site is not covered in the DEIR.

For the off-site trail connection construction, the DEIR states that noise impacts are significant without mitigation and provides a list of mitigation measures (4.6-1) to reduce this impact to less-than-significant level. Generally, we agree with this finding and the proposed mitigation measures.

For on-site construction, the DEIR states that noise impacts will be less-than-significant. However, the analysis presented in the DEIR does not – in our opinion – adequately support this conclusion, for the reasons outlined below.

PROBLEMS WITH THE ON-SITE CONSTRUCTION NOISE IMPACT ANALYSIS

- <u>SMP 39 is Excluded</u>

  Construction noise from the SMP 39 site is not included in the analysis in Section 4.6 of the DEIR. An explanation for this omission is provided in the final paragraph on page 4.6-21, which reads in part:

  "Due to the substantial distance between SMP 39 and the sensitive noise receptors, it was anticipated that construction noise associated SMP 39 would be below the City of Livermore's exterior noise level threshold of 60 dBA DNL at the nearest sensitive receptor locations. Thus, construction noise levels for SMP 39 were not evaluated as part of the Environmental Noise Study for SMP 39."

  There are two problems with this explanation:

  First, CEQA requires an actual analysis to show whether a project impact is significant or less-than-significant. Simply "anticipating" that there will be no significant impact falls short of the standard required for a CEQA study.

  Second, the 60 dBA DNL exterior noise standard (which comes from the land-use compatibility table in the Noise Element of the City of Livermore General Plan) is only one of the applicable local regulations. The DEIR analysis should address all applicable regulations in both the General Plan and Municipal Code.

- <u>Analysis for SMP 40 is Incomplete</u>

  The noise impact analysis for construction on the SMP 40 site compares Salter's noise level predictions with instantaneous maximum noise level (Lmax) limits of 70 dBA during the day and 60 dBA at night, which are taken from Policy N-1.5.P3 of the City of Livermore General Plan.

  However, these Lmax noise limits are not the only local regulations that would apply to construction noise on the SMP 40 site.

  For example, the DEIR does not show how construction noise from SMP 40 would compare to Policy N-1.5.P2 of the General Plan, which prescribes the following noise limits, depending on the cumulative duration of the noise:

Daytime Noise Limit (7AM – 10PM)	Nighttime Noise Limit (10PM – 7AM)	Cumulative Duration
60 dBA	50 dBA	No more than 15-minutes in any hour.
65 dBA	55 dBA	No more than 5-minutes in any hour.
70 dBA	60 dBA	No more than 1-minute in any hour.

Similarly, the DEIR does not include an DNL analysis for construction noise from SMP 40 to show that it will be below the 60 dBA exterior noise standard taken from land-use compatibility table (Table 9-7) in the General Plan. This will be particularly important if any construction work is to occur at night.

- <u>There is an Error in the Calculations for SMP 40</u>

  Table 4.6-6 of the DEIR lists estimated Lmax noise levels for various pieces of construction equipment at a distance of 50-feet (these are standard reference values, taken from the FHWA Construction Noise Handbook) and extrapolates them to a distance of 884 feet.

  According to Table 4.6-6, the equipment noise levels received at a distance of 884 are 57 dBA lower than lower than those received at a distance of 50-feet. This is incorrect. According to the radiation equation for point sources (such as individual pieces of construction equipment) the reduction in noise level from 50-feet to 884 feet is:

  $10 \times LOG_{10}(884/50) = 25$ dBA

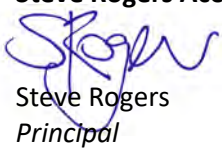
  So, the estimated Lmax noise levels provided in Table 4.6-6 are 32 dBA lower than they should be. Which means that noise from several of the pieces of equipment listed should be expected to produce a maximum level of noise at the nearest residences that is either right at the 60 dBA nighttime limit or, in the case of paving equipment, 4 dBA above it.

- <u>Construction on the East Side of the SMP 40 Site is Overlooked</u>

  The construction noise analysis in the DEIR for SMP 40 considers assumes receivers 884-feet away from the equipment – which is the distance between the location proposed for Building 2 and the nearest residences. However, there will be certain phases of construction – such as site preparation and paving/landscaping/site concrete – when noisy equipment could be operating closer than 884-feet from nearby residential uses.

  For example, the eastern corner of the SMP 40 site is within 600-feet of the nearest residential use. Received noise levels at a distance of 600-feet from the equipment would be 3 dBA higher than those received at 884-feet, which means that the expected noise level at the nearest residences when paving equipment is in use in the eastern corner of the site would be 67 dBA, Lmax and not 32 dBA, Lmax as reported in Table 4.6-6.

SUMMARY & RECOMMENDATIONS



We find that, while much of the noise analysis in the DEIR has been done to the standard expected of a CEQA study, the evaluation of noise impacts during the construction phases is incomplete and contains a significant calculation error. We therefore recommend that the preparers be requested to revise/correct the Noise Section (4.6) of the DEIR as follows:

- Include SMP 39 in the on-site construction noise impact analysis. The analysis should take account of the anticipated number of pieces of equipment in use at any one time during each phase as well as estimated usage factors, so that construction noise impacts can be evaluated in the in the context of the City of Livermore General Plan DNL 60 dBA exterior noise standard (from Table 9-7) and the time-dependent noise limits in Policy N-1.5.P2, as well as the Lmax noise limits in Policy N-1.5.P3.
- For on-site construction on the SMP 40 site, the noise impact analysis should be expanded to take account of the anticipated number of pieces of equipment in use at any one time during each phase as well as estimated usage factors, so that construction noise impacts can be evaluated in the in the

context of the City of Livermore General Plan DNL 60 dBA exterior noise standard (from Table 9-7) and the time-dependent noise limits in Policy N-1.5.P2, as well as the Lmax noise limits in Policy N-1.5.P3.

- Table 4.6-6 should be revised to show the correct (25 dBA) reduction in point-source noise levels from 50-feet to 884-feet.
- Provide additional analysis for any construction activity on the SMP 40 site (such as site preparation, paving/landscaping) that could occur closer than 884-feet from the nearest residential use.

Yours sincerely,
Steve Rogers Acoustics, LLC

Salter Project 23-0142

INTRODUCTION

This report summarizes our environmental noise study of future traffic and loading dock activities from the proposed 6-building warehouse facility along Jack London Boulevard, south of Livermore Airport and west of Discovery Drive in Livermore, California. The purpose of the study was to determine the estimated growth in traffic noise levels resulting in the loading dock trucking activity and if traffic noise impacts from the proposed facility will meet the relevant requirements of the City General Plan Noise Element and Noise Ordinance.

EXECUTIVE SUMMARY

- Noise from the project's loading docks, future intra-project vehicle traffic, and likely HVAC equipment will increase CNEL[1] or DNL[2] noise levels at noise-sensitive receiver locations by 1 dB. An increase of 3 dB or less DNL is not expected to be noticeable and is not considered significant.
- Noise from project-created traffic would not result in a significant increase in noise levels on Jack London Boulevard or Isabel Avenue at adjacent properties.
- Temporary construction noise will be consistent with the City's Noise Ordinance and will not exceed the criteria established by General Plan Noise Objectives N-1.1 and N-1.5.

REPORT ORGANIZATION

This report contains the following sections:

- Project Site
- Acoustical Criteria
- Existing Noise Environment
- Noise Impact Assessment
  - Construction Noise
  - Loading Dock and Intra-Project Traffic Noise (Parking Lot)
  - Tenant HVAC Equipment Noise

[1] Community Noise Equivalent Level (CNEL) – A descriptor for the 24-hour A-weighted average noise level. The CNEL concept accounts for the increased acoustical sensitivity of people to noise during the evening and nighttime hours. Sound levels during the hours from 7 pm to 10 pm are penalized 5 dB; sound levels during the hours from 10 pm to 7 am are penalized 10 dB. A 10-dB increase in sound level is perceived by people to be a doubling of loudness.

[2] Day-Night Average Sound Level (DNL) – A descriptor established by the U.S. Environmental Protection Agency to describe the average day-night level with a penalty applied to noise occurring during the nighttime hours (10 pm - 7 am) to account for the increased sensitivity of people during sleeping hours. Also noted as Ldn. The difference between CNEL and DNL is often less than 1 dB.

PROJECT SITE

The proposed project will have a total lot area of approximately 47.86 acres, located south of West Jack London Boulevard. It is bounded by the Livermore Airport to the north, and Discovery Drive to the east, in the City of Livermore.

There will be six warehouse buildings totaling 2,084,953 square feet with 104 total loading docks. The site is adjacent to existing office and warehouse facilities to the east, approximately 850 feet away. An industrial quarry is located to the south. There are no noise-sensitive residential properties within 2,300 feet of the project site.

ACOUSTICAL CRITERIA

The following are project criteria and/or guidelines for the City of Livermore and State of California.

City of Livermore 2003-2025 General Plan Noise Element

Policy P4, Objective N-1.1

The Noise Element of the Livermore General Plan (Chapter 9, Policy P4 of Objective N-1.1) contains land use compatibility guidelines for environmental noise in the community. Table 1, below, summarizes these guidelines for residential and industrial land uses[3] in terms of CNEL or DNL. The definitions of each land use category follow below the table.

Table 1: Summary of Table 9-7 – Land Use Compatibility Guidelines for Community Noise CNEL or DNL, dB

Land Use Category	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential Low-Density[4], Single-family, Duplex, Mobile Homes	≤60	55-70	70-75	>75
Industrial, Manufacturing, Utilities, Agricultural	≤75	70-80	>75	--

[3] Table 9-7 of the Noise Element, page 9-27.

[4] Per General Plan Noise Ordinance Objective N-1.4, Policy P4, the criterion for single-family residential back yards is 60 dB CNEL/DNL.

Normally Acceptable: *If the noise level is within the "normally acceptable" level, noise exposure would be acceptable for the intended land use. Development may occur without requiring an evaluation of the noise environment unless the use could generate noise impacts on adjacent uses.*

Conditionally Acceptable: *If the noise level is within the "conditionally acceptable" level, noise exposure would be conditionally acceptable; a specified land use may be permitted only after detailed analysis of the noise environment and the project characteristics to determine whether noise insulation or protection features are required. Such noise insulation features may include measures to protect noise-sensitive outdoor activity areas (e.g., at residences, schools, or parks) or may include building sound insulation treatments such as sound-rated windows to protect interior spaces in sensitive receptors.*

Normally Unacceptable: *If the noise level is within the "normally unacceptable" level, analysis and mitigation are required. Development should generally not be undertaken unless adequate noise mitigation options have been analyzed and appropriate mitigations incorporated into the project to reduce the exposure of people to unacceptable noise levels.*

Clearly Unacceptable: *New construction should not be undertaken unless all feasible noise mitigation options have been analyzed and appropriate mitigation incorporated into the project to adequately reduce exposure of people to unacceptable noise levels.*

Noise Element Objective N-1.5

Objective N-1.5 seeks to reduce the level of noise generated by "stationary mechanical and other noise-generating equipment". Policy P1 states that "the City shall require that industrial and commercial uses be designed and operated to avoid the generation of noise effects on surrounding land uses from exceeding the following noise levels for exterior environments, operating longer than half an hour per hour:

- 55 dBA[5] L50[6] (7:00am to 10:00pm)
- 45 dBA L50 (10:00pm to 7:00am)

Policy P2 allows short-term events to have levels louder than those cited above. For events that occur less than 15 minutes per hour, levels can be increased by 5 dBA; events no more than 5 minutes per hour are allowed an additional 10 dBA, and those taking place one minute or less per hour are allowed an additional 15 dBA. Policy P4 allows an exemption from Policy P1 for motor vehicles on public streets between the hours of 7:00am and 8:00pm. We understand that Policies P1, P2, and P4 could apply to the noise from backup alarms (aka "beepers" or "squawkers").

[5] A-Weighted Sound Level – The A-weighted sound pressure level, expressed in decibels (dB). Sometimes the unit of sound level is written as dB(A). A weighting is a standard weighting that accounts for the sensitivity of human hearing to the range of audible frequencies. People perceive a 10 dB increase in sound level to be twice as loud.

[6] L50 – The noise level exceeded 50% of the time. For a discussion of environmental acoustics, please refer to Appendix A.

Objective N-1.5 specifically describes "stationary source noises", so when referring to L_{50} noise levels we analyzed the noise of trucks that are expected to sit in the loading dock area, estimated to be at least 2,395 feet from the nearest residence.

Policy P3 establishes instantaneous maximum noise levels allowed (Lmax[7]) of 70 dBA during the day and 60 dBA during the night.

California Department of Transportation (CalTrans) Construction Vibration Criteria

The California Department of Transportation[8] (DOT) provides vibration guidelines for two scenarios: human perception and construction damage. These tables are included below as guidelines for potential project vibration levels. "Transient" vibrations are classified as impulsive events that are short in duration (e.g., debris falling, blasting). "Continuous" vibrations are more sustained vibration events over longer periods of time (e.g., jackhammering, drilling). Table 2 describes the human response to different levels of ground-borne vibration for transient and continuous events.

Table 2: Guideline Vibration Annoyance Potential Threshold Criteria[9]

Human Response	Maximum PPV[10] (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.90	0.10
Severe	2.00	0.40

Table 3 provides a guideline for vibration criteria to assess the damage potential from ground vibration induced by construction equipment. Thresholds for continuous vibrations are lower than those for transient vibrations and are therefore considered more "conservative". These are standard significance thresholds used in the industry to determine impacts of ground borne vibrations on structures.

7 L_{max} (Maximum Sound Level) – The maximum sound level for a specified measurement period of time as defined in ASTM E1686.

8 Transportation and Construction Vibration Guidance Manual September 2013 (DOT Document).

9 This is Table 20 from the DOT document.

10 (PPV): Peak Particle Velocity.

Table 3: Guideline Vibration Damage Potential Threshold Criteria[11]

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old buildings	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial buildings	2.00	0.50

The immediate adjacent properties are all modern industrial or commercial buildings. Across Isabel Avenue/Highway 84 to the east are existing single-family residences. Based on Table 3, we have applied the more stringent residential criteria of 1.0 PPV for transient events and 0.50 PPV for continuous events.

State of California CEQA Guidelines and Impact Criteria

The California Environmental Quality Act (CEQA) contains guidelines that evaluate the significance of noise attributable to a proposed project. This would include (but is not limited to) added traffic noise, mechanical equipment noise, and construction noise. CEQA asks the following applicable questions. Would the project result in:

1. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
2. Generation of excessive ground borne vibration or ground borne noise levels?
3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public-use airport, would the project expose people residing or working in the project area to excessive noise levels?

CEQA does not define the noise level increase that is considered "substantial". Typically, the local general plan would establish limits with respect to allowable noise and vibration increases. However, the City of Livermore General Plan does not contain numerical standards of significance for noise increases. For the items above, noise level increases of 3 dBA or less are generally considered less-than-significant. Substantial adverse community response would be expected only for increases of 5 dBA or more.

11 This is Table 19 of the DOT document.

EXISTING NOISE ENVIRONMENT

Project Site Description

To quantify the existing site noise environment, a monitor continuously measured noise levels along Jack London Boulevard on 5 and 10 April 2023. **Table 4** shows a summary of the measured data. **Figure 1**, attached, shows the approximate measurement location.

Table 4: Measured Environmental Noise Levels

Site	Location	DNL (dB)	Leq(h) (dB)
LT-1	Jack London Boulevard, approximately 12-feet above grade	75	76

Site Noise Context

Noise measurements at the project site (see **Figure 1**), collected data from vehicle pass-bys on Jack London Boulevard. The measured on-site noise level was DNL 75 dB (see **Figure 1**). LT-1 was placed on the closest access utility pole across from the future site on Jack London Boulevard. Adjustments were made, as appropriate, to estimate the change in noise levels from the long-term monitor location to the locations of the nearest residences east of Isabel Avenue.

We have combined cumulative existing and future noise sources that would result from the project's completion. Future project sources include the proposed loading dock noise, rooftop HVAC equipment, parking areas, and estimated traffic contribution, while the existing noise sources are the existing traffic. Adding expected noise contribution to the existing noise environment logarithmically would result in a noise level of approximately **DNL 75 dB** from all contributing noise sources upon the project's completion.

DNL **30**[a] dB [HVAC] + DNL **32**[b] dB [employee lot] + DNL **50**[c] dB [trucks] = DNL **50**[d] dB [future noise level at receivers]

a = cumulative building rooftop HVAC noise
b = employee parking lot noise
c = loading dock truck noise

d = cumulative future project sources

DNL **67**[e] dB [existing traffic] + DNL **50**[e] dB [combined future sources] **=** DNL **67**[f] dB [future noise level at receivers]

e = measured at project site, see **Figure 1**
e = determined from loading docks + HVAC noise + parking lots
f = calculated

See **Appendix A** for additional information on decibel mathematics.

NOISE IMPACT ASSESSMENT ANALYSIS

We evaluated the following noise sources from the proposed project on the surrounding environment:

- Potential rooftop mechanical equipment noise
- Short-term construction noise and vibration
- Project-related traffic increases

We have drawn the following conclusions from the analysis:

The following summarizes the portion of the CEQA checklist pertaining to noise.

Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project exceeding standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

A: Permanent Increase in Noise Levels due to Project-Generated Noise

It is anticipated that the potential office spaces located on northern facades of the six buildings will be mechanically ventilated. Based on previous projects of similar design, we have assumed the use of up to four typical 5-ton package rooftop units located above each office (a total of 56 units). No outdoor mechanical equipment has been specified at this time. Specific equipment will be confirmed during the design phase.

Preliminary sound power level data provided from a similarly sized project with similar 5-ton outdoor package fan units indicates that combined noise from these units sums to approximately DNL 30 dB at the nearest property lines, assuming the units operate continuously for 24-hour operation. The rooftop parapet is assumed to provide acoustical shielding to nearby neighbors because they would break line-of-sight to the nearest receivers.

Depending on the final equipment placement, as well as any specific parapets, barriers, and shielding provided by buildings (which would reduce noise levels at the property lines), noise levels may vary. We do not expect the noise contribution to be significant in these aspects.

B: Predicted Permanent Increase in Noise Levels due Project Traffic Volumes

It has been communicated by the team that the projected truck trips per day will be approximately as shown below in Table 5.

Table 5: SMP-39 Truck Trips

Hour	Percent	ITE Trips
7 – 9 AM	10.8%	78
9 AM – 4 PM	61.0%	439
4 – 6 PM	10.8%	78
6 – 10 PM	3.9%	28
10 PM – 7 AM	13.4%	96
Total	100 %	719

Overall, the project would result in a net increase in daily trips by 719, amounting to an overall traffic noise DNL increase of <1 dB. Therefore, this would not result in a significant increase in noise levels at existing adjacent properties.

C: Temporary Increase in Noise Levels due to Construction

Construction activities will likely include the use of heavy equipment for grading and other activities, through completion of buildings and landscaping. Heavy trucks would travel to, from, and within the site hauling soil, equipment, and building materials. Smaller equipment, such as jackhammers, pneumatic tools, and saws could also be used throughout the demolition and construction phases in various areas. The noise and vibration associated with these activities would be generated within the entire project area.

Based on our experience with similar projects' construction methods and phasing, our preliminary understanding and assumptions of expected equipment is shown in Table 6. Reference levels for construction equipment are listed in Table 7, both at the reference distance of 50-feet and at 2,640-feet, which is the distance from eastern edge of the SMP 39 property to the residences across Isabel Avenue.

Table 6: List of Typical Construction Equipment and Phasing

Phase	Equipment
Demolition	Concrete/Industrial Saws, Excavators, Rubber-Tired Dozers, Tractors/Loaders/Backhoes
Site Preparation	Graders, Rubber-Tired Dozers, Tractors/Loaders/Backhoes
Grading/Excavation	Excavators, Drill Rig for Shoring Beams (Caisson Drilling), Rubber-Tired Dozers, Tractors/Loaders/Backhoes
Trenching	Tractor/Loader/Backhoe, Excavators
Building Exterior	Cranes, Forklifts, Generator Sets, Tractors/Loaders/Backhoes, Welders
Building Interior/ Architectural Coating	Air Compressors, Aerial Lift
Paving/Landscaping/ Site Concrete	Cement and Mortar Mixers, Paving Equipment, Rollers, Tractors/Loaders/Backhoes

Table 7: Construction Equipment Reference Noise Levels[12]

Typical Equipment	Estimated Maximum Instantaneous L_{max} Noise Level (dBA at 50 feet)	Estimated Maximum Instantaneous L_{max} Noise Level (dBA at 2,640 feet)
Aerial Lift	83	49
Air Compressors	81	47
Cement and Mortar Mixers	85	51
Concrete/Industrial Saws	76	42
Cranes	83	49
Drill Rig for Shoring Beams (Caisson Drilling)	85	51
Excavators	85	51
Forklifts	83	49
Generator Sets	81	47
Graders	85	51
Paving Equipment	89	55
Rollers	74	40
Rubber-Tired Dozers	85	51
Tractors/Loaders/Backhoes	84	50
Welders	73	39

Actual construction noise levels will vary based on distance to each piece of equipment or work area from the receiver and shielding from adjacent buildings and construction elements. It should be noted that construction activities are prohibited during the specific time period outlined in Section 9.36.080 of the City's Municipal Code, and our calculations do not take shielding from adjacent buildings into consideration. Section 9.36.080 is as follows:

12 Equipment noise levels at 50-feet are from Section 9, Federal Highway Administration Highway Traffic Noise Construction Noise Handbook (August 2006) and Table 12-2, Transit Noise and Vibration Impact Assessment, United States Department of Transportation, Office of Planning and Environment, Federal Transit Administration, May 2006.

Section 9.36.080 Hammers, pile drivers, pneumatic tools and similar equipment

The operation between the hours of 6:00 p.m. Saturday to 7:00 a.m. Monday; 8:00 p.m. to 7:00 a.m. on Monday, Tuesday, Wednesday and Thursdays; 8:00 p.m. Friday to 9:00 a.m. on Saturday or at all on city-observed holidays of any pile driver, pneumatic tools, derrick, electric hoist, sandblaster or other equipment used in construction, demolition or other repair work, the use of which is attended by loud or unusual noise, is prohibited. (Ord. 1672 § 2, 2002; Ord. 1128 § 2, 1983; 1960 code § 13B.3(f))

Construction Equipment Schedule

We received the following equipment schedule that CalEEMod utilized for their model for air quality emissions. **Table 8** below summarizes the equipment and associated sound levels at the nearest residential property (approximately 2,640 feet away).

Table 8: Construction Equipment Schedule

Phase Name	Offroad Equipment Type	Amount	Usage Hours	Resulting DNL	Resulting Lmax
Grading	Excavators	2	8	66	54
Grading	Graders	1	8	66	51
Grading	Rubber Tired Dozers	1	8	66	51
Grading	Scrapers	2	8	66	54
Grading	Tractors/Loaders/Backhoes	2	8	66	53
Total Grading Phase	**All Equipment Running Simultaneously**			**67**	**60**
Paving	Pavers	2	8	67	58
Paving	Paving Equipment	2	8	67	58
Paving	Rollers	2	8	66	43
Total Paving Phase	**All Equipment Running Simultaneously**			**67**	**61**
Building Construction	Cranes	1	7	66	49
Building Construction	Forklift	3	8	66	54
Building Construction	Generator Sets	1	8	66	47
Building Construction	Tractors/Loaders/Backhoes	3	7	66	56
Building Construction	Welders	1	8	66	39
Total Building Construction	**All Equipment Running Simultaneously**			**67**	**59**
Architectural Coating	Air Compressors	1	8	66	47

It should be noted that the DNL was calculated using daytime construction noise levels for daytime hours for the listed hours of operation and measured nighttime hours from existing traffic. Despite restrictions of nighttime construction activities, from the noise levels shown above in Table 8, it could be possible to exceed the General Plan Objectives as follows:

Objective N-1.5 P3

- As shown above in Table 8, with all the phases running construction equipment as intended, the resulting Lmax would range between 59 and 61 dBA. Since construction is not permitted during nighttime hours, the Lmax criterion of 70 dBA would be met and not be considered a significant increase.

Due to these results, it will not be necessary to incorporate any mitigation measures for construction noise.

Would the project result in generation of excessive ground-borne vibration or ground-borne noise levels?

A: Permanent Increase in Vibration Levels due to Project-Generated Vibration

The planned use for the site, as warehouse buildings, is not expected to generate significant amounts of ground-borne noise or vibration.

B: Temporary Increase in Vibration Levels due to Construction

The nearest and most sensitive adjacent receivers include residences to the east approximately 500 feet from the closest area of construction on the project site. Industrial-zoned parcels to the north are assumed to be less sensitive.

Project construction may include activities such as the use of concrete saws, excavation and grading, and the use of rolling stock equipment (tracked vehicles, compactors, etc.). Typical construction vibration levels at 50-feet are listed in Table 9, below. Most of the construction will occur set back from the property line. As indicated in the criteria section above, the risk of damage to nearby structures may begin to occur at a limit of 1.0 in/sec PPV for transient vibration events and 0.50 PPV for continuous events.

Table 9: Example Construction Vibration Levels[13]

Equipment	PPV at 50 ft. (in/sec)[14]
Vibratory Roller	0.049
Hydraulic Breaker	0.03 to 0.08
Large Bulldozer	0.03
Loaded Trucks	0.03
Excavator	0.03
Caisson/pier drilling	0.03
Jackhammer	0.01
Small Bulldozer	0.001
Crane, Forklift, Bobcat	No significant vibration

Based on the vibration levels shown in Table 8, construction equipment is not expected to cause structural damage to adjacent properties because project construction is not expected to exceed the thresholds for new residential buildings or commercial/industrial structures as shown above in Table 3. Ground-borne noise would also not be expected to be significant at these vibration levels.

FUTURE LOADING DOCK AND INTRA-PROJECT TRAFFIC NOISE ESTIMATES

Future Loading Dock Calculation Methodology

Operational noise from the proposed facility is expected to consist primarily of tractor-trailers accessing loading dock areas. To estimate truck noise at the proposed facility, we referenced recently measured noise levels at a distribution facility elsewhere in California which involved semi-trucks similar in size to those that are expected to access the proposed project's facility.

Calculations for resulting noise levels due to on-site truck and car trip generation durations and activities were based on the measurements at this local distribution facility with ancillary information provided to us for that reference project in 2018.

Based on the assumptions described below, estimated noise levels were then compared to applicable criteria to determine if noise from the proposed facility would exceed the City's noise goals (described above) at the nearest receivers.

Traffic volumes for the proposed project were referenced from the provided Traffic Impact Analysis document (dated 4 April 2023) by TJKM, which describes the total daily truck trips and the partial

13 Table 12-2, Transit Noise and Vibration Impact Assessment, United States Department of Transportation, Office of Planning and Environment, Federal Transit Administration, May 2006.

14 Using a value of n = 1.5 per FTA recommendation, where n is the attenuation rate through the ground

distribution over the peak AM and PM hours and the relative expected proportion of project-generated trips using Jack London Boulevard and Isabel Avenue.

Intra-Project Traffic Methodology

Intra-project traffic noise will consist of traffic noise associated with future warehouse employee vehicles within the designated parking lots. To estimate vehicle noise at the employee parking lots, we also reference the Traffic Impact Analysis document for the expected traffic volume of warehouse employees.

Noise Source Analysis and Assumptions

Future Loading Docks

Our analysis estimated future noise from the facility based on the following assumptions discussed with the client via email, and per the overall site plan:

1. Trucks will enter and exit the site from three driveways off West Jackson Boulevard, from the north.
2. Non-truck noises associated with loading/unloading activity (i.e., forklifts, rolling doors, carts, pallet crushing, items dropping), are assumed to be located near the dock doors and are included in our analysis.
3. An average truck trip (not including unloading/loading) is estimated to last for a cumulative period of about 2 minutes and be at least 930 feet from the nearest commercial property line.
4. Trucks occupy the loading dock in their loading area that is nearest to noise-sensitive receiver (Commercial buildings east of Discovery Drive, to the east of the building).
5. Total number of loading docks: 104
6. Number and distribution of truck trips is based on the traffic impact analysis, with approximately 719 total truck trips per 24-hour period (continuous 24/7 operation) distributed as follows:
    - AM Peak is 7-9 AM- 10.8%
    - 9-4 PM -61%
    - PM Peak is 4 PM - 6 PM -10.8%
    - 6 PM - 10 PM 3.9%
    - 10 PM -7 AM 13.4%
7. The proposed warehouse buildings have south-facing loading docks which are recessed approximately 60 feet from the easternmost building's façade, providing substantial shielding for truck operation noise. This feature is expected to obstruct the direct line of sight of the project's loading docks from the commercial neighbors to the east, especially in buildings closer to Discovery Drive.
8. Having measured operations at a local representative loading dock site, a typical truck "trip" consists of the following events (estimated sound levels based on measurements at similar facilities):

a. Truck passby (arrival, departure): 69 dBA at 30 feet

b. Truck airbrakes: 72 dBA at 25 feet

c. Truck backup alarm: 79 dBA at 30 feet

d. Brief idle before engine shutoff: 70 dBA at 25 feet

e. Truck engine ignition and airbrakes: 71 dBA at 25 feet

f. Truck accelerating from stop: 74 dBA at 25 feet

g. Truck trip reference heights[15] (above grade)

i. Passby, brief idle, acceleration, and ignition: 8 feet

ii. Back-up beeper and airbrake: 2.5 feet

Intra-Project Traffic Noise

Our analysis estimated future noise from the facility parking lots is based on the following assumptions:

1. Employees will enter and exit the site from the three driveways from the north (via Jack London Boulevard).
2. Vehicle trips will be split between Jack London Boulevard and Isabel Avenue per the TJKM report's traffic projections. Our traffic analysis calculations tell us the following:

- 80% of project generated trips will be along Jack London Boulevard
- 20% of project generated trips will be along Isabel Avenue
- There will be an average noise level increase of approximately 3dB on both roadways due to traffic increases. This increase is not considered to be significant.

3. Once on site, vehicles will travel an average of 15 miles per hour or less.
4. Vehicles will be spread out evenly amongst the parking areas.
5. An average vehicle trip is estimated to last for a cumulative period of about 2 minutes and be at least 900 feet from the nearest commercial property line.
6. Similar percentages were assumed for intra-project vehicle trips in the project parking lots as were truck trips, as shown in the distribution below.

- AM Peak is 7-9 AM- 10.8%
- 9-4 PM -61%
- PM Peak is 4 PM - 6 PM -10.8%
- 6 PM - 10 PM 3.9%
- 10 PM -7 AM 13.4%

[15] Truck source heights excerpted from Caltrans Technical Noise Supplement document (TeNS) document dated October 1998.

Estimated Future Noise Levels

Loading Dock Future Noise Levels (CNEL/DNL)

We estimated noise levels at local receptors from the sources described in the previous section. To account for future increases in local traffic noise levels, we added 1 dB DNL to the measured levels[16] (see Table 4 above).

Table 10 below summarizes the estimated DNL levels at the closest property plane to the east of the building, under the assumption that the facility would receive its trucking activities 24 hours per day.

Table 10: Calculated Future Facility Noise at Noise-Sensitive Land Uses: CNEL/DNL, dBA

Scenario	Nearby Receiving Locations	Existing Noise at Receiver	Loading Docks at Receiver	Intra-Project Traffic Noise Levels at Receiver	Combined Existing plus Project	Change (dB)
24-hour Operations	East Property Line (Residences across Isabel Avenue)	67	61	32	68	+1 dB

The data shows that loading dock-generated noise is not expected to impact adjacent receivers to the north and the residences to the east. The calculated increase in DNL at the nearest property line with the project and future traffic noise levels (near term 2025) will be approximately 1 dB. A change of 3 dB or less is not expected to be noticeable and is not considered significant.

Future L_{50} Noise Levels

The following assumptions were made about the 24-hour operation of the project in our estimated L_{50} calculations:

- The volume of expected truck trips is consistent with the truck trip distribution established in item 6 of the Noise Source Analysis and Assumptions section (i.e., a maximum of 10 truck per hour at nighttime, or 13.4% of trucks between 10:00 pm and 7:00 am).
- The 6- and 10-foot berms will be incorporated into the project.
- Backup alarms are expected to be at a height of approximately 2.5 feet.
- Trucks do not move great distances when their backup alarm is engaged.

[16] The California Department of Transportation assumes a traffic volume increase of three-percent per year, which corresponds to a 1 dB increase in DNL over a ten-year period.

Table 11 summarizes the estimated daytime and nighttime L_{50} for the proposed project. Since backup alarms for nighttime are predicted to occur less than 15 minutes per hour, the criterion can increase by 5 dBA per Policy P2. However, since back up alarms would be more than 15 minutes per hour during the daytime, no additional increases are accounted for in our analysis.

Table 11: Calculated 24-Hour Future Facility L_{50} Value: L_{50}, dBA

Time of Day	Estimated L_{50} Value	Criterion L_{50} Value
Daytime (7am-10pm)	40 dBA	55 dBA
Nighttime (10pm-7am)	35 dBA	50 dBA

Our calculations of overall operational L_{50} noise levels do not exceed the allowable values stated by the City (i.e., Policy P1, Objective N-1.5), it is our understanding that other current similar projects in the vicinity have caused local neighbor complaints due to trucks' back-up alarms at those locations in the past.

Back-up alarms were assumed to be 79 dB at a reference distance of 30 feet. The distance attenuation between the loading dock to the façade of the nearest residence provides a 31 dB reduction. Although backup alarms would be audible from the residences, the L_{50} threshold of 50 dBA will not be exceeded due to the limited number of trips during this timeframe (estimated at 40 trips in 9-hour time frame).

Calculations assumed the source height of these backup alarms to be approximately 2.5 feet from grade. The current buildings would adequately obstruct the direct line-of-sight of these backup alarms to the residential receivers. The dimensions of the proposed berms are calculated to reduce intermittent noise levels (such as those produced by backup alarms) by up to 6 dB at the closest residents.

Quieter backup alarms (aka "squawkers"), which are becoming more prevalent in delivery vehicles for various large e-commerce websites, and other vendors, may be used by trucking operators visiting this site in the future, therefore beeper noise has the potential to be reduced. A best practice for consideration would be to implement these alternative devices in other truck populations in the future.

CONCLUSIONS AND COMMENTS

1. Future loading dock-generated noise (due to on-site trucks and vehicles) over a 24-hour operation period is not expected to impact receivers to the east. The calculated increase in CNEL/DNL at the nearest noise-sensitive residential receivers with the project and future traffic noise levels will be <1 dB. A change of 2 dB or less is not considered significant nor is it expected to be noticeable to residents east of the project site.
2. Temporary construction noise will be consistent with the City's Noise Ordinance and will not exceed the criteria established by General Plan Noise Objectives N-1.1 and N-1.5.

3. Considering the 2,395-foot distance between the nearest loading dock and the closest residents, and the trucks being a stationary source rather than a moving vehicle once the leaving the loading dock area of the project site, the city's L_{50} criterion is not applicable once a truck begins moving closer to the residential area. Given the minority of expected project truck trips conducted in the nighttime hours (10 trips per hour on average from 10 PM to 7 AM), noise from stationary trucks at the nearest loading dock are expected to comply with the City's L_{50} nighttime requirement assuming backup alarms are not continuously operating for more than 30 minutes per hour.

APPENDIX A: FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL NOISE

This section provides background information to aid in understanding the technical aspects of this report.

Three dimensions of environmental noise are important in determining subjective response. These are:

- The intensity or level of the sound
- The frequency spectrum of the sound
- The time-varying character of the sound

Airborne sound is a rapid fluctuation of air pressure above and below atmospheric pressure. Sound levels are usually measured and expressed in decibels (dBA), with 0 dBA corresponding roughly to the threshold of hearing.

The "frequency" of a sound refers to the number of complete pressure fluctuations per second in the sound. The unit of measurement is the cycle per second (cps) or hertz (Hz). Most of the sounds, which we hear in the environment, do not consist of a single frequency, but of a broad band of frequencies, differing in level. The name of the frequency and level content of a sound is its sound spectrum. A sound spectrum for engineering purposes is typically described in terms of octave bands, which separate the audible frequency range (for human beings, from about 20 to 20,000 Hz) into ten segments.

Many rating methods have been devised to permit comparisons of sounds having quite different spectra. Surprisingly, the simplest method correlates with human response practically as well as the more complex methods. This method consists of evaluating all of the frequencies of a sound in accordance with a weighting that progressively de-emphasizes the importance of frequency components below 1000 Hz and above 5000 Hz. This frequency weighting reflects the fact that human hearing is less sensitive at low frequencies and at extreme high frequencies relative to the mid-range.

The weighting system described above is called "A"-weighting, and the level so measured is called the "A-weighted sound level" or "A-weighted noise level." The unit of A-weighted sound level is sometimes abbreviated "dBA." In practice, the sound level is conveniently measured using a sound level meter that includes an electrical filter corresponding to the A-weighting characteristic. All U.S. and international standard sound level meters include such a filter. Typical sound levels found in the environment and in industry are shown in Figure A-1.

Although a single sound level value may adequately describe environmental noise at any instant in time, community noise levels vary continuously. Most environmental noise is a conglomeration of distant noise sources, which results in a relatively steady background noise having no identifiable source. These distant sources may include traffic, wind in trees, industrial activities, etc. and are relatively constant from moment to moment. As natural forces change or as human activity follows its daily cycle, the sound level may vary slowly from hour to hour. Superimposed on this slowly varying background is a succession of identifiable noisy events of brief duration. These may include nearby activities such as single vehicle pass-bys, aircraft flyovers, etc. which cause the environmental noise level to vary from instant to instant.

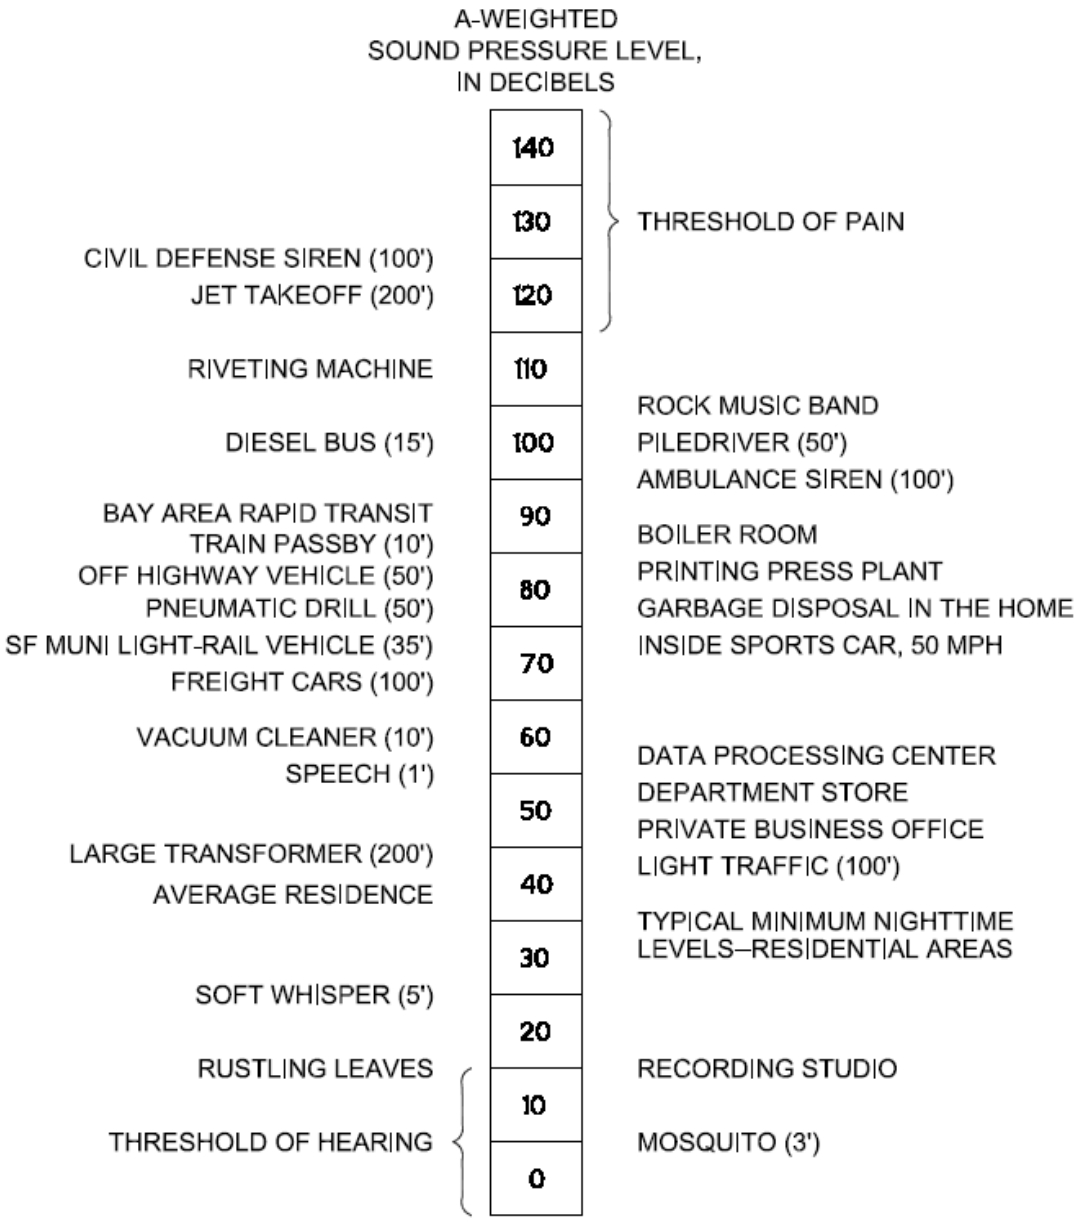
To describe the time-varying character of environmental noise, statistical noise descriptors were developed. "L10" is the A-weighted sound level equaled or exceeded during 10 percent of a stated time period. The L10 is considered a good measure of the maximum sound levels caused by discrete noise events. "L50" is the A-weighted sound level that equals or exceeded 50 percent of a stated time period; it represents the median sound level. The "L90" is the A-weighted sound level equaled or exceeded during 90 percent of a stated time period and is used to describe the background noise.

As it is often cumbersome to quantify the noise environment with a set of statistical descriptors, a single number called the average sound level or "L_{eq}" is now widely used. The term "L_{eq}" originated from the concept of a so-called equivalent sound level which contains the same acoustical energy as a varying sound level during the same time period. In simple but accurate technical language, the L_{eq} is the average A-weighted sound level in a stated time period. The L_{eq} is particularly useful in describing the subjective change in an environment where the source of noise remains the same but there is change in the level of activity. Widening roads and/or increasing traffic are examples of this kind of situation.

In determining the daily measure of environmental noise, it is important to account for the different response of people to daytime and nighttime noise. During the nighttime, exterior background noise levels are generally lower than in the daytime; however, most household noise also decreases at night, thus exterior noise intrusions again become noticeable. Further, most people trying to sleep at night are more sensitive to noise. To account for human sensitivity to nighttime noise levels, a special descriptor was developed. The descriptor is called the L_{dn} (Day/Night Average Sound Level), which represents the 24-hour average sound level with a penalty for noise occurring at night. The L_{dn} computation divides the 24-hour day into two periods: daytime (7:00 am to 10:00 pm); and nighttime (10:00 pm to 7:00 am). The nighttime sound levels are assigned a 10 dBA penalty prior to averaging with daytime hourly sound levels.

For highway noise environments, the average noise level during the peak hour traffic volume is approximately equal to the L_{dn}.

The effects of noise on people can be listed in three general categories:



- Subjective effects of annoyance, nuisance, dissatisfaction
- Interference with activities such as speech, sleep, and learning
- Physiological effects such as startle, hearing loss

The sound levels associated with environmental noise usually produce effects only in the first two categories. Unfortunately, there has never been a completely predictable measure for the subjective effects of noise nor of the corresponding reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and habituation to noise over time.

Thus, an important factor in assessing a person's subjective reaction is to compare the new noise environment to the existing noise environment. In general, the more a new noise exceeds the existing, the less acceptable the new noise will be judged.

Regarding increases in noise level, knowledge of the following relationships will be helpful in understanding the quantitative sections of this report:

Except in carefully controlled laboratory experiments, a change of only 1 dBA in sound level cannot be perceived. Outside of the laboratory, a 3 dBA change is considered a just-noticeable difference. A change in level of at least 5 dBA is required before any noticeable change in community response would be expected. A 10 dBA change is subjectively heard as approximately a doubling in loudness and would almost certainly cause an adverse community response.

Salter Project 21-0471

INTRODUCTION

This report summarizes our study of environmental noise of the proposed project (Livermore Oaks Business Park SMP-40) on nearby land uses. The project site is west of Isabel Avenue (State Highway 84), north of Stanley Boulevard, and south of Discovery Drive in Livermore, California. The purpose of the study was to determine whether estimated activity noise and construction noise from the proposed facility will meet the relevant requirements of the City General Plan Noise Element and Noise Ordinance at adjacent land uses.

EXECUTIVE SUMMARY

- Noise from the project's loading docks, future intra-project vehicle traffic, and likely HVAC equipment will increase CNEL[1] or DNL[2] noise levels at noise-sensitive receiver locations at most by 3 dB. An increase of 3 dB or less DNL is not expected to be noticeable and is not considered significant.
- Noise from project-created traffic would not result in a significant increase in noise levels on Isabel Avenue at adjacent properties.
- Temporary construction noise will exceed the City's Noise Ordinance and will need mitigation measures not to exceed the criteria established by General Plan Noise Objectives N-1.1 and N-1.5.

REPORT ORGANIZATION

This report is organized into the following sections:

- Project Site
- Acoustical Criteria
- Existing Noise Environment
- Noise Impact Assessment
  - Construction Noise
  - Loading Dock and Intra-Project Traffic Noise (Parking Lot)
  - Tenant HVAC Equipment Noise

[1] Community Noise Equivalent Level (CNEL) – A descriptor for the 24-hour A-weighted average noise level. The CNEL concept accounts for the increased acoustical sensitivity of people to noise during the evening and nighttime hours. Sound levels during the hours from 7 pm to 10 pm are penalized 5 dB; sound levels during the hours from 10 pm to 7 am are penalized 10 dB. A 10-dB increase in sound level is perceived by people to be a doubling of loudness.

[2] Day-Night Average Sound Level (DNL) – A descriptor established by the U.S. Environmental Protection Agency to describe the average day-night level with a penalty applied to noise occurring during the nighttime hours (10 pm - 7 am) to account for the increased sensitivity of people during sleeping hours. Also noted as Ldn. The difference between CNEL and DNL is often less than 1 dB.

PROJECT SITE

The proposed project will have a total area of approximately 40 acres, west of Isabel Avenue (State Highway 84) and between Stanley Boulevard and Discovery Drive in the City of Livermore. Warehouse Building 1 will be about 470,350 square feet with 68 loading docks, while Building 2 will be 288,750 square feet with 62 loading docks. The site is adjacent to existing industrially zoned warehouse facilities with loading docks to the north. Noise-sensitive residential receivers are located across Isabel Avenue to the east about 1,785-feet away from Building 1, and 600-feet away the northeast corner of the SMP-40 site. Two berms have been incorporated on the project site: a 6-foot by 125-foot landscape berm on the Northeast corner of the project property line, and a 10-foot by 60-foot screening wall east of Building 2's southern loading docks.

ACOUSTICAL CRITERIA

The following are project criteria and/or guidelines per the City of Livermore and State of California.

City of Livermore 2003-2025 General Plan Noise Element

Policy P4, Objective N-1.1

The Noise Element of the Livermore General Plan (Chapter 9, Policy P4 of Objective N-1.1) contains land use compatibility guidelines for environmental noise in the community. Table 1, below, summarizes these guidelines for residential and industrial land uses[3] in terms of CNEL or DNL. The definitions of each land use category follow below the table.

Table 1: Summary of Table 9-7 – Land Use Compatibility Guidelines for Community Noise CNEL or DNL, dB

Land Use Category	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential Low-Density[4], Single-family, Duplex, Mobile Homes	≤60	55-70	70-75	>75
Industrial, Manufacturing, Utilities, Agricultural	≤75	70-80	>75	--

[3] Table 9-7 of the Noise Element, page 9-27.

[4] Per General Plan Noise Ordinance Objective N-1.4, Policy P4, the criterion for single-family residential back yards is 60 dB CNEL/DNL.

Normally Acceptable: *If the noise level is within the "normally acceptable" level, noise exposure would be acceptable for the intended land use. Development may occur without requiring an evaluation of the noise environment unless the use could generate noise impacts on adjacent uses.*

Conditionally Acceptable: *If the noise level is within the "conditionally acceptable" level, noise exposure would be conditionally acceptable; a specified land use may be permitted only after detailed analysis of the noise environment and the project characteristics to determine whether noise insulation or protection features are required. Such noise insulation features may include measures to protect noise-sensitive outdoor activity areas (e.g., at residences, schools, or parks) or may include building sound insulation treatments such as sound-rated windows to protect interior spaces in sensitive receptors.*

Normally Unacceptable: *If the noise level is within the "normally unacceptable" level, analysis and mitigation are required. Development should generally not be undertaken unless adequate noise mitigation options have been analyzed and appropriate mitigations incorporated into the project to reduce the exposure of people to unacceptable noise levels.*

Clearly Unacceptable: *New construction should not be undertaken unless all feasible noise mitigation options have been analyzed and appropriate mitigation incorporated into the project to adequately reduce exposure of people to unacceptable noise levels.*

Noise Element Objective N-1.5

Objective N-1.5 seeks to reduce the level of noise generated by "stationary mechanical and other noise-generating equipment". Policy P1 states that "the City shall require that industrial and commercial uses be designed and operated to avoid the generation of noise effects on surrounding land uses from exceeding the following noise levels for exterior environments, operating longer than half an hour per hour:

- 55 dBA[5] L50[6] (7:00am to 10:00pm)
- 45 dBA L50 (10:00pm to 7:00am)

Policy P2 allows short-term events to have levels louder than those cited above. For events that occur less than 15 minutes per hour, levels can be increased by 5 dBA; events no more than 5 minutes per hour are allowed an additional 10 dBA, and those taking place one minute or less per hour are allowed an additional 15 dBA.

[5] A-Weighted Sound Level – The A-weighted sound pressure level, expressed in decibels (dB). Sometimes the unit of sound level is written as dB(A). A weighting is a standard weighting that accounts for the sensitivity of human hearing to the range of audible frequencies. People perceive a 10 dB increase in sound level to be twice as loud.

[6] L50 – The noise level exceeded 50% of the time. For a discussion of environmental acoustics, please refer to Appendix A.

Policy P4 allows an exemption from Policy P1 for motor vehicles on public streets between the hours of 7:00am and 8:00pm. We understand that Policies P1, P2, and P4 could apply to the noise from backup alarms (aka "beepers" or "squawkers").

Objective N-1.5 specifically describes "stationary source noises", so when referring to L_{50} noise levels we analyzed the noise of trucks that are expected to sit in the loading dock area, estimated to be at least 1,025 feet from the nearest residence.

Policy P3 establishes instantaneous maximum noise levels allowed (Lmax[7]) of 70 dBA during the day and 60 dBA during the night.

California Department of Transportation (CalTrans) Construction Vibration Criteria

The California Department of Transportation[8] (DOT) provides vibration guidelines for two scenarios: human perception and construction damage. These tables are included below as guidelines for potential project vibration levels. "Transient" vibrations are classified as impulsive events that are short in duration (e.g., debris falling, blasting). "Continuous" vibrations are more sustained vibration events over longer periods of time (e.g., jackhammering, drilling). Table 2 describes the human response to different levels of ground-borne vibration for transient and continuous events.

Table 2: Guideline Vibration Annoyance Potential Threshold Criteria[9]

Human Response	Maximum PPV[10] (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Barely perceptible	0.04	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.90	0.10
Severe	2.00	0.40

7 L_{max} (Maximum Sound Level) – The maximum sound level for a specified measurement period of time as defined in ASTM E1686.

8 Transportation and Construction Vibration Guidance Manual September 2013 (DOT Document).

9 This is Table 20 from the DOT document.

10 (PPV): Peak Particle Velocity.

Table 3 provides a guideline for vibration criteria to assess the damage potential from ground vibration induced by construction equipment. Thresholds for continuous vibrations are lower than those for transient vibrations and are therefore considered more "conservative". These are standard significance thresholds used in the industry to determine impacts of ground borne vibrations on structures.

Table 3: Guideline Vibration Damage Potential Threshold Criteria[11]

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old buildings	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial buildings	2.00	0.50

The immediate adjacent properties are all modern industrial or commercial buildings. Across Isabel Avenue/Highway 84 to the east are existing single-family residences. Based on Table 3, we have applied the more stringent residential criteria of 1.0 PPV for transient events and 0.50 PPV for continuous events.

State of California CEQA Guidelines and Impact Criteria

The California Environmental Quality Act (CEQA) contains guidelines that evaluate the significance of noise attributable to a proposed project. This would include (but is not limited to) added traffic noise, mechanical equipment noise, and construction noise. CEQA asks the following applicable questions. Would the project result in:

1. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
2. Generation of excessive ground borne vibration or ground borne noise levels?
3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public-use airport, would the project expose people residing or working in the project area to excessive noise levels?

11 This is Table 19 of the DOT document.

CEQA does not define the noise level increase that is considered "substantial". Typically, the local general plan would establish limits with respect to allowable noise and vibration increases. However, the City of Livermore General Plan does not contain numerical standards of significance for noise increases. For the items above, noise level increases of 3 dBA or less are generally considered less-than-significant. Substantial adverse community response would be expected only for increases of 5 dBA or more.

EXISTING NOISE ENVIRONMENT

Project Site Description

To quantify the existing site noise environment, two monitors continuously measured noise levels along the project property lines to the north and east between 2 and 4 November 2021. Table 4 summarizes measured data and Figure 1, attached, shows the approximate measurement locations. Locations were selected based not only on project setbacks but also on what nearby locations were accessible via public rights-of-way.

Table 4: Measured Environmental Noise Levels

Site	Location	Measured DNL (dBA)
LT-1	Business Park, approximately 10-feet above grade	65
LT-2	Arroyo Bike Trail, approximately 10-feet above grade	67

Site Noise Context

Noise measurements at the project site (see Figure 1), collected data from vehicle pass-bys on nearby roads. Measured on-site noise levels were DNL 65 dB and 67 dB at the project site (see Figure 1). LT-1 was placed near the nearest existing warehouse across from residences, and LT-2 was placed on the closest accessible utility pole across from residences. Adjustments were made, as appropriate, to estimate the change in noise levels from the long-term monitor location to the locations of the nearest residences east of Isabel Avenue.

We have combined cumulative existing and future noise sources that would result from the project's completion. Future project sources include the proposed loading dock noise, rooftop HVAC equipment, parking areas, and estimated traffic contribution, while the existing noise sources are the existing traffic. Adding expected noise contribution to the existing noise environment logarithmically would result in a noise level of approximately DNL 67 dB from all contributing noise sources upon the project's completion.

DNL 29[a] dB [Future HVAC] + DNL 29[b] dB [employee lot] + DNL 52 [c] dB [trucks] = DNL 52 [d] dB [future noise level at receivers]

a = cumulative building rooftop HVAC noise
b = employee parking lot noise
c = truck noise at loading docks

d = cumulative future project sources

DNL 67[e] dB [existing traffic] + DNL 52[e] dB [combined future sources] = DNL 67[f] dB [future noise level at receivers]

e = measured at project site, see **Figure 1**
e = determined from loading docks + HVAC noise + parking lots
f = calculated

See Appendix A for additional information on decibel mathematics.

NOISE IMPACT ASSESSMENT ANALYSIS

We evaluated the following noise sources from the proposed project on the surrounding environment:

- Potential rooftop mechanical equipment noise
- Short-term construction noise and vibration
- Project-related traffic increases

We have drawn the following conclusions from the analysis:

The following summarizes the portion of the CEQA checklist pertaining to noise.

Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

A: Permanent Increase in Noise Levels due to Project-Generated Noise

The owner anticipates that tenant office spaces located on the corners of each building will be mechanically ventilated with typical 5-ton package units located above the offices in each corner of each building. No other outdoor mechanical equipment has been specified at this time. Specific equipment will be confirmed during the design phase.

Preliminary sound power level data has been provided for these 5-ton outdoor package fan units indicating that combined noise from these units sums to approximately DNL 29 dB at the nearest property lines. This assumes 24-hour operation of this equipment (in line with the operation hours of the building). The rooftop parapet is assumed to provide acoustical shielding to nearby neighbors because they would break line-of-sight to the nearest receivers.

Depending on the final equipment placement, as well as any specific parapets, barriers, and shielding provided by buildings (which would reduce noise levels at the property lines), noise levels may vary. We do not expect the noise contribution to be significant in these aspects.

B: Predicted Permanent Increase in Noise Levels due Project Traffic Volumes

It has been communicated by the team that the projected truck trips per day will be approximately as shown below in Table 5.

Table 5: SMP-40 Truck Trips

Hour	Percent	ITE Trips
7 – 9 AM	9.4%	20
9 AM – 4 PM	42.7%	91
4 – 6 PM	12.7%	27
6 – 10 PM	16.4%	35
10 PM – 7 AM	18.8%	40
Total	100 %	213

Overall, the project would result in a net increase in daily trips by 213, amounting to an overall traffic noise DNL increase of approximately 2 dB. Therefore, this would not result in a significant increase in noise levels at existing adjacent properties.

C: Temporary Increase in Noise Levels due to Construction

Construction activities will likely include the use of heavy equipment for grading and other activities, through completion of buildings and landscaping. Heavy trucks would travel to, from, and within the site hauling soil, equipment, and building materials. Smaller equipment, such as jackhammers, pneumatic tools, and saws could also be used throughout the demolition and construction phases in various areas. The noise and vibration associated with these activities would be generated within the entire project area.

Based on our experience with similar projects' construction methods and phasing, our preliminary understanding and assumptions of expected equipment is shown in Table 6. Reference levels for construction equipment are listed in Table 7, both at the reference distance of 50-feet and at 600-feet, which is the closest distance between the project and the residences across Isabel Avenue.

Table 6: List of Typical Construction Equipment and Phasing

Phase	Equipment
Demolition	Concrete/Industrial Saws, Excavators, Rubber-Tired Dozers, Tractors/Loaders/Backhoes
Site Preparation	Graders, Rubber-Tired Dozers, Tractors/Loaders/Backhoes
Grading/Excavation	Excavators, Drill Rig for Shoring Beams (Caisson Drilling), Rubber-Tired Dozers, Tractors/Loaders/Backhoes
Trenching	Tractor/Loader/Backhoe, Excavators
Building Exterior	Cranes, Forklifts, Generator Sets, Tractors/Loaders/Backhoes, Welders
Building Interior/ Architectural Coating	Air Compressors, Aerial Lift
Paving/Landscaping/ Site Concrete	Cement and Mortar Mixers, Paving Equipment, Rollers, Tractors/Loaders/Backhoes

Table 7: Construction Equipment Reference Noise Levels[12]

Typical Equipment	Estimated Maximum Instantaneous L_{max}[13] Noise Level (dBA at 50 feet)	Estimated Maximum Instantaneous L_{max} Noise Level (dBA at 600 feet)
Aerial Lift	83	61
Air Compressors	81	59
Cement and Mortar Mixers	85	63
Concrete/Industrial Saws	76	54
Cranes	83	61
Drill Rig for Shoring Beams (Caisson Drilling)	85	63
Excavators	85	63
Forklifts	83	61
Generator Sets	81	59
Graders	85	63
Paving Equipment	89	67
Rollers	74	52
Rubber-Tired Dozers	85	63
Tractors/Loaders/Backhoes	84	62
Welders	73	51

Actual construction noise levels will vary based on distance to each piece of equipment or work area from the receiver and shielding from adjacent buildings and construction elements. It should be noted that construction activities are prohibited during the specific time period outlined in Section 9.36.080 of the City's Municipal Code. Section 9.36.080 is as follows:

12 Equipment noise levels at 50-feet are from Section 9, Federal Highway Administration Highway Traffic Noise Construction Noise Handbook (August 2006) and Table 12-2, Transit Noise and Vibration Impact Assessment, United States Department of Transportation, Office of Planning and Environment, Federal Transit Administration, May 2006.

13 L_{max} (Maximum Sound Level) – The maximum sound level for a specified measurement period of time as defined in ASTM E1686.

Section 9.36.080 Hammers, pile drivers, pneumatic tools and similar equipment

The operation between the hours of 6:00 p.m. Saturday to 7:00 a.m. Monday; 8:00 p.m. to 7:00 a.m. on Monday, Tuesday, Wednesday and Thursdays; 8:00 p.m. Friday to 9:00 a.m. on Saturday or at all on city-observed holidays of any pile driver, pneumatic tools, derrick, electric hoist, sandblaster or other equipment used in construction, demolition or other repair work, the use of which is attended by loud or unusual noise, is prohibited. (Ord. 1672 § 2, 2002; Ord. 1128 § 2, 1983; 1960 code § 13B.3(f))

Construction Equipment Schedule

We received the following equipment schedule that CalEEMod utilized for their model for air quality emissions. Table 8 below summarizes the equipment and associated sound levels at the nearest residential property (approximately 600 feet away).

Table 8: Construction Equipment Schedule

Phase Name	Offroad Equipment Type	Amount	Usage Hours	Resulting DNL	Resulting Lmax
Grading	Excavators	2	8	67	66
Grading	Graders	1	8	67	63
Grading	Rubber Tired Dozers	1	8	67	63
Grading	Scrapers	2	8	67	66
Grading	Tractors/Loaders/Backhoes	2	8	67	65
Total Grading Phase	**All Equipment Running Simultaneously**			**70**	**72**
Paving	Pavers	2	8	69	70
Paving	Paving Equipment	2	8	69	70
Paving	Rollers	2	8	66	55
Total Paving Phase	**All Equipment Running Simultaneously**			**70**	**73**
Building Construction	Cranes	1	7	67	61
Building Construction	Forklift	3	8	67	66
Building Construction	Generator Sets	1	8	67	59
Building Construction	Tractors/Loaders/Backhoes	3	7	68	67
Building Construction	Welders	1	8	66	51
Total Building Construction	**All Equipment Running Simultaneously**			**69**	**70**
Architectural Coating	Air Compressors	1	8	67	59

It should be noted that the DNL was calculated using daytime construction noise levels for daytime hours for the listed hours of operation and measured nighttime hours from existing traffic. Despite restrictions of nighttime construction activities, from the noise levels shown above in Table 8, it could be possible to exceed the General Plan Objectives as follows:

Objective N-1.5 P3

- As shown above in Table 8, with all the phases running construction equipment as intended, the resulting Lmax would range between 70 and 73 dBA. Since construction is not permitted during nighttime hours, only the daytime Lmax criterion of 70 dBA would be applicable and would not be met. Therefore, it will be necessary to implement the mitigation measures shown below.

Due to these possibilities, the following is a list of measures that are required to be adopted by the contractor to reduce the impact of construction noise on neighbors:

1. Consistent with the Livermore Municipal Code, construction will be limited to weekdays between the hours of 7:00 a.m. and 8:00 p.m. and Saturdays through Sunday between the hours of 9:00 a.m. and 6:00 p.m.
2. There are residences located approximately 600 feet from the project site. Thus, to help reduce the impact of noise construction, it will be necessary that a barrier be built prior to the planned permanent 10-foot tall berm on the east side of the project. If this is not feasible, we recommend building the planned permanent 10-foot tall berm before construction activities. This will be necessary to reduce construction noise impacts on the residences. The barrier/berm should be 10 feet tall. This would help reduce the construction noise impacts on the residences by approximately 10 dB.
3. The barrier can be field-built provided they meet the following criteria:
    a. Minimum surface density of 4 psf.

        Many constructions could meet the surface density requirement. For example, a stud wall with exterior-grade plywood sheathing and a stucco finish (or two layers of 5/8-inch thick plywood) would meet this requirement.

    b. The barrier should be free of cracks and drainage holes/slots along the bottom of the barrier be kept to a minimum. Where needed, they should be covered by 1 psf mass-loaded vinyl flaps (e.g., Kinetics KNM-100) so water can flow around the vinyl and still drain.

    c. Joints between sheathing layers be offset by 16 inches minimum.
4. Contractors shall utilize “quiet” models of air compressors and other stationary noise sources where technology exists.
5. Internal combustion engine-driven equipment shall be equipped with mufflers which are in good condition and appropriate for the equipment.

6. Stationary noise-generating equipment, such as air compressors and portable power generators, shall be located as far away as possible from adjacent property lines.
7. Staging areas and construction material areas shall be located as far away as feasible from adjacent residences.
8. All unnecessary idling of internal combustion engines should be prohibited.
9. The contractor should designate a "noise disturbance construction superintendent" who will be responsible for tracking and responding to any complaints about construction noise. The noise disturbance construction superintendent will determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and will require that reasonable measures are implemented to correct the problem. The telephone number for the noise disturbance construction superintendent will be posted at the construction site and included in any construction notices sent to neighbors.

Would the project result in generation of excessive ground-borne vibration or ground-borne noise levels?

A: Permanent Increase in Vibration Levels due to Project-Generated Vibration

The planned use for the site, as warehouse buildings, is not expected to generate significant amounts of ground-borne noise or vibration.

B: Temporary Increase in Vibration Levels due to Construction

The nearest and most sensitive adjacent receivers include residences to the east approximately 500 feet from the closest area of construction on the project site. Industrial-zoned parcels to the north are assumed to be less sensitive.

Project construction may include activities such as the use of concrete saws, excavation and grading, and the use of rolling stock equipment (tracked vehicles, compactors, etc.). Typical construction vibration levels at 50-feet are listed in Table 9, below. Most of the construction will occur set back from the property line. As indicated in the criteria section above, the risk of damage to nearby structures may begin to occur at a limit of 1.0 in/sec PPV for transient vibration events and 0.50 PPV for continuous events.

Table 9: Example Construction Vibration Levels[14]

Equipment	PPV at 50 ft. (in/sec)[15]
Vibratory Roller	0.049
Hydraulic Breaker	0.03 to 0.08
Large Bulldozer	0.03
Loaded Trucks	0.03
Excavator	0.03
Caisson/pier drilling	0.03
Jackhammer	0.01
Small Bulldozer	0.001
Crane, Forklift, Bobcat	No significant vibration

Based on the vibration levels shown in Table 9, construction equipment is not expected to cause structural damage to adjacent properties because project construction is not expected to exceed the thresholds for new residential buildings or commercial/industrial structures as shown above in Table 3. Ground-borne noise would also not be expected to be significant at these vibration levels.

FUTURE LOADING DOCK AND INTRA-PROJECT TRAFFIC NOISE

Future Loading Dock Calculation Methodology

Operational noise from the proposed facility is expected to consist primarily of tractor-trailers accessing loading dock areas. To estimate truck noise at the proposed facility, we referenced recently measured noise levels at a local distribution facility which involved semi-trucks similar in size to those that are expected to access the proposed project's facility.

Calculations for resulting noise levels due to on-site truck and car trip generation durations and activities were based on the measurements at this local distribution facility with ancillary information provided to us for that project on 15 February 2018 and 20 December 2023.

Based on the assumptions described below, estimated noise levels were then compared to applicable criteria to determine if noise from the proposed facility would exceed the City's noise goals (described above) at adjacent residences.

14 Table 12-2, Transit Noise and Vibration Impact Assessment, United States Department of Transportation, Office of Planning and Environment, Federal Transit Administration, May 2006.

15 Using a value of n = 1.5 per FTA recommendation, where n is the attenuation rate through the ground

Traffic volumes produced by the proposed project were provided by TJKM in December 2023. Their study estimated that a total of 213 truck trips[16] would occur at the facilities throughout the 24 hours of operation. Overton Moore Properties provided further details about the potentially likely distribution of those trucks each hour throughout the 24-hour operation period.

Intra-Project Traffic Analysis Methodology

Intra-project traffic noise will consist of traffic noise associated with future warehouse employee vehicles within the designated parking lots. To estimate vehicle noise at the employee parking lots, we referenced the TJKM provided traffic volumes for the proposed project.

Noise Source Analysis and Assumptions

Future Loading Docks

Our analysis estimated future noise from the facility based on the following assumptions discussed with the client via email, and per the overall site plan:

1. Trucks will enter and exit the site from Atlantis Court and Challenger Street, from the north (via Discovery Drive).
2. Non-truck noises associated with loading/unloading activity (i.e., forklifts, rolling doors, carts, pallet crushing, items dropping), are assumed to be located near the dock doors and are included in our analysis.
3. An average truck trip (not including unloading/loading) is estimated to last for a cumulative period of about 2 minutes and be at least 1025 feet from the nearest residential property line.
4. Trucks occupy the loading dock in their loading area that is nearest to noise-sensitive receiver (Residents across Isabel Avenue, to the east of the building).
5. Total number of loading docks: 130 (68 in Building 1 and 62 in Building 2)
6. Number and distribution of truck trips is based on TJKM's traffic study estimate, with approximately 213 total truck trips per 24-hour period (continuous 24/7 operation) distributed as follows:
    - AM Peak is 7-9 AM – 9.4%
    - 9-4 PM – 42.7%
    - PM Peak is 4 PM - 6 PM – 12.7%
    - 6 PM - 10 PM – 16.4%
    - 10 PM - 7 AM – 18.8%

[16] Email correspondence provided on 12/20/23 confirmed the 213 daily truck trips as 20% of total vehicle trips based in ITE data (TJKM Study)

7. Building 2 provides substantial acoustical shielding for most of Building 1 and its operations to the eastern residents. Because of this, Building 1 is not expected to have a meaningful impact on the residential receivers' sound environment to the east.
8. Loading docks in Building 2 are located on the north and south facades, configured to maintain the maximum possible distance away from the residential area to the east.
9. North-facing docks of Building 2 will have a direct line-of-sight to the warehouse to the north. We assume that some shielding is provided by the perpendicular orientation of the docks of Building 1, which would slightly reduce our overall calculated noise contribution of the loading docks to the northern warehouse receivers because of the partial line-of-sight.
10. 24-hour operation assumed.
11. Loading docks not in use on each building have closed doors.
12. A typical truck "trip" consists of the following events (estimated sound levels based on aforementioned measurements at similar facilities):
    a. Truck passby (arrival, departure at slow speed): 69 dBA at 30 feet
    b. Truck airbrakes: 72 dBA at 25 feet
    c. Truck backup alarm: 79 dBA at 30 feet
    d. Brief idle before engine shutoff: 70 dBA at 25 feet
    e. Truck engine ignition and airbrakes: 71 dBA at 25 feet
    f. Truck accelerating from stop: 74 dBA at 25 feet
    g. Truck noise source reference heights[17] (above grade)
        i. Passby, brief idle, acceleration, and ignition: 8 feet
        ii. Back-up beeper and airbrake: 2.5 feet
        iii. Topographical site analysis included in Section C3.1 of the Grading and Drainage Plan show potential terrain shielding of about three feet between the dock elevation and receivers to the east of Isabel Avenue

Intra-Project Traffic Noise

Our analysis estimated future noise from the facility parking lots is based on the following assumptions:

1. Employees will enter and exit the site from Atlantis Court and Challenger Street, from the north (via Discovery Drive).
2. Once on site, vehicles will move at 15 miles per hour or less.
3. Vehicles will be spread out evenly amongst the seven parking areas.

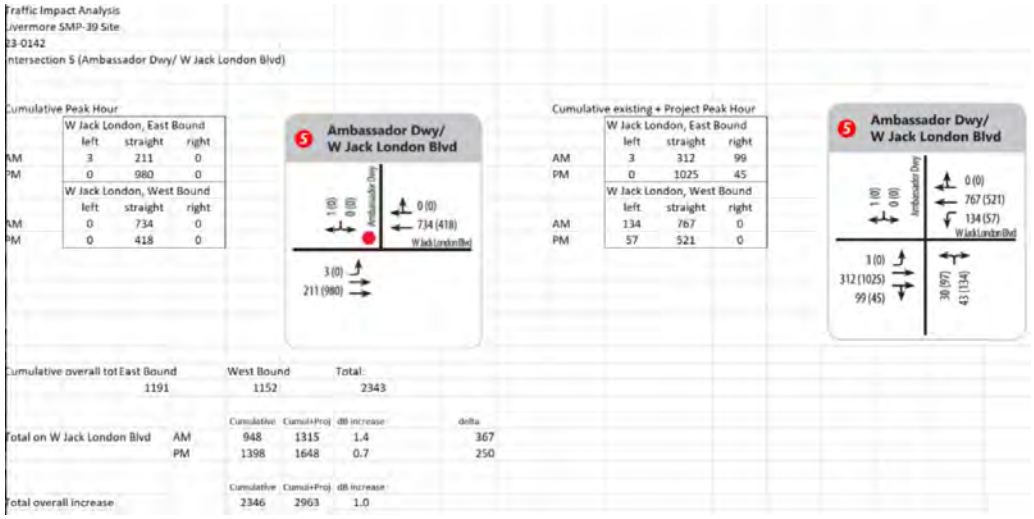
[17] Truck source heights excerpted from Caltrans Technical Noise Supplement document (TeNS) document dated October 1998.

4. An average vehicle trip is estimated to last for a cumulative period of about 2 minutes and be at least 550 feet from the nearest residential property line.
5. Similar proportional percentages were assumed for vehicle trips in the project parking lots as were the truck trips, as shown in the distribution below.
    - AM Peak is 7 AM - 9 AM- 9.4%
    - 9 AM – 4 PM -42.7%
    - PM Peak is 4 PM -6 PM -12.7%
    - 7 PM - 10 PM 16.4%
    - 10 PM - 7 AM 18.8%

Estimated Future Noise Levels

Future Average Noise Levels (CNEL/DNL)

We estimated noise levels at local receptors from the sources described in the previous section. To account for future increases in local traffic noise levels (growth in traffic on Isabel Avenue and other local roadways), we added 1 dB DNL to the measured levels[18] (see Table 4 above).



We calculated the acoustical impact of project traffic increase due to both projects SMP-39 and SMP-40 with the provided peak hour traffic volumes for the cumulative without project and cumulative with project scenarios. The analysis used the FHWA-RD-77-108 traffic noise calculation model. The figures below show the various calculations for the intersections of interest (i.e., 5, 9, 10, and 11) as provided to us via the traffic volume study developed for both SMP-39 and SMP-40.

Figure A: Intersection Map Legend

[18] The California Department of Transportation assumes a traffic volume increase of three-percent per year, which corresponds to a 1 dBA increase in DNL over a ten-year period.

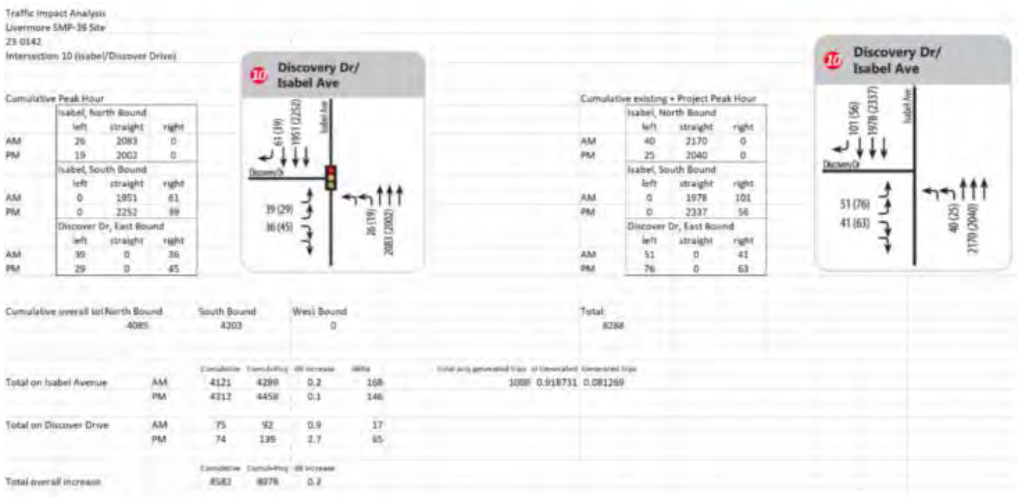
Figure D: Traffic Volume Analysis for Intersection 10



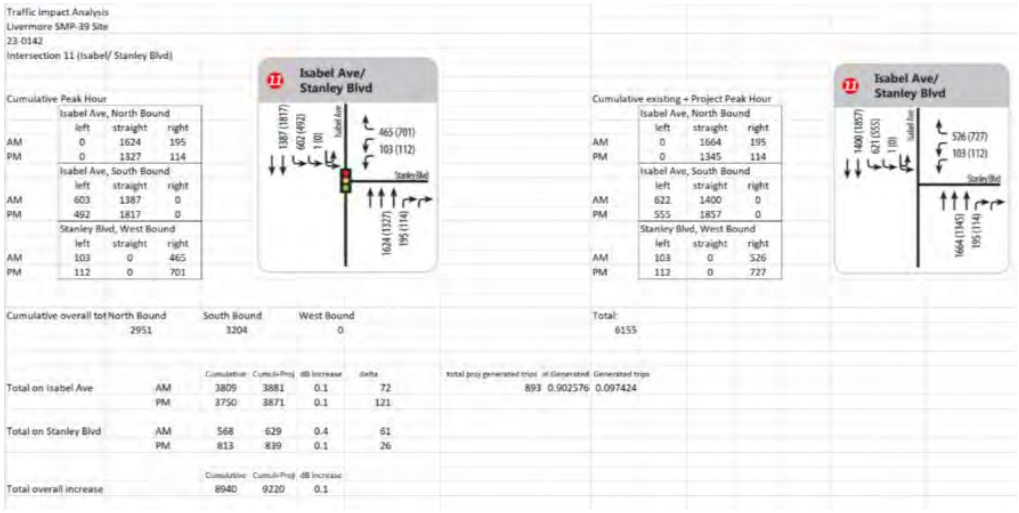


Figure E: Traffic Volume Analysis for Intersection 11

As shown above, the increase in traffic due to the project would be approximately 1 to 2 dBA to the DNL when combined.

Table 10 below summarizes the estimated DNL levels at the closest property plane to the east of the building, under the assumption that the facility would receive its trucking and commuting employee activities during the 24 hours of operation.

Table 10: Calculated 24-Hour Future Facility Noise at Nearest Noise-Sensitive Land Uses: CNEL/DNL, dBA

Nearby Receiving Locations	Existing Noise at Receiver (Residences)	Loading Docks at Receiver	Intra-Project Traffic Noise Levels at Receiver	Combined Existing plus Project	Change (dBA)
East Property Line (Residences across Isabel)	67	60	32	69	+2
North Property Line (Neighboring Warehouse)	65	65	36	68	+3

The calculated increase in DNL at the residential property line with the project and future traffic noise levels (near term 2025) will be approximately 2 dB. At the northern industrial uses, a DNL 3 dB change is predicted. A change of 3 dB or less is not expected to be noticeable and is not considered significant.

Our calculations of maximum noise levels assume that the trucks operating at the closest docks to the residences will be active at the same proportion as stated above. The noise analysis also assessed the increase in traffic noise levels resulting from project traffic in combination with future traffic noise level increases on the surrounding roadway network resulting from other anticipated development in the region. The resultant cumulative increase is 3 dB. This would not be considered a significant increase to the predicted project operation noise environment.

Future L_{50} Noise Levels

The following assumptions were made about the 24-hour operation of the project in our estimated L_{50} calculations:

- The volume of expected truck trips is consistent with the truck trip distribution established in item 6 of the Noise Source Analysis and Assumptions section (i.e., a maximum of 5 trucks per hour at nighttime, or 18.8% of trucks between 10:00 pm and 7:00 am).
- The 6- and 10-foot berms will be incorporated into the project.
- Backup alarms are expected to be at a height of approximately 2.5 feet.
- Trucks do not move great distances when their backup alarm is engaged.

Table 11 summarizes the estimated daytime and nighttime L_{50} for the proposed project. Since backup alarms for nighttime are predicted to occur less than 15 minutes per hour, the criterion can increase by 5 dBA per Policy P2. However, since back up alarms would be more than 15 minutes per hour during the daytime, no additional increases are accounted for in our analysis.

Table 11: Calculated 24-Hour Future Facility L_{50} Value: L_{50}, dBA

Time of Day	Estimated L_{50} Value	Criterion L_{50} Value
Daytime (7am-10pm)	50 dBA	55 dBA
Nighttime (10pm-7am)	45 dBA	50 dBA

Although our calculations of overall operational L_{50} noise levels do not exceed the allowable values stated by the City (i.e., Policy P1, Objective N-1.5), backup alarm noise may be audible at residences to the east during quieter nighttime hours. It is our understanding that other current similar projects in the vicinity have caused local neighbor complaints due to trucks' back-up alarms at those locations in the past.

Back-up alarms were assumed to be 79 dB at a reference distance of 30 feet. The distance attenuation between the loading dock to the façade of the nearest residence provides a 31 dB reduction. Although backup alarms would be audible from the residences, the L_{50} threshold of 50 dBA will not be exceeded due to the limited number of trips during this timeframe (estimated at 40 trips in 9-hour time frame).

Calculations assumed the source height of these backup alarms to be approximately 2.5 feet from grade. The incorporation of the proposed 6- and 10-foot-tall berms would adequately obstruct the direct line-of-sight of these backup alarms to the residential receivers. The dimensions of the proposed berms are calculated to reduce intermittent noise levels (such as those produced by backup alarms) by up to 6 dB at the closest residents.

Quieter backup alarms (aka "squawkers"), which are becoming more prevalent in delivery vehicles for various large e-commerce websites, and other vendors, may be used by trucking operators visiting this site in the future, therefore beeper noise has the potential to be reduced. A best practice for consideration would be to implement these alternative devices in other truck populations in the future.

CONCLUSIONS AND COMMENTS

1. Future cumulative project site noise from rooftop HVAC equipment, loading dock-generated noise, stationary trucks, and employee vehicles, is not expected to significantly impact receivers to the east or to the north. The calculated increase in CNEL/DNL for the warehouse receivers to the north will be 3 dB, while the closest residential receivers across Isabel Avenue will have a 2dB increase from the existing environment under the expected 24-hour operations.

   A change of 3 dB or less is not considered significant for residents to the east or the commercial neighbors to the north of the project site. A cumulative DNL of 69 dB for the receivers does not exceed the industrial 75 dB DNL threshold defined in Table 9-7 of the Livermore Noise Element as well as the L_{50} level from Objective N-1.5 of the General Plan.

   Considering the 1,025-foot distance between the nearest loading dock and the closest residents, and the trucks being a stationary source rather than a moving vehicle once the leaving the loading dock area of the project site, the city's L_{50} criterion is not applicable once a truck begins moving closer to the residential area. Given the minority of expected project truck trips conducted in the nighttime

hours (less than 5 trips per hour on average from 10 PM to 7 AM), noise from stationary trucks at the nearest loading dock are expected to comply with the City's L_{50} nighttime requirement assuming backup alarms are not continuously operating for more than 30 minutes per hour.

2. Temporary construction noise will impact the residences, and thus, it will be necessary to incorporate mitigation measures such as a 10-foot-tall berm or barrier on the east side of the project to reduce the noise by 10 dB.

3. It is our understanding that there are no State or Federal requirements for noise levels of backup alarms except for OSHA, which only requires them to be "significantly louder" than the surrounding environment. Because the background noise levels around most facilities are not known, manufacturers typically increase the alarm volume to compensate.

   Best practices to reduce alarm audibility at the facility to be evaluated would be to require users to limit alarm volume levels, employ signal personnel, lights, and other means to notify people about ongoing truck activities within the facility.

APPENDIX A: FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL NOISE

This section provides background information to aid in understanding the technical aspects of this report.

Three dimensions of environmental noise are important in determining subjective response. These are:

- The intensity or level of the sound
- The frequency spectrum of the sound
- The time-varying character of the sound

Airborne sound is a rapid fluctuation of air pressure above and below atmospheric pressure. Sound levels are usually measured and expressed in decibels (dBA), with 0 dBA corresponding roughly to the threshold of hearing.

The "frequency" of a sound refers to the number of complete pressure fluctuations per second in the sound. The unit of measurement is the cycle per second (cps) or hertz (Hz). Most of the sounds, which we hear in the environment, do not consist of a single frequency, but of a broad band of frequencies, differing in level. The name of the frequency and level content of a sound is its sound spectrum. A sound spectrum for engineering purposes is typically described in terms of octave bands, which separate the audible frequency range (for human beings, from about 20 to 20,000 Hz) into ten segments.

Many rating methods have been devised to permit comparisons of sounds having quite different spectra. Surprisingly, the simplest method correlates with human response practically as well as the more complex methods. This method consists of evaluating all of the frequencies of a sound in accordance with a weighting that progressively de-emphasizes the importance of frequency components below 1000 Hz and above 5000 Hz. This frequency weighting reflects the fact that human hearing is less sensitive at low frequencies and at extreme high frequencies relative to the mid-range.

The weighting system described above is called "A"-weighting, and the level so measured is called the "A-weighted sound level" or "A-weighted noise level." The unit of A-weighted sound level is sometimes abbreviated "dBA." In practice, the sound level is conveniently measured using a sound level meter that includes an electrical filter corresponding to the A-weighting characteristic. All U.S. and international standard sound level meters include such a filter. Typical sound levels found in the environment and in industry are shown in Figure A-1.

Although a single sound level value may adequately describe environmental noise at any instant in time, community noise levels vary continuously. Most environmental noise is a conglomeration of distant noise sources, which results in a relatively steady background noise having no identifiable source. These distant sources may include traffic, wind in trees, industrial activities, etc. and are relatively constant from moment to moment. As natural forces change or as human activity follows its daily cycle, the sound level may vary slowly from hour to hour. Superimposed on this slowly varying background is a succession of

identifiable noisy events of brief duration. These may include nearby activities such as single vehicle pass-bys, aircraft flyovers, etc. which cause the environmental noise level to vary from instant to instant.

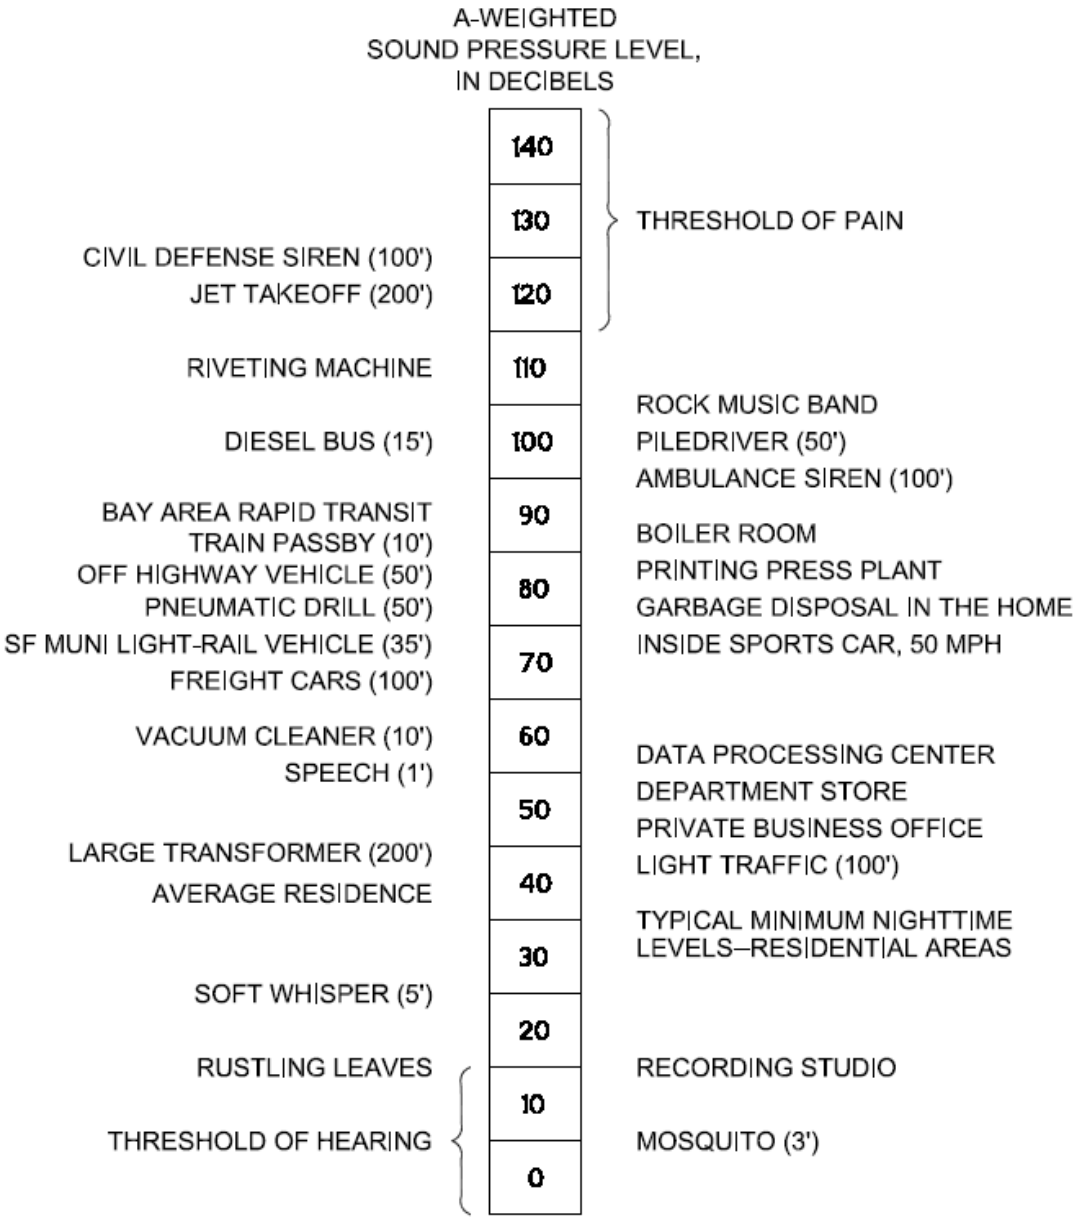
To describe the time-varying character of environmental noise, statistical noise descriptors were developed. "L10" is the A-weighted sound level equaled or exceeded during 10 percent of a stated time period. The L10 is considered a good measure of the maximum sound levels caused by discrete noise events. "L50" is the A-weighted sound level that is equaled or exceeded 50 percent of a stated time period; it represents the median sound level. The "L90" is the A-weighted sound level equaled or exceeded during 90 percent of a stated time period and is used to describe the background noise.

As it is often cumbersome to quantify the noise environment with a set of statistical descriptors, a single number called the average sound level or "L_{eq}" is now widely used. The term "L_{eq}" originated from the concept of a so-called equivalent sound level which contains the same acoustical energy as a varying sound level during the same time period. In simple but accurate technical language, the L_{eq} is the average A-weighted sound level in a stated time period. The L_{eq} is particularly useful in describing the subjective change in an environment where the source of noise remains the same but there is change in the level of activity. Widening roads and/or increasing traffic are examples of this kind of situation.

In determining the daily measure of environmental noise, it is important to account for the different response of people to daytime and nighttime noise. During the nighttime, exterior background noise levels are generally lower than in the daytime; however, most household noise also decreases at night, thus exterior noise intrusions again become noticeable. Further, most people trying to sleep at night are more sensitive to noise. To account for human sensitivity to nighttime noise levels, a special descriptor was developed. The descriptor is called the L_{dn} (Day/Night Average Sound Level), which represents the 24-hour average sound level with a penalty for noise occurring at night. The L_{dn} computation divides the 24-hour day into two periods: daytime (7:00 am to 10:00 pm); and nighttime (10:00 pm to 7:00 am). The nighttime sound levels are assigned a 10 dBA penalty prior to averaging with daytime hourly sound levels.

For highway noise environments, the average noise level during the peak hour traffic volume is approximately equal to the L_{dn}.

The effects of noise on people can be listed in three general categories:



- Subjective effects of annoyance, nuisance, dissatisfaction
- Interference with activities such as speech, sleep, and learning
- Physiological effects such as startle, hearing loss

The sound levels associated with environmental noise usually produce effects only in the first two categories. Unfortunately, there has never been a completely predictable measure for the subjective effects of noise nor of the corresponding reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and habituation to noise over time.

Thus, an important factor in assessing a person's subjective reaction is to compare the new noise environment to the existing noise environment. In general, the more a new noise exceeds the existing, the less acceptable the new noise will be judged.

With regard to increases in noise level, knowledge of the following relationships will be helpful in understanding the quantitative sections of this report:

Except in carefully controlled laboratory experiments, a change of only 1 dBA in sound level cannot be perceived. Outside of the laboratory, a 3 dBA change is considered a just-noticeable difference. A change in level of at least 5 dBA is required before any noticeable change in community response would be expected. A 10 dBA change is subjectively heard as approximately a doubling in loudness, and would almost certainly cause an adverse community response.

SMP 39/SMP 40 Project
Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum

In addition to the letters that were provided responses in the "Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum", as well as the "Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum" dated March 4, 2024, the City received four subsequent comment letters in regard to the proposed project. Written comments were received from the following entities:

Date	Commenter
3/5/2024	Grace Holbrook, Attorneys for Carpenters Local 713 (1)
3/5/2024	Grace Holbrook, Attorneys for Carpenters Local 713 (2)
N/A	Pete Sheehan, Golden State Environmental Justice Alliance
3/5/2024	Margaret R. Akerblom, Allen Matkins Leck Gamble Mallory & Natsis LLP

While CEQA does not require that written responses be provided for letters received after the close of the public review period, the comments are acknowledged by the City, and the City has chosen to prepare written responses to the comments for the decision-makers consideration in making an informed decision. Responses to the comment letters, which are included as Attachment 1, are provided below. Where revisions to the EIR text are required in response to a comment, new text is double underlined and deleted text is ~~struck through~~.

The comments received did not identify any new significant impact, substantial increase in severity of a significant impact identified in the EIR, or any significant new information. Therefore, recirculation of the EIR is not required.

Response to Grace Holbrook, Attorneys for Carpenters Local 713 (1)
The majority of the comment letter, including the entirety of Comment I and Comment II within the comment letter, is identical to the comment letter dated February 14, 2024 submitted by Attorneys for Carpenters Local 713 and responded to in the "Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum" dated March 4, 2024. As such, with regard to Comment I and Comment II included in the comment letter, please see the "Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum."

The only new comment included in the letter is Comment III related to certification/recirculation of the Final EIR. See the response provided below regarding certification/recirculation of the EIR. As discussed above, CEQA does not require that written responses be provided for letters received after the close of the public review period. Nonetheless, the City has voluntarily provided written responses to all letters submitted by the commenter, including those received after the close of the Draft EIR public review period, and has addressed all environmental issues mentioned in the comment letters. The commenter does not provide any justification to support their claim that "the City provided inadequate responses" to their concerns.

Response to Grace Holbrook, Attorneys for Carpenters Local 713 (2)
As clearly stated in the in the "Supplemental Responses to Comments Received After the Close of the Draft Environmental Impact Report Public Review Period and Erratum" dated March 4, 2024, under *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1993) 6 C4th 1112

(*Laurel Heights II*) and Section 15088.5 of the State CEQA Guidelines,[1] a lead agency is only required to recirculate a draft EIR when "significant new information" is added to the document after public notice is given of the availability of the Draft EIR for public review under Section 15087 but before certification. Pursuant to CEQA Guidelines Section 15088.5, the term "information" can include changes in the project or environmental setting, as well as additional data or other information. New information added to an EIR is not considered "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the City has decided not to implement. "Significant new information" requiring recirculation includes any of the following:

1. A new significant environmental impact would result from the project or for a new mitigation measure proposed to be implemented.
2. A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
3. A feasible project alternative or mitigation measure considerably different from other previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
4. The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

The revisions made to the Draft EIR in response to comments received did not identify any new significant impact, substantial increase in severity of a significant impact identified in the EIR, or any significant new information. Specifically, in the case of the proposed project, while revisions were made to Chapter 4.6, Noise, of the Draft EIR, the Draft EIR already determined that the proposed project would result in a significant temporary construction noise impact (see page 4.6-23 of the Draft EIR). Thus, a new impact related to noise has not been identified in response to public comments. In addition, the revisions did not find that the Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. Therefore, recirculation of the EIR related to criteria 1, 2, or 4, described above, is not required.

With regard to criterion 3, while a new construction noise mitigation measure (Mitigation Measure 4.6-1[a]) has been added in response to public comments, the measure is feasible and would clearly lessen the potential environmental impact to a less-than-significant level. In addition, the requirements of Mitigation Measure 4.6-1(a) are similar to the requirements already included in Mitigation Measure 4.6-1 of the Draft EIR. Furthermore, the applicant has agreed to adopt Mitigation Measure 4.6-1(a). Thus, according to Section 15188.5(a)(3), recirculation is not required.

The written responses to comments received after the close of the Draft EIR public review period, as well as the associated errata showing further revisions to the Draft EIR text since the Final EIR was released, are included in the record and considered part of the EIR. As stated in the Findings, Facts in Support of Findings, and Statement of Overriding Considerations prepared for the proposed project, the Draft EIR, Final EIR, Mitigation Monitoring and Reporting Program (MMRP), and the written responses to comments and associated errata prepared subsequent to the Final EIR that were included with the Planning Commission and City Council staff reports together comprise the EIR for the project.

[1] Stephen L. Kostka and Michael H. Zischke. *Practice Under the California Environmental Quality Act, Second Edition, March 2022 Update, Volume 2*. March 2022, pg. 16-21.

It should also be noted that, while the commenter states that, "the Planning Commission must not certify the Final EIR until, at a minimum, the document reflects the most up-to-date version," the Planning Commission is not charged with certifying the Final EIR. Rather, the Planning Commission's action related to the CEQA document for the proposed project is whether or not to recommend that City Council adopt a resolution certifying the Final EIR. The City Council has the decision-making authority on the proposed project.

Response to Pete Sheehan, Golden State Environmental Justice Alliance

The comment letter does not provide any new information or comments beyond the comment letter dated October 13, 2023, submitted by Golden State Environmental Justice Alliance during the Draft EIR comment period, to which the City provided responses in the Final EIR. As such, with regard to the comments and information included in this subsequent comment letter, please see Response to Comment 6-8 included on page 2-105 of the Final EIR. As stated therein, the commenter's concerns and information appear to be related to environmental justice; however, CEQA Guidelines Appendix G does not include a section specifically dedicated to the topic of environmental justice. In addition, the analysis of potential health effects of criteria pollutants is discussed under Impact 4.2-6 of the Draft EIR, which begins on page 4.2-54. The Draft EIR also includes an evaluation of aggregate total health risks in the Air Quality, Greenhouse Gas Emissions, and Energy chapter, starting on page 4.2-58. As detailed therein, in accordance with Bay Area Air Quality Management District (BAAQMD) Air Quality Guidelines, an analysis of all known sources of toxic air contaminants (TACs) within a 1,000-foot radius of the project site boundary was conducted, in conjunction with health risks associated with the proposed project, and compared to the applicable BAAQMD thresholds of significance. As shown in Table 4.2-12 of the Draft EIR on page 4.2-58, the evaluation included a quantitative analysis of health risks associated with heavy-duty truck operations, emergency generators, and vehicles traveling along Isabel Avenue/SR 84. The Draft EIR concludes that the proposed project would not cause an aggregate total increase in cancer risk levels of more than 100 persons in one million, a chronic non-cancer hazard index greater than 10.0, or result in an annual average concentration of 0.8 micrograms per cubic meter ($\mu g/m^3$) or greater of particulate matter 2.5 micrometers in diameter ($PM_{2.5}$), and a less-than-significant impact would occur.

Furthermore, the Draft EIR notes in several instances throughout Chapter 4.2, Air Quality, Greenhouse Gas Emissions, and Energy, that the San Francisco Bay Area Air Basin is designated as nonattainment for State and federal eight-hour ozone and State PM_{10} ambient air quality standards (AAQS). The BAAQMD's thresholds of significance for CEQA review were established with consideration given to the health-based AAQS and are designed to aid the BAAQMD in implementing the applicable attainment plans to achieve attainment of the AAQS.[2]

Response to Margaret R. Akerblom, Allen Matkins Leck Gamble Mallory & Natsis LLP

The provision of safety features and fencing along the proposed trail are not a CEQA issue. The proposed trail would be constructed in accordance with all applicable City standards, including those set forth within Chapter 12, Parks and Trails, of the City of Livermore Design Standards and Guidelines, and all additional design standards included in the proposed SMP 40 Development Agreement. The proposed trail design is conceptual at this time. The City will review the final design of the trail to ensure consistency with all applicable standards. To assume that the public would leave the Zone 7 portion of the proposed trail and enter the Arroyo Mocho or the adjacent mining properties, or that doing so would create a substantial public safety hazard, is speculative. The comment is noted for the record and will be forwarded to the decision-makers for their consideration.

[2] Bay Area Air Quality Management District. *Air Quality Guidelines* [pg. 5-10]. April 2023.

Additional Staff-Initiated Changes
Based on comments received by the Planning Commission during the March 5, 2024 public hearing on the proposed project, the following additional staff-initiated changes have been made to Mitigation Measure 4.8-3 of the Draft EIR:

> *4.8-3* *Prior to the issuance of the first building permit, the project applicant shall be required to develop a Transportation Demand Management (TDM) Program for SMP 39 and SMP 40. The TDM Program shall be monitored by the project applicant/operator on an annual basis to determine the efficacy of the selected TDM strategies in achieving the reduction below the regional average VMT per employee of three percent (i.e., the performance target). An Annual Status Report on the TDM Program shall be submitted to the City of Livermore Engineering Division beginning a year after the issuance of any certificate of occupancy and shall include details on the TDM strategies, including an Employer Carpool Program which has a goal to reduce VMT per employee by approximately four percent and, thus, would meet and exceed the performance target. The Employer Carpool Program shall implement a ridesharing program and establish a permanent transportation management association with funding requirements for employers. Data shall be collected in October of each year and the Annual Status Report shall be submitted by December 31st of each year. The report shall be prepared in the form and format designated by the City. The data shall include project-generated VMT estimates compatible with the methodology used to estimate the benchmark VMT so that performance comparisons can be made. If the Annual Status Report demonstrates that the project is not in compliance with the performance target set forth in this mitigation measure, the project must incorporate additional TDM strategies to meet the performance target in coordination with City staff. The project applicant/operator may propose new TDM strategies that develop over time to further reduce project-generated VMT if substantial evidence is provided to support the efficacy of the strategy. If the Annual Status Reports demonstrate that the performance target has been achieved for ~~three~~ five consecutive years once SMP 39 and SMP 40 are both fully occupied and operational, the project shall no longer need to provide annual reporting. The five-year reporting requirement shall reset when a new use occupies any portion of the SMP 39 or SMP 40 property.*

The foregoing revisions are for clarification purposes and do not change the conclusions of the Draft EIR. In addition, the applicant has agreed to the foregoing changes to Mitigation Measure 4.8-3.

The MMRP, as well as the Findings, Facts in Support Of Findings, and Statement Of Overriding Considerations, have been updated to reflect all changes made to the Draft EIR text since the close of the Draft EIR public review period, and are included in the staff report packet for the City Council hearing on the proposed project.

RE: City of Livermore's SMP 39 and 40 Planning Commission Meeting

Dear Ashley Vera,

On behalf of "**Carpenters Local 713**", my Office is submitting these comments for the City of Livermore's ("**City**") Draft Environmental Impact Report ("**Draft EIR**" or "**DEIR**") and Final Environmental Impact Report ("**Final EIR**" or "**FEIR**") for the **March 5, 2024 Planning Commission Meeting** for the SMP 39 and 40 Project ("**Project**").

According to the Project's Notice of Availability ("**NOA**") of a Draft EIR Project Description:

> "On **SMP 38**, the proposed project includes a Sphere of Influence (SOI) Amendment to **include** SMP 38 within the **City of Livermore** SOI and **remove** it from the **City of Pleasanton's** SOI. The City of Livermore General Plan land use designation for SMP 38 would remain Limited Agriculture and Open Space/Sand and Gravel and the Alameda County zoning designation would remain Agriculture. **Development of SMP 38** is **not proposed**.
>
> For **SMP 39**, the proposed project would include development of a total of **up to six light industrial buildings**, consisting of **up to approximately 755,500 square feet** (sf) of new building space, and associated **internal roadways** and **other** improvements. **For SMP 40**, the proposed project would include development of **two industrial buildings** containing up to **759,275 sf of new building space** with

related **internal roadways** and **other** improvements. A number of approvals would be required for development of SMP 39 and SMP 40, including a **SOI Amendment for SMP 39**, **General Plan Amendment**, **Pre-zoning** and **Annexation**, **Zoning Map Amendment**/Planned Development, Vesting Tentative Subdivision **Maps**, a **Pre-Annexation Agreement**, and **Development Agreement**. A **Site Plan Design Review** entitlement is required for SMP 39 and SMP 40, which would include a review of the site plan, building, and landscape design; however, the entitlement is **only proposed for SMP 40 at this time**. A Site Plan Design Review entitlement will be required **at a later date** for the future development of **SMP 39**. In addition, the proposed project would include **annexation of four additional parcels** (APNs 904-10-2-3, -5, -7, and -8) located **east of SMP 40**. Development is **not proposed** on the additional parcels **as part** of the proposed project.

The project would include a **paved at-grade, on-site trail along the boundaries** of the SMP 40 site, consistent with the City's Active Transportation Plan. Specifically, the on-site trail would extend from the northeastern corner of the site, along the project site's eastern, southern, and western boundaries, before connecting to an existing off-site paved shared-use path at the northwestern corner of site, which extends along the west side of the Oaks Business Park to the north and connects to West Jack London Boulevard.

In addition, the project would include a **new off-site connection to the existing Arroyo Mocho Trail**, located on the east side of Isabel Avenue/SR 84. For the purposes of the Draft EIR analysis, three alternatives for the proposed off-site Isabel Avenue/SR 84 crossing to the existing Arroyo Mocho Trail are considered and evaluated in the Draft EIR, including the following, and described in more detail in the Draft EIR:

- Trail Connection Option 1 – **At-Grade** Crossing at **Discovery Drive**;
- Trail Connection Option 2 – **Undercrossing** at **Isabel** Bridge; and
- Trail Connection Option 3 – **Overcrossing** of **Isabel** Avenue/SR 84."

NOA of Draft EIR, pp. 1-2, emph. added.

The concurrently circulated Draft EIR contains the same project description. DEIR, pp. 1-2—1-4.

Carpenters Local 713 is a labor union representing union carpenters in Alameda County , and has a strong interest in well-ordered land use planning and in addressing the environmental impacts of development projects.

Local 713 members live, work, and recreate in the City and surrounding communities and would be directly affected by the Project's environmental impacts.

Carpenters Local 713 expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Res. Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

Carpenters Local 713 incorporates by reference all comments related to the Project or its CEQA review, including the Environmental Impact Report. See *Citizens for Clean Energy v City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, Carpenters Local 713 requests that the City provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**) (Pub. Res. Code, § 21000 *et seq.*), and the California Planning and Zoning Law ("**Planning and Zoning Law**") (Gov. Code, §§ 65000–65010). California Public Resources Code Sections 21092.2, and 21167(f) and California Government Code Section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

I. THE CITY SHOULD REQUIRE THE USE OF A LOCAL WORKFORCE TO BENEFIT THE COMMUNITY'S ECONOMIC DEVELOPMENT AND ENVIRONMENT

The City should require the Project to be built using local workers who have graduated from a Joint Labor-Management Apprenticeship Program and make a commitment to hiring a local workforce.

Community benefits such as local hire can also be helpful to reduce environmental impacts and improve the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site can reduce the length of vendor trips, reduce greenhouse gas emissions, and provide localized economic benefits. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai re Local Hire Requirements and Considerations for Greenhouse Gas Modeling.

Workforce requirements promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

Furthermore, workforce policies have significant environmental benefits given that they improve an area's jobs-housing balance, decreasing the amount and length of job commutes and the associated greenhouse gas (GHG) emissions. In fact, on May 7,

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf.

2021, the South Coast Air Quality Management District found that that the "[u]se of a local state-certified apprenticeship program" can result in air pollutant reductions.[2]

Locating jobs closer to residential areas can have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[3]

Moreover, local hire mandates and skill-training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and Michael Duncan have noted, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match those held by local residents.[4] Some municipalities have even tied local hire and other workforce policies to local development permits to address transportation issues. Cervero and Duncan note that:

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about

[4] Cervero, Robert and Duncan, Michael (2006) Which Reduces Vehicle Travel More: Jobs-Housing Balance or Retail-Housing Mixing? Journal of the American Planning Association 72 (4), 475-490, 482, *available at* http://reconnectingamerica.org/assets/Uploads/UTCT-825.pdf.

negotiating corporate participation in First Source as a condition of approval for development permits.

Recently, the State of California verified its commitment towards workforce development through the Affordable Housing and High Road Jobs Act of 2022, otherwise known as Assembly Bill No. 2011 ("**AB2011**"). AB2011 amended the Planning and Zoning Law to allow ministerial, by-right approval for projects being built alongside commercial corridors that meet affordability and labor requirements.

The City should consider utilizing local workforce policies and requirements to benefit the local area economically and to mitigate greenhouse gas, improve air quality, and reduce transportation impacts.

II. THE PROJECT WOULD BE APPROVED IN VIOLATION OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

A. Background Concerning the California Environmental Quality Act

The California Environmental Quality Act is a California statute designed to inform decision-makers and the public about the potential significant environmental effects of a project. 14 California Code of Regulations ("**CEQA Guidelines**"), § 15002, subd. (a)(1).[5] At its core, its purpose is to "inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made." *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.

1. Background Concerning Environmental Impact Reports

CEQA directs public agencies to avoid or reduce environmental damage, when possible, by requiring alternatives or mitigation measures. CEQA Guidelines, § 15002, subds. (a)(2)-(3); see also *Berkeley Keep Jets Over the Bay Committee v. Board of Port Comes* (2001) 91 Cal.App.4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553; *Laurel Heights Improvement Assn.*, 47 Cal.3d at p. 400. The EIR serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced." CEQA

[5] The CEQA Guidelines, codified in Title 14 of the California Code of Regulations, section 15000 et seq., are regulatory guidelines promulgated by the state Natural Resources Agency for the implementation of CEQA. Cal. Pub. Res. Code, § 21083. The CEQA Guidelines are given "great weight in interpreting CEQA except when . . . clearly unauthorized or erroneous." *Center for Biological Diversity v. Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 217.

Guidelines, § 15002, subd. (a)(2). If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in Public Resources Code section 21081. See CEQA Guidelines, § 15092, subds. (b)(2)(A)-(B).

While the courts review an EIR using an 'abuse of discretion' standard, the reviewing court is not to *uncritically* rely on every study or analysis presented by a project proponent in support of its position. *Berkeley Jets*, 91 Cal.App.4th at p. 1355 (quoting *Laurel Heights Improvement Assn.*, 47 Cal.3d at pp. 391, 409 fn. 12) (internal quotations omitted). A clearly inadequate or unsupported study is entitled to no judicial deference. *Id.* Drawing this line and determining whether the EIR complies with CEQA's information disclosure requirements presents a question of law subject to independent review by the courts. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 515; *Madera Oversight Coalition, Inc. v. County of Madera* (2011) 199 Cal.App.4th 48, 102, 131. As the court stated in *Berkeley Jets*, prejudicial abuse of discretion occurs if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process. 91 Cal.App.4th at p. 1355 (internal quotations omitted).

The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. *Communities for a Better Environment v. Richmond* (2010) 184 Cal.App.4th 70, 80 (quoting *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 449-450). The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been considered. *Id.* For the EIR to serve these goals it must present information so that the foreseeable impacts of pursuing the project can be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made. *Id.*

A strong presumption in favor of requiring preparation of an EIR is built into CEQA. This presumption is reflected in what is known as the "fair argument" standard under which an EIR must be prepared whenever substantial evidence in the record supports a fair argument that a project may have a significant effect on the environment. *Quail*

Botanical Gardens Found., Inc. v. City of Encinitas (1994) 29 Cal.App.4th 1597, 1602; *Friends of "B" St.* v. *City of Hayward* (1980) 106 Cal.3d 988, 1002.

The fair argument test stems from the statutory mandate that an EIR be prepared for any project that "may have a significant effect on the environment." PRC, § 21151; see *No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.App.3d 68, 75; accord *Jensen v. City of Santa Rosa* (2018) 23 Cal.App.5th 877, 884. Under this test, if a proposed project is not exempt and may cause a significant effect on the environment, the lead agency must prepare an EIR. PRC, §§ 21100 (a), 21151; CEQA Guidelines, § 15064 (a)(1), (f)(1). An EIR may be dispensed with only if the lead agency finds no substantial evidence in the initial study or elsewhere in the record that the project may have a significant effect on the environment. *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 785. In such a situation, the agency must adopt a negative declaration. PRC, § 21080, subd. (c)(1); CEQA Guidelines, §§ 15063 (b)(2), 15064(f)(3).

"Significant effect upon the environment" is defined as "a substantial or potentially substantial adverse change in the environment." PRC, § 21068; CEQA Guidelines, § 15382. A project may have a significant effect on the environment if there is a reasonable probability that it will result in a significant impact. *No Oil, Inc.*, 13 Cal.3d at p. 83 fn. 16; see *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 309. If any aspect of the project may result in a significant impact on the environment, an EIR must be prepared even if the overall effect of the project is beneficial. CEQA Guidelines, § 15063(b)(1); see *County Sanitation Dist. No. 2 v. County of Kern* (2005) 127 Cal.App.4th 1544, 1580.

This standard sets a "low threshold" for preparation of an EIR. *Consolidated Irrigation Dist. v. City of Selma* (2012) 204 Cal.App.4th 187, 207; *Nelson v. County of Kern* (2010) 190 Cal.App.4th 252; *Pocket Protectors v. City of Sacramento* (2004) 124 Cal.App.4th 903, 928; *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 580; *Citizen Action to Serve All Students v. Thornley* (1990) 222 Cal.App.3d 748, 754; *Sundstrom*, 202 Cal.App.3d at p. 310. If substantial evidence in the record supports a fair argument that the project may have a significant environmental effect, the lead agency must prepare an EIR even if other substantial evidence before it indicates the project will have no significant effect. See *Jensen,* 23 Cal.App.5th at p. 886; *Clews Land & Livestock v. City of San Diego* (2017) 19 Cal.App.5th 161, 183; *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 150; *Brentwood Assn. for No Drilling, Inc. v. City of*

Los Angeles (1982) 134 Cal.App.3d 491; *Friends of "B" St.*, 106 Cal.App.3d 988; CEQA Guidelines, § 15064(f)(1).

B. The Project May Have a Significant Impact on Biological Resources

There is substantial evidence the Project will have a significant impact on biological resources. As discussed in further detail in a comment letter from biological resources expert Shawn Smallwood, PhD with regards to the proposed Project, incorporated by reference herein, "the existing environmental setting has not been accurately characterized, and several important types of potential project impacts have been inadequately analyzed. These types of impacts include habitat loss, interference with wildlife movement, and wildlife-automobile collision mortality." (See **Exhibit D** [December 12, 2023 comment letter from Shawn Smallwood, PhD regarding SMP 38, SMP 39, and SMP 40 biological resources analysis].)

First, for example, with regards to the potential for habitat loss, Dr. Smallwood predicts:

> SMP 38 (111.7 acres), SMP 39 (51.9 acres) and SMP 40 (41 acres) support 11.4 bird nests/acre/year. Based on this assumption, the combined projects, SMP 39 and SMP 40, on 92.9 acres would eliminate 1,059 nest sites, and assuming SMP 38 is also later developed, then the combined projects, SMP 38, SMP 39, ad SMP 40, on 204.6 would eliminate 2,332 nest sites.

(**Exhibit D**, p. 28.)

Accordingly, Dr. Smallwood points out that this loss in nest sites would constitute a significant impact from the Project that was not quantitatively addressed in the Draft EIR. (**Exhibit D**, p. 28.) Further, Dr. Smallwood notes that the loss in nests would lead to a loss in the reproductive capacity of the site, thus decreasing the number of birds at the Site over time. (*Id.*)

Second, Dr. Smallwood discusses the Projects impacts on interference with wildlife movement, highlighting that the DEIR's analysis of whether the Project will interfere with wildlife movement in the Project Site area is "flawed and misleading." (**Exhibit D**, p. 29.) Specifically, Dr. Smallwood states that:

> According to the DEIR, "The project area does not fall within an Essential Habitat Connectivity area mapped by the CDFW." However, at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18486, the California Essential Habitat Connectivity Project specifically points out

> that it is not: "A California Department of Fish and Game or US Fish and Wildlife Service response to potential impacts to a habitat or species from a project subject to the California Environmental Quality Act (CEQA)," nor "Fine scale, with every important piece of habitat identified" nor ""Essential", meaning the only places of importance" nor "A solution by itself for how to provide necessary linkages for any given species of plant or animal... Linkage designs will vary depending on focal species chosen and the goal of providing connected habitat for a chosen species might be met several different ways" nor "The final word on connectivity for California." With analytical grid cells of 2,000 acres, the spatial grain of the California Essential Habitat Connectivity Project is much too coarse for the conclusion the DEIR draws from it.

(**Exhibit D**, p. 29.)

Moreover, Dr. Smallwood points out that the DEIR contains a flawed "argument that SMP 39 is cut off from open areas by well-trafficked roads, the airport, the gravel quarries, and therefore cannot function as a wildlife movement corridor" and notes that the same argument is used for SMP 40. (*Id.*) However, as Dr. Smallwood notes, the DEIR simply uses speculation here and provides no supporting evidence to this assertion. (*Id.*)

Third, Dr. Smallwood discusses the Project's traffic impacts to wildlife, noting that traffic generated from the Project will endanger wildlife that must cross roads used by traffic getting to and from the Project Site. (**Exhibit D**, p. 30.) Dr. Smallwood discusses traffic-caused wildlife mortality and highlights various traffic mortality numbers collected from a wildlife mortality study performed only eleven (11) miles from the Project Site in the County of Contra Costa. (*Id.*) Dr. Smallwood concludes an analysis should be done on "whether increased traffic generated by the project site would similarly result in local impacts on wildlife." (*Id.* at p. 31.)

In addition, the biological impact analysis of the EIR is legally flawed for the following reasons.

First, the DEIR's biological resources impact analysis relies on multiple inadequate biological field surveys outlined in Appendices D and E of the DEIR prepared by Monk & Associates that are described in insufficient detail.

For example, with regards to the field surveys, the DEIR states that:

> "SMP 39 and SMP 40 were both first surveyed in 2000, with follow-up surveys over the years, including in November 2013, for various development proposals. In addition, a **project-specific field survey** was conducted on SMP 39 on **October 14, 2021**, and on SMP 40 on **June 10, 2019** to record biological resources within the sites, and to assess the likelihood of resource agency regulated areas to be located within the sites. An **additional survey** was conducted for SMP 40 on **June 21, 2019** to flag the Arroyo Mocho's riparian drip line to allow for the project engineers to survey the limits of the riparian vegetation and overlay the area on the project site plan, and **another general survey** of SMP 40 was conducted on **September 10, 2021.**"

DEIR, p. 4.3-24. [Emphasis added.']

However, the DEIR's reliance on these biological resources field surveys is improper for several reasons.

First, the DEIR and its accompanying Appendices D and E leave out crucial information about the site surveys.

In summarizing the various site surveys that occurred in 2013, 2019, and 2021, DEIR Appendix D's Biological Resources Analysis ("**SMP-39 BRA**") states that "[e]ach site survey involved searching all habitats on the site and recording all plant and wildlife species observed. . . ." and that the "evaluation included an examination of the site to determine if there could be potential areas within the project site that would be regulated as waters of the United States and/or State . . ." DEIR Appendix D, p. 2. Thus, the SMP-39 BRA field surveys seem to indicate that visual inspections were done during these site visits. However, SMP-39 BRA is insufficient for numerous reasons as it leaves out crucial information about the site surveys while relying on the surveys to form conclusions about the Project's potential biological resources impacts.

As a preliminary matter, *one* (1) single field survey alone for just the SMP-39 Project Site is insufficient to adequately identify all of the potential habitats and plant and wildlife species occurring within the Project Site, as the site surveys purport to have looked for. In the City's Final EIR Responses to Comments, Response No. 5-12, the City counters our office's prior comment that "[o]ne single field survey is sufficient to get a baseline description of a project site's pant communities and wildlife habitats and to determine if additional surveys for special-status species are necessary." (FEIR

Response to Comments, p. 2-75.) However, as Dr. Smallwood notes in his comment letter on the Project, "[m]ore surveys are needed than my two surveys [sic] to inventory use of the project site by wildlife" (**Exhibit D**, pp. 14-15), that the appropriate detection surveys have not been completed at SMP 39 and SMP 40," (*id.* at p. 17), that "[r]econnaissance surveys for wildlife are not designed to detect special-status species" indicating that protocol-level detection surveys are appropriate but that Monk & Associates did not perform such detection surveys here, thus rendering the Draft EIR's "characterization of the existing environmental setting . . . therefore incomplete and inaccurate." (*Id.* at p. 19.) Therefore, it is clear that the single survey conducted for SMP-39 is inadequate.

Moreover, the SMP-39 BRA does not specify what time of the day the surveys were conducted during, (DEIR Appendix D, p. 2) which, again, leaves open the possibility that certain species, for example, nocturnal species, could present themselves at different times of the day. This is further highlighted in Dr. Smallwood's comment letter, where he notes that:

> For none of the above surveys was there reporting of what time the surveys began, or how long the surveys lasted. No checklist is shared of habitat elements that the biologists might have used during their survey to later crosscheck against documented habitats of each special-status species. No explanation is provided of whether or how animal behavior data or other evidence contributed to the biologist's assessment of the site for its importance to animal movement. It is therefore difficult to assess survey outcomes relative to survey effort and methods.

(**Exhibit D**, p. 16.)

Even further, in one (1) single survey, the surveyor may fail to identify species that would only present themselves during certain times of the *year*. According to the SMP-39 BRA in Appendix D, for example, the most recent surveys were conducted in June 2019 (a summer month) and October 2021 (a fall month), while failing to account for the spring and winter months. DEIR Appendix D, p. 2. However, there may be certain plant or animal species that would not be identifiable to an observer during the summer or fall months but that could nevertheless be present at the Project Site and be identifiable during other seasons of the year. For example, and as noted by Dr. Smallwood, in response to the DEIR's assertion that no special-status plants were observed during some of the surveys at the Project Sites during various months over the years, Dr. Smallwood responds that this reporting is misleading

"because only one of the several surveys was conducted during the plant blooming season. Monk and Associates (2021, 2023) did not meet the minimum standards of [California Department of Fish and Wildlife's ("**CDFW**")] (2018) plant survey guidelines. While the FEIR's Responses to Comments counters our office's prior comments, asserting that the CDFW's survey guidelines cited are guidelines for conducting floristic surveys for rare and endangered or other special-status species, the site surveys still failed to meet the CDFW's minimum plant survey guidelines standards. Thus, new surveys must be conducted that meet these standards.

Therefore, the DEIR's reliance on surveys not in compliance with California Department of Fish and Wildlife's survey guidelines[6] and its misuse of the California Natural Diversity Database ("**CNDD**") resulted in potentially inaccurate determinations. For example, with regards to botanical field surveys, the CDFW's survey guidelines state that such field surveys should be conducted in a way that will maximize the likelihood of identifying special status plants and sensitive natural communities that may be present at a site.[7] Specifically, the guidelines state that "[m]ore than one field visit is usually necessary to adequately capture the floristic diversity of a project area."[8]

For each of the foregoing reasons, the Project may have a significant impact on biological resources. Accordingly, the DEIR's findings as to the Project's biological impacts are not supported with substantial evidence that is of verifiable or credible value and the DEIR must be revised and recirculated to reassess those impacts, including on the wildlife species with potential to occur on the Project Site using protocol-level detection surveys and describing those surveys with sufficient detail.

C. The Project May Have Significant Noise Impacts.

There is substantial evidence that the Project will have significant traffic impacts. As discussed by Principal Steve Rogers of Steve Rogers Acoustics, "the evaluation of noise impacts during the construction phases is incomplete and contains a significant

[6] *See*, California Natural Resources Agency, *Department of Fish and Wildlife Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities, available at* https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959&inline, pp. 4, 5-6, accessed on Oct. 9, 2023), updated on Feb. 3, 2023; *see generally* California Department of Fish and Wildlife California Natural Diversity Database, *available at* https://wildlife.ca.gov/Data/CNDDB/Plants-and-Animals (last visited on Oct. 9, 2023.)

[7] California Natural Resources Agency, *supra*, at p. 4.

[8] *Id.*

calculation error." (**Exhibit E**, p. 3 [December 12, 2023 comment letter re City of Livermore SMP 38/SMP 39/SMP 40 Project Review of DEIR Noise Section & Appendices]), fully incorporated herein.

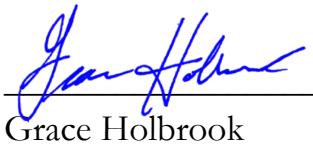
First, as noted by Mr. Rogers for the DEIR's construction noise impacts, the DEIR concludes there will be a less than significant impact for on-site construction, but per the DEIR's analysis, the DEIR fails to adequately support this conclusion for multiple reasons. (**Exhibit E**, p. 2.) For example, the DEIR fails to include SMP 39's construction noise impacts in its section 4.6 analysis. (*Id.*) Second, Mr. Rogers notes that the noise analysis for SMP 40 is incomplete. Specifically,

> The noise impact analysis for construction on the SMP 40 site compares Salter's noise level predictions with instantaneous maximum noise level (Lmax) limits of 70 dBA during the day and 60 dBA at night, which are taken from Policy N-1.5.P3 of the City of Livermore General Plan.
>
> However, these Lmax noise limits are not the only local regulations that would apply to construction noise on the SMP 40 site.
>
> . . .
>
> Similarly, the DEIR does not include an DNL analysis for construction noise from SMP 40 to show that it will be below the 60 dBA exterior noise standard taken from land-use compatibility table (Table 9-7) in the General Plan. This will be particularly important if any construction work is to occur at night.

(**Exhibit E**, pp. 2-3.)

Third, Mr. Rogers highlights that there was an error in the calculations for SMP 40 with regards to various construction equipment pieces at a 50-foot distance. (*Id.*) Lastly, Mr. Rogers states that the construction noise analysis on the east side of the SMP 40 site is overlooked, as it assumes receivers 884 feet away from the equipment, while during other phases of construction, the noisy equipment may be operating closer than 884-feet from nearby residential uses. (*Id.*)

For each of the foregoing reasons, the Project may have a significant noise impact and the EIR should therefore be revised and recirculated.



III. THE FEIR CANNOT BE CERTIFIED AS THE CITY HAS FAILED TO RESPOND TO THE ISSUES RAISED BY CARPENTERS LOCAL 713

The City's argues that recirculation of the EIR is not required as the comments submitted on the FEIR "did not identify any new significant effect, substantial increase in severity of an impact identified in the EIR, or any significant new information." (Staff Report **Exhibit D** at 1). However, as reiterated above, numerous substantial issues with the EIR were identified by Carpenters Local 713 in its two prior comment letters. (DEIR Comment Letter, **Exhibit F**; FEIR Comment Letter, **Exhibit G**). The City provided inadequate responses to the issues addressed in the DEIR Comment Letter. Further, despite the City stating that it would provide a response to the FEIR Comment Letter, no such memorandum has been provided prior to the comment deadline for this Planning Commission Hearing. (See Staff Report **Exhibit D** at 1). As the City has failed to provide responded to the significant issues raised by Carpenters Local 713, the FEIR cannot be certified under CEQA.

IV. CONCLUSION

Based on the foregoing, the City should deny the FEIR's certification, and the Environmental Impact Report should be revised and recirculated pursuant to CEQA, consistent with the comments and issues identified in this and previous comment letters.

Sincerely,

Grace Holbrook
Attorneys for Carpenters Local 713

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin		
Air Basin	**Rural (miles)**	**Urban (miles)**
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8

[11] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.
[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

[14] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist
