Specializing in Environmental Field Services

August 1, 2016

Ms. Misty Vazquez Ponce
Partner Engineering & Science, Inc.
2154 Torrance Blvd., Suite 200
Torrance, CA 90501

Dear Ms. Ponce:

This letter presents the results of the soil vapor investigation conducted by Optimal Technology (Optimal), for Partner Engineering & Science, Inc. on July 29, 2016. The study was performed at 5355 E. Airport Dr., Ontario, California.

Optimal was contracted to perform a soil vapor survey at this site to screen for possible chlorinated solvents and aromatic hydrocarbons. The primary objective of this soil vapor investigation was to determine if soil vapor contamination is present in the subsurface soil.

Gas Sampling Method

Gas sampling was performed by hydraulically pushing soil gas probes to a depth of 4.0-5.0 feet below ground surface (bgs). An electric rotary hammer drill was used to drill a 1.0-inch diameter hole through the overlying surface to allow probe placement when required. The same electric hammer drill was used to push probes in areas of resistance during placement.

At each sampling location an electric vacuum pump set to draw 0.2 liters per minute (L/min) of soil vapor was attached to the probe and purged prior to sample collection. Vapor samples were obtained in SGE gas-tight syringes by drawing the sample through a luer-lock connection which connects the sampling probe and the vacuum pump. Samples were immediately injected into the gas chromatograph/purge and trap after collection. New tubing was used at each sampling point to prevent cross contamination.

All analyses were performed on a laboratory grade Hewlett Packard model 5890 Series II gas chromatograph equipped with a Hewlett Packard model 5971 Mass Spectra Detector and Tekmar LSC 2000 Purge and Trap. An SGE capillary column using helium as the carrier gas was used to perform all analysis. All results were collected on a personal computer utilizing Hewlett Packard's 5971 MS and chromatographic data collection and handling system.

Quality Assurance

5-Point Calibration
The initial five point calibration consisted of 20, 50, 100, 200 and 500 ul injections of the calibration standard. A calibration factor on each analyte was generated using a best fit line method using the HP data system. If the r^2 factor generated from this line was not greater than 0.990, an additional five point calibration would have been performed. Method reporting limits were calculated to be 0.01-1.0 micrograms per Liter (ug/L) for the individual compounds.

A daily calibration check and end of run calibration check was performed using a pre-mixed standard supplied by Scotty Analyzed Gases. The standard contained common halogenated solvents and aromatic hydrocarbons (see Table 1). The individual compound concentrations in the standards ranged between 0.025 nanograms per microliter (ng/ul) and 0.25 ng/ul.

TABLE 1

Dichlorodifluoromethane	Carbon Tetrachloride	Chloroethane
Trichlorofluoromethane	1,2-Dichloroethane	Benzene
1,1-Dichloroethene	Trichloroethene	Toluene
Methylene Chloride	1,1,2-Trichloroethane	Ethylbenzene
trans-1,2-Dichloroethene	Tetrachloroethene	m-/p-Xylene
1,1-Dichloroethane	Chloroform	o-Xylene
cis-1,2-Dichloroethene	1,1,1,2-Tetrachloroethane	Vinyl Chloride
1,1,1-Trichloroethane	1,1,2,2-Tetrachloroethane	Freon 113
4-Methyl-2-Pentanone	Cyclohexane	Acetone
Chlorobenzene	2-Butanone	Isobutane

Sample Replicates
A replicate analysis (duplicate) was run to evaluate the reproducibility of the sampling system and instrument. The difference between samples did not vary more than 20%.

Equipment Blanks
Blanks were run at the beginning of each workday and after calibrations. The blanks were collected using an ambient air sample. These blanks checked the septum, syringe, GC column, GC detector and the ambient air. Contamination was not found in any of the blanks analyzed during this investigation. Blank results are given along with the sample results.

Tracer Gas Leak Test
A tracer gas was applied to the soil gas probes at each point of connection in which ambient air could enter the sampling system. These points include the top of the sampling probe where the tubing meets the probe connection and the surface bentonite seals. Isobutane was used as the tracer gas. No Isobutane was found in any of the samples collected.

Purge Volume
The standard purge volume of three volumes was purged in accordance with the July 2015 DTSC/RWQCB Advisory for Active Soil Gas Investigations.

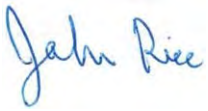
Shut-in Test
A shut-in test was conducted prior to purging or sampling each location to check for leaks in the above-ground sampling system. The system was evaluated to a minimum measured vacuum of 100 inches of water. The vacuum gauge was calibrated and sensitive enough to indicate a water pressure change of at least 0.5 inches.

Scope of Work

To achieve the objective of this investigation a total of 15 vapor samples were collected from 14 locations at the site. Sampling depths, vacuum readings, purge volume and sampling volumes are given on the analytical results page. All the collected vapor samples were analyzed on-site using Optimal's mobile laboratory.

Subsurface Conditions

Subsurface soil conditions at this site were predominately silty-sand from ground surface to 5.0 feet bgs. These soil conditions offered sampling flows at 0" water vacuum. Depth to groundwater was unknown at the time of the investigation.



Results

During this vapor investigation three samples contained levels of Tetrachloroethene (PCE). PCE levels ranged from 0.12 ug/L to 0.23 ug/L. None of the other compounds listed in Table 1 above were detected above the listed reporting limits. A complete table of analytical results is included with this report.

Disclaimer

All conclusions presented in this letter are based solely on the information collected by the soil vapor survey conducted by Optimal Technology. Soil vapor testing is only a subsurface screening tool and does not represent actual contaminant concentrations in either the soil and/or groundwater. We enjoyed working with you on this project and look forward to future projects. If you have any questions please contact me at (877) 764-5427.

Sincerely,

John Rice
Project Manager

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal sites subject to CERCLA removals and CERCLA orders

SEMS: A review of the SEMS list, as provided by EDR, and dated 10/20/2021 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
CHEM LAB PRODUCTS Site ID: 0908439 EPA Id: CAN000908439	5160 EAST AIRPOT DRI	WSW 1/4 - 1/2 (0.268 mi.)	J62	25

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 10/20/2021 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
KOPPERS COMPANY INC Site ID: 0900327 EPA Id: CAT000617324	***12200 AIRPORT DRIVE***	***W 1/8 - 1/4 (0.199 mi.)***	***F50***	***21***

Longitude (West):	117.533485 - 117ˆ 32’ 0.55’’
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	450769.1
UTM Y (Meters):	3769126.2
Elevation:	983 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	12015973 GUASTI, CA
Version Date:	2018

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

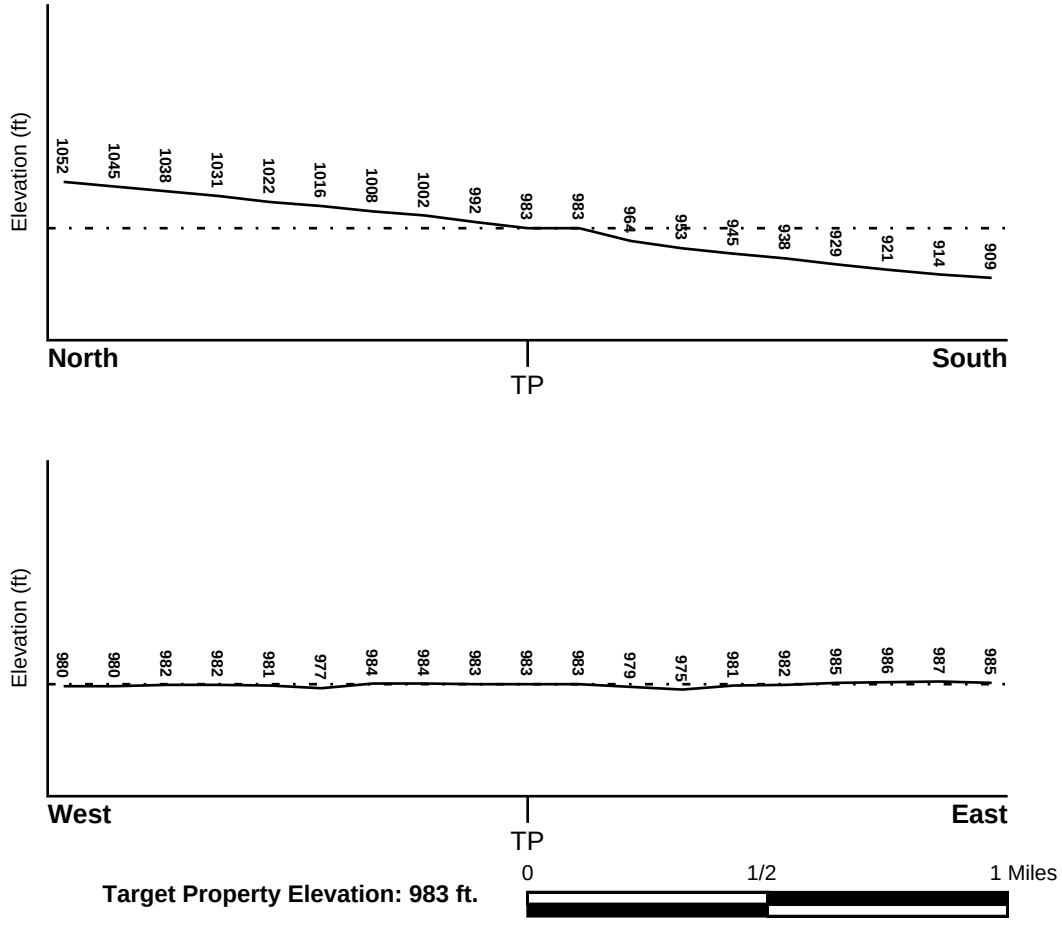
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06071C8633H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06071C8634J	FEMA FIRM Flood data

06065C0017G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
GUASTI	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: DELHI

Soil Surface Texture: fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	18 inches	fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 6.1
2	18 inches	59 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 6.1

Soil Map ID: 2

Soil Component Name: TUJUNGA

Soil Surface Texture: gravelly loamy sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

JONES ENVIRONMENTAL LABORATORY RESULTS

Client:	Farallon Consulting	**Report date:**	3/11/2022
Client Address:	27 Mauchly Suite 213 Irvine, CA	**Jones Ref. No.:** **Client Ref. No.:**	G-0423 1071-080-002
Attn:	Kathy Lehnus	**Date Sampled:** **Date Received:**	3/11/2022 3/11/2022
Project:	5355 E Airport Dr.	**Date Analyzed:**	3/11/2022
Project Address:	5355 E Airport Dr. Ontario, CA	**Physical State:**	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B – Volatile Organics by GC/MS + Oxygenates/Gasoline Range Organics

Sampling – Soil Gas samples were collected in glass gas-tight syringes equipped with Teflon plungers.

A tracer gas mixture of n-pentane, n-hexane, and n-heptane was placed at the tubing-surface interface before sampling. These compounds were analyzed during the 8260B analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. No tracer was detected in any of the samples reported herein.

The sampling rate was approximately 200 cc/min, except when noted differently on the chain of custody record, using a glass gas-tight syringe. Purging was completed using a pump set at approximately 200 cc/min, except when noted differently on the chain of custody record. A default of 3 purge volumes was used as recommended by July 2015 DTSC/RWQCB guidance documents.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for at least one minute. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

No flow conditions occur when a sampling rate greater than 10 mL/min cannot be maintained without applying a vacuum greater than 100 inches of water to the sampling train. The sampling train is left at a vacuum for no less than three minutes. If the vacuum does not subside appreciably after three minutes, the sample location is determined to be a no flow sample.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Sampling Blanks were analyzed every 12 hours as prescribed by the method. In addition, a Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were analyzed with each batch of Soil Gas samples. A duplicate/replicate sample was analyzed each day of the sampling activity. All samples were injected into the GC/MS system within 30 minutes of collection.

1. INTRODUCTION

1.1. PURPOSE & SCOPE

The purpose of this study is to demonstrate that the proposed project site can be designed to provide adequate flood protection without adversely impacting existing off-site drainage systems or adjacent properties. The scope of this analysis includes the pre-developed and post-developed runoff analysis.

2. EXISTING SITE DESCRIPTION

2.1. EXISTING SITE TOPOGRAPHY & HYDROLOGIC PATTERNS

The project site, approximately 12.85 acres, is located approximately 0.25 miles east of the intersection of South Wineville Avenue and Airport Drive in the City of Ontario, County of San Bernardino. The site is referenced by the street address 5355 East Airport Avenue. The site is currently bounded to the north by Southern Pacific Transportation Company Railroad, to the east and west by existing industrial development, and to the south by Airport Drive.

The site in the pre-development condition is developed to manufacture and store animal feed grains. The site includes several existing buildings, shed structures, silos, and above-ground storage tanks (ASTs). The existing structures are generally surrounded by asphaltic concrete (AC) pavements, with isolated areas of Portland cement concrete (PCC), aggregate base pavements, and exposed soils in the south-central portion of the site. The existing pavements are in poor condition, with moderate to severe cracking throughout. The site currently consists approximately 92% of impervious areas. The entire site will be demolished prior to grading.

The natural drainage pattern for the existing condition of the site is north to south. There are no existing no public storm drain systems at the frontage of the project site. Stormwater sheet flow south and discharge onto the existing curb and gutter on Airport Drive. Runoff flows east along Airport Drive and discharge into an existing catch basin located approximately 1,500 feet east of the site. This existing catch basin is connected to the Lower Etiwanda Creek Channel, which convey stormwater to the Wineville Basin. See Figure 1 for the pre-development drainage map.

3. PROJECT SITE DESCRIPTION

3.1. PROJECT DESCRIPTION & HYDROLOGIC PATTERNS

The envisioned development is a proposed industrial building with auto parking spaces and trailer parking spaces. Docking areas are located south of the proposed building. Open landscape areas are proposed around the perimeter of the site. The proposed development will consist approximately 89% of impervious areas.

The proposed development will maintain the same natural drainage pattern as the existing condition. Stormwater will sheet flow from north to south and will be captured by proposed on-site catch basins. The proposed on-site storm drain system will convey the flow into a proposed underground infiltration chamber. This system will be designed to meet project's water quality requirements and provide sufficient storage to meet the 100-year storm hydrology requirement. In a large storm event, stormwater will exit the underground chamber system via pipes and will be pumped out through a proposed parkway drain on Airport Drive. Runoff will sheet flow east along Airport Drive and discharge into the existing catch basin to maintain the same point of discharge as the existing condition. See Figure 2 for the prost-development drainage map.

4. RESULTS & ANALYSIS

4.1. METHODOLOGY

The proposed drainage areas were analyzed using the San Bernardino (SB) County Hydrology Manual. The main methods used for this project were the Rational Method, Synthetic Unit Hydrograph Method, and Basin Routing Analysis. Civil Design software was used to compute the data. Solving for the Rational Method returns the peak flow rate. Unit Hydrograph analysis will determine the total volume generated from a storm event. Basin Routing analysis will analyze the storage volume and outflow flow rate for the proposed underground infiltration chamber.

According to the NRCS Soils Map, the site is entirely composed of type A soil (See Appendix E). The proposed land use was analyzed as commercial for both the pre- and post-development condition. According to the county's manual, Antecedent Moisture Condition (AMC) I is used for the 2-year storm event and AMC III was used for the 100-year storm event in order to give more confidence to mitigate any increase runoff, if needed.

For the rational method analysis, the runoff coefficient is determined by the land use for each condition. The rainfall intensities are based on the time of concentration for each drainage area and the intensity-duration curves provided in the county's manual. The flow lengths and terrain elevations were determined using existing topography for the pre-development condition and the conceptual grading plans for the post-development condition.

For the unit hydrograph analysis, the lag time was determined by using the time of concentration based on the rational method analysis. Rainfall depths were obtained from the National Oceanic and Atmospheric Administration (NOAA) Point Precipitation Frequency Estimates. The rainfall depth data are included in Appendix E. The rainfall used in the hydrology calculations are summarized on Table 4.1.

Table 4.1: Rainfall Depths	
Storm Event & Duration	Rainfall Depth (inches)
2-Year, 1-Hour	0.526
2-Year, 6-Hour	1.39
2-Year, 24-Hour	2.51
100-Year, 1-Hour	1.31
100-Year, 6-Hour	3.15
100-Year, 24-Hour	5.74

For the basin routing analysis, the results from the unit hydrograph analysis were used to determine the amount of stormwater entering and existing the proposed underground infiltration chamber at each time interval. The staging data table is provided in Appendix D.

4.2. HYDROLOGY RESULTS & ANALYSIS

The complete rational method analysis and results are included in Appendix B. The complete unit hydrograph analysis and results are included in Appendix C. The tables below provide a summary of the peak flow rate and runoff volume for the pre-developed and post-developed condition for the 2- and 100-year storm.

Table 4.2.1: Pre-Development Hydrology Summary Table					
Storm Event	Area (Acres)	Tc (min.)	Intensity (in/hr)	Flow Rate (cfs) (Rational Method)	Volume (cf) (Unit Hydrograph)
2-Year	12.85	14.77	1.71	14.42	--
100-Year		14.20	3.11	38.03	241,431

Table 4.2.2: Post-Development Hydrology Summary Table					
Storm Event	Area (Acres)	Tc (min.)	Intensity (in/hr)	Flow Rate (cfs) (Rational Method)	Volume (cf) (Unit Hydrograph)
2-Year	12.85	12.60	1.20	12.92	--
100-Year		14.39	3.09	35.24	237,145

Table 4.2.3: Result Analysis Summary Table	
Hydrology Results & Analysis Summary Table:	Project Site Disturbed Area **= 559,755 SF (12.85 Acres)** $Q_{100, PRE}$ = **38.03 CFS** $Q_{100, POST}$ = **35.24 CFS** ΔQ_{100} = **- 2.79 CFS = 0 CFS** ΔV_{100} = **- 4,286 CF = 0 CF** DCV = **51,054 CF** (See Water Quality Management Plan) DCV > ΔV_{100} | **51,054 CF = Site Design Storage Requirement** **Volume Provided = 140,009 CF** (Underground Infiltration Chamber)

Based on the 100-year rational method analysis, the post-development flow rate within the disturbed area decreased compare to the pre-development flow rate. Furthermore, the post-development runoff volume decreased compare to the pre-development runoff volume. The decrease in flow rate and runoff volume was a result from a decrease in impervious areas.

Based on the Water Quality Management Plan for this project, the design capture volume (DCV) for the site is 51,054 cubic feet per second (cfs). Since the DCV is higher than the difference between the pre- and post-development 100-year storm runoff volume (0 cfs), the DCV is the minimum storm runoff storage required for the proposed development.

To satisfy the water quality requirement, an underground infiltration chamber with a storage volume of 140,009 cubic-feet is proposed for the project. Since there are no public storm drain systems around the frontage of the site, the proposed chamber system will provide sufficient storage volume to mitigate the full 100-year storm runoff volume to promote on-site infiltration. In a large storm event, an overflow sump pump is proposed for the project site. The sump pump will be designed to have a maximum outflow flow rate of 4 cfs. This strategy will reduce any potential impacts to the downstream off-site storm drain system and to mitigate any flooding potential.

A basin routing analysis was performed to analyze the proposed chamber system with the sump pump and determine the water surface elevation in a 100-year storm event. The complete results of the basin routing analysis are included in Appendix D and is summarized on Table 4.2.4.

Table 4.2.4: Basin Routing Analysis Summary Table

Basin ID	Peak Flow In – Q_{100} (cfs)	Peak Flow Out – Q_{100} (cfs)	Storage Volume (cf)	Maximum Ponding Depth (ft)	100-year Storm Water Surface Elevation (ft)	Freeboard (ft)
Underground Infiltration Chamber #1	35.24	4.00	140,009	10.00	8.00	2.00

5. CONCLUSION

The proposed development would not create or contribute runoff that would exceed the capacity of the existing downstream storm drain system. Furthermore, the underground infiltration system will be designed to accommodate the 100-year storm event and would not exceed the flow rates and runoff volumes generated by the existing condition. Once construction is complete, there would not be any substantial increase in flood boundaries, levels or frequencies in any areas outside the development. The hydrologic analyses and calculations were designed in accordance with the San Bernardino County Hydrology Manual. The results from the analysis will be the basis for the grading and on-site storm-drain construction documents for the project.

Evaluation of the appropriateness of guidelines and the accuracy of County data was beyond the scope of this study. Usage of this report is limited to address the purpose and scope previously defined by the project owner. The contents of this report are professional opinion and as such, are not to be considered a guaranty or warranty.

APPENDIX D

BASIN ROUTING ANALYSIS

CONTECH ENGINEERED SOLUTIONS

CMP: Underground Detention System
Storage Volume Estimation

Date: 03-22-2022
Project Name: 5355 Airport Drive

City / County: Ontario
State: California

Designed By: JL
Company: WLG
Telephone:

=Adjustable Input Cells

Contech Engineered Solutions, LLC is pleased to offer the following estimate of storage volume for the above named project. The results are submitted as an estimate only, without liability on the part of Contech Engineered Solutions, LLC for accuracy or suitability to any particular applicaton and are subject to verification of the Engineer of Record. **This tool is only applicable for rectangular shaped systems.**

Summary of Inputs

System Information		Backfill Information		Pipe & Analysis Information	
Out-to-out length (ft):	615.0	Backfill Porosity (%):	40%	System Diameter (in):	96
Out-to-out width (ft):	30.0	Depth Above Pipe (in):	12.0	Pipe Spacing (in):	2
Number of Manifolds (ea):	1.0	Depth Below Pipe (in):	12.0	Incremental Analysis (in):	2
Number of Barrels (ea):	3.0	Width At Ends (ft):	2.0	System Invert (Elevation):	966
		Width At Sides (ft):	2.0		

Storage Volume Estimation

System		Pipe		Stone		Total System		Miscellaneous		Staging

PROJECT SUMMARY

CALCULATION DETAILS
- LOADING = HS20/HS25
- APPROX. LINEAR FOOTAGE = 1,851 LF

STORAGE SUMMARY
- STORAGE VOLUME REQUIRED = 140,000 CF
- PIPE STORAGE VOLUME = 93,041 CF
- BACKFILL STORAGE VOLUME = 46,967 CF
- TOTAL STORAGE PROVIDED = 140,009 CF

PIPE DETAILS
- DIAMETER = 96"
- CORRUGATION = 5x1
- GAGE = 16
- COATING = ALT2
- WALL TYPE = PERFORATED
- BARREL SPACING = 36"

BACKFILL DETAILS
- WIDTH AT ENDS = 24"
- ABOVE PIPE = 12"
- WIDTH AT SIDES = 24"
- BELOW PIPE = 12"

NOTES

- ALL RISER AND STUB DIMENSIONS ARE TO CENTERLINE. ALL ELEVATIONS, DIMENSIONS, AND LOCATIONS OF RISERS AND INLETS, SHALL BE VERIFIED BY THE ENGINEER OF RECORD PRIOR TO RELEASING FOR FABRICATION.
- ALL FITTINGS AND REINFORCEMENT COMPLY WITH ASTM A998.
- ALL RISERS AND STUBS ARE $2\frac{2}{3}$" x $\frac{1}{2}$" CORRUGATION AND 16 GAGE UNLESS OTHERWISE NOTED.
- RISERS TO BE FIELD TRIMMED TO GRADE.
- QUANTITY OF PIPE SHOWN DOES NOT PROVIDE EXTRA PIPE FOR CONNECTING THE SYSTEM TO EXISTING PIPE OR DRAINAGE STRUCTURES. OUR SYSTEM AS DETAILED PROVIDES NOMINAL INLET AND/OR OUTLET PIPE STUB FOR CONNECTION TO EXISTING DRAINAGE FACILITIES. IF ADDITIONAL PIPE IS NEEDED IT IS THE RESPONSIBILITY OF THE CONTRACTOR.
- BAND TYPE TO BE DETERMINED UPON FINAL DESIGN.
- THE PROJECT SUMMARY IS REFLECTIVE OF THE DYODS DESIGN, QUANTITIES ARE APPROX. AND SHOULD BE VERIFIED UPON FINAL DESIGN AND APPROVAL. FOR EXAMPLE, TOTAL EXCAVATION DOES NOT CONSIDER ALL VARIABLES SUCH AS SHORING AND ONLY ACCOUNTS FOR MATERIAL WITHIN THE ESTIMATED EXCAVATION FOOTPRINT.
- THESE DRAWINGS ARE FOR CONCEPTUAL PURPOSES AND DO NOT REFLECT ANY LOCAL PREFERENCES OR REGULATIONS. PLEASE CONTACT YOUR LOCAL CONTECH REP FOR MODIFICATIONS.

ASSEMBLY
SCALE: 1" = 60'

The design and information shown on this drawing is provided as a service to the project owner, engineer and contractor by Contech Engineered Solutions LLC ("Contech"). Neither this drawing, nor any part thereof, may be used, reproduced or modified in any manner without the prior written consent of Contech. Failure to comply is done at the user's own risk and Contech expressly disclaims any liability or responsibility for such use.

If discrepancies between the supplied information upon which the drawing is based and actual field conditions are encountered as site work progresses, these discrepancies must be reported to Contech immediately for re-evaluation of the design. Contech accepts no liability for designs based on missing, incomplete or inaccurate information supplied by others.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County Southwestern Part, California
Survey Area Data: Version 13, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 5, 2020—Feb 6, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
Db	Delhi fine sand	A	143.7	76.2%
TuB	Tujunga loamy sand, 0 to 5 percent slopes	A	44.9	23.8%
Totals for Area of Interest			**188.6**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

APPENDIX F

INFILTRATION REPORT

March 9, 2022

Prologis
17777 Center Court Drive North, Suite 100
Cerritos, California 90703

Attention: Mr. John Carter
Director, Project Management

Project No.: 22G128-2

Subject: Results of Infiltration Testing
Proposed Warehouse
5355 East Airport Drive
Ontario, California

Reference: Geotechnical Investigation, Proposed Warehouse, 5355 East Airport Drive, Ontario, California, prepared by Southern California Geotechnical, Inc. (SCG) for Prologis, SCG Project No. 22G128-1, dated March 9, 2022.

Dear Mr. Carter:

In accordance with your request, we have conducted infiltration testing at the subject site. We are pleased to present this report summarizing the results of the infiltration testing and our design recommendations.

Scope of Services

The scope of services performed for this project was in general accordance with our Proposal No. 22P129, dated January 21, 2022. The scope of services included site reconnaissance, subsurface exploration, field testing, and engineering analysis to determine the infiltration rates of the on-site soils. The infiltration testing was performed in general accordance with the guidelines published in the Riverside County – Low Impact Development BMP Design Handbook – Section 2.3 of Appendix A, prepared for the Riverside County Department of Environmental Health (RCDEH), dated December, 2013. The San Bernardino County standards defer to the guidelines published by the RCDEH.

Site and Project Description

The subject site is located on the north side of East Airport Drive, 1,310± feet east of the intersection of South Wineville Avenue and East Airport Drive in Ontario, California. The site is also referenced by the street address 5355 East Airport Drive. The site is bounded to the north by Union Pacific railroad tracks, to the east and west by an industrial development, and to the south by East Airport Drive. The general location of the site is illustrated on the Site Location Map, enclosed as Plate 1 of this report.

The site consists of an irregular-shaped property, 14.58± acres in size. The site is developed to manufacture and store animal feed grains. The development includes several buildings and shed structures ranging in size from 2,200± ft^2 to 20,175± ft^2, and several silos and above-ground

storage tanks (ASTs) primarily located in the north-central region of the site. The existing structures are generally of concrete tilt-up and/or metal-framed construction, and are presumed to be supported on conventional shallow foundations with concrete slab-on-grade floors. The existing structures are generally surrounded by asphaltic concrete (AC) pavements, with isolated areas of Portland cement concrete (PCC), aggregate base pavements, and exposed soils in the south-central portion of the site. The existing pavements are in poor condition, with moderate to severe cracking throughout. Two medium-size trees are present in the south-central region of the site.

Detailed topographic information was not available at the time of this report. Based on elevations obtained from Google Earth and visual observations made at the time of the subsurface investigation, the site slopes gently to the south-southeast at a gradient of less than 1 percent.

Proposed Development

A preliminary site plan, identified as Scheme 01 and prepared by RGA, for the proposed development was provided to our office by the client. Based on this plan, the subject site will be developed with a 259,189± ft² warehouse, located in the north-central region of the site. Dock-high doors will be constructed along a portion of the south building wall. The proposed building is expected to be surrounded by AC pavements in the parking and drive areas, PCC pavements in the loading dock area, and concrete flatwork and landscaped planters throughout the site.

We understand that the proposed development will include on-site stormwater infiltration. Based on our experience with similar projects in the area, the infiltration systems are expected to be below-grade chambers. The bottoms of the infiltration systems are expected to be 10 to 12± feet below the existing site grades.

Concurrent Study

SCG concurrently conducted a geotechnical investigation at the subject site, referenced above. As a part of this study, five (5) borings (identified as Boring Nos. B-1 through B-5) were advanced to depths of 20 to 30± feet below the existing site grades.

AC pavements were encountered at the ground surface of Boring Nos. B-1 through B-4. The pavement sections generally consist of 0 to 2½± inches of AC, underlain by 1 to 3½± inches of aggregate base. Artificial fill soils were encountered beneath the existing pavements at Boring Nos. B-1 through B-4 and at the ground surface at Boring No. B-5, extending to depths of 2½ to 6½± feet below the existing site grades. The fill soils generally consist of loose to medium dense sands and silty sands, with occasional dense silty sands. Native alluvium was encountered beneath the artificial fill soils at all of the boring locations, extending to at least the maximum depth explored of 30± feet. The near-surface alluvium generally consists of loose to medium dense sands and sandy silts, extending to depths of 6½ to 12± feet. At greater depths, the alluvium generally consists of medium dense to dense sands, silty sands and sandy silts. Boring No. B-3 encountered a stratum of dense silty sands at a depth of 14½ to 17± feet. Boring No. B-5 encountered a stratum of loose well-graded sands at a depth of 12 to 17± feet.

Groundwater

Free water was not encountered during the drilling of any of the borings. Based on the lack of any water within the borings, and the moisture contents of the recovered soil samples, the static groundwater table is considered to have existed at a depth in excess of 30± feet at the time of the subsurface exploration.

As part of our research, we reviewed available groundwater data in order to determine groundwater levels for the site. Water level data was obtained from the California Department of Water Resources Water Data Library website, https://wdl.water.ca.gov/waterdatalibrary/. The nearest monitoring well on record (identified as State Well Number: 01S06W29H001S) is located 3,400± feet southeast of the project site. Water level readings within this monitoring well indicate a high groundwater level of 277± feet below the ground surface in April 2019.

Subsurface Exploration

Scope of Exploration

The subsurface exploration conducted for the infiltration testing consisted of six (6) infiltration test borings, advanced to depths of 10 to 12± feet below the existing site grades. The infiltration borings were advanced using a truck-mounted drilling rig, equipped with 8-inch-diameter hollow-stem augers and were logged during drilling by a member of our staff. The approximate locations of the infiltration test borings (identified as I-1 through I-6) are indicated on the Infiltration Test Location Plan, enclosed as Plate 2 of this report.

Upon the completion of the infiltration borings, the bottom of each test boring was covered with 2± inches of clean ¾-inch gravel. A sufficient length of 3-inch-diameter perforated PVC casing was then placed into each test hole so that the PVC casing extended from the bottom of the test hole to the ground surface. Clean ¾-inch gravel was then installed in the annulus surrounding the PVC casing.

Geotechnical Conditions

AC pavements were encountered at the ground surface of Infiltration Test Nos. I-1 through I-5. The pavement sections generally consist of 0 to 6± inches of AC, underlain by 0 to 9± inches of aggregate base. An 8±-inch-thick PCC section was encountered at the ground surface at Infiltration Test Nos. I-6. Steel reinforcement was not encountered at this location. Artificial fill soils were encountered beneath the existing pavements at all of the infiltration boring location, extending to depths of 3 to 4± feet below the existing site grades. The fill soils generally consist of medium dense to dense silty sands, with occasional loose sands. The fill soils possess a disturbed mottled appearance resulting in their classification as artificial fill. Native alluvial soils were encountered beneath the fill soils at all of the infiltration boring locations, extending to at least the maximum depth explored of 12± feet. The alluvium generally consists of loose sands, silty sands and silty sands to sandy silts, with occasional medium dense silty sands. The Boring Logs, which illustrate the conditions encountered at the boring locations, are included with this report.

Infiltration Testing

As previously mentioned, the infiltration testing was performed in general accordance with the guidelines published in Riverside County – Low Impact Development BMP Design Handbook – Section 2.3 of Appendix A, which apply to San Bernardino County.

Pre-soaking

In accordance with the county infiltration standards for sandy soils, all infiltration test borings were pre-soaked 2 hours prior to the infiltration testing or until all of the water had percolated through the test holes. The pre-soaking process consisted of filling test borings by inverting a full 5-gallon bottle of clear water supported over each hole so that the water flow into the hole holds constant at a level at least 5 times the hole's radius above the gravel at the bottom of each hole. Pre-soaking was completed after all of the water had percolated through the test holes.

Infiltration Testing

Following the pre-soaking process of the infiltration test borings, SCG performed the infiltration testing. Each test hole was filled with water to a depth of at least 5 times the hole's radius above the gravel at the bottom of the test holes. In accordance with the Riverside County guidelines, since "sandy soils" (where 6 inches of water infiltrated into the surrounding soils in less than 25 minutes for two consecutive readings) were encountered at the bottom of the infiltration test borings, readings were taken at 10-minute intervals for a total of 1 hour. After each reading, water was added to the borings so that the depth of the water was at least 5 times the radius of the hole. The water level readings are presented on the spreadsheets enclosed with this report. The infiltration rates for each of the timed intervals are also tabulated on the spreadsheets.

The infiltration rates from the tests are tabulated in inches per hour. In accordance with the typically accepted practice, it is recommended that the most conservative reading from the latter part of the infiltration tests be used as the design infiltration rate. The rates are summarized below:

Infiltration Test No.	Depth (feet)	Soil Description	Infiltration Rate (inches/hour)
I-1	10	Silty fine Sand, little medium Sand	3.9
I-2	12	Silty fine to medium Sand	3.0
I-3	12	Silty fine to medium Sand, trace coarse Sand	4.6
I-4	12	Silty fine Sand to fine Sandy Silt, trace medium Sand	3.1
I-5	10	Silty fine Sand, little medium Sand, trace fine Gravel	3.5
I-6	10	Silty fine Sand to fine Sandy Silt, trace medium Sand, trace fine Gravel	3.0

Laboratory Testing

Moisture Content

The moisture contents for the recovered soil samples within the borings were determined in accordance with ASTM D-2216 and are expressed as a percentage of the dry weight. These test results are presented on the Boring Logs.

Grain Size Analysis

The grain size distribution of selected soils collected from the base of each infiltration test boring have been determined using a range of wire mesh screens. These tests were performed in general accordance with ASTM D-422 and/or ASTM D-1140. The weight of the portion of the sample retained on each screen is recorded and the percentage finer or coarser of the total weight is calculated. The results of these tests are presented on Plates C-1 through C-6 of this report.

Design Recommendations

Six (6) infiltration tests were performed at the subject site. As noted above, the infiltration rates at these locations vary from 3.0 to 4.6 inches per hour. The major factor affecting the difference in infiltration rates at the infiltration test locations is the presence of silt in the soils at the tested depths. Based on the infiltration test results, we recommend an infiltration rate of 3.0 inches per hour be used in the design of the infiltration systems, if the bottom of the infiltration systems extend between 10 to 12± feet below the existing site grades.

The design of the storm water infiltration systems should be performed by the project civil engineer, in accordance with the City of Ontario and/or County of San Bernardino guidelines. It is recommended that the system be constructed so as to facilitate removal of silt and clay, or other deleterious materials from any water that may enter the systems. The presence of such materials would decrease the effective infiltration rates. It is recommended that the project civil engineer apply an appropriate factor of safety. The infiltration rates recommended above is based on the assumption that only clean water will be introduced to the subsurface profile. Any fines, debris, or organic materials could significantly impact the infiltration rate. It should be noted that the recommended infiltration rates are based on infiltration testing at six (6) discrete locations and that the overall infiltration rates of the proposed infiltration systems could vary considerably.

Infiltration Rate Considerations

The infiltration rates presented herein was determined in accordance with the San Bernardino County guidelines and are considered valid only for the time and place of the actual test. Varying subsurface conditions will exist in other areas of the site, which could alter the recommended infiltration rates presented above. The infiltration rates will decline over time between maintenance cycles as silt or clay particles accumulate on the BMP surface. The infiltration rate is highly dependent upon a number of factors, including density, silt and clay content, grainsize distribution throughout the range of particle sizes, and particle shape. Small changes in these factors can cause large changes in the infiltration rates.

Infiltration rates are based on unsaturated flow. As water is introduced into soils by infiltration, the soils become saturated and the wetting front advances from the unsaturated zone to the saturated zone. Once the soils become saturated, infiltration rates become zero, and water can only move through soils by hydraulic conductivity at a rate determined by pressure head and soil permeability. Changes in soil moisture content will affect the infiltration rate. Infiltration rates should be expected to decrease until the soils become saturated. Soil permeability values will then govern groundwater movement. Permeability values may be on the order of 10 to 20 times less than infiltration rates. The system designer should incorporate adequate factors of safety and allow for overflow design into appropriate traditional storm drain systems, which would transport storm water off-site.

Construction Considerations

The infiltration rates presented in this report are specific to the tested locations and tested depths. Infiltration rates can be significantly reduced if the soils are exposed to excessive disturbance or compaction during construction. Compaction of the soils at the bottom of the infiltration system can significantly reduce the infiltration ability of the basins. Therefore, the subgrade soils within proposed infiltration system areas should not be over-excavated, undercut or compacted in any significant manner. It is recommended that a note to this effect be added to the project plans and/or specifications.

We recommend that a representative from the geotechnical engineer be on-site during the construction of the proposed infiltration systems to identify the soil classification at the base of each system. It should be confirmed that the soils at the base of the proposed infiltration systems correspond with those presented in this report to ensure that the performance of the systems will be consistent with the rates reported herein.

We recommend that scrapers and other rubber-tired heavy equipment not be operated on the basin bottom, or at levels lower than 2 feet above the bottom of the system, particularly within basins. As such, the bottom 24 inches of the infiltration systems should be excavated with non-rubber-tired equipment, such as excavators.

Basin Maintenance

The proposed project may include infiltration basins. Water flowing into these basins will carry some level of sediment. Wind-blown sediments and erosion of the basin side walls will also contribute to sediment deposition at the bottom of the basin. This layer has the potential to significantly reduce the infiltration rate of the basin subgrade soils. Therefore, a formal basin maintenance program should be established to ensure that these silt and clay deposits are removed from the basin on a regular basis. Appropriate vegetation on the basin sidewalls and bottom may reduce erosion and sediment deposition.

Basin maintenance should also include measures to prevent animal burrows, and to repair any burrows or damage caused by such. Animal burrows in the basin sidewalls can significantly increase the risk of erosion and piping failures.

Location of Infiltration Systems

The use of on-site storm water infiltration systems carries a risk of creating adverse geotechnical conditions. Increasing the moisture content of the soil can cause the soil to lose internal shear strength and increase its compressibility, resulting in a change in the designed engineering properties. Overlying structures and pavements in the infiltration area could potentially be damaged due to saturation of the subgrade soils. The proposed infiltration systems for this site should be located at least 25 feet away from any structures, including retaining walls. Even with this provision of locating the infiltration system at least 25 feet from the building(s), it is possible that infiltrating water into the subsurface soils could have an adverse effect on the proposed or existing structures. It should also be noted that utility trenches which happen to collect storm water can also serve as conduits to transmit storm water toward the structure, depending on the slope of the utility trench. Therefore, consideration should also be given to the proposed locations of underground utilities which may pass near the proposed infiltration system.

The infiltration system designer should also give special consideration to the effect that the proposed infiltration systems may have on nearby subterranean structures, open excavations, or descending slopes. In particular, infiltration systems should not be located near the crest of descending slopes, particularly where the slopes are comprised of granular soils. Such systems will require specialized design and analysis to evaluate the potential for slope instability, piping failures and other phenomena that typically apply to earthen dam design. This type of analysis is beyond the scope of this infiltration test report, but these factors should be considered by the infiltration system designer when locating the infiltration systems.

General Comments

This report has been prepared as an instrument of service for use by the client in order to aid in the evaluation of this property and to assist the architects and engineers in the design and preparation of the project plans and specifications. This report may be provided to the contractor(s) and other design consultants to disclose information relative to the project. However, this report is not intended to be utilized as a specification in and of itself, without appropriate interpretation by the project architect, structural engineer, and/or civil engineer. The design of the proposed storm water infiltration system is the responsibility of the civil engineer. The role of the geotechnical engineer is limited to determination of infiltration rate only. By using the design infiltration rate contained herein, the civil engineer agrees to indemnify, defend, and hold harmless the geotechnical engineer for all aspects of the design and performance of the proposed storm water infiltration system. The reproduction and distribution of this report must be authorized by the client and Southern California Geotechnical, Inc. Furthermore, any reliance on this report by an unauthorized third party is at such party's sole risk, and we accept no responsibility for damage or loss which may occur.

The analysis of this site was based on a subsurface profile interpolated from limited discrete soil samples. While the materials encountered in the project area are considered to be representative of the total area, some variations should be expected between boring locations and testing depths. If the conditions encountered during construction vary significantly from those detailed herein, we should be contacted immediately to determine if the conditions alter the recommendations contained herein.

This report has been based on assumed or provided characteristics of the proposed development. It is recommended that the owner, client, architect, structural engineer, and civil engineer carefully review these assumptions to ensure that they are consistent with the characteristics of the proposed development. If discrepancies exist, they should be brought to our attention to verify that they do not affect the conclusions and recommendations contained herein. We also recommend that the project plans and specifications be submitted to our office for review to verify that our recommendations have been correctly interpreted. The analysis, conclusions, and recommendations contained within this report have been promulgated in accordance with generally accepted professional geotechnical engineering practice. No other warranty is implied or expressed.

Closure

We sincerely appreciate the opportunity to be of service on this project. We look forward to providing additional consulting services during the course of the project. If we may be of further assistance in any manner, please contact our office.

Respectfully Submitted,

BORING LOG LEGEND

SAMPLE TYPE	GRAPHICAL SYMBOL	SAMPLE DESCRIPTION
AUGER		SAMPLE COLLECTED FROM AUGER CUTTINGS, NO FIELD MEASUREMENT OF SOIL STRENGTH. (DISTURBED)
CORE		ROCK CORE SAMPLE: TYPICALLY TAKEN WITH A DIAMOND-TIPPED CORE BARREL. TYPICALLY USED ONLY IN HIGHLY CONSOLIDATED BEDROCK.
GRAB		SOIL SAMPLE TAKEN WITH NO SPECIALIZED EQUIPMENT, SUCH AS FROM A STOCKPILE OR THE GROUND SURFACE. (DISTURBED)
CS		CALIFORNIA SAMPLER: 2-1/2 INCH I.D. SPLIT BARREL SAMPLER, LINED WITH 1-INCH HIGH BRASS RINGS. DRIVEN WITH SPT HAMMER. (RELATIVELY UNDISTURBED)
NSR		NO RECOVERY: THE SAMPLING ATTEMPT DID NOT RESULT IN RECOVERY OF ANY SIGNIFICANT SOIL OR ROCK MATERIAL.
SPT		STANDARD PENETRATION TEST: SAMPLER IS A 1.4 INCH INSIDE DIAMETER SPLIT BARREL, DRIVEN 18 INCHES WITH THE SPT HAMMER. (DISTURBED)
SH		SHELBY TUBE: TAKEN WITH A THIN WALL SAMPLE TUBE, PUSHED INTO THE SOIL AND THEN EXTRACTED. (UNDISTURBED)
VANE		VANE SHEAR TEST: SOIL STRENGTH OBTAINED USING A 4 BLADED SHEAR DEVICE. TYPICALLY USED IN SOFT CLAYS-NO SAMPLE RECOVERED.

COLUMN DESCRIPTIONS

DEPTH: Distance in feet below the ground surface.

SAMPLE: Sample Type as depicted above.

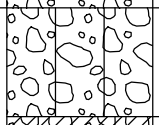
BLOW COUNT: Number of blows required to advance the sampler 12 inches using a 140 lb hammer with a 30-inch drop. 50/3" indicates penetration refusal (>50 blows) at 3 inches. WH indicates that the weight of the hammer was sufficient to push the sampler 6 inches or more.

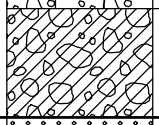
POCKET PEN.: Approximate shear strength of a cohesive soil sample as measured by pocket penetrometer.

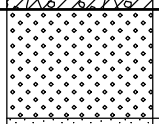
GRAPHIC LOG: Graphic Soil Symbol as depicted on the following page.

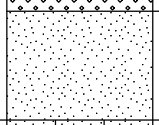
DRY DENSITY: Dry density of an undisturbed or relatively undisturbed sample in lbs/ft^3.

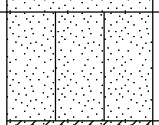
MOISTURE CONTENT: Moisture content of a soil sample, expressed as a percentage of the dry weight.

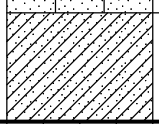


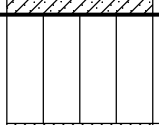


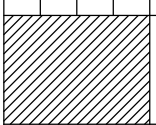


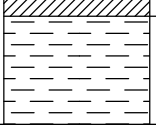


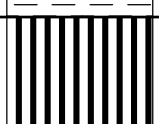


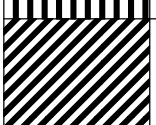


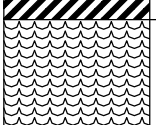


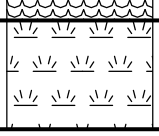












LIQUID LIMIT: The moisture content above which a soil behaves as a liquid.

PLASTIC LIMIT: The moisture content above which a soil behaves as a plastic.

PASSING #200 SIEVE: The percentage of the sample finer than the #200 standard sieve.

UNCONFINED SHEAR: The shear strength of a cohesive soil sample, as measured in the unconfined state.

	Final	10:31 AM		8.80			

Per County Standards, Infiltration Rate calculated as follows:

$$Q = \frac{\Delta H(60r)}{\Delta t(r + 2H_{avg})}$$

Where:

- Q = Infiltration Rate (in inches per hour)
- ΔH = Change in Height (Water Level) over the time interval
- r = Test Hole (Borehole) Radius
- Δt = Time Interval
- H_{avg} = Average Head Height over the time interval

Preliminary Water Quality Management Plan (PWQMP)

For compliance with Santa Ana Regional Water Quality Control Board

Order Number R8-2010-0036 (NPDES Permit No. CAS618036)

for

Project Name:	**5355 Airport Drive**
Ontario Project #:	
Project Description:	**Proposed Industrial Building**
Applicant Name:	**Prologis (John Carter)**
Applicant Address:	**3546 Concours St. #100, Ontario Ca 91764**
Project Address:	**5355 E. Airport Dr. Ontario, CA 91761**
Size of Development:	**12.85 Acres**

Submittal Date: March 2022

Preliminary Water Quality Management Plan (PWQMP)

1. Introduction

The Preliminary Water Quality Management Plan (PWQMP) is a planning tool to improve integration of required water quality elements, stormwater management, water conservation, rainwater harvesting and re-use, and flood management in land use planning and the City's development process. The Preliminary WQMP will assist project applicants and planners in properly designing and laying out project sites so that water quality may be incorporated in the most effective manner and at the lowest cost for the developer.

The San Bernardino County Municipal Separate Storm Sewer System Permit (MS4 Permit) requires project-specific Water Quality Management plans (WQMP) to be prepared for all priority new development and significant redevelopment projects listed in Section 2 of this document. The MS4 Permit stipulates that the City of Ontario require priority project applicants to submit a Preliminary project-specific WQMP, as early as possible, during the environmental review or planning phase of a development project and that the Preliminary WQMP be approved prior to the issuance of land use entitlement.

2. Priority Projects (requiring a Preliminary WQMP)

Land Use entitlement shall not be issued for any of the listed projects, below, until a Preliminary WQMP has been approved by the City's Engineering Department. For construction projects not going through entitlement, a Preliminary and Final project-specific WQMP shall be approved, prior to the issuance of construction permits:

Check the appropriate project category below, for this project:

Check below	**Project Categories**
	1. All significant re-development projects. Significant re-development is defined as the addition or replacement of 5,000 or more square feet of impervious surface on an already developed site subject to discretionary approval of the Permittee. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of the facility, or emergency redevelopment activity required to protect public health and safety. Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing developed site, and the existing development was not subject to WQMP requirements, the numeric sizing criteria discussed below applies only to the addition or replacement, and not to the entire developed site. Where redevelopment results in an increase of fifty percent or more of the impervious surfaces of a previously existing developed site, the numeric sizing criteria applies to the entire development (new and existing).

Check below	Project Categories
✓	2. New development projects that create 10,000 square feet or more of impervious surface (collectively over the entire project site) including commercial, industrial, residential housing subdivisions (i.e., detached single family home subdivisions, multi-family attached subdivisions or townhomes, condominiums, apartments, etc.), mixed-use, and public projects. This category includes development projects on public and private land, which fall under the planning and building authority of the permitting agency.
	3. Automotive repair shops (with SIC codes 5013, 5014, 5541, 7532- 7534, 7536-7539).
	4. Restaurants and Food Service Establishments where the land area of development is 5,000 square feet or more.
	5. Developments of 2,500 square feet of impervious surface or more adjacent to (within 200 feet) or discharging directly into environmentally sensitive areas (ESA's) such as areas designated in the Ocean Plan as areas of special biological significance or waterbodies listed on the CWA Section 303(d) list of impaired waters.
✓	6. Parking lots of 5,000 square feet or more exposed to storm water. Parking lot is defined as land area or facility for the temporary storage of motor vehicles.
	7. Retail Gasoline Outlets (RGOs) that are either 5,000 sq ft or more, or have a projected average daily traffic of 100 or more vehicles per day.
	8. *This project is not covered under any of the categories listed above.

* If the development is not covered under any of the project categories listed in Section 2, the project is not required to design and install Site Design/LID BMPs or Treatment Control BMPs to treat the design storm event (Design Capture Volume) described in Section 4.

3. Preliminary WQMP Objectives

Through a combination of Site Design/LID BMPs (where feasible), Source Control, and/or Treatment Control BMPs, project-specific WQMPs shall address all identified pollutants and hydrologic conditions of concern from new development and significant re-development projects for the categories of projects (priority projects) listed in Section 2. Under each type of BMP, listed below, please indicate which BMPs are planned to be implemented and included in the Final WQMP for the project:

A. Site Design/LID (Low Impact Design) for Reducing Stormwater Runoff:

The MS4 Permit requires each priority development project to infiltrate, harvest and use, evapotranspire, or bio-treat the runoff from a 2-yr, 24-hour storm event (Design Capture Volume). If site conditions do not permit infiltration, harvest and use, evapotranspiration, and/or bio-treatment of the entire Design Capture Volume, at the project site, Site Design/LID techniques are required to be implemented to the Maximum Extent Practicable, at the project site, and the remainder of the DCV shall be infiltrated, harvested, bio-treated or treated by alternative measures.

Project applicants shall submit a Preliminary WQMP that documents the LID/Site Design BMPs, proposed for the project. Please indicate, in the table below, which Site Design/LID BMPs will be utilized on this project to accomplish this requirement:

Site Design/LID Practice	Planned	Not Planned
Provide at least the minimum effective area required for LID BMPs, to comply with the WQMP (see Table 3-1 below).	✓	
Grade parking lot areas/drive aisles/roof drains to sheet flow runoff into landscaped swales, via curb cuts or zero-face curbs or otherwise disconnect direct drainage from MS4.		✓
Design landscaped areas as swales and grade to accept runoff from building roofs, parking lots and project roadways.		✓
Install surface retention basins or infiltration trenches to receive impervious area runoff.		✓
Install pervious pavement in parking stalls, alleys, driveways, gutters, walkways, trails or patios.		✓
Install underground stormwater retention chambers where downstream landscaped areas are limited.	✓	
Install approved Stormwater Drywells in detention areas.		✓
Construct streets, sidewalks, and parking lot stalls to the minimum widths necessary.	✓	
Install on-site Biotreatment basins/trenches with underdrains, where soil type is poorly draining.		✓
Install “Engineered Soil” to increase uptake/soil storage capacity and/or evapotranspiration.		✓
Install Rainwater Harvesting/Use Equipment.		✓
Utilize approved off-site retention/infiltration, biotreatment or proprietary treatment, where it is infeasible to install, on-site.		✓

Table 3-1 Minimum Effective Area[1] Required for LID BMPs (surface + subsurface facilities) for Project WQMP to Demonstrate Infeasibility[2] (% of site)

Project Type	New Development	Re-Development
SF/MF Residential < 7 du/ac	10%	5%
SF/MF Residential < 7 - 18 du/ac	7%	3.5%
SF/MF Residential > 18 du/ac	5%	2.5%
Mixed Use, Commercial/Industrial w/FAR< 1.0	10%	5%

Mixed Use, Commercial/Industrial w/FAR 1.0-2.0	7%	3.5%
Mixed Use, Commercial/Industrial w/FAR> 2.0	5%	2.5%
Podium (parking under > 75% of project)	3%	1.5%
Zoning allowing development to property lines	2%	1%
Transit Oriented Development[3]	5%	2.5%
Parking	5%	2.5%

[1] "Effective area" is defined as land area which 1) is suitable for a retention/infiltration BMP (based on infeasibility criteria) and 2) is located down-gradient from building roof or paved areas, so that it may receive gravity flow runoff.

[2] Criteria only required if the project WQMP seeks to demonstrate that the full DCV cannot be feasibly managed on-site.

[3] Transit oriented development is defined as a project with development center within one half mile of a mass transit center.

Key: du/ac = dwelling units/acre, FAR = Floor Area Ratio = ratio of gross floor area of building to gross lot area, MF = Multi Family, SF = Single Family

B. Source Control BMPs – The following BMPs are designed to control stormwater pollutants and runoff water at the location where it is generated. Please indicate which of the listed BMPs are planned to be implemented for the project:

Source Control BMPs	Planned	Not Planned
Minimize non-stormwater site runoff through efficient irrigation system design and controllers.	✓	
Minimize trash and debris in storm runoff through a regular parking lot, storage yard and roadway sweeping program.	✓	
Provide proper covers/roofs and secondary containment for outside material storage & work areas.	✓	
Provide solid roofs over all trash enclosures.	✓	
Site Owner(s)/Property Manager/HOA or POA will be familiar with the project WQMP and stormwater BMPs.	✓	
Owner or HOA or POA to provide Education/Training of site occupants and employees on stormwater BMPs.	✓	
Install stormwater placards/stenciled messages with a "No Dumping" message on all on-site/off-site storm drain inlets.	✓	
Provide contained equipment/vehicle wash rack areas that discharge to sanitary sewer.		✓

C. Treatment Control BMPs – The following BMPs are designed to control stormwater pollutants where it is not feasible to install on-site Site Design/LID BMPs, with the requisite capacity to treat the Design Capture Volume for identified Pollutants of Concern or where pretreatment of stormwater runoff is required, ahead of infiltration BMPs. Please indicate which of the listed BMPs are planned to be implemented for the project:

Treatment Control BMP	Planned	Not Planned
Gravity Separator devices for pretreatment of sediment, trash/litter or Oil & Grease	✓	
Proprietary Biofiltration vaults/devices		✓
Media Cartridge Filtration Vaults		✓
Proprietary Filter Inserts for on-site storm drain inlets or retention basin/trench overflow drains	✓	
Regional Treatment facilities are installed or are planned for installation, off-site, and provide a superior level of treatment or clear advantage to on-site treatment BMPs		✓

4. Volume-based calculation (approximate) for sizing on-site or off-site Stormwater Retention/Infiltration, Harvest & Re-Use or Biotreatment facilities

1) Calculate the "Watershed Imperviousness Ratio", i, which is equal to the percent of impervious area in the BMP Drainage Area divided by 100.

2) Calculate the composite runoff coefficient C_{BMP} for the Drainage Area above using the following equation:

$$\mathbf{C_{BMP} = 0.858i^3 - 0.78i^2 + 0.774i + 0.04}$$

where: $\mathbf{C_{BMP}}$ = composite runoff coefficient; and,

i = watershed imperviousness ratio.

3) Determine the area-averaged "6-hour Mean Storm Rainfall", P_6, for the Drainage Area. This is calculated by multiplying the area averaged 2-year 1-hour value (0.55"-0.6") by the appropriate regression coefficient from Table 1 (1.4807). The 2-yr, 1-hr value for southern Ontario is approximately to 0.5" (P_6 = 0.5*1.4807 = 0.74 and northern Ontario is approximately 0.6" in/hr (P_6 = 0.6*1.4807 = 0.89).

4) Determine the appropriate drawdown time. Use the regression constant a = 1.582 for 24 hours and a = 1.963 for 48 hours. *Note: Regression constants are provided for both 24 hour and 48 hour drawdown times; however, 48 hour drawdown times should be used in most areas of California. Drawdown times in excess of 48 hours should be used with caution as vector breeding can be a problem after water has stood in excess of 72 hours. (Use of the 24 hour drawdown time should be limited to drainage areas with coarse soils (Class 'A' soils, that readily drain.)*

5) Calculate the "Maximized Detention Volume", P_0, using the following equation:

$$\mathbf{P_0 = a \cdot C_{BMP} \cdot P_6}$$

where: $\mathbf{P_0}$ = Maximized Detention Volume, in inches

a = 1.582 for 24 hour and a = 1.963 for 48 hour drawdown,

C_{BMP} = composite runoff coefficient; and,

P_6 = 6-hour Mean Storm Rainfall, in inches

6) Calculate the "Target Capture Volume", V_0, using the following equation:

$$\mathbf{V_0 = (P_0 \cdot A) / 12}$$

where: **V_0** = Target Capture Volume, in acre-feet

P_0 = Maximized Detention Volume, in inches; and,

A = BMP Drainage Area, in acres

Project Volume-based calculation (approximate) for planned on-site or off-site Stormwater Retention/Infiltration, Harvest & Re-Use or Biotreatment facilities:

Variable	Factor/Formula	Area 1 Result	Area 2 Result	Area 3 Result	Area 4 Result
Ratio of impervious surface/total site surface	(i)	89%			
C_{BMP}= runoff coefficient	$0.858i^3 – 0.78i^2 + 0.774i + 0.04$ =	0.716			
P_6	**P_6 = 2-yr,1- hr depth*1.4807 =	0.78			
Detention Volume-acre inches	P_0 = a * C_{BMP} * P_6 =	1.09			
Drawdown rate of basin/trench (a)	1.582 for 24-hr drawdown or 1.963 for 48-hr drawdown =	1.963			
Project Total Area (ac)	(A)	12.85			
Design Capture Volume, cu. ft. (DCV)	$V_0 = [(P_0 * A)/12]*43560$ =	51,054			
Water Volume infiltrated in first 3 hrs of storm	Vol= in/hr/12 x ft^2 of infiltration area x 3 hrs	N/A			
Retention/treatment Volume provided, cu. ft.	Retention capacity of basins, trenches, underground system or biotreatment proposed	140,009			

**For P_6 value, use site coordinates and NOAA website to determine project's average 2-yr, 1-hr rainfall depth, at: http://hdsc.nws.noaa.gov/hdsc/pfds/sa/sca_pfds.html .

5. Hydrologic Conditions of Concern (HCOC) and use of the on-line San Bernardino County HCOC Map for determining necessary mitigation steps necessary if there are HCOCs downstream of a project:

Project applicants may access the on-line HCOC Map at: http://sbcounty.permitrack.com/WAP/ . The map will indicate any hydrology concerns with downstream waterways that are hydraulically connected to the project and will indicate if there are any approved regional projects downstream that could be utilized for off-site mitigation of HCOCs. Please indicate here if the project will or will not be able to retain/infilter, harvest and use or biotreat and detain the DCV, on-site, as calculated in Section 4 and if there are HCOCs identified downstream of the project:

Retain or Harvest/Use the DCV on site?	Yes	✓	No	
Biotreat the DCV but not infilter the runoff?	Yes		No	✓
HCOCs identified downstream of site?	Yes		No	✓

If the entire DCV will not be retained on site, the DCV is biotreated but not infiltered or additional detention capacity is needed to address identified HCOCs, downstream of the site, please list here, what additional mitigation measures will be utilized (on-site or off-site) to address HCOCs (see Section 4.2.1-4.2.3 of the SB County WQMP Technical Guidance):

The entire DCV is retained on site.

6. Site Plan and Conceptual Grading/Drainage Plan requirements for submission with the Preliminary WQMP:

Provide a Site Plan and Conceptual Grading/Drainage Plan along with this Preliminary WQMP, which conceptually shows the proposed locations of buildings, homes, parking lots, parks, new paved roadways, landscaped areas, drainage patterns and drainage sub-areas, methods of conveyance, proposed retention/infiltration, harvest & use or biotreatment facilities that are planned for installation. Where it is determined to be infeasible to capture and detain design storm runoff volumes, on-site, please include other design features, as described in Section 3, above. Include numbered or lettered notes on the Site Plan with a legend detailing other BMPs, as described in Section 3.

GENERAL NOTES

1. SEE PRELIMINARY WQMP REPORT, PREPARED BY LANGAN ENGINEERING, FOR THE COMPLETE DESIGN CAPTURE VOLUME AND INFILTRATION BASIN CALCULATIONS.
2. CALCULATIONS WERE BASED ON THE REQUIREMENTS ON THE SAN BERNARDINO TECHNICAL GUIDANCE DOCUMENT FOR WATER QUALITY MANAGEMENT PLANS – SANTA ANA RIVER.
3. PROPOSED ON-SITE DRAINAGE SYSTEM LAYOUT IS PRELIMINARY.
4. PROPOSED OFF-SITE WQMP WILL BE DESIGNED AND SHOWN ON THE FINAL WQMP REPORT.
5. PRELIMINARY DETAILS OF THE INFILTRATION CHAMBERS AND CDS UNITS ARE IN THE PRELIMINARY WQMP REPORT.
6. FIELD INFILTRATION RATES WERE OBTAINED FROM INFILTRATION REPORT, PREPARED BY SOUTHERN CALIFORNIA GEOTECHNICAL, INC., DATED MARCH 9, 2022.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County Southwestern Part, California
Survey Area Data: Version 13, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 5, 2020—Feb 6, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Db	Delhi fine sand	A	143.7	76.2%
TuB	Tujunga loamy sand, 0 to 5 percent slopes	A	44.9	23.8%
Totals for Area of Interest			**188.6**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

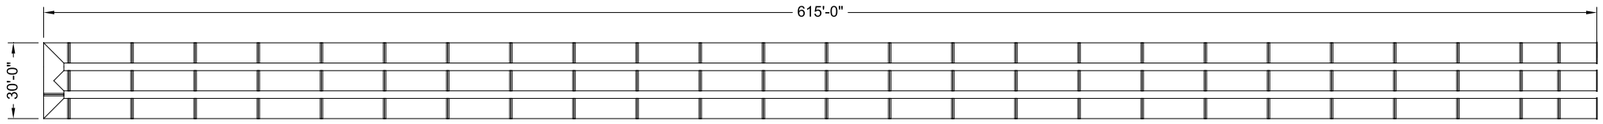
PRELIMINARY BMP DETAILS



PROJECT SUMMARY

CALCULATION DETAILS
- LOADING = HS20/HS25
- APPROX. LINEAR FOOTAGE = 1,851 LF

STORAGE SUMMARY
- STORAGE VOLUME REQUIRED = 140,000 CF
- PIPE STORAGE VOLUME = 93,041 CF
- BACKFILL STORAGE VOLUME = 46,967 CF
- TOTAL STORAGE PROVIDED = 140,009 CF

PIPE DETAILS
- DIAMETER = 96"
- CORRUGATION = 5x1
- GAGE = 16
- COATING = ALT2
- WALL TYPE = PERFORATED
- BARREL SPACING = 36"

BACKFILL DETAILS
- WIDTH AT ENDS = 24"
- ABOVE PIPE = 12"
- WIDTH AT SIDES = 24"
- BELOW PIPE = 12"

NOTES

- ALL RISER AND STUB DIMENSIONS ARE TO CENTERLINE. ALL ELEVATIONS, DIMENSIONS, AND LOCATIONS OF RISERS AND INLETS, SHALL BE VERIFIED BY THE ENGINEER OF RECORD PRIOR TO RELEASING FOR FABRICATION.
- ALL FITTINGS AND REINFORCEMENT COMPLY WITH ASTM A998.
- ALL RISERS AND STUBS ARE $2\frac{2}{3}$" x $\frac{1}{2}$" CORRUGATION AND 16 GAGE UNLESS OTHERWISE NOTED.
- RISERS TO BE FIELD TRIMMED TO GRADE.
- QUANTITY OF PIPE SHOWN DOES NOT PROVIDE EXTRA PIPE FOR CONNECTING THE SYSTEM TO EXISTING PIPE OR DRAINAGE STRUCTURES. OUR SYSTEM AS DETAILED PROVIDES NOMINAL INLET AND/OR OUTLET PIPE STUB FOR CONNECTION TO EXISTING DRAINAGE FACILITIES. IF ADDITIONAL PIPE IS NEEDED IT IS THE RESPONSIBILITY OF THE CONTRACTOR.
- BAND TYPE TO BE DETERMINED UPON FINAL DESIGN.
- THE PROJECT SUMMARY IS REFLECTIVE OF THE DYODS DESIGN, QUANTITIES ARE APPROX. AND SHOULD BE VERIFIED UPON FINAL DESIGN AND APPROVAL. FOR EXAMPLE, TOTAL EXCAVATION DOES NOT CONSIDER ALL VARIABLES SUCH AS SHORING AND ONLY ACCOUNTS FOR MATERIAL WITHIN THE ESTIMATED EXCAVATION FOOTPRINT.
- THESE DRAWINGS ARE FOR CONCEPTUAL PURPOSES AND DO NOT REFLECT ANY LOCAL PREFERENCES OR REGULATIONS. PLEASE CONTACT YOUR LOCAL CONTECH REP FOR MODIFICATIONS.

ASSEMBLY
SCALE: 1" = 60'

The design and information shown on this drawing is provided as a service to the project owner, engineer and contractor by Contech Engineered Solutions LLC ("Contech"). Neither this drawing, nor any part thereof, may be used, reproduced or modified in any manner without the prior written consent of Contech. Failure to comply is done at the user's own risk and Contech expressly disclaims any liability or responsibility for such use.

If discrepancies between the supplied information upon which the drawing is based and actual field conditions are encountered as site work progresses, these discrepancies must be reported to Contech immediately for re-evaluation of the design. Contech accepts no liability for designs based on missing, incomplete or inaccurate information supplied by others.

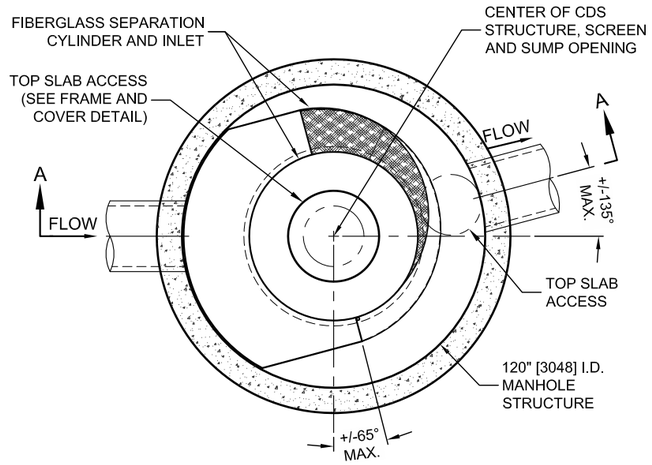
Contech Engineered Solutions, LLC is pleased to offer the following estimate of storage volume for the above named project. The results are submitted as an estimate only, without liability on the part of Contech Engineered Solutions, LLC for accuracy or suitability to any particular applicaton and are subject to verification of the Engineer of Record. **This tool is only applicable for rectangular shaped systems.**



Summary of Inputs

System Information		Backfill Information		Pipe & Analysis Information	
Out-to-out length (ft):	615.0	Backfill Porosity (%):	40%	System Diameter (in):	96
Out-to-out width (ft):	30.0	Depth Above Pipe (in):	12.0	Pipe Spacing (in):	2
Number of Manifolds (ea):	1.0	Depth Below Pipe (in):	12.0	Incremental Analysis (in):	2
Number of Barrels (ea):	3.0	Width At Ends (ft):	2.0	System Invert (Elevation):	966
		Width At Sides (ft):	2.0

NOTES/SPECIAL REQUIREMENTS:

* PER ENGINEER OF RECORD

GENERAL NOTES
1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH ( ) ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH ENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.contechEScom
4. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING.
5. STRUCTURE SHALL MEET AASHTO HS20 LOAD RATING, ASSUMING GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION. CASTINGS SHALL MEET HS20 (AASHTO M 306) AND BE CAST WITH THE CONTECH LOGO.
6. IF REQUIRED, PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE (LIFTING CLUTCHES PROVIDED).
C. CONTRACTOR TO ADD JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS, AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

APPENDIX F

INFILTRATION REPORT

March 9, 2022

Prologis
17777 Center Court Drive North, Suite 100
Cerritos, California 90703

Attention: Mr. John Carter
Director, Project Management

Project No.: 22G128-2

Subject: Results of Infiltration Testing
Proposed Warehouse
5355 East Airport Drive
Ontario, California

Reference: Geotechnical Investigation, Proposed Warehouse, 5355 East Airport Drive, Ontario, California, prepared by Southern California Geotechnical, Inc. (SCG) for Prologis, SCG Project No. 22G128-1, dated March 9, 2022.

Dear Mr. Carter:

In accordance with your request, we have conducted infiltration testing at the subject site. We are pleased to present this report summarizing the results of the infiltration testing and our design recommendations.

Scope of Services

The scope of services performed for this project was in general accordance with our Proposal No. 22P129, dated January 21, 2022. The scope of services included site reconnaissance, subsurface exploration, field testing, and engineering analysis to determine the infiltration rates of the on-site soils. The infiltration testing was performed in general accordance with the guidelines published in the Riverside County – Low Impact Development BMP Design Handbook – Section 2.3 of Appendix A, prepared for the Riverside County Department of Environmental Health (RCDEH), dated December, 2013. The San Bernardino County standards defer to the guidelines published by the RCDEH.

Site and Project Description

The subject site is located on the north side of East Airport Drive, 1,310± feet east of the intersection of South Wineville Avenue and East Airport Drive in Ontario, California. The site is also referenced by the street address 5355 East Airport Drive. The site is bounded to the north by Union Pacific railroad tracks, to the east and west by an industrial development, and to the south by East Airport Drive. The general location of the site is illustrated on the Site Location Map, enclosed as Plate 1 of this report.

The site consists of an irregular-shaped property, 14.58± acres in size. The site is developed to manufacture and store animal feed grains. The development includes several buildings and shed structures ranging in size from 2,200± ft^2 to 20,175± ft^2, and several silos and above-ground

storage tanks (ASTs) primarily located in the north-central region of the site. The existing structures are generally of concrete tilt-up and/or metal-framed construction, and are presumed to be supported on conventional shallow foundations with concrete slab-on-grade floors. The existing structures are generally surrounded by asphaltic concrete (AC) pavements, with isolated areas of Portland cement concrete (PCC), aggregate base pavements, and exposed soils in the south-central portion of the site. The existing pavements are in poor condition, with moderate to severe cracking throughout. Two medium-size trees are present in the south-central region of the site.

Detailed topographic information was not available at the time of this report. Based on elevations obtained from Google Earth and visual observations made at the time of the subsurface investigation, the site slopes gently to the south-southeast at a gradient of less than 1 percent.

Proposed Development

A preliminary site plan, identified as Scheme 01 and prepared by RGA, for the proposed development was provided to our office by the client. Based on this plan, the subject site will be developed with a 259,189± ft² warehouse, located in the north-central region of the site. Dock-high doors will be constructed along a portion of the south building wall. The proposed building is expected to be surrounded by AC pavements in the parking and drive areas, PCC pavements in the loading dock area, and concrete flatwork and landscaped planters throughout the site.

We understand that the proposed development will include on-site stormwater infiltration. Based on our experience with similar projects in the area, the infiltration systems are expected to be below-grade chambers. The bottoms of the infiltration systems are expected to be 10 to 12± feet below the existing site grades.

Concurrent Study

SCG concurrently conducted a geotechnical investigation at the subject site, referenced above. As a part of this study, five (5) borings (identified as Boring Nos. B-1 through B-5) were advanced to depths of 20 to 30± feet below the existing site grades.

AC pavements were encountered at the ground surface of Boring Nos. B-1 through B-4. The pavement sections generally consist of 0 to 2½± inches of AC, underlain by 1 to 3½± inches of aggregate base. Artificial fill soils were encountered beneath the existing pavements at Boring Nos. B-1 through B-4 and at the ground surface at Boring No. B-5, extending to depths of 2½ to 6½± feet below the existing site grades. The fill soils generally consist of loose to medium dense sands and silty sands, with occasional dense silty sands. Native alluvium was encountered beneath the artificial fill soils at all of the boring locations, extending to at least the maximum depth explored of 30± feet. The near-surface alluvium generally consists of loose to medium dense sands and sandy silts, extending to depths of 6½ to 12± feet. At greater depths, the alluvium generally consists of medium dense to dense sands, silty sands and sandy silts. Boring No. B-3 encountered a stratum of dense silty sands at a depth of 14½ to 17± feet. Boring No. B-5 encountered a stratum of loose well-graded sands at a depth of 12 to 17± feet.

Groundwater

Free water was not encountered during the drilling of any of the borings. Based on the lack of any water within the borings, and the moisture contents of the recovered soil samples, the static groundwater table is considered to have existed at a depth in excess of 30± feet at the time of the subsurface exploration.

As part of our research, we reviewed available groundwater data in order to determine groundwater levels for the site. Water level data was obtained from the California Department of Water Resources Water Data Library website, https://wdl.water.ca.gov/waterdatalibrary/. The nearest monitoring well on record (identified as State Well Number: 01S06W29H001S) is located 3,400± feet southeast of the project site. Water level readings within this monitoring well indicate a high groundwater level of 277± feet below the ground surface in April 2019.

Subsurface Exploration

Scope of Exploration

The subsurface exploration conducted for the infiltration testing consisted of six (6) infiltration test borings, advanced to depths of 10 to 12± feet below the existing site grades. The infiltration borings were advanced using a truck-mounted drilling rig, equipped with 8-inch-diameter hollow-stem augers and were logged during drilling by a member of our staff. The approximate locations of the infiltration test borings (identified as I-1 through I-6) are indicated on the Infiltration Test Location Plan, enclosed as Plate 2 of this report.

Upon the completion of the infiltration borings, the bottom of each test boring was covered with 2± inches of clean ¾-inch gravel. A sufficient length of 3-inch-diameter perforated PVC casing was then placed into each test hole so that the PVC casing extended from the bottom of the test hole to the ground surface. Clean ¾-inch gravel was then installed in the annulus surrounding the PVC casing.

Geotechnical Conditions

AC pavements were encountered at the ground surface of Infiltration Test Nos. I-1 through I-5. The pavement sections generally consist of 0 to 6± inches of AC, underlain by 0 to 9± inches of aggregate base. An 8±-inch-thick PCC section was encountered at the ground surface at Infiltration Test Nos. I-6. Steel reinforcement was not encountered at this location. Artificial fill soils were encountered beneath the existing pavements at all of the infiltration boring location, extending to depths of 3 to 4± feet below the existing site grades. The fill soils generally consist of medium dense to dense silty sands, with occasional loose sands. The fill soils possess a disturbed mottled appearance resulting in their classification as artificial fill. Native alluvial soils were encountered beneath the fill soils at all of the infiltration boring locations, extending to at least the maximum depth explored of 12± feet. The alluvium generally consists of loose sands, silty sands and silty sands to sandy silts, with occasional medium dense silty sands. The Boring Logs, which illustrate the conditions encountered at the boring locations, are included with this report.

Infiltration Testing

As previously mentioned, the infiltration testing was performed in general accordance with the guidelines published in Riverside County – Low Impact Development BMP Design Handbook – Section 2.3 of Appendix A, which apply to San Bernardino County.

Pre-soaking

In accordance with the county infiltration standards for sandy soils, all infiltration test borings were pre-soaked 2 hours prior to the infiltration testing or until all of the water had percolated through the test holes. The pre-soaking process consisted of filling test borings by inverting a full 5-gallon bottle of clear water supported over each hole so that the water flow into the hole holds constant at a level at least 5 times the hole's radius above the gravel at the bottom of each hole. Pre-soaking was completed after all of the water had percolated through the test holes.

Infiltration Testing

Following the pre-soaking process of the infiltration test borings, SCG performed the infiltration testing. Each test hole was filled with water to a depth of at least 5 times the hole's radius above the gravel at the bottom of the test holes. In accordance with the Riverside County guidelines, since "sandy soils" (where 6 inches of water infiltrated into the surrounding soils in less than 25 minutes for two consecutive readings) were encountered at the bottom of the infiltration test borings, readings were taken at 10-minute intervals for a total of 1 hour. After each reading, water was added to the borings so that the depth of the water was at least 5 times the radius of the hole. The water level readings are presented on the spreadsheets enclosed with this report. The infiltration rates for each of the timed intervals are also tabulated on the spreadsheets.

The infiltration rates from the tests are tabulated in inches per hour. In accordance with the typically accepted practice, it is recommended that the most conservative reading from the latter part of the infiltration tests be used as the design infiltration rate. The rates are summarized below:

Infiltration Test No.	Depth (feet)	Soil Description	Infiltration Rate (inches/hour)
I-1	10	Silty fine Sand, little medium Sand	3.9
I-2	12	Silty fine to medium Sand	3.0
I-3	12	Silty fine to medium Sand, trace coarse Sand	4.6
I-4	12	Silty fine Sand to fine Sandy Silt, trace medium Sand	3.1
I-5	10	Silty fine Sand, little medium Sand, trace fine Gravel	3.5
I-6	10	Silty fine Sand to fine Sandy Silt, trace medium Sand, trace fine Gravel	3.0

Laboratory Testing

Moisture Content

The moisture contents for the recovered soil samples within the borings were determined in accordance with ASTM D-2216 and are expressed as a percentage of the dry weight. These test results are presented on the Boring Logs.

Grain Size Analysis

The grain size distribution of selected soils collected from the base of each infiltration test boring have been determined using a range of wire mesh screens. These tests were performed in general accordance with ASTM D-422 and/or ASTM D-1140. The weight of the portion of the sample retained on each screen is recorded and the percentage finer or coarser of the total weight is calculated. The results of these tests are presented on Plates C-1 through C-6 of this report.

Design Recommendations

Six (6) infiltration tests were performed at the subject site. As noted above, the infiltration rates at these locations vary from 3.0 to 4.6 inches per hour. The major factor affecting the difference in infiltration rates at the infiltration test locations is the presence of silt in the soils at the tested depths. Based on the infiltration test results, we recommend an infiltration rate of 3.0 inches per hour be used in the design of the infiltration systems, if the bottom of the infiltration systems extend between 10 to 12± feet below the existing site grades.

The design of the storm water infiltration systems should be performed by the project civil engineer, in accordance with the City of Ontario and/or County of San Bernardino guidelines. It is recommended that the system be constructed so as to facilitate removal of silt and clay, or other deleterious materials from any water that may enter the systems. The presence of such materials would decrease the effective infiltration rates. It is recommended that the project civil engineer apply an appropriate factor of safety. The infiltration rates recommended above is based on the assumption that only clean water will be introduced to the subsurface profile. Any fines, debris, or organic materials could significantly impact the infiltration rate. It should be noted that the recommended infiltration rates are based on infiltration testing at six (6) discrete locations and that the overall infiltration rates of the proposed infiltration systems could vary considerably.

Infiltration Rate Considerations

The infiltration rates presented herein was determined in accordance with the San Bernardino County guidelines and are considered valid only for the time and place of the actual test. Varying subsurface conditions will exist in other areas of the site, which could alter the recommended infiltration rates presented above. The infiltration rates will decline over time between maintenance cycles as silt or clay particles accumulate on the BMP surface. The infiltration rate is highly dependent upon a number of factors, including density, silt and clay content, grainsize distribution throughout the range of particle sizes, and particle shape. Small changes in these factors can cause large changes in the infiltration rates.

Infiltration rates are based on unsaturated flow. As water is introduced into soils by infiltration, the soils become saturated and the wetting front advances from the unsaturated zone to the saturated zone. Once the soils become saturated, infiltration rates become zero, and water can only move through soils by hydraulic conductivity at a rate determined by pressure head and soil permeability. Changes in soil moisture content will affect the infiltration rate. Infiltration rates should be expected to decrease until the soils become saturated. Soil permeability values will then govern groundwater movement. Permeability values may be on the order of 10 to 20 times less than infiltration rates. The system designer should incorporate adequate factors of safety and allow for overflow design into appropriate traditional storm drain systems, which would transport storm water off-site.

Construction Considerations

The infiltration rates presented in this report are specific to the tested locations and tested depths. Infiltration rates can be significantly reduced if the soils are exposed to excessive disturbance or compaction during construction. Compaction of the soils at the bottom of the infiltration system can significantly reduce the infiltration ability of the basins. Therefore, the subgrade soils within proposed infiltration system areas should not be over-excavated, undercut or compacted in any significant manner. It is recommended that a note to this effect be added to the project plans and/or specifications.

We recommend that a representative from the geotechnical engineer be on-site during the construction of the proposed infiltration systems to identify the soil classification at the base of each system. It should be confirmed that the soils at the base of the proposed infiltration systems correspond with those presented in this report to ensure that the performance of the systems will be consistent with the rates reported herein.

We recommend that scrapers and other rubber-tired heavy equipment not be operated on the basin bottom, or at levels lower than 2 feet above the bottom of the system, particularly within basins. As such, the bottom 24 inches of the infiltration systems should be excavated with non-rubber-tired equipment, such as excavators.

Basin Maintenance

The proposed project may include infiltration basins. Water flowing into these basins will carry some level of sediment. Wind-blown sediments and erosion of the basin side walls will also contribute to sediment deposition at the bottom of the basin. This layer has the potential to significantly reduce the infiltration rate of the basin subgrade soils. Therefore, a formal basin maintenance program should be established to ensure that these silt and clay deposits are removed from the basin on a regular basis. Appropriate vegetation on the basin sidewalls and bottom may reduce erosion and sediment deposition.

Basin maintenance should also include measures to prevent animal burrows, and to repair any burrows or damage caused by such. Animal burrows in the basin sidewalls can significantly increase the risk of erosion and piping failures.

Location of Infiltration Systems

The use of on-site storm water infiltration systems carries a risk of creating adverse geotechnical conditions. Increasing the moisture content of the soil can cause the soil to lose internal shear strength and increase its compressibility, resulting in a change in the designed engineering properties. Overlying structures and pavements in the infiltration area could potentially be damaged due to saturation of the subgrade soils. The proposed infiltration systems for this site should be located at least 25 feet away from any structures, including retaining walls. Even with this provision of locating the infiltration system at least 25 feet from the building(s), it is possible that infiltrating water into the subsurface soils could have an adverse effect on the proposed or existing structures. It should also be noted that utility trenches which happen to collect storm water can also serve as conduits to transmit storm water toward the structure, depending on the slope of the utility trench. Therefore, consideration should also be given to the proposed locations of underground utilities which may pass near the proposed infiltration system.

The infiltration system designer should also give special consideration to the effect that the proposed infiltration systems may have on nearby subterranean structures, open excavations, or descending slopes. In particular, infiltration systems should not be located near the crest of descending slopes, particularly where the slopes are comprised of granular soils. Such systems will require specialized design and analysis to evaluate the potential for slope instability, piping failures and other phenomena that typically apply to earthen dam design. This type of analysis is beyond the scope of this infiltration test report, but these factors should be considered by the infiltration system designer when locating the infiltration systems.

General Comments

This report has been prepared as an instrument of service for use by the client in order to aid in the evaluation of this property and to assist the architects and engineers in the design and preparation of the project plans and specifications. This report may be provided to the contractor(s) and other design consultants to disclose information relative to the project. However, this report is not intended to be utilized as a specification in and of itself, without appropriate interpretation by the project architect, structural engineer, and/or civil engineer. The design of the proposed storm water infiltration system is the responsibility of the civil engineer. The role of the geotechnical engineer is limited to determination of infiltration rate only. By using the design infiltration rate contained herein, the civil engineer agrees to indemnify, defend, and hold harmless the geotechnical engineer for all aspects of the design and performance of the proposed storm water infiltration system. The reproduction and distribution of this report must be authorized by the client and Southern California Geotechnical, Inc. Furthermore, any reliance on this report by an unauthorized third party is at such party's sole risk, and we accept no responsibility for damage or loss which may occur.

The analysis of this site was based on a subsurface profile interpolated from limited discrete soil samples. While the materials encountered in the project area are considered to be representative of the total area, some variations should be expected between boring locations and testing depths. If the conditions encountered during construction vary significantly from those detailed herein, we should be contacted immediately to determine if the conditions alter the recommendations contained herein.

This report has been based on assumed or provided characteristics of the proposed development. It is recommended that the owner, client, architect, structural engineer, and civil engineer carefully review these assumptions to ensure that they are consistent with the characteristics of the proposed development. If discrepancies exist, they should be brought to our attention to verify that they do not affect the conclusions and recommendations contained herein. We also recommend that the project plans and specifications be submitted to our office for review to verify that our recommendations have been correctly interpreted. The analysis, conclusions, and recommendations contained within this report have been promulgated in accordance with generally accepted professional geotechnical engineering practice. No other warranty is implied or expressed.

Closure

We sincerely appreciate the opportunity to be of service on this project. We look forward to providing additional consulting services during the course of the project. If we may be of further assistance in any manner, please contact our office.

Respectfully Submitted,

BORING LOG LEGEND

SAMPLE TYPE	GRAPHICAL SYMBOL	SAMPLE DESCRIPTION
AUGER		SAMPLE COLLECTED FROM AUGER CUTTINGS, NO FIELD MEASUREMENT OF SOIL STRENGTH. (DISTURBED)
CORE		ROCK CORE SAMPLE: TYPICALLY TAKEN WITH A DIAMOND-TIPPED CORE BARREL. TYPICALLY USED ONLY IN HIGHLY CONSOLIDATED BEDROCK.
GRAB		SOIL SAMPLE TAKEN WITH NO SPECIALIZED EQUIPMENT, SUCH AS FROM A STOCKPILE OR THE GROUND SURFACE. (DISTURBED)
CS		CALIFORNIA SAMPLER: 2-1/2 INCH I.D. SPLIT BARREL SAMPLER, LINED WITH 1-INCH HIGH BRASS RINGS. DRIVEN WITH SPT HAMMER. (RELATIVELY UNDISTURBED)
NSR		NO RECOVERY: THE SAMPLING ATTEMPT DID NOT RESULT IN RECOVERY OF ANY SIGNIFICANT SOIL OR ROCK MATERIAL.
SPT		STANDARD PENETRATION TEST: SAMPLER IS A 1.4 INCH INSIDE DIAMETER SPLIT BARREL, DRIVEN 18 INCHES WITH THE SPT HAMMER. (DISTURBED)
SH		SHELBY TUBE: TAKEN WITH A THIN WALL SAMPLE TUBE, PUSHED INTO THE SOIL AND THEN EXTRACTED. (UNDISTURBED)
VANE		VANE SHEAR TEST: SOIL STRENGTH OBTAINED USING A 4 BLADED SHEAR DEVICE. TYPICALLY USED IN SOFT CLAYS-NO SAMPLE RECOVERED.

COLUMN DESCRIPTIONS

DEPTH: Distance in feet below the ground surface.

SAMPLE: Sample Type as depicted above.

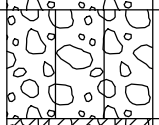
BLOW COUNT: Number of blows required to advance the sampler 12 inches using a 140 lb hammer with a 30-inch drop. 50/3" indicates penetration refusal (>50 blows) at 3 inches. WH indicates that the weight of the hammer was sufficient to push the sampler 6 inches or more.

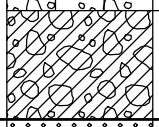
POCKET PEN.: Approximate shear strength of a cohesive soil sample as measured by pocket penetrometer.

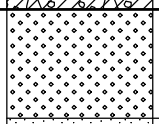
GRAPHIC LOG: Graphic Soil Symbol as depicted on the following page.

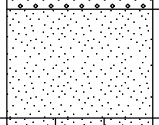
DRY DENSITY: Dry density of an undisturbed or relatively undisturbed sample in lbs/ft^3.

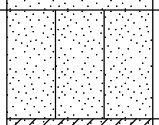
MOISTURE CONTENT: Moisture content of a soil sample, expressed as a percentage of the dry weight.

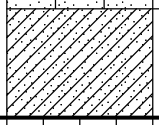


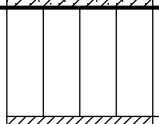


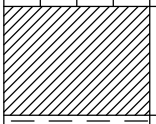


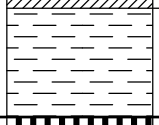


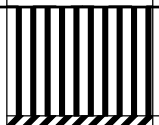


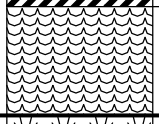


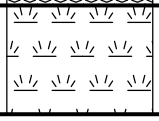












LIQUID LIMIT: The moisture content above which a soil behaves as a liquid.

PLASTIC LIMIT: The moisture content above which a soil behaves as a plastic.

PASSING #200 SIEVE: The percentage of the sample finer than the #200 standard sieve.

UNCONFINED SHEAR: The shear strength of a cohesive soil sample, as measured in the unconfined state.

	Final	10:31 AM		8.80			

Per County Standards, Infiltration Rate calculated as follows:

$$Q = \frac{\Delta H(60r)}{\Delta t(r + 2H_{avg})}$$

Where:

- Q = Infiltration Rate (in inches per hour)
- ΔH = Change in Height (Water Level) over the time interval
- r = Test Hole (Borehole) Radius
- Δt = Time Interval
- H_{avg} = Average Head Height over the time interval

Per County Standards, Infiltration Rate calculated as follows:

$$Q = \frac{\Delta H(60r)}{\Delta t(r + 2H_{avg})}$$

Where:

- Q = Infiltration Rate (in inches per hour)
- ΔH = Change in Height (Water Level) over the time interval
- r = Test Hole (Borehole) Radius
- Δt = Time Interval
- H_{avg} = Average Head Height over the time interval

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the potential noise impacts and the necessary noise mitigation measures, if any, for the proposed 5355 East Airport Drive development ("Project"). The proposed Project is to consist of a 270,337 square foot warehouse. This study has been prepared to satisfy applicable City of Ontario standards and thresholds of significance based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines (1).

The results of this 5355 East Airport Drive Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report. Table ES-1 shows the findings of significance for each potential noise and/or vibration impact under CEQA before and after any required mitigation measures.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Operational Noise	7	*Less Than Significant*	-
Construction Noise	8	*Less Than Significant*	-
Construction Vibration		*Less Than Significant*	-

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed 5355 East Airport Drive ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, sets out the local regulatory setting, presents the study methods and procedures for noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term stationary-source operational noise and short-term construction noise and vibration impacts.

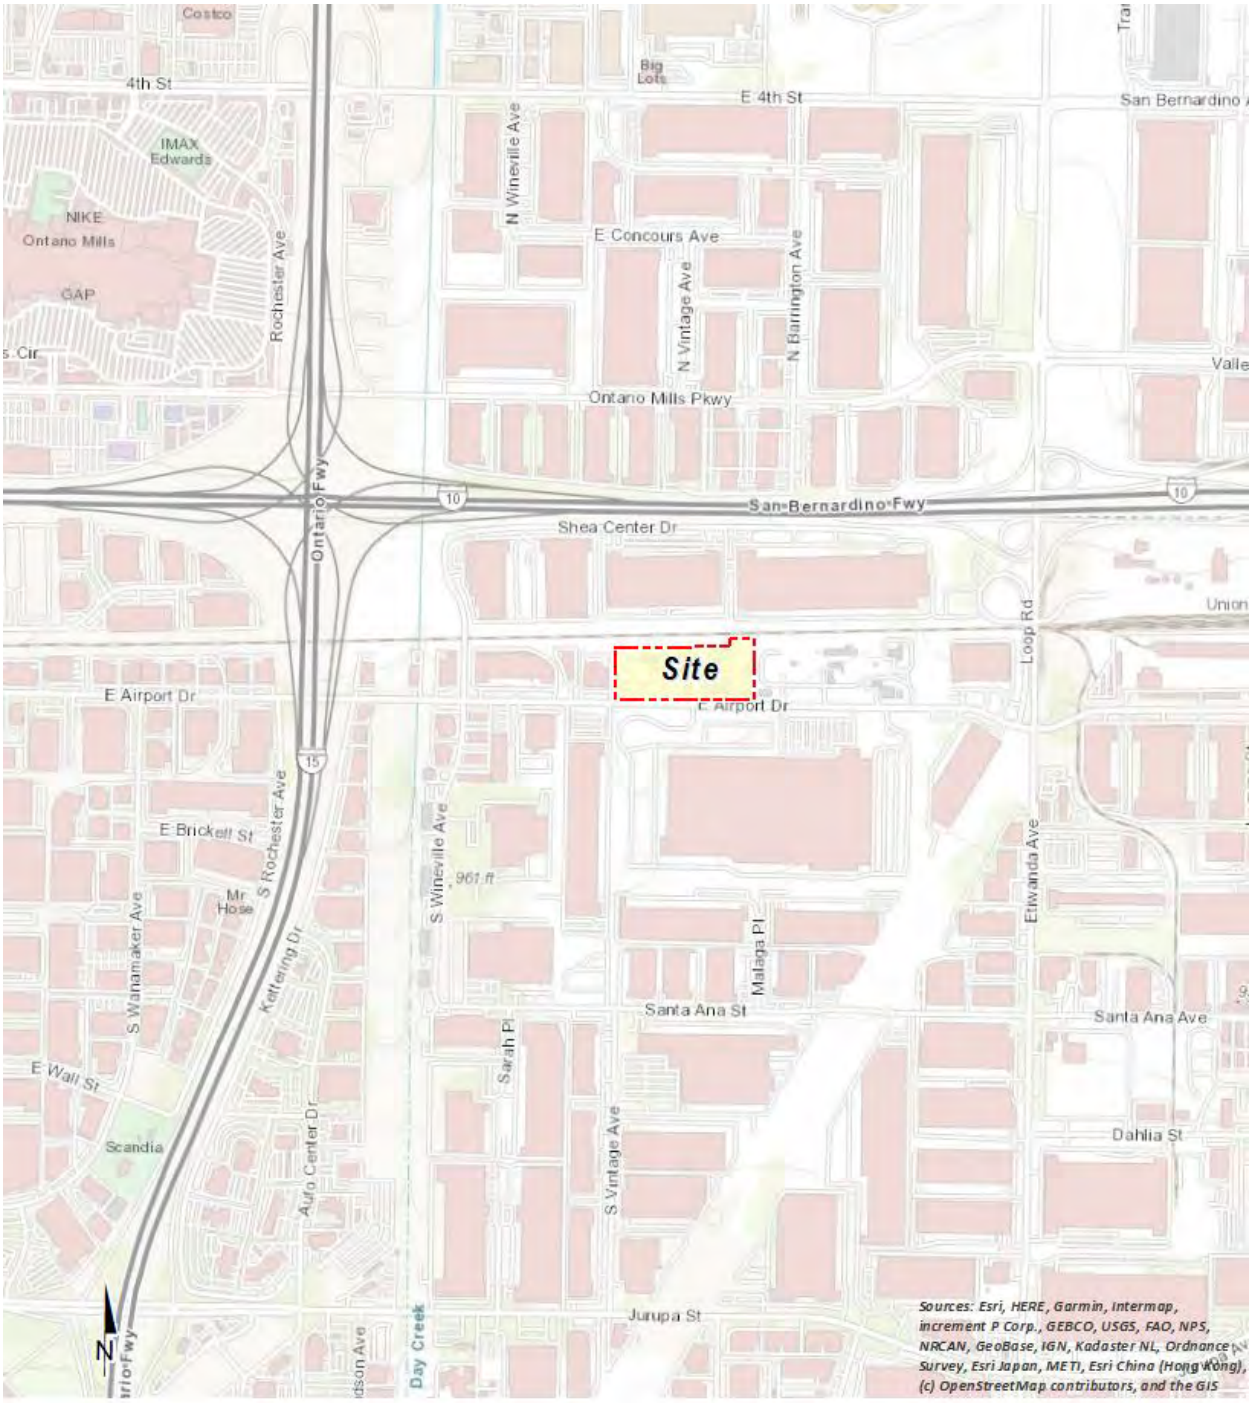
1.1 SITE LOCATION

The proposed Project is located at 5355 East Airport Drive in the City of Ontario as shown on Exhibit 1-A. The Project is located approximately 2.7 miles east of the Ontario International Airport (ONT).

1.2 PROJECT DESCRIPTION

The proposed Project is to consist of a 270,337 square foot warehouse.as shown on Exhibit 1-B. The on-site Project-related noise sources are expected to include: loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, and truck movements. This noise analysis is intended to describe noise level impacts associated with the expected typical operational activities at the Project site.

EXHIBIT 1-A: LOCATION MAP



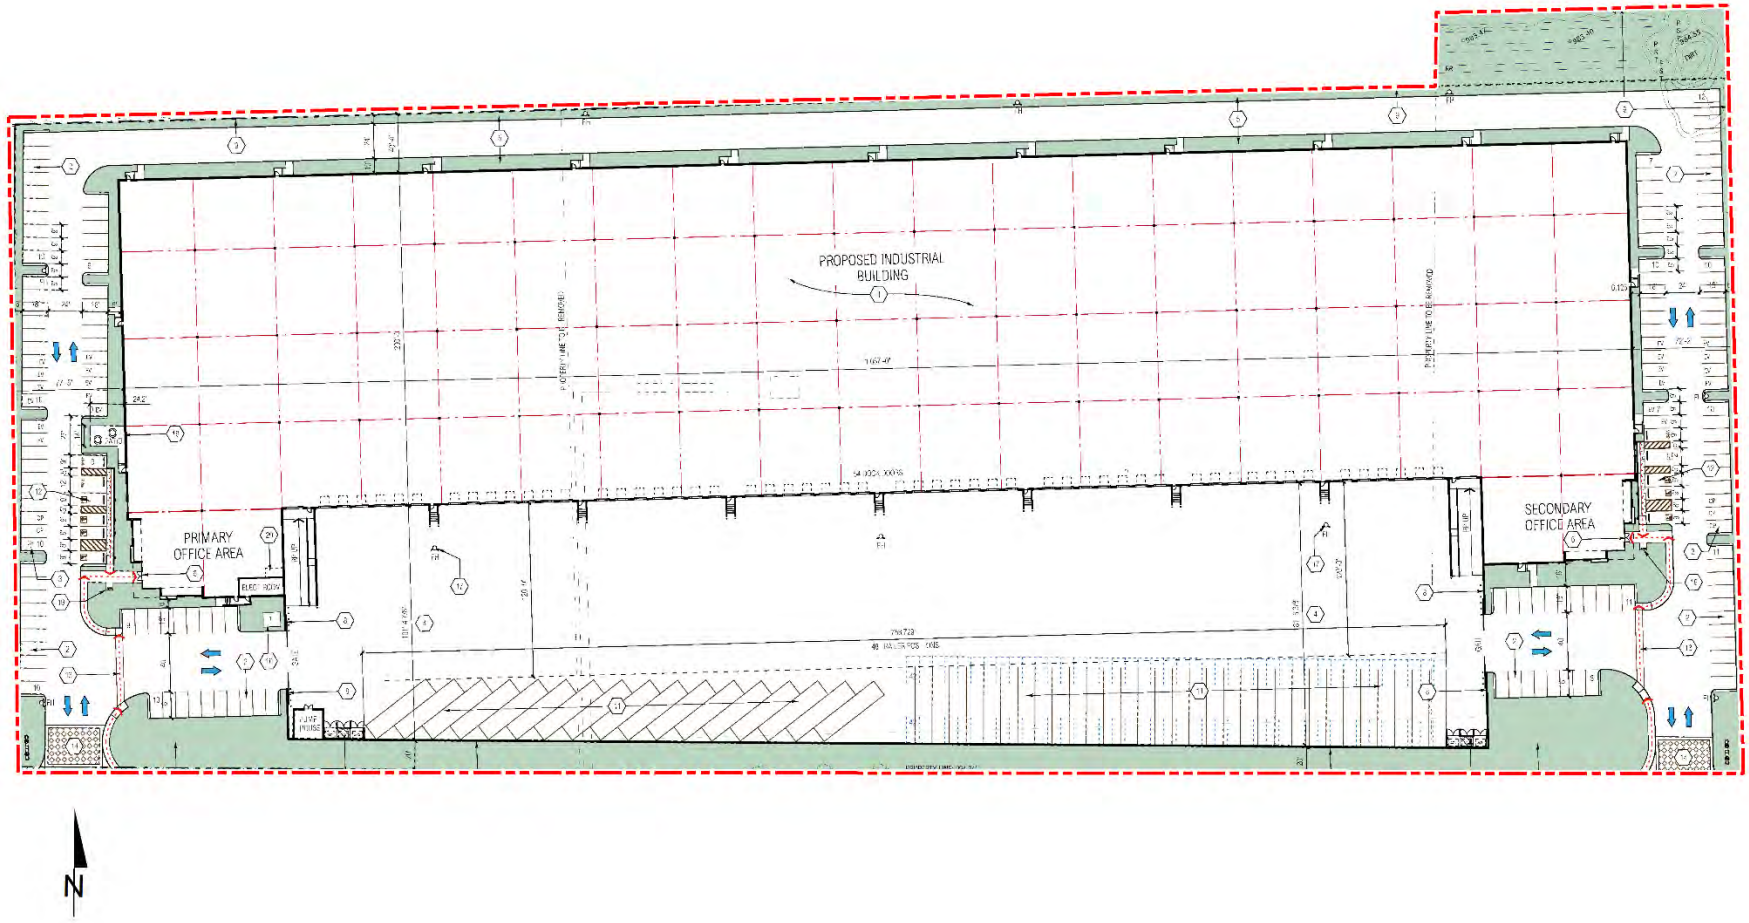


EXHIBIT 1-B: SITE PLAN

2 FUNDAMENTALS

Noise is simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		
QUIET SUBURBAN NIGHTTIME	LIBRARY	30	FAINT	NO EFFECT
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		
	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (2) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 1,000 feet, which can cause serious discomfort. (3) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most used metric is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time-of-day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when noise can become more intrusive. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The City of Ontario relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (2)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually

sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (4)

2.3.3 ATMOSPHERIC EFFECTS

Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (2)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an "out of sight, out of mind" effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby residents. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of-sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The Federal Highway Administration (FHWA) does not consider the planting of vegetation to be a noise abatement measure. (5)

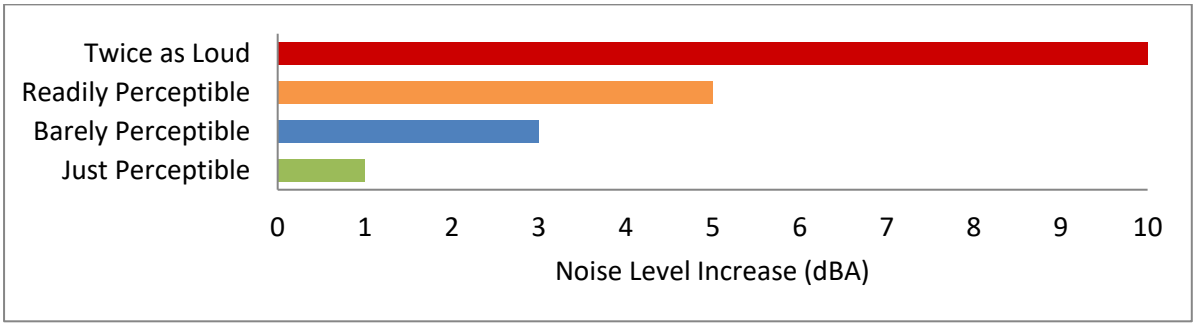
2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for an observation point or receiver by controlling the noise source, transmission path, receiver, or all three. This concept is known as the source-path-receiver concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receiver. Noise barriers, however, do have limitations. For a noise barrier to work, it must block the line-of-sight path of sound from the noise source.

2.6 LAND USE COMPATIBILITY WITH NOISE



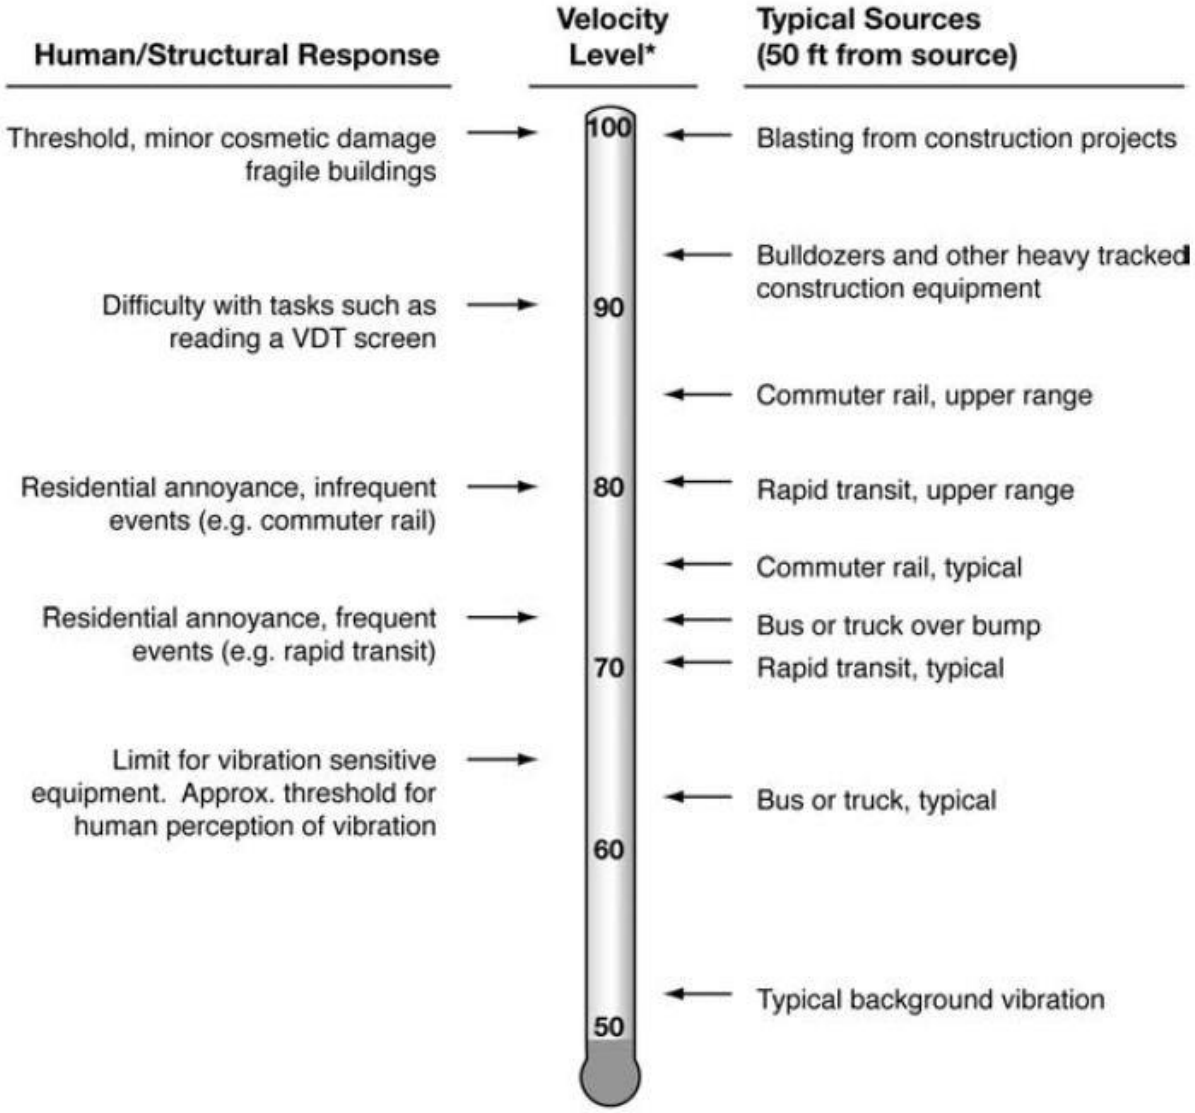
Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (6)

2.7 COMMUNITY RESPONSE TO NOISE

Approximately sixteen percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints may occur. Twenty to thirty percent of the population will not complain even in very severe noise environments. (7 pp. 8-6) Thus, a variety of reactions can be expected from people exposed to any given noise environment.

Surveys have shown that community response to noise varies from no reaction to vigorous action for newly introduced noises averaging from 10 dB below existing to 25 dB above existing. (8) According to research originally published in the Noise Effects Handbook (7), the percentage of high annoyance ranges from approximately 0 percent at 45 dB or less, 10 percent are highly annoyed around 60 dB, and increases rapidly to approximately 70 percent being highly annoyed at approximately 85 dB or greater. Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. A change of 3 dBA is considered barely perceptible, and changes of 5 dBA are considered readily perceptible. (4)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 VIBRATION

Per the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Impact Assessment Manual* (8) , vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment and/or activities.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

Source: Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual.

3 REGULATORY SETTING

The federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared per guidelines adopted by the Governor's Office of Planning and Research (OPR). (9) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

3.2 CITY OF ONTARIO GENERAL PLAN NOISE ELEMENT

The City of Ontario General Plan (Policy Plan) identifies several policies to minimize the impacts of excessive noise levels throughout the community. Policy Plan Section S4, Noise Hazards, establishes a goal of maintaining *an environment where noise does not adversely affect the public's health, safety, and welfare.* (10) To satisfy this goal, the Policy Plan identifies six policies related to: noise mitigation; coordination with transportation authorities; airport noise mitigation; truck traffic; roadway design; and airport noise compatibility. Noise criteria identified at Policy Plan Table LU-7 provide guidelines to evaluate land use compatibility within various noise environments. Table LU-7 is reproduced here as Exhibit 3-A *Noise Level Exposure and Land Use Compatibility Guidelines*. The Project industrial land uses are considered *clearly acceptable* within exterior noise level environments approaching 70 dBA CNEL and *normally acceptable* within noise level environments up to 75 dBA CNEL. For noise level environments greater than 80 dBA CNEL, the Project land uses would be considered *clearly unacceptable,* and no new construction should be permitted.

EXHIBIT 3-A: NOISE LEVEL EXPOSURE AND LAND USE COMPATIBILITY GUIDELINES

LAND USE CATEGORIES		COMMUNITY NOISE EQUIVALENT LEVEL (CNEL)						
Category	Land Use	55	60	65	70	75	80

LEGEND

Clearly Acceptable:	No special noise insulation required, assuming buildings of normal conventional construction.
Normally Acceptable:	Acoustical reports will be required for major new residential construction. Conventional construction with closed windows and fresh air supply systems of air conditioning will normally suffice.
Normally Unacceptable:	New construction should be discouraged. Noise/aviation easements required for all new construction. If new construction does proceed, a detailed analysis of noise reduction requirements must be made and necessary noise insulation features included.
Clearly Unacceptable:	No new construction should be permitted.

Source: The Ontario Plan Safety Section on Noise Hazards (Table LU-7).

3.3 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the 5355 East Airport Drive, stationary-source (operational) noise levels are evaluated against standards established under a City's Municipal Code. The City of Ontario requires that noise from new stationary sources in the City comply with the City's Noise Ordinance, which limits the acceptable noise at the property line of the impacted property, to reduce nuisances to sensitive land uses. Compliance with the City's Noise Ordinance would result in noise levels that are acceptable to the City and would result in less than significant noise impacts from stationary sources (11).

Section 5-29.04(a) identifies the allowable daytime and nighttime ambient exterior noise standards for each land use type. For Manufacturing and Industrial land uses (Noise Zone V), such as the Project, ambient exterior noise levels may not exceed 70 dBA L_{eq}. For residential land uses (Noise Zone I), ambient exterior noise levels may not exceed 65 dBA L_{eq} during the daytime hours (7:00 a.m. to 10:00 p.m.) and may not exceed 45 dBA L_{eq} during the nighttime hours (10:00 p.m. to 7:00 a.m.) (12). The lower noise level standard shall apply on the boundary between two (2) different noise zones. If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard. The maximum acceptable Project-related operational noise levels received at off-site land uses in the City of Ontario are identified on Table 3-1.

TABLE 3-1: OPERATIONAL NOISE STANDARDS

Noise Zone	Land Use	Exterior Noise Levels (dBA Leq)[2]	
		Daytime (7am-10pm)	Nighttime (10pm-7am)
I	Single-Family Residential	65	45
II	Multi-Family Residential	65	50
III	Commercial	65	60
IV	Residential Mixed-Use	70	70
V	Manufacturing and Industrial	70	70

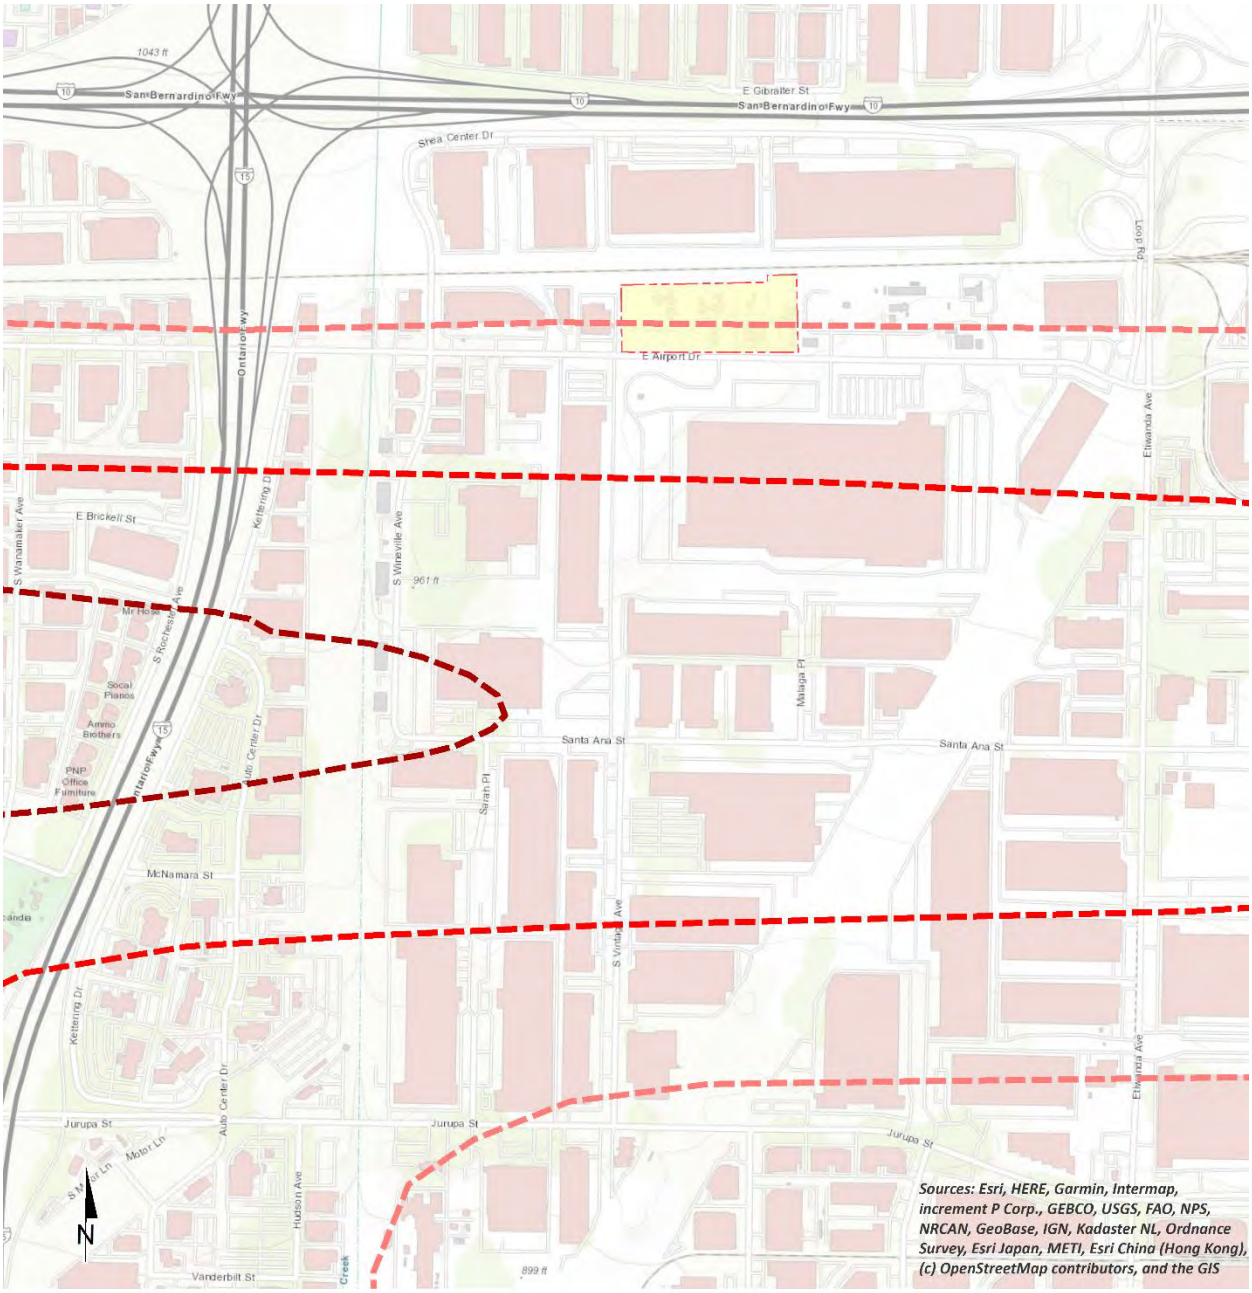
[1] Source: Section 5-29.04 of the City of Ontario Municipal Code (Appendix 3.1).
[2] L_{eq} represents a steady state sound level containing the same total energy as a time varying signal over a given period.

3.4 CONSTRUCTION NOISE STANDARDS

The City of Ontario has set restrictions to control noise impacts associated with construction. Section 5-29.09 of the Municipal Code states: No person, while engaged in construction, remodeling, digging, grading, demolition or any other related building activity, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, on any weekday except between the hours of 7:00 a.m. and 6:00 p.m. or on Saturday or Sunday between the hours of 9:00 a.m. and 6:00 p.m. (12) While the City establishes limits to the hours during which construction activity may take place, it does not identify specific noise level limits for construction noise levels at potentially affected receiver locations for CEQA analysis purposes.

Therefore, a numerical construction threshold based on Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual is used for analysis of daytime construction impacts, as discussed below.

According to the FTA, local noise ordinances are typically not very useful in evaluating construction noise. They usually relate to nuisance and hours of allowed activity, and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the impact of a construction project. Project construction noise criteria should account for the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land use. Due to the lack of standardized construction noise thresholds, the FTA provides guidelines that can be considered reasonable criteria for construction noise assessment. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive residential land use (8 p. 179).



3.5 VIBRATION STANDARDS

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. (8) To analyze vibration impacts originating from the operation and construction of 5355 East Airport Drive, vibration-generating activities are appropriately evaluated against standards established under a City's Municipal Code, if such standards exist. However, the City of Ontario does not identify specific vibration level limits. Therefore, for analysis purposes, the Caltrans *Transportation and Construction Vibration Guidance Manual*, (13 p. 38) Table 19, vibration damage are used in this noise study to assess potential temporary construction-related impacts at adjacent building locations. The nearest noise sensitive buildings adjacent to the Project site can best be described as "older residential structures" with a maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec).

3.6 AIRPORT LAND USE COMPATIBILITY

The Project site is located approximately 2.7 miles east of the Ontario International Airport (ONT). This places the Project site within the ONT Airport Influence Area according to Policy Map 2-1 of the *Ontario International Airport Land Use Compatibility Plan (ONT ALUCP).* The ONT ALUCP was amended July 2018 to promote compatibility between airport and the land uses that surround it (14). Since the Project site is located within the ONT Airport Influence Area, the Project is subject to the Noise Criteria established on Table 2-3 in the ONT ALUCP. As shown on Exhibit 3-B, the Project site is located within the ONT Airport Influence Area but outside the 65 dBA CNEL airport noise impact zone consistent with Policy Map 2-3. According to Table 2-3 of the ONT ALUCP, industrial land uses located outside the 65 dBA CNEL noise level contours of ONT, such as the Project, are considered *normally compatible land use.* For *normally compatible land use,* either the activities associated with the land use are inherently noisy or standard construction methods will sufficiently attenuate exterior noise to an acceptable indoor community noise equivalent level (CNEL).

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on currently adopted guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1) For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

B. Generation of excessive ground-borne vibration or ground-borne noise levels?

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

4.1 NOISE LEVEL INCREASES (THRESHOLD A)

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines. Under CEQA, consideration must be given to the magnitude of the increase, the existing baseline ambient noise levels, and the location of receivers to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (15) This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged.

The Federal Interagency Committee on Noise (FICON) (16) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (CNEL) and equivalent continuous noise level (L_{eq}).

As previously stated, the approach used in this noise study recognizes *that there is no single noise increase that renders the noise impact significant*, based on a 2008 California Court of Appeal ruling on Gray v. County of Madera. (15) For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur if the noise criteria may be exceeded. Therefore, for this analysis, a *readily perceptible* 5 dBA or greater project-related noise level increase is considered a significant impact when the without project noise levels are below 60 dBA. Per the FICON, in areas where the without project noise levels range from 60 to 65 dBA, a 3 dBA *barely perceptible* noise level increase appears to be appropriate for most people. When the without project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if

the noise criteria for a given land use is exceeded, since it likely contributes to an existing noise exposure exceedance. The FICON guidance provides an established source of criteria to assess the impacts of substantial temporary or permanent increase in baseline ambient noise levels. Based on the FICON criteria, the amount to which a given noise level increase is considered acceptable is reduced when the without Project (baseline) noise levels are already shown to exceed certain land-use specific exterior noise level criteria. The specific levels are based on typical responses to noise level increases of 5 dBA or *readily perceptible*, 3 dBA or *barely perceptible*, and 1.5 dBA depending on the underlying without Project noise levels for noise-sensitive uses. These levels of increases and their perceived acceptance are consistent with guidance provided by both the Federal Highway Administration (4 p. 9) and Caltrans (17 p. 2_48).

4.2 VIBRATION (THRESHOLD B)

As described in Section 3.5, the vibration impacts originating from the construction of the 5355 East Airport Drive, vibration-generating activities are appropriately evaluated using the Caltrans vibration damage thresholds to assess potential temporary construction-related impacts at adjacent building locations. The nearest noise sensitive buildings adjacent to the Project site can best be described as "older residential structures" with a maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec).

4.3 CEQA GUIDELINES NOT FURTHER ANALYZED (THRESHOLD C)

CEQA Noise Threshold C applies when there are nearby public and private airports and/or air strips and focuses on land use compatibility of the Project to nearby airports and airstrips. The closest airport which would require additional noise analysis under CEQA guideline C is the Ontario International Airport. As previously indicated in Section 3.6, the Project site is located within the ONT Airport Influence Area but is located outside the 65 dBA CNEL airport noise impact zone. Therefore, airport noise impacts are considered *less than significant,* and no further noise analysis is provided under Guideline C.

4.4 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed Project. Table 4-1 shows the significance criteria summary matrix that includes the allowable criteria used to identify potentially significant incremental noise level increases.

TABLE 4-1: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Receiving Land Use	Condition(s)	Significance Criteria	
			Daytime	Nighttime
Operational	Noise-Sensitive	Exterior Noise Level Standards[1]	65 dBA L_{eq}	45 dBA L_{eq}
		If ambient is < 60 dBA Leq[2]	≥ 5 dBA L_{eq} Project increase	
		If ambient is 60 - 65 dBA Leq[2]	≥ 3 dBA L_{eq} Project increase	
		If ambient is > 65 dBA Leq[2]	≥ 1.5 dBA L_{eq} Project increase	
Construction		Permitted hours of 7:00 a.m. and 6:00 p.m. on weekdays[3]		
		Noise Level Threshold[4]	80 dBA L_{eq}	
		Vibration Level Threshold[5]	0.3 PPV (in/sec)

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, 24-hour noise level measurements were taken at four locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Tuesday, March 8th, 2022. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the equivalent daytime and nighttime hourly noise levels. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (18)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (2) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (8)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (8) In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels

and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location.

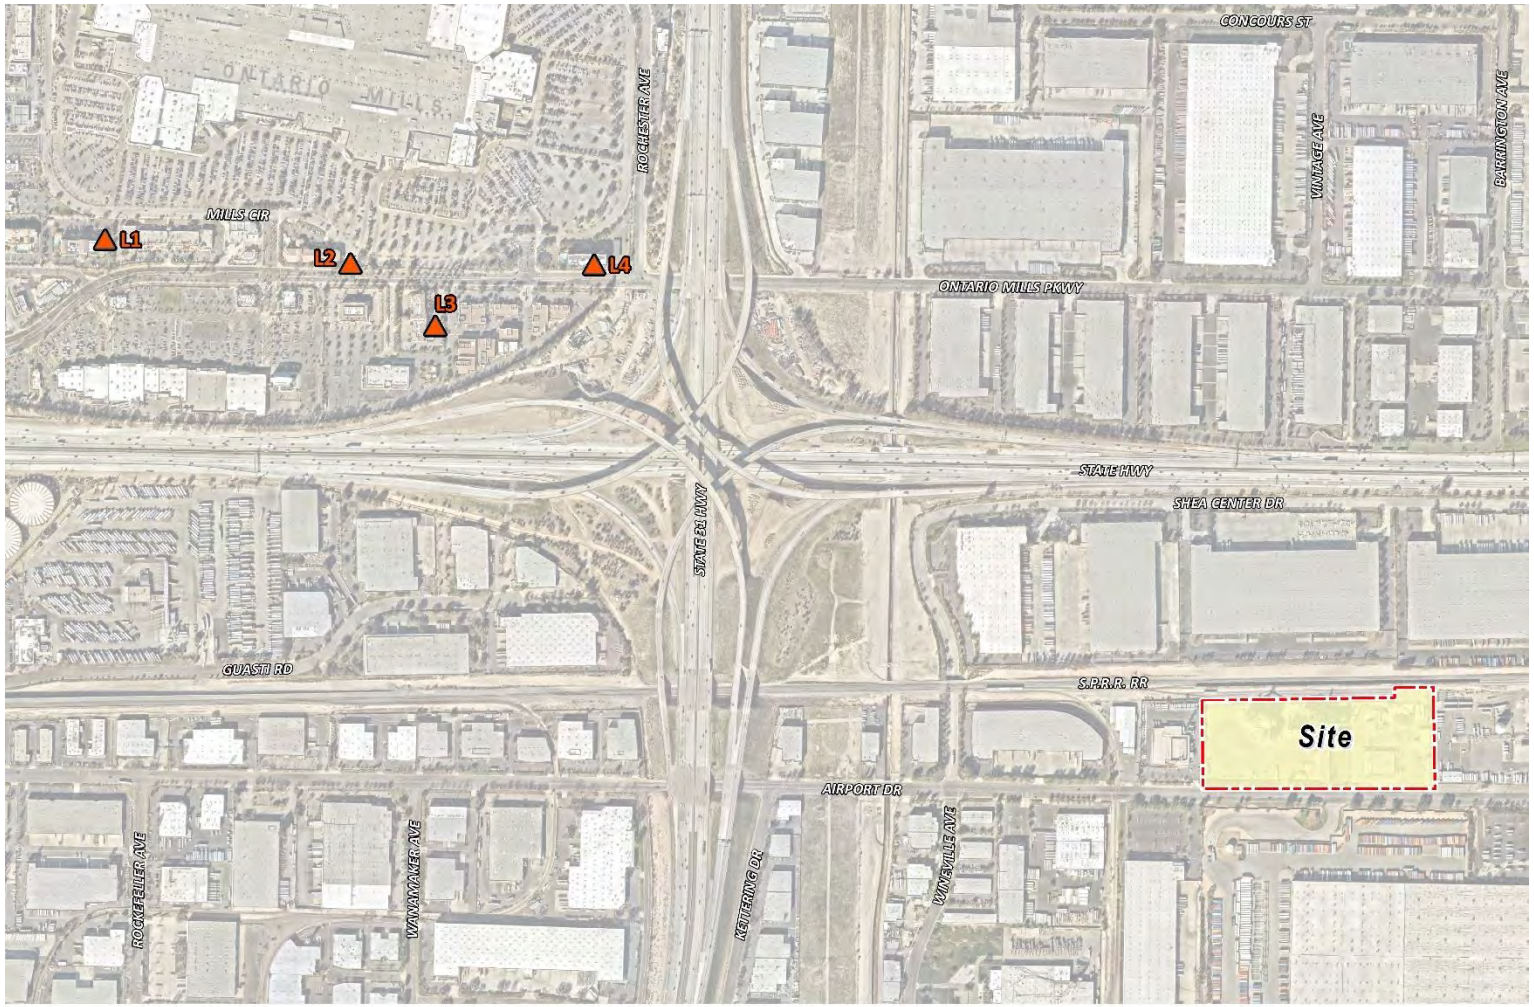

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Description	Energy Average Noise Level (dBA L_{eq})[2]	
		Daytime	Nighttime
L1	Located northwest of the Project site near Ayres Hotel Ontario Mills Mall at 4395 Ontario Mills Parkway.	58.4	59.0
L2	Located northwest of the Project site near Hampton Inn & Suites Ontario at 4500 Ontario Mills Parkway.	61.7	61.3
L3	Located northwest of the Project site near Country Inn & Suites by Radisson, Ontario at Ontario Mills at 4674 Ontario Mills Parkway.	67.1	62.2
L4	Located northwest of the Project site near Hyatt Place Ontario/Rancho Cucamonga at 4760 Mills Circle.	69.8	68.2

[1] See Exhibit 5-A for the noise level measurement locations.
[2] Energy (logarithmic) average levels. The long-term 24-hour measurement worksheets are included in Appendix 5.2.
"Daytime" = 7:00 a.m. to 7:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

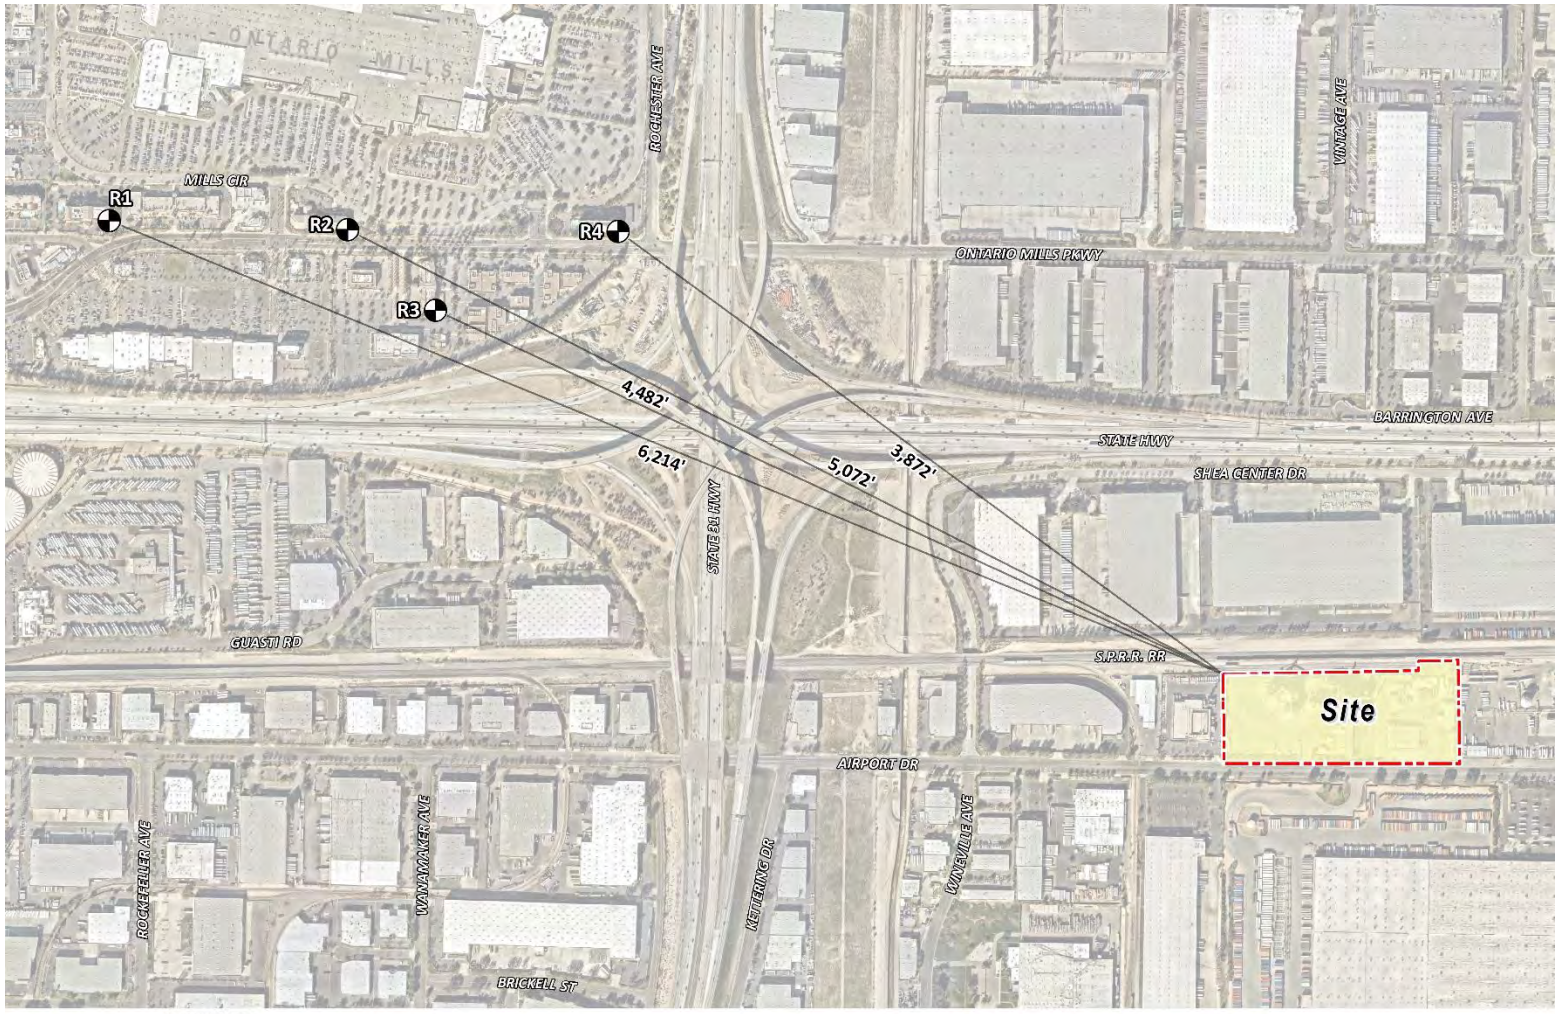
EXHIBIT 5-A: NOISE MEASUREMENT LOCATIONS

This page intentionally left blank

6 RECEIVER LOCATIONS

To assess the potential for long-term operational and short-term construction noise impacts, the following sensitive receiver locations, as shown on Exhibit 6-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

To describe the potential off-site Project noise levels, four receiver locations in the vicinity of the Project site were identified. The selection of receiver locations is based on FHWA guidelines and is consistent with additional guidance provided by Caltrans and the FTA, as previously described in Section 5.2. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Distance is measured in a straight line from the project boundary to each receiver location.



R1: Location R1 represents the existing noise sensitive Ayres Hotel Ontario Mills Mall at 4395 Ontario Mills Parkway, approximately 6,214 feet northwest of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R1 is placed at the building façade. A 24-hour noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R2: Location R2 represents the existing noise sensitive Hampton Inn & Suites Ontario at 4500 Ontario Mills Parkway, approximately 5,072 feet northwest of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R2 is placed at the building façade. A 24-hour noise measurement was taken near this location, L2, to describe the existing ambient noise environment.

R3: Location R3 represents the existing noise Country Inn & Suites by Radisson, Ontario at Ontario Mills at 4674 Ontario Mills Parkway, approximately 4,482 feet northwest of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R3 is placed at the building façade. A 24-hour noise measurement was taken near this location, L3, to describe the existing ambient noise environment.

R4: Location R4 represents the existing noise Hyatt Place Ontario/Rancho Cucamonga at 4760 Mills Circle, approximately 3,872 feet northwest of the Project site. Since there are no private outdoor living areas (backyards) facing the Project site, receiver R4 is placed at the building façade. A 24-hour noise measurement was taken near this location, L4, to describe the existing ambient noise environment.

EXHIBIT 6-A: RECEIVER LOCATIONS

7 OPERATIONAL NOISE ANALYSIS

This section analyzes the potential stationary-source operational noise impacts at the nearby receiver locations, identified in Section 6, resulting from the operation of the proposed 5355 East Airport Drive Project. Exhibit 7-A identifies the noise source locations used to assess the operational noise levels.

7.1 OPERATIONAL NOISE SOURCES

This operational noise analysis is intended to describe noise level impacts associated with the expected typical of daytime and nighttime activities at the Project site. To present the potential worst-case noise conditions, this analysis assumes the Project would be operational 24 hours per day, seven days per week. Consistent with similar warehouse and industrial uses, the Project business operations would primarily be conducted within the enclosed buildings, except for traffic movement, parking, as well as loading and unloading of trucks at designated loading bays. The on-site Project-related noise sources are expected to include: loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, and truck movements.

7.2 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 7-1 used to estimate the Project operational noise impacts. It is important to note that the following projected noise levels assume the worst-case noise environment with the loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, and truck movements all operating at the same time. These sources of noise activity will likely vary throughout the day.

7.2.1 MEASUREMENT PROCEDURES

The reference noise level measurements presented in this section were collected using a Larson Davis LxT Type 1 precisions sound level meter (serial number 01146). The LxT sound level meter was calibrated using a Larson-Davis calibrator, Model CAL 200, was programmed in "slow" mode to record noise levels in "A" weighted form and was located at approximately five feet above the ground elevation for each measurement. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (18)

EXHIBIT 7-A: OPERATIONAL NOISE SOURCE LOCATIONS

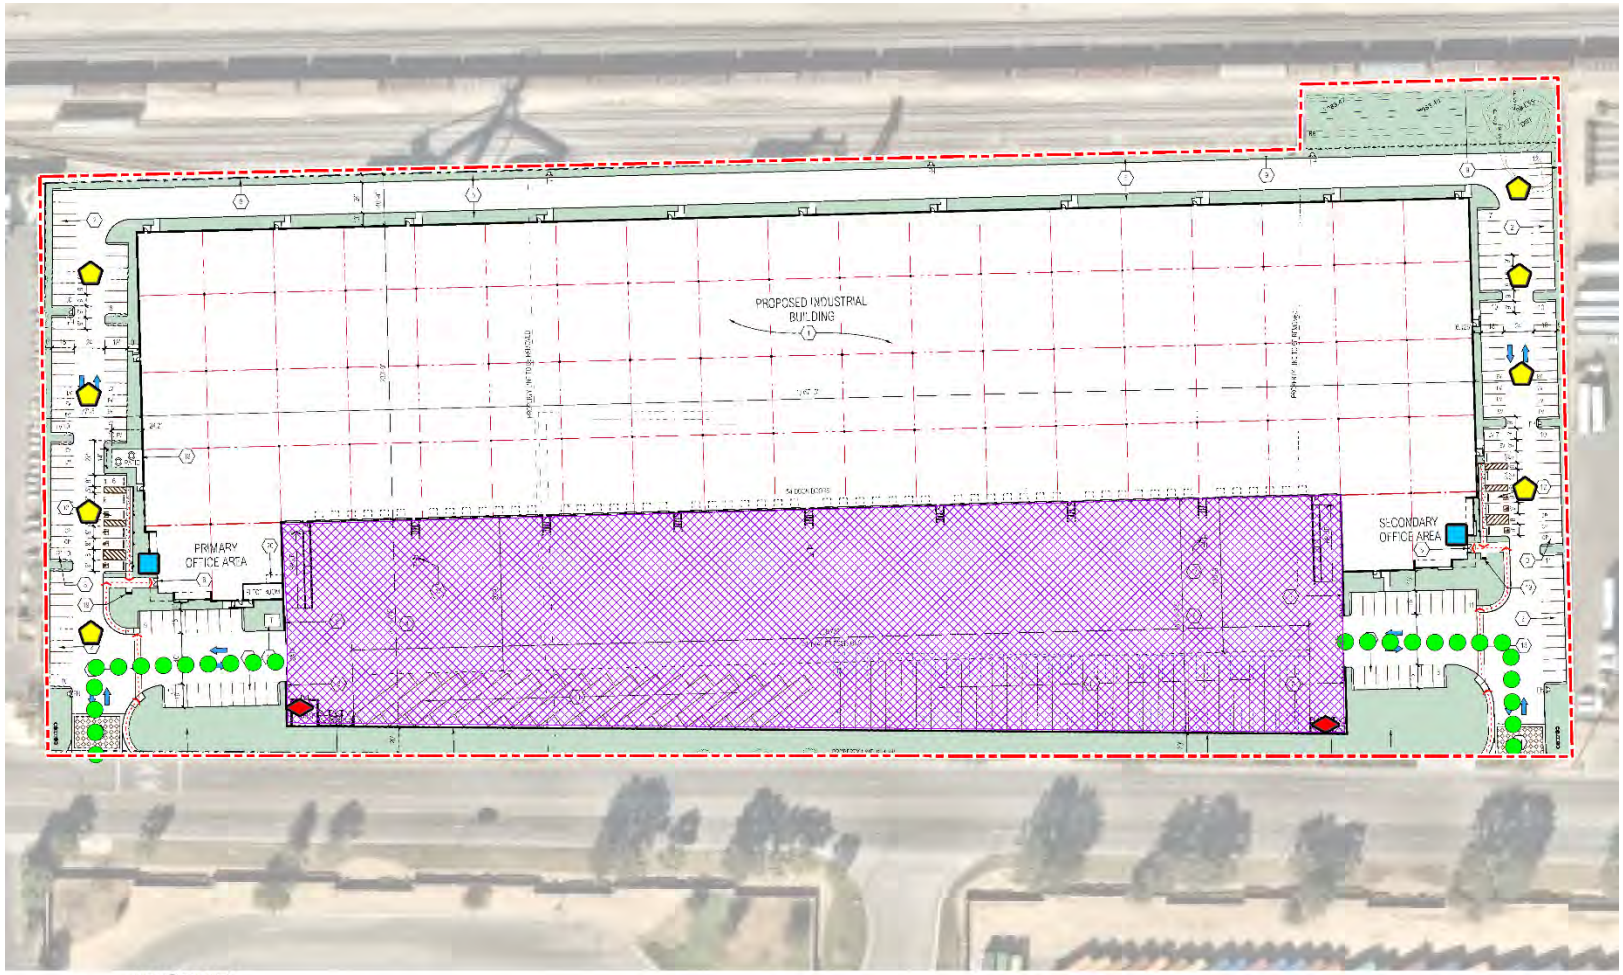


TABLE 7-1: REFERENCE NOISE LEVEL MEASUREMENTS

Noise Source[1]	Noise Source Height (Feet)	Min./ Hour[2]		Reference Noise Level (dBA L_{eq}) @ 50 Feet	Sound Power Level (dBA)[3]
		Day	Night		
Loading Dock Activity	8'	60	60	65.7	111.5
Roof-Top Air Conditioning Units	5'	39	28	57.2	88.9
Trash Enclosure Activity	5'	10	10	57.3	89.0
Parking Lot Vehicle Movements	5'	60	60	56.1	87.8
Truck Movements	8'	60	60	59.8	93.2

[1] As measured by Urban Crossroads, Inc.
[2] Anticipated duration (minutes within the hour) of noise activity during typical hourly conditions expected at the Project site. "Daytime" = 7:00 a.m. - 10:00 p.m.; "Nighttime" = 10:00 p.m. - 7:00 a.m.
[3] Sound power level represents the total amount of acoustical energy (noise level) produced by a sound source independent of distance or surroundings. Sound power levels calculated using the CadnaA noise model at the reference distance to the noise source.

7.2.2 LOADING DOCK ACTIVITY

The reference loading dock activities are intended to describe the typical outdoor operational noise activities associated with the Project. This includes truck idling, reefer activity (refrigerator truck/cold storage), deliveries, backup alarms, trailer docking including a combination of tractor trailer semi-trucks, two-axle delivery trucks, and background operation activities. Since the noise levels generated by cold storage loading dock activity can be slightly higher due to the use of refrigerated trucks or reefers.

The reference noise level measurement was taken in the center of the loading dock activity area and represents multiple concurrent noise sources resulting in a combined noise level of 65.7 dBA L_{eq} at a uniform distance of 50 feet. Specifically, the reference noise level measurement represents one truck located approximately 30 feet from the noise level meter with another truck passing by to park roughly 20 feet away, both with their engines idling. Throughout the reference noise level measurement, a separate docked and running reefer truck was located approximately 50 feet east of the measurement location. Additional background noise sources included truck pass-by noise, truck drivers talking to each other next to docked trucks, and air brake release noise when trucks parked.

7.2.3 ROOF-TOP AIR CONDITIONING UNITS

The noise level measurements describe a single mechanical roof-top air conditioning unit. The reference noise level represents a Lennox SCA120 series 10-ton model packaged air conditioning unit. At the uniform reference distance of 50 feet, the reference noise levels are 57.2 dBA L_{eq}. Based on the typical operating conditions observed over a four-day measurement period, the roof-top air conditioning units are estimated to operate for and average 39 minutes per hour during the daytime hours, and 28 minutes per hour during the nighttime hours. These operating conditions reflect peak summer cooling requirements with measured temperatures approaching

96 degrees Fahrenheit (°F) with average daytime temperatures of 82°F. For this noise analysis, the air conditioning units are expected to be located on the roof of the Project buildings.

7.2.4 TRASH ENCLOSURE ACTIVITY

To describe the noise levels associated with a trash enclosure activity, Urban Crossroads collected a reference noise level measurement at an existing trash enclosure containing two dumpster bins. The trash enclosure noise levels describe metal gates opening and closing, metal scraping against concrete floor sounds, dumpster movement on metal wheels, and trash dropping into the metal dumpster. The reference noise levels describe trash enclosure noise activities when trash is dropped into an empty metal dumpster, as would occur at the Project Site. The measured reference noise level at the uniform 50-foot reference distance is 57.3 dBA L_{eq} for the trash enclosure activity. The reference noise level describes the expected noise source activities associated with the trash enclosures for the Project's proposed building. Typical trash enclosure activities are estimated to occur for 10 minutes per hour.

7.2.5 PARKING LOT VEHICLE MOVEMENTS

To describe the on-site parking lot activity, a long-term 29-hour reference noise level measurement was collected in the center of activity within the staff parking lot of a warehouse distribution center. At 50 feet from the center of activity, the parking lot produced a reference noise level of 56.1 dBA L_{eq}. Parking activities are expected to take place during the full hour (60 minutes) throughout the daytime and evening hours. The parking lot noise levels are mainly due cars pulling in and out of parking spaces in combination with car doors opening and closing.

7.2.6 TRUCK MOVEMENTS

The truck movements reference noise level measurement was collected over a period of 1 hour and 28 minutes and represents multiple heavy trucks entering and exiting the outdoor loading dock area producing a reference noise level of 59.8 dBA L_{eq} at 50 feet. The noise sources included at this measurement location account for trucks entering and existing the Project driveways and maneuvering in and out of the outdoor loading dock activity area.

7.3 CADNAA NOISE PREDICTION MODEL

To fully describe the exterior operational noise levels from the Project, Urban Crossroads, Inc. developed a noise prediction model using the CadnaA (Computer Aided Noise Abatement) computer program. CadnaA can analyze multiple types of noise sources using the spatially accurate Project site plan, georeferenced Nearmap aerial imagery, topography, buildings, and barriers in its calculations to predict outdoor noise levels.

Using the ISO 9613-2 protocol, CadnaA will calculate the distance from each noise source to the noise receiver locations, using the ground absorption, distance, and barrier/building attenuation inputs to provide a summary of noise level at each receiver and the partial noise level contributions by noise source. Consistent with the ISO 9613-2 protocol, the CadnaA noise prediction model relies on the reference sound power level (L_w) to describe individual noise sources. While sound pressure levels (e.g., L_{eq}) quantify in decibels the intensity of given sound

sources at a reference distance, sound power levels (L_w) are connected to the sound source and are independent of distance. Sound pressure levels vary substantially with distance from the source and diminish because of intervening obstacles and barriers, air absorption, wind, and other factors. Sound power is the acoustical energy emitted by the sound source and is an absolute value that is not affected by the environment.

The operational noise level calculations provided in this noise study account for the distance attenuation provided due to geometric spreading, when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. A default ground attenuation factor of 0.5 was used in the CadnaA noise analysis to account for mixed ground representing a combination of hard and soft surfaces. Appendix 7.1 includes the detailed noise model inputs used to estimate the Project operational noise levels presented in this section.

7.4 PROJECT OPERATIONAL NOISE LEVELS

Using the reference noise levels to represent the proposed Project operations that include loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, and truck movements, Urban Crossroads, Inc. calculated the operational source noise levels that are expected to be generated at the Project site and the Project-related noise level increases that would be experienced at each of the sensitive receiver locations. Table 7-2 shows the Project operational noise levels during the daytime hours of 7:00 a.m. to 10:00 p.m. The daytime hourly noise levels at the off-site receiver locations are expected to range from 22.2 to 27.4 dBA L_{eq}.

TABLE 7-2: DAYTIME PROJECT OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA Leq)			
	R1	R2	R3	R4
Loading Dock Activity	21.0	25.2	26.4	25.8
Roof-Top Air Conditioning Units	7.6	10.8	12.1	13.5
Trash Enclosure Activity	0.0	2.6	4.0	0.0
Parking Lot Vehicle Movements	11.5	15.6	16.9	18.5
Truck Movements	12.6	15.4	16.8	16.8
Total (All Noise Sources)	**22.2**	**26.2**	**27.4**	**27.2**

[1] See Exhibit 7-A for the noise source locations. CadnaA noise model calculations are included in Appendix 7.1.

Table 7-3 shows the Project operational noise levels during the nighttime hours of 10:00 p.m. to 7:00 a.m. The nighttime hourly noise levels at the off-site receiver locations are expected to range from 22.1 to 27.4 dBA L_{eq}. The differences between the daytime and nighttime noise levels are largely related to the estimated duration of noise activity as outlined in Table 7-1 and Appendix 7.1.

TABLE 7-3: NIGHTTIME PROJECT OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA Leq)			
	R1	R2	R3	R4
Loading Dock Activity	21.0	25.2	26.4	25.8
Roof-Top Air Conditioning Units	5.2	8.4	9.7	11.0
Trash Enclosure Activity	0.0	1.7	3.0	0.0
Parking Lot Vehicle Movements	11.5	15.6	16.9	18.5
Truck Movements	12.6	15.4	16.8	16.8
Total (All Noise Sources)	**22.1**	**26.1**	**27.4**	**27.1**

[1] See Exhibit 7-A for the noise source locations. CadnaA noise model calculations are included in Appendix 7.1.

7.5 PROJECT OPERATIONAL NOISE LEVEL COMPLIANCE

To demonstrate compliance with local noise regulations, the Project-only operational noise levels are evaluated against exterior noise level thresholds based on the City of Ontario exterior noise level standards at nearby noise-sensitive receiver locations. Table 7-4 shows the operational noise levels associated with 5355 East Airport Drive Project will satisfy the City of Ontario exterior noise level standards.

TABLE 7-4: OPERATIONAL NOISE LEVEL COMPLIANCE

Receiver Location[1]	Project Operational Noise Levels (dBA Leq)[2]		Noise Level Standards (dBA Leq)[3]		Noise Level Standards Exceeded?[4]	
	Daytime	Nighttime	Daytime	Nighttime	Daytime	Nighttime
R1	22.2	22.1	65.0	45.0	No	No
R2	26.2	26.1	65.0	45.0	No	No
R3	27.4	27.4	65.0	45.0	No	No
R4	27.2	27.1	65.0	45.0	No	No

[1] See Exhibit 6-A for the receiver locations.
[2] Proposed Project operational noise levels as shown on Tables 7-2 and 7-3.
[3] Exterior noise level standards, for residential land use, as shown on Table 4-1.
[4] Do the estimated Project operational noise source activities exceed the noise level standards?
"Daytime" = 7:00 a.m. - 10:00 p.m.; "Nighttime" = 10:00 p.m. - 7:00 a.m.

7.6 PROJECT OPERATIONAL NOISE LEVEL INCREASES

To describe the Project operational noise level increases, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearby receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (2) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describes the Project noise level increases to the existing ambient noise environment. As indicated on Tables 7-5 and 7-6, the Project will not generate an unmitigated nighttime operational noise level increase at the nearest receiver locations. Project-related operational noise level increases will satisfy the operational noise level increase significance criteria presented on Table 4-1. Therefore, the incremental Project operational noise level increase is considered *less than significant* at all receiver locations.

TABLE 7-5: DAYTIME PROJECT OPERATIONAL NOISE LEVEL INCREASES

Receiver Location[1]	Total Project Operational Noise Level[2]	Measurement Location[3]	Reference Ambient Noise Levels[4]	Combined Project and Ambient[5]	Project Increase[6]	Increase Criteria[7]	Increase Criteria Exceeded?
R1	22.2	L1	58.4	58.4	0.0	5.0	No
R2	26.2	L2	61.7	61.7	0.0	5.0	No

[3] Reference noise level measurement locations as shown on Exhibit 5-A.
[4] Observed nighttime ambient noise levels as shown on Table 5-1.
[5] Represents the combined ambient conditions plus the Project activities.
[6] The noise level increase expected with the addition of the proposed Project activities.
[7] Significance increase criteria as shown on Table 4-1.

7.7 OFF-SITE TRAFFIC NOISE ANALYSIS

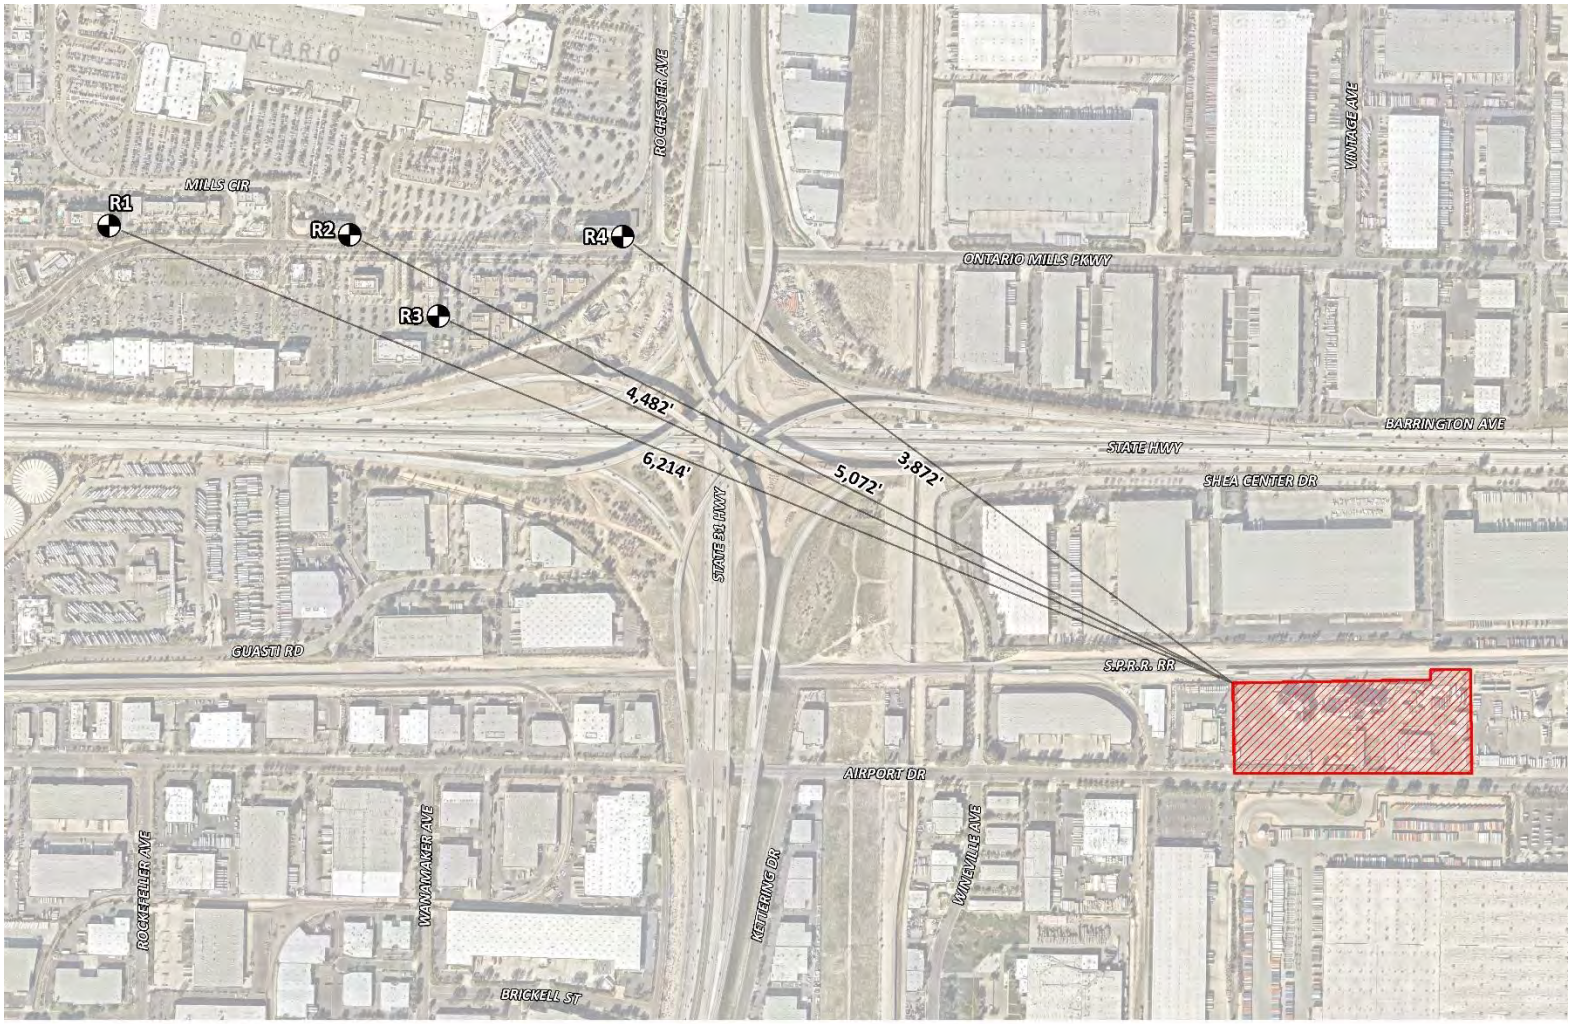
Traffic generated by the operation of the proposed Project will influence the traffic noise levels in surrounding off-site areas and at the Project site. The off-site Project-related traffic represents an incremental increase to the existing roadway volumes, which is not expected to generate a barely perceptible noise level increase of 3 dBA CNEL at nearby sensitive land uses adjacent to study area roadways, since a doubling of the existing traffic volumes would be required to generate a 3 dBA CNEL increase. Due to the low traffic volumes generated by the Project, the off-site traffic noise levels generated by the Project are considered less than significant and no further analysis is required.

8 CONSTRUCTION ANALYSIS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project. Exhibit 8-A shows the construction activity boundaries in relation to the nearest sensitive receiver locations previously described in Section 6. According to Section 5-29.09 of the Municipal Code states: *No person, while engaged in construction, remodeling, digging, grading, demolition or any other related building activity, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, on any weekday except between the hours of 7:00 a.m. and 6:00 p.m. or on Saturday or Sunday between the hours of 9:00 a.m. and 6:00 p.m.* (12)

In addition, since neither the City of Ontario General Plan or County Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers for CEQA analysis purposes. Therefore, a numerical construction threshold based on Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual is used for analysis of daytime construction impacts. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive residential land use. (8 p. 179).

8.1 CONSTRUCTION NOISE LEVELS



The FTA *Transit Noise and Vibration Impact Assessment Manual* recognizes that construction projects are accomplished in several different stages and outlines the procedures for assessing noise impacts during construction. Each stage has a specific equipment mix, depending on the work to be completed during that stage. As a result of the equipment mix, each stage has its own noise characteristics; some stages have higher continuous noise levels than others, and some have higher impact noise levels than others. The Project construction activities are expected to occur in the following stages:

- Demolition
- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

8.2 CONSTRUCTION REFERENCE NOISE LEVELS

To describe construction noise activities, this construction noise analysis was prepared using reference construction equipment noise levels from the Federal Highway Administration (FHWA) published the Roadway Construction Noise Model (RCNM), which includes a national database of construction equipment reference noise emission levels. (21) The RCNM equipment database, provides a comprehensive list of the noise generating characteristics for specific types of construction equipment. In addition, the database provides an acoustical usage factor to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation.

EXHIBIT 8-A: CONSTRUCTION NOISE SOURCE LOCATIONS

8.3 CONSTRUCTION NOISE ANALYSIS

Using the reference construction equipment noise levels and the CadnaA noise prediction model, calculations of the Project construction noise level impacts at the nearby sensitive receiver locations were completed. Consistent with FTA guidance for general construction noise assessment, Table 8-1 presents the combined noise levels for the loudest construction equipment, assuming they operate at the same time. As shown on Table 8-2, the construction noise levels are expected to range from 27.6 to 38.6 dBA L_{eq} at the nearby receiver locations. Appendix 8.1 includes the detailed CadnaA construction noise model inputs.

TABLE 8-1: CONSTRUCTION REFERENCE NOISE LEVELS

Construction Stage	Reference Construction Activity	Reference Noise Level @ 50 Feet (dBA L_{eq})[1]	Combined Noise Level (dBA L_{eq})[2]	Combined Sound Power Level (PWL)[3]
Demolition	Demolition Equipment	82	83	115
	Backhoes	74		
	Hauling Trucks	72		
Site Preparation	Crawler Tractors	78	80	112
	Hauling Trucks	72

	Rollers	73		
Architectural Coating	Cranes	73	77	109
	Air Compressors	74		
	Generator Sets	70		

[1] FHWA Roadway Construction Noise Model (RCNM).
[2] Represents the combined noise level for all equipment assuming they operate at the same time consistent with FTA Transit Noise and Vibration Impact Assessment guidance.
[3] Sound power level represents the total amount of acoustical energy (noise level) produced by a sound source independent of distance or surroundings. Sound power levels calibrated using the CadnaA noise model at the reference distance to the noise source.

TABLE 8-2: CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})						
	Demolition	Site Preparation	Grading	Building Construction	Paving	Architectural Coating	Highest Levels[2]
R1	33.6	30.6	33.6	31.6	33.6	27.6	33.6
R2	35.9	32.9	35.9	33.9	35.9	29.9	35.9
R3	37.1	34.1	37.1	35.1	37.1	31.1	37.1
R4	38.6	35.6	38.6	36.6	38.6	32.6	38.6

[1] Noise receiver locations are shown on Exhibit 8-A.
[2] Construction noise level calculations based on distance from the construction activity, which is measured from the Project site boundary to the nearest receiver locations. CadnaA construction noise model inputs are included in Appendix 8.1.

8.4 CONSTRUCTION NOISE LEVEL COMPLIANCE

To evaluate whether the Project will generate potentially significant short-term noise levels at nearest receiver locations, a construction-related daytime noise level threshold of 80 dBA L_{eq} is used as a reasonable threshold to assess the daytime construction noise level impacts. The construction noise analysis shows that the nearest receiver locations will satisfy the reasonable daytime 80 dBA L_{eq} significance threshold during Project construction activities as shown on Table 8-3. Therefore, the noise impacts due to Project construction noise are considered *less than significant* at all receiver locations.

TABLE 8-3: CONSTRUCTION NOISE LEVEL COMPLIANCE

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})		
	Highest Construction Noise Levels[2]	Threshold[3]	Threshold Exceeded?[4]
R1	33.6	80	No
R2	35.9	80	No
R3	37.1	80	No
R4	38.6	80	No

[1] Noise receiver locations are shown on Exhibit 8-A.
[2] Highest construction noise level calculations based on distance from the construction noise source activity to the nearest receiver locations as shown on Table 8-2.
[3] Construction noise level thresholds as shown on Table 4-1.
[4] Do the estimated Project construction noise levels exceed the construction noise level threshold?

8.5 NIGHTTIME CONCRETE POUR NOISE ANALYSIS

It is our understanding that nighttime concrete pouring activities will occur as a part of Project building construction activities. Nighttime concrete pouring activities are often used to support reduced concrete mixer truck transit times and lower air temperatures than during the daytime hours and are generally limited to the actual building pad area as shown on Exhibit 8-B. Since the nighttime concrete pours will take place outside the permitted City of Ontario Municipal Code, Section 5-29.09 hours of *7:00 a.m. and 6:00 p.m.* or on Saturday or Sunday between the hours of 9:00 a.m. and 6:00 p.m. The Project Applicant will be required to obtain authorization for nighttime work from the City of Ontario. Any nighttime construction noise activities shall satisfy the noise limits outlined in Table 4-1.

8.5.1 NIGHTTIME CONCRETE POUR REFERENCE NOISE LEVEL MEASUREMENTS

To estimate the noise levels due to nighttime concrete pour activities, sample reference noise level measurements were taken during a nighttime concrete pour at a construction site. Urban Crossroads, Inc. collected short-term nighttime concrete pour reference noise level measurements during the noise-sensitive nighttime hours between 1:00 a.m. to 2:00 a.m. at 27334 San Bernardino Avenue in the City of Redlands. The reference noise levels describe the expected concrete pour noise sources that may include concrete mixer truck movements and pouring activities, concrete paving equipment, rear mounted concrete mixer truck backup alarms, engine idling, air brakes, generators, and workers communicating/whistling.

To describe the nighttime concrete pour noise levels associated with the construction of the 5355 East Airport Drive, this analysis relies on reference sound power level of 100.3 dBA L_w. While the Project noise levels will depend on the actual duration of activities and specific equipment fleet in use at the time of construction, the reference sound power level of 100.3 dBA L_w is used to describe the expected Project nighttime concrete pour noise activities.

EXHIBIT 8-B: NIGHTTIME CONCRETE POUR NOISE SOURCE AND RECEIVER LOCATIONS

8.5.2 NIGHTTIME CONCRETE POUR NOISE LEVEL COMPLIANCE

As shown on Table 8-4, the noise levels associated with the nighttime concrete pour activities are estimated to range from 18.6 to 24.1 dBA L_{eq} and will satisfy the City of Ontario nighttime stationary-source exterior hourly average L_{eq} residential noise level threshold adjusted to reflect the ambient noise conditions at all the receiver locations. Based on the results of this analysis, all nearest noise receiver locations will experience *less than significant* impacts due to the Project related nighttime concrete pour activities. Appendix 8.2 includes the CadnaA nighttime concrete pour noise model inputs.

TABLE 8-4: NIGHTTIME CONCRETE POUR NOISE LEVEL COMPLIANCE

Receiver Location[1]	Use	Construction Noise Levels (dBA L_{eq})		
		Paving Construction[2]	Nighttime Threshold[3]	Threshold Exceeded?[4]
R1	Residence	18.6	45	No
R2	Residence	21.2	45	No
R3	Residence	22.5	45	No
R4	Residence	24.1	45	No

[2] Paving construction noise level calculations based on distance from the construction noise source activity to nearby receiver locations.
[3] Exterior nighttime noise level standards as shown on Table 5-1.
[4] Do the estimated Project construction noise levels exceed the nighttime construction noise level threshold?

8.6 CONSTRUCTION VIBRATION ANALYSIS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods employed. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Ground vibration levels associated with various types of construction equipment are summarized on Table 8-5. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the potential for human response (annoyance) and building damage using the following vibration assessment methods defined by the FTA. To describe the vibration impacts the FTA provides the following equation: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 8-5: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded Trucks	0.076
Large bulldozer	0.089

Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual

Table 8-6 presents the expected Project related vibration levels at the nearby receiver locations. At distances ranging from 3,872 to 6,214 feet from Project construction activities, construction vibration velocity levels are estimated to be 0.000 in/sec PPV. Based on maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec), the typical Project construction vibration levels will fall below the building damage thresholds at all the noise sensitive receiver locations. Therefore, the Project-related vibration impacts are considered *less than significant* during typical construction activities at the Project site.

Moreover, the vibration levels reported at the sensitive receiver locations are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating adjacent to the Project site perimeter.

TABLE 8-6: PROJECT CONSTRUCTION VIBRATION LEVELS

Receiver[1]	Distance to Const. Activity (Feet)[2]	Typical Construction Vibration Levels PPV (in/sec)[3]					Thresholds PPV (in/sec)[4]	Thresholds Exceeded?[5]
		Small bulldozer	Jackhammer	Loaded Trucks	Large bulldozer	Highest Vibration Level		
R1	6,214'	0.000	0.000	0.000	0.000	0.000	0.3	No
R2	5,072'	0.000	0.000	0.000	0.000	0.000	0.3	No
R3	4,482'	0.000	0.000	0.000	0.000	0.000	0.3	No
R4	3,872'	0.000	0.000	0.000	0.000	0.000	0.3	No

Master of Science in Civil and Environmental Engineering
California Polytechnic State University, San Luis Obispo • December, 1993

Bachelor of Science in City and Regional Planning
California Polytechnic State University, San Luis Obispo • June, 1992

PROFESSIONAL REGISTRATIONS

PE – Registered Professional Traffic Engineer – TR 2537 • January, 2009
AICP – American Institute of Certified Planners – 013011 • June, 1997–January 1, 2012
PTP – Professional Transportation Planner • May, 2007 – May, 2013
INCE – Institute of Noise Control Engineering • March, 2004

PROFESSIONAL AFFILIATIONS

ASA – Acoustical Society of America
ITE – Institute of Transportation Engineers

PROFESSIONAL CERTIFICATIONS

Certified Acoustical Consultant – County of San Diego • March, 2018
Certified Acoustical Consultant – County of Orange • February, 2011
FHWA-NHI-142051 Highway Traffic Noise Certificate of Training • February, 2013

CHAPTER 29: NOISE

5-29.01 Declaration of findings and policy

5-29.02 Definitions

5-29.03 Designated noise zones

5-29.04 Exterior noise standards

5-29.05 Interior noise standards

5-29.06 Exemptions

5-29.07 Loud and disturbing noise

5-29.08 Real property maintenance noise regulations

5-29.09 Construction activity noise regulations

5-29.10 Other public agency exceptions

5-29.11 Schools, day care centers, churches, libraries, museums, health care institutions; Special provisions

5-29.12 Sound amplifying equipment

5-29.13 Amplified sound

5-29.14 Motor vehicles

5-29.15 Noise level measurement

5-29.16 Prima facie violation

5-29.17 Penalty

5-29.18 Enforcement and administration

5-29.19 City Manager waiver

5-29.20 Noise abatement program

Sec. 5-29.01. Declaration of findings and policy.

It is hereby found and declared that:

(a) The making and creation of excessive, unnecessary or unusually loud noises within the limits of the City is a condition that has existed for some time, however, the extent and volume of such noises is increasing;

(b) The making, creation or maintenance of such excessive, unnecessary, unnatural or unusually loud noises that are prolonged, unusual and unnatural in their time, place and use affect and are a detriment to public health, comfort, convenience, safety, welfare and prosperity of the residents of the City; and

(c) The necessity in the public interest for the provisions and prohibitions hereinafter contained and enacted, is declared as a matter of legislative determination and public policy, and it is further declared

that the provisions and prohibitions hereinafter contained and enacted are in pursuance of and for the purpose of securing and promoting the public health, comfort, convenience, safety, welfare and prosperity and the peace and quiet of the residents of the City.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.02. Definitions.

As used in this chapter, specific words and phrases are defined as follows:

(a) "Ambient noise level" shall mean the all-encompassing noise level associated with a given environment and is a composite of sounds from all sources, excluding the alleged offensive noise or excessive sound, at the location and approximate time at which a comparison with the alleged offensive noise is to be made.

(b) "Applicable (noise) zone" shall mean the noise zone category based on the actual use of the property, provided that the actual use is a legal use in the City.

(c) "A-weighted sound level" shall mean the sound pressure level in decibels (dBAs) as measured with a sound level meter using the A-weighted filter network (scale) at slow response and at a pressure of twenty (20) micropascals. The A-weighted filter de-emphasizes the very low and a very high frequency component of sound in a manner similar to the response of the human ear, and is a numerical method of rating human judgment of loudness.

(d) "Decibel (dBA)" shall mean a unit for measuring the amplitude of a sound, equal to twenty (20) times the logarithm to the base ten (10) of the ratio of pressure of the sound measured to the reference pressure of twenty (20) micropascals.

(e) "Equivalent sound or noise level (Leq)" shall mean the International Electrotechnical Commission (IEC) 60804 Standard for measurement, or the most recent revision thereof, for the sound level corresponding to a steady state noise level over a given sample period with the same amount of acoustic energy as the actual time varying noise level or the energy average noise level during the sample period. The measurement period for the purposes of this chapter is fifteen (15) minutes.

(f) "Impulsive noise" shall mean a noise of short duration usually less than one (1) second and of high intensity, with an abrupt onset and rapid decay. Such objectionable noises may also be repetitive.

(g) "Intrusive noise" shall mean that noise that intrudes over and above the ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, time of occurrence and tonal information content, as well as the prevailing ambient noise level.

(h) "Maintenance" shall mean the upkeep, repair or preservation of existing property or structures.

(i) "Noise" shall mean any unwanted sound or sound that is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing or is otherwise annoying.

(j) "Noise level (sound level)" shall mean the weighted sound pressure level obtained by use of a sound level meter having a standard frequency filter for attenuating part of the sound spectrum. For purposes of this chapter, all noise levels (sound levels) shall be A-weighted sound pressure level.

(k) "Noise (sound) level meter" shall mean an instrument, including a microphone, an amplifier, an output meter and frequency weighting networks for the measurement and determination of noise and sound levels. For the purposes of this chapter, the sound level meter must meet the International Electrotechnical Commission (IEC) 60651 and 60804 Standards, or the most recent revisions thereof, for Type 1 sound level meters or an instrument and the associated recording and analyzing equipment that will provide equivalent data.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.03. Designated noise zones.

The properties hereinafter described shall be assigned to the following noise zones:

Noise Zone I:	All single-family residential properties;
Noise Zone II:	All multi-family residential properties and mobile home parks;
Noise Zone III:	All commercial property;
Noise Zone IV:	The residential portion of mixed use properties;
Noise Zone V:	All manufacturing or industrial properties and all other uses.

The actual use of the property, and not necessarily its zoning designation, shall be the determining factor in establishing whether a property is in Noise Zone I, II, III, IV or V, provided that the actual use is a legal use within the applicable zone.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.04. Exterior noise standards.

(a) The following exterior noise standards, unless otherwise specifically indicated, shall apply to all properties within a designated noise zone.

Allowable Exterior Noise Level (1)		***Allowed Equivalent Noise Level, Leq. (2)***	
Noise Zone	***Type of Land Use***	***7 a.m. to 10 p.m.***	***10 p.m. to 7 a.m.***
I	Single-Family Residential	65 dBA	45 dBA
II	Multi-Family Residential, Mobile Home Parks	65 dBA	50 dBA
III	Commercial Property	65 dBA	60 dBA
IV	Residential Portion of Mixed Use	70 dBA	70 dBA
V	Manufacturing and Industrial, Other Uses	70 dBA	70 dBA

(1) If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard.

(2) Measurements for compliance are made on the affected property pursuant to § 5-29.15.

(b) It is unlawful for any person at any location within the incorporated area of the City to create noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which noise causes the noise level, when measured at any location on any other property, to exceed either of the following:

(1) The noise standard for the applicable zone for any fifteen-minute (15) period; and

(2) A maximum instantaneous (single instance) noise level equal to the value of the noise standard plus twenty (20) dBA for any period of time (measured using A-weighted slow response).

(c) In the event the ambient noise level exceeds the noise standard, the maximum allowable noise level under such category shall be increased to reflect the maximum ambient noise level.

(d) The Noise Zone IV standard shall apply to that portion of residential property falling within one hundred (100) feet of a commercial property or use, if the noise originates from that commercial property or use.

(e) If the measurement location is on a boundary between two (2) different noise zones, the lower noise level standard applicable to the noise zone shall apply.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.05. Interior noise standards.

(a) The following interior noise standards, unless otherwise specifically indicated, shall apply to all properties within a designated noise zone.

Allowable Interior Noise Level (1)		**Allowed Equivalent Noise Level, Leq.** (2)	
Noise Zone	***Type of Land Use***	***7 a.m. to 10 p.m.***	***10 p.m. to 7 a.m.***
I	Single-Family Residential	45 dBA	40 dBA
II	Multi-Family Residential, Mobile Home Parks	45 dBA	40 dBA
IV	Residential Portion of Mixed Use	45 dBA	40 dBA

(1) If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard.

(2) Measurements for compliance are made on the affected property pursuant to § 5-29.15.

(b) It is unlawful for any person at any location within the incorporated area of the City to create noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which noise causes the noise level, when measured at any location on any other property, to exceed either of the following:

(1) The noise standard for the applicable zone for any fifteen-minute (15) period;

(2) A maximum instantaneous (single instance) noise level equal to the value of the noise standard plus twenty (20) dBA for any period of time (measured using A-weighted slow response).

(c) In the event the ambient noise level exceeds the noise standard, the maximum allowable noise level under such category shall be increased to reflect the maximum ambient noise level.

(d) The Noise Zone IV standard shall apply to that portion of residential property falling within one hundred (100) feet of a commercial property or use, if the noise originates from that commercial property or use.

(e) If the measurement location is on a boundary between two (2) different noise zones, the lower noise level standard applicable to the noise zone shall apply.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.06. Exemptions.

The following activities shall be exempted from the provisions of this chapter:

(a) Any activity conducted on public property, or on private property with the consent of the owner, by any public entity or its officers, employees, representatives, agents, subcontractors, permittees, licensees or lessees that the public entity has authorized are exempt from the provisions of this chapter. This includes, without limitation, sporting and recreational activities that are sponsored, co-sponsored, permitted or allowed by the City or any school district within the City's jurisdictional boundaries. This also includes, without limitation, occasional outdoor gatherings, public dances, shows or sporting and entertainment events, provided such events are conducted pursuant to an approval, authorization, contract, lease, permit or sublease by the appropriate public entity, specifically the planning commission or City Council;

(b) Occasional outdoor gatherings, public dances, show, sporting and entertainment events, provided said events are conducted pursuant to a permit or license issued by the appropriate jurisdiction relative to the staging of said events;

(c) Any mechanical device, apparatus or equipment used, related to or connected with emergency machinery, vehicle, work or warning alarm or bell, provided the sounding of any bell or alarm on any building or motor vehicle shall terminate its operation within forty-five (45) minutes in any hour of its being activated;

(d) Noise sources associated with construction, repair, remodeling, demolition or grading of any real property. Such activities shall instead be subject to the provisions of § 5-29.09;

(e) Noise sources associated with construction, repair, remodeling, demolition or grading of public rights-of-way or during authorized seismic surveys;

(f) All mechanical devices, apparatus or equipment associated with agriculture operations provided that:

(1) Operations do not take place between 8:00 p.m. and 7:00 a.m.;

(2) Such operations and equipment are utilized for the protection or salvage of agricultural crops during periods of potential or actual frost damage or other adverse weather conditions; or

(3) Such operations and equipment are associated with agricultural pest control through pesticide application, provided the application is made in accordance with permits issued by or regulations enforced by the California Department of Agriculture;

(g) Noise sources associated with the maintenance of real property. Such activities shall instead be subject to the provisions of § 5-29.08;

(h) Any activity to the extent regulation thereof has been preempted by state or federal law;

(i) Any noise sources associated with people and/or music associated with a party at a residential property. Such noise shall be subject to the provisions of OMC § 5-29.07;

(j) Any noise source emanating from an ice cream truck within the City. Such noise shall be subject to the provisions of OMC § 4-18.04;

(k) Any noise sources associated with barking dogs or other intermittent noises made by animals on any properly within the City. Such noise shall be subject to the provisions of OMC Chapter 1, Title 6;

(l) Noise sources related to uses approved by a permit or development agreement adopted prior to the date of adoption of this chapter and that contains acoustic or noise standard conditions of approval. This exemption shall only be applicable during the effective period of the City-approved permit or development agreement.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.07. Loud and disturbing noise.

(a) It is unlawful for any person or property owner within the City to make, cause or allow to be made any loud, excessive, impulsive or intrusive noise, disturbance or commotion that disturbs the peace or quiet of any area or that causes discomfort or annoyance to any reasonable person of normal sensitivities in the area, after a Police or Code Enforcement Officer has first requested that the person or property owner cease and desist from making such noise. The types of loud, disturbing, excessive, impulsive or intrusive noise may include, but shall not be limited to, yelling, shouting, hooting, whistling, singing, playing a musical instrument, or emitting or transmitting any loud music or noise from any mechanical or electrical sound making or sound-amplifying device.

(b) The factors, standards, and conditions that may be considered in determining whether a violation of the provisions of this section has been committed, included, but not limited to, the following:

(1) The level of the noise;

(2) The level and intensity of the background (ambient) noise, if any;

(3) The proximity of the noise to residential or commercial sleeping areas;

(4) The nature and zoning of the area within which the noise emanates;

(5) The density of inhabitation of the area within which the noise emanates;

(6) The time of day and night the noise occurs;

(7) The duration of the noise;

(8) Whether the noise is constant, recurrent or intermittent;

(9) Whether the noise is produced by a commercial or noncommercial activity; and

(10) Whether the use is lawful under the provisions of Title 5 of this Code and whether the noise is one that could reasonably be expected from the activity or allowed use.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.08. Real property maintenance noise regulations.

(a) No person, while engaged in maintenance of real property, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, except between the hours of 8:00 a.m. and 6:00 p.m.

(b) Trimming or pruning that requires the use of chainsaws or mulching machines shall only be allowed between the hours of 8:00 a.m. and 6:00 p.m. on a weekday and between the hours of 9:00 a.m. and 5:00 p.m. on Saturday or Sunday.

(c) The use of electrical or gasoline powered blowers, such as commonly used by gardeners or other persons for cleaning lawns, yards, driveways, gutters and other property shall only be allowed between the hours of 8:00 a.m. and 6:00 p.m. on a weekday and between the hours of 9:00 a.m. and 5:00 p.m. on Saturday or Sunday.

(d) No landowner, gardener, property maintenance service, contractor, subcontractor or employer shall permit or allow any person or persons working under his or her direction or control to operate any tool, equipment or machine in violation of the provisions of this section.

(e) Exceptions. The provisions of this section shall not apply to the following:

(1) Emergency property maintenance required by the building official;

(2) The maintenance, repair or improvement of any public work or facility by public employees, by any person or persons acting pursuant to a public works contract, or by any person or persons performing such work or pursuant to the direction of, or on behalf of, any public agency; provided, however, this exception shall not apply to the City, or its employees, contractors or agents, unless:

(i) The City Manager or department head determines that the maintenance, repair or improvement is immediately necessary to maintain public service,

(ii) The maintenance, repair or improvement is of a nature that cannot feasibly be conducted during normal business hours, or

(iii) The City Council has approved project specifications, contract provisions, or an environmental document that specifically authorizes maintenance during hours of the day that would otherwise be prohibited pursuant to this section; and

(3) Any maintenance that complies with the noise limits specified in § 5-29.04.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.09. Construction activity noise regulations.

(a) No person, while engaged in construction, remodeling, digging, grading, demolition or any other related building activity, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, on any weekday except between the hours of 7:00 a.m. and 6:00 p.m. or on Saturday or Sunday between the hours of 9:00 a.m. and 6:00 p.m.

(b) No landowner, construction company owner, contractor, subcontractor, or employer shall permit or allow any person or persons working under their direction and control to operate any tool, equipment or machine in violation of the provisions of this section.

(c) Exceptions.

(1) The provisions of this section shall not apply to emergency construction work performed by a private party when authorized by the City Manager or his or her designee;

(2) The maintenance, repair or improvement of any public work or facility by public employees, by any person or persons acting pursuant to a public works contract, or by any person or persons performing such work or pursuant to the direction of, or on behalf of, any public agency; provided, however, this exception shall not apply to the City, or its employees, contractors or agents, unless:

(i) The City Manager or a department head determines that the maintenance, repair or improvement is immediately necessary to maintain public services,

(ii) The maintenance, repair or improvement is of a nature that cannot feasibly be conducted during normal business hours, or

(iii) The City Council has approved project specifications, contract provisions, or an environmental document that specifically authorizes construction during hours of the day that would otherwise be prohibited pursuant to this section; and

(3) Any construction that complies with the noise limits specified in §§ 5-29.04 or 5-29.05.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.10. Other public agency exceptions.

The provisions of this chapter shall not be construed to prohibit any work at different hours by or under the direction of any other public agency or public or private utility companies in cases of necessity or emergency.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.11. Schools, day care centers, churches, libraries, museums, health care institutions; Special provisions.

It is unlawful for any person to create any noise that causes the outdoor noise level at any school, day care center, hospital or similar health care institution, church, library or museum while the same is in use, to exceed the noise standards specified in § 5-29.04 prescribed for the assigned Noise Zone I.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.12. Sound amplifying equipment.

Loudspeakers, sound amplifiers, public address systems or similar devices used to amplify sounds shall be subject to the provisions of § 5-29.13. Such sound amplifying equipment shall not be construed to include electronic devices, including but not limited to, radios, tape players, tape recorders, compact disc players, MP3 players, electric keyboards, music synthesizers, record players or televisions, which are designed and operated for personal use, or used entirely within a building and are not designed or used to convey the human voice, music or any other sound to an audience outside such building, or which are used in vehicles and heard only by occupants of the vehicle in which installed.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.13. Amplified sound.

(a) The City Council enacts the following legislation for the sole purpose of securing and promoting the public health, comfort, safety and welfare for its citizenry. While recognizing that the use of sound amplifying equipment may be entitled to certain protection by the constitutional rights of freedom of speech and assembly, the City Council finds that in order to protect the public safety and the correlative rights of the citizens of this community to privacy and freedom from public nuisance of loud and unnecessary noise, reasonable regulation of the time, place and manner of the use of amplifying equipment is necessary. In no event shall approval or authorization required herein be withheld by reason of the constitutionally protected content of any material proposed to be broadcast through amplifying equipment.

(b) It is unlawful for any person, other than personnel of law enforcement or governmental agencies, to install, use or operate a loudspeaker or sound amplifying device in a fixed or movable position or mounted upon any vehicle within the City for the purpose of giving instructions, directions, talks, addresses or lectures to any persons or assemblages of persons in or upon any street, alley, sidewalk, park, place or public property without a permit to do so from the Police Chief or his or her designee. Notwithstanding any other provision of this chapter, the provisions of this section shall also apply to the use of sound amplifying equipment upon public or private property when used in connection with outdoor or indoor public or private events, whether or not admission is charged or food or beverages are sold, when such activity is to be attended by more than one hundred (100) persons and the noise emanating from the event will be audible at the property plane, or in the case of a street dance or concert on the nearest residential property. Those activities listed in § 5-29.06(a) are exempt from the requirements of this section.

(c) The Police Chief or his or her designee is authorized to approve and issue permits under this section.

(d) An application for a permit required by this section shall be filed with the Police Chief at least sixteen (16) days and no more than one hundred twenty (120) days prior to the date on which the sound amplifying equipment is intended to be used. Applications for events covered by the First Amendment of the United States Constitution are exempt from the time requirements of this section if it is shown that circumstances require a shorter filing period and the event will not constitute an unsafe condition. The application shall contain the following information:

(1) The name, address and telephone number of both the owner and the user of the sound amplifying equipment;

(2) The license number, if a sound truck is to be used;

(3) A general description of the sound amplifying equipment which is to be used;

(4) Whether sound amplifying equipment will be used for commercial or noncommercial purpose;

(5) The dates and times upon and within which, and the streets or property over or upon which, the equipment is proposed to be operated;

(6) The name or names of one (1) or more persons who will be present during the conduct of any activities for which registration is sought and who will have authority to reduce the volume of any sound amplifying equipment during the course of the activities if required pursuant to this chapter and, otherwise, to insure compliance with the provisions of this chapter;

(7) A statement by the applicant that he or she is willing and able to comply with the provisions of this chapter and the conditions of the permit; and

(8) A sketch of the area or facilities within which the activities are to be conducted, with approximate dimensions and illustration of the location and orientation of all sound-amplifying equipment.

(e) The Police Chief shall deny the permit application or revoke any permit if the chief finds any of the following:

(1) The application contains materially false or intentionally misleading information;

(2) The use of sound amplifying equipment at an event or activity proposed will be located in or upon a premises, building or structure that is hazardous to the health or safety of the employees or patrons of the premises, business, activity, or event, or the general public, under the standards established by the Uniform Building or Fire Codes, or other applicable codes, as set forth in OMC Titles 4 and 8;

(3) The use of sound amplifying equipment at an event or activity proposed in or upon a premises, building or structure that lacks adequate on-site parking for participants attending the proposed event or activity under the applicable standards set forth in OMC Title 9;

(4) The conditions of any motor vehicle movement are such that, in his or her opinion, the use of the equipment would constitute an unreasonable interference with traffic safety;

(5) The conditions of pedestrian movement are such that the use of the equipment would constitute a detriment to traffic safety;

(6) The application submitted by the applicant reveals that the applicant would violate the provisions of this section or any other provision of federal, state and/or local law;

(7) The applicant is unwilling or unable to comply with the provisions of this chapter or any conditions imposed upon any permit issued;

(8) There had already been a permitted event at the intended location, or within a two hundred (200) yard radius of the intended location and the prior permitted event was located on residentially zoned property or on a street, alley, public parking lot or neighborhood park within three (3) months prior to the intended event. Community parks are exempt from this subsection (8); or

(9) The applicant or location has had previous violations within the past calendar year, and in the judgment of the Police Chief, issuance would be contrary to the intent of this section.

(f) In determining whether the use of the equipment would constitute an unreasonable interference with or detriment to traffic safety, the Police Chief shall consider, but shall not necessarily be limited to:

(1) The volumes, patterns and speed of vehicular and pedestrian traffic in the proposed area of use;

(2) The relationship of the proposed use of equipment and potential impacts upon traffic patterns;

(3) Availability of sufficient room for the operation of the equipment without significantly interfering with the traffic patterns;

(4) Proximity to schools, playgrounds and similar facilities where use of such equipment might attract children into traffic patterns; or

(5) Proximity to busy intersections or other potentially hazardous conditions where use of such equipment might constitute a hazard by reason of its tendency to distract drivers of vehicles or pedestrians.

(g) Issuance or denial.

(1) If the application is approved, the Police Chief shall return an approved copy of the application to the applicant and shall issue a permit. The permit shall constitute permission for the use of the sound amplifying equipment as requested.

(2) Any application filed shall be either approved or disapproved within five (5) days of the filing thereof.

(3) If the application is disapproved, the Police Chief shall return a disapproved copy forthwith to the applicant with a written statement on the reason for disapproval.

(i) Any person aggrieved by a decision of the Police Chief or his or her designee may file an appeal to the City Manager. A complete and proper appeal shall be filed with the City Clerk within ten (10) calendar days of the action that is the subject of the appeal. If the applicant fails to file an appeal within the ten (10) day filing period provided herein, denial shall take effect immediately upon expiration of such filing period. All appeals shall be in writing and shall contain the following information: (a) name(s) of the person filing the appeal, (b) a brief statement in ordinary and concise language of the relief sought, and (c) the signatures of all parties named as appellants and their mailing addresses. After receiving the appeal, the City Clerk shall immediately forward the matter to the City Manager for handling.

(ii) The City Manager shall, upon receipt of the appeal, set the matter for hearing before the City Manager or a hearing officer. Any hearing officer shall be a licensed attorney or recognized mediator designated by the City Manager. The hearing shall be set for not more than ten (10) calendar days after the receipt of the appeal unless a longer time is requested or consented to by the appellant. Notice of such hearing shall be given in writing and mailed at least five (5) calendar days prior to the date of the hearing, by U.S. mail, with a proof of service attached, addressed to the address listed on the permit application, or the written appeal if different from the permit application. The notice shall state the grounds of the complaint or reason for the denial and shall state the time and place where such hearing will be held.

(iii) The City Manager or hearing officer shall, within ten (10) calendar days following the conclusion of the hearing, make a written finding and decision, which shall be delivered to the City and the appellant by first class mail. Notwithstanding any provision in this Code, the decision of the City Manager or hearing officer shall be the final administrative decision of the City. Any party dissatisfied with the decision of the City Manager or hearing officer may seek review of such decision under the provisions of Code Civil Procedure, §§ 1094.5 and 1094.8, as amended from time to time.

(h) In addition to any other provisions of this Code, the use of sound-amplifying equipment and sound trucks in the City shall be subject to the following regulations:

(1) The only sounds permitted are music and human speech;

(2) Sound shall not be emitted within one hundred (100) yards of hospitals, churches, schools and City Hall;

(3) The volume of sound shall be controlled so that it will not be audible for a distance in excess of one hundred (100) feet from the sound amplifying equipment or sound truck, and so that the volume is not unreasonably loud, raucous, jarring, disturbing or a nuisance to persons within the range of allowed audibility; or

(4) The sound amplifying equipment or sound truck shall not be used between the hours of 8:00 p.m. and 8:00 a.m.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.14. Motor vehicles.

The use of any motor vehicle in such a condition as to create excessive, impulsive or intrusive noises is prohibited. The discharge into the open air of the exhaust of any internal combustion engine, stationary or mounted on wheels, motorboat or motor vehicle, including motor cycle, whether or not discharged through a muffler or other similar device, which discharge creates excessive, unusual, impulsive or intrusive noise is prohibited. Motor vehicles shall comply with the noise regulations of the California Vehicle Code.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.15. Noise level measurement.

(a) The location selected for measuring exterior noise levels in a residential area shall be at any part of a private yard, patio, deck or balcony normally used for human activity and identified by the owner or, if occupied by someone other than the owner, the occupant of the affected property as suspected of exceeding the noise level standard. This location may be the closest point in the private yard or patio, or on the deck or balcony, to the noise source, but should not be located in nonhuman activity areas such as trash container storage areas, planter beds, above or contacting a property line fence, or other areas not normally used as part of the yard, patio, deck or balcony. The location selected for measuring exterior noise levels in a nonresidential area shall be at the closest point to the noise source. The measurement microphone height shall be five (5) feet above finish elevation or, in the case of a deck or balcony, the measurement microphone height shall be five (5) feet above the finished floor level.

(b) The location selected for measuring interior noise levels shall be made within the affected residential unit. The measurements shall be made at a point at least four (4) feet from the wall, ceiling or floor, or within the frame of a window opening, nearest the noise source. The measurements shall be made with windows in an open position.

(c) Any decibel measurement made pursuant to the provisions of this chapter shall be measured in decibels (dBAs) as measured with a sound level meter using the A-weighted sound pressure level.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.16. Prima facie violation.

Any noise exceeding the noise level standard as specified in §§ 5-29.04 and 5-29.05, shall be deemed to be prima facie evidence of a violation of the provisions of this chapter.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.17. Penalty.

(a) Any person who negligently or knowingly violates any provision of this chapter shall be guilty of an infraction and upon conviction shall be punishable by a fine specified in OMC § 1-2.01. Each day a violation occurs shall constitute a separate offense and shall be punishable as such.

(b) Any person who negligently or knowingly violates any provision of this chapter may also be subject to fine(s) specified in the administrative citation schedule of fines set forth in OMC § 1-5.04. The manner of issuing administrative citations shall comply with all the procedures specified in OMC Chapter 5, Title 1.

(c) As an additional remedy, the operation or maintenance of any device, instrument, vehicle or machinery in violation of any provisions of this chapter, which operation or maintenance causes or creates sound levels exceeding the allowable standards as specified in this chapter, shall be deemed and is declared to be a public nuisance and may be subject to abatement by a restraining order or injunction issued by a court of competent jurisdiction.

(d) Any violation of this chapter is declared to be a public nuisance and may be abated in accordance with law. The expense of enforcing this chapter is declared to be public nuisance and may be by resolution of the City Council declared to be a lien and special assessment against the property on which such nuisance is maintained, and any such charge shall also be a personal obligation of the property owner.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.18. Enforcement and administration.

(a) It shall be the responsibility of Police or Code Enforcement Officers to enforce the provisions of this chapter and to perform all other functions required by this chapter. Such duties shall include, but not be limited to investigating potential violations, issuing warning notices and citations, and providing evidence to the City prosecutor for legal action.

(b) For violations of § 5-29.07, Police or Code Enforcement Officers shall obtain a declaration under penalty of perjury from two (2) declarants living in separate households within a sixty (60) day period stating in detail all of the following:

(1) That the declarant is a resident of a residential neighborhood located within two hundred (200) yards of the noise source; and

(2) Within the past month declarant has heard noise for substantially long periods to the extreme annoyance of the declarant.

(3) Declarations from two (2) declarants are required to prove a violation of § 5-29.07, but are not required to prove that a person has violated any other provision of this chapter.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.19. City Manager waiver.

The City Manager is authorized to grant a temporary waiver to the provisions of this chapter for a period of time necessary to correct the violations of this chapter, if such temporary waiver would be in the public interest and there is no feasible and prudent alternative to the activity, or the method of conducting the activity, for which the temporary waiver is sought. This time period may include a commitment to a program that includes placing necessary orders and entering into necessary contracts within thirty (30) days for repair or installation.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.20. Noise abatement program.

(a) In circumstances where adopted community-wide noise standards and policies prove impractical in controlling noise generated from a specific source, the City Council may establish a noise abatement program that recognizes the characteristics of the noise source and affected property and that incorporates specialized mitigation measures.

(b) Noise abatement programs shall set forth in detail the approved terms, conditions and requirements for achieving maximum compliance with noise standards and policies. Said terms, conditions and requirements may include, but shall not be limited to, limitations, restrictions, or prohibitions on operating hours, location of operations, and the types of equipment.

IE DISTRIBUTION CENTER #14 VEHICLE MILES TRAVELED (VMT) ANALYSIS

Ms. Tracy Zinn,

Urban Crossroads, Inc. is pleased to provide the following Vehicle Miles Traveled (VMT) Analysis for the IE Distribution Center #14 development (**Project**), which is located which is located at 5355 E. Airport Drive in the City of Ontario.

PROJECT OVERVIEW

It is our understanding that the Project consists of a single 270,377 square foot warehouse building. The proposed Project has been evaluated assuming a mix of warehousing (243,303 square feet or 90% of the total square footage) and high-cube cold storage use (27,034 square feet or 10% of the total square footage). The Project site is currently occupied and operating as a grain processing company and corn storage and distribution facility within warehousing space totaling 41,780 square feet. There are two driveways on Airport Drive. A preliminary site plan for the proposed Project is shown in Exhibit 1.

EXHIBIT 1: PRELIMINARY SITE PLAN

BACKGROUND

Changes to California Environmental Quality Act (CEQA) Guidelines were adopted in December 2018, which require all lead agencies to adopt VMT as a replacement for automobile delay-based level of service (LOS) as the measure for identifying transportation impacts for land use projects. This statewide mandate went into effect July 1, 2020. To aid in this transition, the Governor's Office of Planning and Research (OPR) released a Technical Advisory on Evaluating Transportation Impacts in CEQA (December of 2018) (**Technical Advisory**) (1). Based on the Technical Advisory, the City of Ontario has developed and adopted their own VMT methodologies and thresholds, which were adopted by City Council in June 2020 (**City Guidelines**) (2). This VMT analysis has been developed based on the adopted City Guidelines.

VMT SCREENING

City Guidelines identify Projects that meet certain VMT screening criteria may be presumed to result in a less than significant transportation impact. It is our understanding the City of Ontario utilizes the San Bernardino County Transportation Authority (SBCTA) VMT Screening Tool (**Screening Tool**). The Screening Tool allows users to select an assessor's parcel number (APN) to determine if a project's location meets one or more of the screening thresholds for land use projects identified in the City Guidelines. The City Guidelines lists the following VMT screening criteria:

- Transit Priority Area (TPA) Screening
- Low VMT Area Screening
- Project Type Screening

A land use project need only meet one of the above screening criteria to result in a less than significant impact.

STEP 1: TPA SCREENING

Consistent with guidance identified in the City Guidelines, projects located within a Transit Priority Area (TPA) (i.e., within ½ mile of an existing "major transit stop"[1] or an existing stop along a "high-quality transit corridor"[2]) may be presumed to have a less than significant impact absent substantial evidence to the contrary. However, the presumption may not be appropriate if a project:

- Has a Floor Area Ratio (FAR) of less than 0.75;

[1] Pub. Resources Code, § 21064.3 ("'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.").
[2] Pub. Resources Code, § 21155 ("For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.").

- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization); or
- Replaces affordable residential units with a smaller number of moderate or high-income residential units.

The Screening Tool was utilized to locate the Project site and its proximity to a TPA. Results, as shown in Attachment A, the Project Site is not located within ½ mile of an existing major transit stop or along a high-quality transit corridor.

TPA screening criteria is not met.

STEP 2: LOW VMT AREA SCREENING

The City Guidelines state that projects may be presumed to have a less than significant VMT impact if located in an already low VMT generating traffic analysis zones (TAZs) that generates a VMT per service population that does not exceed the Citywide average under General Plan Buildout condition VMT per service population. The Screening Tool uses the sub-regional San Bernardino Transportation Analysis Model (SBTAM) to measure VMT performance within individual TAZ's within the region. The Project's physical location based on parcel number is selected in the Screening Tool to determine the TAZ in which the Project will reside. The Project's TAZs VMT per service population was compared to Citywide average buildout VMT per service population. The parcel containing the proposed Project was selected and the Screening Tool was run for origin-destination (OD) VMT per service population. The Project is not located within a low VMT generating zone (See Attachment A).

Low VMT Area screening criteria is not met.

STEP 3: PROJECT TYPE SCREENING

The City Guidelines identify that local serving retail less than 50,000 square feet or other local serving essential services (e.g., day care centers, public schools, medical/dental office buildings, etc.) are presumed to have a less than significant impact absent substantial evidence to the contrary. The Project, as intended, does not contain any local serving uses.

Additionally, the City Guidelines state that small projects generating net new trips fewer than 110 daily vehicle trips may be presumed to have a less than significant impact, subject to discretionary approval by the City.

EXISTING TRAFFIC

The Project site is currently occupied and operating as a grain processing company and corn storage and distribution facility within warehousing space totaling 41,780 square feet. In an effort to understand the existing traffic associated with the current use, traffic counts were collected at the driveways on Tuesday, March 1, 20220 through Thursday, March 3, 2022. Table 1 summarizes the trip generation by day and the average existing trip generation based on the count data

collected over two days. As shown in Table 1, the existing site currently generates an average of 316 vehicle trips per day.

TABLE 1: EXISTING TRIP GENERATION SUMMARY

	AM Peak Hour			PM Peak Hour			
Land Use	In	Out	Total	In	Out	Total	Daily

3-axle Trucks:	0	0	0	0	0	0	6
4+-axle Trucks:	3	4	8	1	0	1	84
Total Truck Trips:	6	6	12	1	0	1	107
Total Trips[1]	**17**	**13**	**30**	**1**	**1**	**2**	**316**

[1] Total Trips = Passenger Cars + Truck Trips.

PROPOSED PROJECT

It is our understanding that the Project consists of a single 270,377 square foot warehouse building. In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021) was used for the proposed uses. Table 3 summarizes the trip generation rates. For purposes of this assessment, the following land uses and vehicle mixes have been utilized:

- ITE land use code 150 (Warehousing) has been used to derive site specific trip generation estimates for up to 243,303 square feet (90% of the total square footage). A warehouse is primarily devoted to the storage of materials but may also include office and maintenance areas. The vehicle mix has been obtained from the ITE's Trip Generation Manual. The truck percentages were further broken down by axle type per the following SCAQMD recommended truck mix: 2-Axle = 16.7%; 3-Axle = 20.7%; 4+-Axle = 62.6%.
- ITE land use code 157 (High-Cube Cold Storage Warehouse) has been used to derive site specific trip generation estimates for up to 27,034 square feet (10% of the total square footage). High-cube cold storage warehouses include warehouses characterized by the storage and/or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. High-cube cold storage warehouses are facilities typified by temperature-controlled environments for frozen food or other perishable products. The High-Cube Cold Storage Warehouse vehicle mix has been obtained from the ITE's Trip Generation Manual. The truck percentages were further broken down by axle type per the following SCAQMD recommended truck mix: 2-Axle = 34.7%; 3-Axle = 11.0%; 4+-Axle = 54.3%.

TABLE 3: TRIP GENERATION RATES

4+-axle Trucks:			2	1	3	2	2	4	92
Total Truck Trips (Actual Vehicles):			2	2	4	4	3	7	146
Warehousing Trips (Actual Vehicles)[2]			31	9	40	12	31	43	416
High-Cube Cold Storage	27.038	TSF							
Passenger Cars:			2	0	2	1	2	3	38
2-axle Trucks:			0	0	0	0	0	0	8
3-axle Trucks:			0	0	0	0	0	0	2
4+-axle Trucks:			0	0	0	0	0	0	12
Total Truck Trips (Actual Vehicles):			0	0	0	0	0	0	22
Cold Storage Trips (Actual Vehicles)[2]			2	0	2	1	2	3	60
Passenger Cars			31	7	38	9	30	39	308
Trucks			2	2	4	4	3	7	168
Total Project Trips (Actual Vehicles)[2]			**33**	**9**	**42**	**13**	**33**	**46**	**476**

[1] TSF = thousand square feet

[2] Total Trips = Passenger Cars + Truck Trips.

TRIP GENERATION COMPARISON

Table 5 shows the trip generation comparison between the existing use and proposed Project and identifies the resulting net new trips. As shown, the Project is anticipated to generate 160 net new average daily trips.

TABLE 5: TRIP GENERATION COMPARISON

	AM Peak Hour			PM Peak Hour			
Land Use	In	Out	Total	In	Out	Total	Daily
Actual Vehicles:							
Existing Use							
Passenger Cars:	11	7	18	0	1	1	209
Trucks:	6	6	12	1	0	1	107
Existing Trips (Actual Vehicles)[2]	**17**	**13**	**30**	**1**	**1**	**2**	**316**
Proposed Project							
Passenger Cars:	31	7	38	9	30	39	308
Trucks:	2	2	4	4	3	7	168
Total Project Trips (Actual Vehicles)[2]	**33**	**9**	**42**	**13**	**33**	**46**	**476**
Passenger Cars:	20	0	20	9	29	38	99
Trucks:	-4	-4	-8	3	3	6	61
Net New Project Trips (Actual Vehicles)[2]	**16**	**-4**	**12**	**12**	**32**	**44**	**160**

[1] TSF = thousand square feet

[2] Total Trips = Passenger Cars + Truck Trips.

The Project is anticipated to generate 160 net new daily vehicle trips. Therefore, the Project generates daily vehicle trips exceeding the 110 daily vehicle trip threshold.

Project Type screening criteria is not met.

As the Project was not found to meet any of the aforementioned VMT screening criteria, a project level VMT analysis is prepared to assess the Project's potential impact to VMT.

VMT ANALYSIS

VMT MODELING

The City Guidelines identify the San Bernardino Transportation Analysis Model (**SBTAM**) as the appropriate tool for conducting VMT analysis for land use projects in the City of Ontario, as it considers interaction between different land uses based on socio-economic data, such as population, households, and employment. Consistent with The City of Ontario Plan (TOP) The City has recently adopted an updated version of SBTAM also referred to as The Ontario Plan (**TOP**) model. This model contains updated roadway network and socio-economic data within the city

and includes a base year of 2019 and a General Plan Buildout of 2050. Outside of the City of Ontario, the model assumes datasets consistent with the 2016 Southern California Association of Governments (SCAG) Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS). Urban Crossroads has obtained the newly adopted TOP model from the City of Ontario.

VMT METRIC AND SIGNIFICANCE THRESHOLD

City Guidelines identify the efficiency based metric VMT per service population (i.e., population and employees) as the measure of potential impact within the City of Ontario. VMT per service population is an efficiency metric that allows a project's VMT to be compared to the remainder of the City. Projects found to increase the average VMT per service population within the City may be deemed to have a significant impact. More specifically, City Guidelines identify the following impact threshold for project level VMT analyses:

- A significant impact would occur if the project VMT per Service Population exceeds the Citywide average for Service Population under General Plan Buildout Conditions.

The City of Ontario's average VMT per service population under General Plan Buildout Conditions was calculated using the TOP 2050 model. Table 6 identifies a summary for the City of Ontario's Citywide average VMT per service population.

TABLE 6: CITYWIDE VMT PER SERVICE POPULATION

Ontario	Buildout
Service Population	706,494
VMT	19,508,184
VMT per Service Population	27.61

As shown in Table 6, the City of Ontario's VMT per service population for General Plan Buildout (2050) conditions has been calculated as **27.61 VMT per service population**.

PROJECT LAND USE CONVERSION

In order to evaluate Project VMT, standard land use information must first be converted into a SBTAM compatible dataset. The SBTAM model utilizes socio-economic data (SED) (e.g., population, households, employment, etc.) instead of land use information for the purposes of vehicle trip estimation. Project land use information such as building square footage must first be converted to SED for input into SBTAM. Adjustments in SED have been made to the appropriate TAZ 53699101 within the SBTAM model to reflect the Project's proposed land uses (i.e., warehouse). Table 7 summarizes the employment estimates for the Project. It should be noted that the employment estimates are consistent with the employment density factors identified in the Southern California Association of Governments (SCAG) Employment Density Study (October 2001) (3).

TABLE 7: EMPLOYMENT ESTIMATES

Land Use	Quantity (SF)	Employment Density Factor[3]	Estimated Employees
Warehouse	270,337	1 employee per 1,195 SF	226

PROJECT TOTAL VMT CALCULATION

Consistent with City Guidelines and standard VMT calculation methods, total VMT is calculated from SBTAM's OD trip matrices and then divided by a project's service population to derive the VMT efficiency metric VMT per service population.

Table 8 presents project-generated total VMT calculated as the total of passenger car, light-duty, medium-duty, and heavy-duty truck trips. Total trips by vehicle type are then multiplied by the average trip length for each vehicle type. The average trip length for heavy, medium, and light duty trucks used for this analysis was obtained from the South Coast Air Quality Management District (SCAQMD) documents for the implementation of the Facility-Based Mobile Source Measures (FBMSMs) adopted in the 2016 Air Quality Management Plan (AQMP). SCAQMD's "Preliminary Warehouse Emission Calculations" cites 39.9-mile trip length for heavy-duty trucks and 14.2-mile trip length for medium and light duty trucks based on SCAG 2016 Regional Transportation Plan (RTP).

TABLE 8: TOTAL VMT

	Base Year (2019)	Buildout Year (2050)	Baseline (2022)
Automobile VMT	4,337	3,939	4,299
Truck VMT	3,278	4,085	3,357
Total VMT	7,616	8,025	7,655

Table 9 presents the calculation of VMT per service population, which is simply the product of total VMT for the Project divided by the Project's service population or in this case the number of Project employees.

TABLE 9: PROJECT VMT PER SERVICE POPULATION

	Base Year (2019)	Buildout Year (2050)	Baseline (2022)
Service Population[4]	226	226	226
VMT	7,616	8,025	7,655
VMT per service population	33.67	35.47	33.84

Table 10 identifies the comparison between Project's baseline and cumulative VMT per service population to the City's impact threshold. The City of Ontario has identified a VMT per service population significance threshold of 27.61, which is the City of Ontario's General Plan Buildout with the TOP model. As shown below, the Project would exceed the City's VMT per service

[3] SCAG Employment Density Study; Table II-B
[4] Since the Project does not have a residential component, the service population consists entirely of employment.

population impact threshold for both the baseline conditions by 22.56%-28.47%, respectively. The Project VMT impact is therefore considered potentially significant.

TABLE 10: PROJECT COMPARISON TO CITY OF ONTARIO VMT THRESHOLD

	Baseline	Buildout Year
Impact Threshold	27.61	27.61
Project	33.84	35.47
Percent Change	+22.56%	+28.47%
Potentially Significant?	Yes	Yes

PROJECT'S CUMULATIVE EFFECT ON VMT

The City Guidelines, consistent with the Technical Advisory, states that cumulative impacts on VMT "… metrics such as VMT per capita or VMT per employee, i.e., metrics framed in terms of efficiency (as recommended below for use on residential and office projects), cannot be summed because they employ a denominator. A project that falls below an efficiency-based threshold that is aligned with long-term goals and relevant plans has no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa. This is similar to the analysis typically conducted for greenhouse gas emissions, air quality impacts, and impact that utilize plan compliance as a threshold of significance."[5] As the Project is consistent with the RTP/SCS and is found to have a potentially significant impact at the project level. The Project is also considered to have a potentially significant cumulative impact as well.

VMT REDUCTION STRATEGIES

Transportation Demand Management (TDM) strategies in the form of commute trip reduction program measures have been reviewed for the purpose of reducing Project related VMT impacts (i.e., commute trips) determined to be potentially significant. The level of effectiveness of each trip reduction measure has been determined based on the Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (CAPCOA, 2021) (**2021 Handbook**). As the future building tenants are not known for the Project, the effectiveness of each commute trip reduction measures may be limited. In addition to specific tenancy considerations, locational context is also a major factor relevant to the potential application and effectiveness of TDM measures. The three locational contexts identified by the 2021 Handbook are suburban, urban, and rural.[6] The locational context of the Project is characteristically suburban.

Under the most favorable circumstances and ideal conditions a project can realize a maximum reduction of 45% in commute VMT through implementation of the trip reduction program measures listed below.[7] However, ideal conditions are rarely realized as variables such as a

[5] OPR's Technical Advisory; Page 6
[6] 2021 Handbook; Page 43
[7] 2021 Handbook; Page 61

projects locational context limitation (i.e., non-urban areas). Additionally, to achieve ideal conditions a project must achieve one hundred percent employee participation and maximum employee eligibility, which are not generally expected. The proposed Project would require a minimum reduction of 25.58% to achieve a less than significant impact. The 2021 Handbook lists the following trip reduction measures. These measures can be implemented individually or grouped together to create either a voluntary or mandatory commute trip reduction (CTR) program.

- T-7 – Implement Commute Trip Reduction Marketing
- T-8 – Provide Ridesharing Program
- T-10 – Provide End-of-Trip Facilities

Other regional transportation measures that may reduce VMT include but are not limited to improving/increasing access to transit, increasing access to common goods and service, or orientating land uses towards alternative transportation. These regional transportation measures may be infeasible at the project level but will generally be implemented as the surrounding communities develop. There is no means, however, to quantify any VMT reductions that could result from implementation. Additionally, the effectiveness of the CTR program measures listed above have potential to reduce the Project VMT are dependent on as yet unknown building tenant(s); and as noted above, VMT reductions from various CTR measures cannot be guaranteed.

CONCLUSION

Based on the results of this analysis the following findings are made:

- The Project's was evaluated against screening criteria as outlined in the City Guidelines. The Project was not found to meet any available screening criteria, and a model based VMT analysis was performed.
- The Project's VMT analysis found the Project to exceed the City's VMT per employee threshold by 22.56% in baseline conditions and 28.47% in buildout conditions. The Project is determined to have a potentially significant transportation impact.
- Since the future tenants are unknown at this time, implementation of the feasible TDM measures discussed above cannot be guaranteed to reduce the Project generated VMT per employee; the Project's VMT impact is considered significant and unavoidable.

If you have any questions, please contact me directly at aso@urbanxroads.com.

Respectfully submitted,

IE DISTRIBUTION CENTER #14 TRIP GENERATION ASSESSMENT

Urban Crossroads, Inc. is pleased to submit the following responses to the Trip Generation Assessment for the proposed IE Distribution Center #14 development (**Project**), which is located at 5355 E. Airport Drive in the City of Ontario. This letter describes the proposed Project trip generation and determines whether any traffic operations analysis is required based on the County's Transportation Impact Study Guidelines (July 9, 2019, referred to as **City Guidelines**) as the City does not have their own level of service (LOS) guidelines.

PROPOSED PROJECT

It is our understanding that the Project consists of a single 270,377 square foot warehouse building. The proposed Project has been evaluated assuming a mix of warehousing (243,303 square feet or 90% of the total square footage) and high-cube cold storage use (27,034 square feet or 10% of the total square footage). The Project site is currently occupied and operating as a grain processing company and corn storage and distribution facility within warehousing space totaling 41,780 square feet. There are two driveways on Airport Drive. A preliminary site plan for the proposed Project is shown in Exhibit 1.

EXHIBIT 1: PRELIMINARY SITE PLAN

TRIP GENERATION

EXISTING TRAFFIC

The Project site is currently occupied and operating as a grain processing company and corn storage and distribution facility within warehousing space totaling 41,780 square feet. In an effort to understand the existing traffic associated with the current use, traffic counts were collected at the driveways on Tuesday, March 1, 20220 through Thursday, March 3, 2022. Attachment A includes the driveway count data. Table 1 summarizes the trip generation by day and the average existing trip generation based on the count data collected over two days. The existing site currently generates an average of 316 two-way trips per day, with 30 trips during the AM peak hour and 2 trips during the PM peak hour (in actual vehicles).

TABLE 1: EXISTING TRIP GENERATION SUMMARY

	AM Peak Hour			PM Peak Hour			
Land Use	In	Out	Total	In	Out	Total	Daily

4+-axle Trucks:	3	4	8	1	0	1	84
Total Truck Trips:	6	6	12	1	0	1	107
Total Trips[1]	**17**	**13**	**30**	**1**	**1**	**2**	**316**

[1] Total Trips = Passenger Cars + Truck Trips.

PROPOSED PROJECT

It is our understanding that the Project consists of a single 270,377 square foot warehouse building. In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021) was used for the proposed uses. Table 2 summarizes the trip generation rates. For purposes of this assessment, the following land uses and vehicle mixes have been utilized:

- ITE land use code 150 (Warehousing) has been used to derive site specific trip generation estimates for up to 243,303 square feet (90% of the total square footage). A warehouse is primarily devoted to the storage of materials but may also include office and maintenance areas. The vehicle mix has been obtained from the ITE's Trip Generation Manual. The truck percentages were further broken down by axle type per the following SCAQMD recommended truck mix: 2-Axle = 16.7%; 3-Axle = 20.7%; 4+-Axle = 62.6%.
- ITE land use code 157 (High-Cube Cold Storage Warehouse) has been used to derive site specific trip generation estimates for up to 27,034 square feet (10% of the total square footage). High-cube cold storage warehouses include warehouses characterized by the storage and/or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. High-cube cold storage warehouses are facilities typified by temperature-controlled environments for frozen food or other perishable products. The High-Cube Cold Storage Warehouse vehicle mix has been obtained from the ITE's Trip Generation Manual. The truck percentages were further broken down by axle type per the following SCAQMD recommended truck mix: 2-Axle = 34.7%; 3-Axle = 11.0%; 4+-Axle = 54.3%.

TABLE 2: TRIP GENERATION RATES

Land Use	Units[2]	ITE LU Code	AM Peak Hour In	AM Peak Hour Out	AM Peak Hour Total	PM Peak Hour In	PM Peak Hour Out	PM Peak Hour Total	Daily

Warehousing[1,3]	TSF	150	0.131	0.039	0.170	0.050	0.130	0.180	1.710
Passenger Cars			0.120	0.030	0.150	0.034	0.116	0.150	1.110
2-Axle Trucks			0.002	0.001	0.003	0.003	0.002	0.005	0.100
3-Axle Trucks			0.002	0.002	0.004	0.003	0.003	0.006	0.124
4+-Axle Trucks			0.007	0.006	0.013	0.010	0.009	0.019	0.376
High-Cube Cold Storage Warehouse[1,3]	TSF	157	0.085	0.025	0.110	0.034	0.086	0.120	2.120
Passenger Cars			0.076	0.004	0.080	0.019	0.071	0.090	1.370
2-Axle Trucks			0.003	0.007	0.010	0.005	0.005	0.010	0.260
3-Axle Trucks			0.001	0.002	0.003	0.002	0.001	0.003	0.083
4+-Axle Trucks			0.005	0.011	0.016	0.008	0.008	0.016	0.407

[1] Trip Generation & Vehicle Mix Source: Institute of Transportation Engineers (ITE), Trip Generation Manual, Eleventh Edition (2021).

[2] TSF = thousand square feet

[3] Truck Mix: South Coast Air Quality Management District's (SCAQMD) recommended truck mix, by axle type.

Normalized % - Without Cold Storage: 16.7% 2-Axle trucks, 20.7% 3-Axle trucks, 62.6% 4-Axle trucks.

Normalized % - With Cold Storage: 34.7% 2-Axle trucks, 11.0% 3-Axle trucks, 54.3% 4-Axle trucks.

Passenger car equivalent (PCE) factors were applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCEs allow the typical "real-world" mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, to be used for the purposes of capacity and level of service analyses. The PCE factors are consistent with the recommended PCE factors in the County's Guidelines (City's Guidelines do not specify the factors).

The trip generation summary illustrating daily and peak hour trip generation estimates for the proposed Project are summarized on Table 3 for actual vehicles and on Table 4 for PCE. Any intersection operations analysis for a project would need to utilize the PCE trip generation consistent with the City's Guidelines. The proposed Project is anticipated to generate 476 vehicle trip-ends per day with 42 AM peak hour trips and 46 PM peak hour trips (actual vehicles). In comparison the Project is anticipated to generate 732 PCE vehicle trip-ends per day with 49 PCE AM peak hour trips and 57 PCE PM peak hour trips.

TRIP GENERATION COMPARISON

Table 5 shows the trip generation comparison between the existing use and proposed Project and identifies the resulting net new trips. As shown, the Project is anticipated to generate 234 additional two-way trips per day with 1 net new AM peak hour trip and 53 net new PM peak hour trips as compared to the existing use.

TABLE 5: TRIP GENERATION COMPARISON

	AM Peak Hour			PM Peak Hour			
Land Use	In	Out	Total	In	Out	Total	Daily
Actual Vehicles:							
Existing Use							
Passenger Cars:	11	7	18	0	1	1	209
Trucks:	14	16	30	3	0	3	289

[1] TSF = thousand square feet

[2] Total Trips = Passenger Cars + Truck Trips.

FINDINGS

The City's Guidelines identify a project could potentially require further analysis if it meets the following criteria:

- If a project generates more than 100 peak hour trips in either peak hour. This presumption is based on the assumption that projects that generate less than 100 peak hour trips typically do not affect LOS significantly once distributed to the local roadway network.
- The minimum area to be studied should include any intersection at which the proposed project would add 50 or more peak hour trips.

Even without taking any credit for the existing use (which currently generates nominal traffic), the proposed Project is anticipated to generate fewer than 100 peak hour trips. Furthermore, taking into consideration the distribution of traffic to the west and east on E. Airport Drive, the Project is anticipated to contribute fewer than 50 peak hour trips to any off-site intersection. As such, no traffic operations analysis has been recommended based on the findings of this trip generation assessment.

If you have any questions or comments, I can be reached at cso@urbanxroads.com.

Subject: DAB Agenda Item D for March 18, 2024

Ms. Mejia,

- ***Please include this email as part of the public record.***

I would like to express several concerns I have about the referenced project as presented in the Board packet published on the City website. I hope you can clear these up for me.

1. Greenhouse Gas Emissions

It has been clearly demonstrated that our air pollution may be among the worst in the nation. As such it is in the best interest of the citizens of Ontario to reduce local pollution sources wherever possible. The recent warehouse approvals regularly refer to the city policy (CCAP) of limiting new projects to 3000 metric tons of CO2 equivalents per year. The proposal seems to claim that this project will only create 2590.77 metric tons. (pages 333, 334) In reality it is creating 4236.54 metric tons and wants to take credit for 1645.77 no longer emitted by the current occupants. This is their basis for saying no mitigation is needed. Why would they be entitled to claim this credit. They are generating 4236.54 units which exceeds the 3000 max proscribed by the city guidelines. Am I mistaken?

2. SCAQMD guidelines

On page 560 the consultant says the 2022 AQMP plan is not ready and does not need to be considered. I attach the cover sheet of said plan actually adopted in December of 2022.

3. Health & Equity (pages 770, 771)

It seems self-evident in reading these pages that we live in deplorable circumstances. It is incumbent on City leaders to give more consideration to the health of our citizens than to 100,000 sq ft warehouses. To wit:

a. Ozone in the 91st percentile in the State
b. Air Quality in the 95th percentile
c. Traffic in the 89th percentile

4. Mitigation Measures

It seems the least the City could do would be to mandate even the bare minimum of mitigation measures for all these projects as mentioned several times in the documents. (For example, Letter to Thomas Grahn from SQAQMD, page 495, "In the event that the Proposed Project results in significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize these impacts." These could include:

a. Roof top solar
b. Reflective roofing
c. Electric charging stations
d. No or limited on site truck idling
e. Night time deliveries
f. Require deliveries via ZE of NZE vehicles
g. Energy Star appliances

Looking forward to hearing from you.

Raymond Smith

Ontario 91761

MEMORANDUM

TO: Thomas Grahn, Senior Planner
City of Ontario
303 East B Street
Ontario, CA 91764

FROM: Tracy Zinn, Principal
Tracy Chu, Assistant Project Manager

DATE: March 25, 2024

RE: 5355 East Airport Drive (PDEV22-017) – Response to Additional Comment Letter and Verbal Comments Expressed at DAB Meeting

T&B Planning, Inc. is the environmental consulting firm that prepared the Environmental Impact Report (EIR; SCH No. 2022090006) for the 5355 East Airport Drive Project (hereafter "Project"). The Project Applicant, Prologis, Inc., proposes to demolish the existing buildings and structures on the Project site and redevelop the property with a 270,337 square foot (s.f.) warehouse building. The Project's design also includes the installation of associated site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detention facilities, exterior lighting, walls/fencing, and signage as well as site-adjacent improvements to East Airport Drive. The Draft EIR for the Project was published on August 22, 2023, for a 45 day review period, with the local review period and State review period ending on October 5, 2023.

On March 17, 2024, a letter was sent to the City from Raymond Smith (hereinafter "Comment Letter") on the Project. Subsequently, on March 18, 2024, during the Development Advisory Board (DAB) meeting, verbal comments on the Project's potential environmental effects were made by an organization and individuals including Californians Allied for a Responsible Economy (CARECA).

T&B Planning prepared this memorandum in response to the comments received alleging deficiencies in the Draft EIR's environmental impact analysis. This memorandum addresses items in the Comment Letter and the verbal comments received during the DAB meeting that are applicable to CEQA compliance. The responses contained herein demonstrate that the Draft EIR's analyses and conclusions are correct and satisfy CEQA compliance requirements. For the reasons outlined in this memorandum, the comments do not present substantial new information, do not necessitate revisions to the Draft EIR or Final EIR, and do not trigger the need for recirculation of the Draft EIR or Final EIR, or the conduct of additional environmental review pursuant to CEQA Guidelines § 15088.5.

Commenter Letter: Raymond Smith dated March 17, 2024.

1-1 The commenter raises concern about the Project's greenhouse gas (GHG) emissions impacts and questions why the Draft EIR took credit for existing emissions to determine the level of significance. As discussed in Draft EIR Section 4.6, *Greenhouse Gas Emissions*, construction and operation of the Project would generate a total of approximately 4,236.54 $MTCO_2e$/yr. GHG emissions from existing land uses on the Project Site were appropriately subtracted from the Project's gross emissions to determine the net (or new) emissions attributed to the Project. Construction and operation of the Project less emissions from the existing onsite uses would result a net total of new GHG emissions of approximately 2,590.77 $MTCO_2e$/yr, which would fall below the significance threshold of 3,000 $MTCO_2e$/yr; therefore, Project-related GHG emissions are considered less than significant (refer to Draft EIR p. 4.6-22). The CEQA Statute and Guidelines explicitly describe how the baseline of existing environmental conditions is to be defined, against which an EIR measures the impacts of a proposed project. The baseline consists of the conditions at the time the environmental impact review process begins (refer to 14 Cal Code Regs §15126.2). Because existing uses were located on the Project Site when environmental review began, the GHG emissions produced from those uses are accounted for in the baseline. Because those uses would be demolished/cease operation as a result of the Project, and be replaced with a new use, the analysis appropriately considers elimination of the GHG emissions associated with the existing use and the addition of GHG emissions associated with the new use. Therefore, the net emissions generated from the Project demonstrates the overall increase of GHG emissions on the environment. No additions, revisions, or corrections to the Draft EIR or Final EIR are necessary and no further response is required.

1-2 The commenter points out that the Air Quality technical report (*Technical Appendix B1* of the Draft EIR) does not reference the 2022 Air Quality Management Plan (AQMP), which the SCAQMD adopted in December 2022, and instead relies upon the prior, 2016 AQMP. The comment is correct, but does not render the Draft EIR deficient. The Project's Air Quality Impact Analysis was published on August 30, 2022, prior to the adoption of the 2022 AQMP. Nevertheless, the Project would not be in conflict with either the 2016 AQMP or the 2022 AQMP. The criteria for determining consistency with the 2022 AQMP is the same criteria for determining consistency with the 2016 AQMP, and are analyzed below, demonstrating that the Project is in compliance.

- Consistency Criterion 1: The proposed Project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

  Consistency Criterion No. 1 refers to violations of the CAAQS and NAAQS. CAAQS and NAAQS violations would occur if localized or regional significance thresholds were exceeded. As discussed in Draft EIR Section 4.2, *Air Quality*, the Project's localized and regional construction-source emissions would not exceed applicable regional significance threshold and local significance thresholds (LSTs) during both Project construction and operation (refer to Draft EIR pp. 4.2-31 to 4.2-36). As such, a less than significant impact would occur. Accordingly, the Project is determined to be consistent with the first criterion.

- Consistency Criterion 2: The Project will not exceed the assumptions in the AQMP based on the years of Project buildout phase.

  The 2022 AQMP demonstrates that the applicable ambient air quality standards can be achieved within the timeframes required under federal law. Growth projections from local general plans adopted by cities in the SCAQMD are provided to SCAG, which develops regional growth forecasts, which are then used to develop future air quality forecasts for the AQMP. Development consistent with the growth projections in City of Ontario Policy Plan is considered to be consistent with the AQMP. The City of Ontario Policy Plan designates the Project Site for Industrial uses. The Project's proposed warehouse building is consistent with the Site's land use designations and no General Plan Amendment is required. As such, the Project's proposed land use and development is consistent with the Policy Plan's land use designation. Accordingly, the Project is determined to be consistent with the second criterion.

Based on the preceding, the Project would be consistent with the 2022 AQMP and impacts would be less than significant. Information about the Project's consistency with the 2022 AQMP does not present substantial new information resulting in the need for recirculation or additional environmental review pursuant to CEQA Guidelines § 15088.5. No substantive additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

1-3 The commenter cites the CalEnviroScreen scores for the Project site's census tract as shown in the appendices of the Project's Air Quality technical report and raises concern over health impacts to residents. As shown on Draft EIR Figure 4.2-1, *Sensitive Receptor Locations*, there are no residential uses in immediate proximity to the Project Site. The nearest sensitive receptors are hotels, located on the opposite side of I-10 and I-15, and more than 3,800 feet from the Project Site. The Project Site is surrounded by industrial uses. As concluded in Draft EIR Section 4.2, *Air Quality*, (1) the Project's localized construction and operational emissions would not exceed the SCAQMD's localized significance thresholds; (2) based on the Project-specific mobile source health risk assessment (HRA) (*Technical Appendix B2* of the Draft EIR), the Project would not result in significant health impacts due to diesel particulate matter (DPM) emissions; and (3) the Project would not cause or contribute to any Carbon Monoxide (CO) "hot spots (refer to pp. 4.2-33 to 4.2-36 of the Draft EIR). Therefore, localized air quality impacts would be less than significant. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

1-4 The commenter recommends mitigation measures for GHG emissions and cites the SCAQMD's letter submitted on the EIR's Notice of Preparation (NOP). The commenter's suggested mitigation measures include adding roof top solar, reflective roofing, energy star appliances, and electric charging stations, limiting on site truck idling and nighttime deliveries, and requiring zero emission or net zero emission delivery vehicles. The commenter is referred to the Project's Final EIR, which evaluated the feasibility of additional GHG mitigation measures, including 38 measures recommended in the California Department of Justice Warehouse Project Best Practices manual (refer to Final EIR, response to comments B-41 to B-78). Specifically, the commenter is referred to response to comments B-59, B-56, and B-53 for responses to comments suggesting roof top solar, truck idling restrictions, and zero emission vehicles, respectively. Additionally, of the Project's 251 onsite passenger vehicle spaces, 25 spaces would be designated as

electric vehicle parking stalls (Refer to Draft EIR p. 3-6). The Project proposes a conventional warehouse use reflecting contemporary energy efficient/energy conserving designs and operational programs and would be required to comply with the applicable provisions of the California Green Building Standards Code (CalGreen), California Code of Regulations (CCR) Title 24 Part 6: The California Energy Code standards, that are in place at the time construction permit plan check submittals are made. As concluded in Draft EIR Section 4.2, *Air Quality*, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account the elimination of air pollutant emissions from existing uses on the site that would be demolished/cease operation as part of the Project (refer to Draft EIR pp. 4.2-31 to 4.2-32). Because impacts would be less than significant and a number of Project design features and regulatory requirements are already in place to reduce air pollutant emissions, additional mitigation is not warranted.

Comments Received During the DAB Meeting

The following responses are organized to correspond with the environmental topic issues that were mentioned during the Design Advisory Board (DAB) meeting held on March 18, 2024.

Transportation

Concerns about the Project's traffic volumes were raised. Specifically, one commenter stated that [level of service (LOS)] traffic impacts within a 5-mile radius of the Project Site should be analyzed to address impacts on nearby streets and a Traffic Impact Analysis report should be conducted.

First, it should be noted that the basis for evaluation of transportation impacts under CEQA is vehicle miles traveled (VMT) and not LOS. Nonetheless, as stated in the Project's Trip Generation Assessment (*Technical Appendix K* to the Draft EIR), the City's Guidelines identify that a project could potentially require further traffic analysis if the project generates more than 100 peak hour trips in either peak hour. This is based on the assumption that projects that generate fewer than 100 peak hour trips typically do not affect LOS significantly once distributed to the local roadway network. Also, the City's Guidelines state that the minimum area to be studied should include any intersection at which the proposed project would add 50 or more peak hour trips.

The Project is calculated to generate 476 vehicle trip-ends per day with 42 AM peak hour trips and 46 PM peak hour trips (actual vehicles) as shown in Draft EIR *Technical Appendix K*. Even without taking credit for elimination of traffic from the existing uses on the Site that would be demolished/cease operation as a result of the Project, fewer than 100 peak hour trips would be generated. Furthermore, taking into consideration the distribution of traffic to the west and east on East Airport Drive, the Project is would clearly contribute fewer than 50 peak hour trips to any off-site intersection. As such, a LOS-based traffic study is not required based on the findings of the Trip Generation Assessment. Moreover, and as stated above, automobile delay, as measured by LOS and other similar metrics, no longer constitutes a significant environmental effect under CEQA. Lead agencies in California are required to use VMT to evaluate project-related transportation impacts. This statewide mandate went into effect July 1, 2020. CEQA Guidelines Section 15064.3, effective January 1, 2019, "describes specific considerations for evaluating a project's transportation impacts" and provides that, except for roadway capacity projects, "a project's effect on automobile delay (or LOS)" shall not constitute a significant environmental impact" (CEQA Guidelines Section 15064.3(a)). Moreover, vehicle congestion is not a CEQA issue as it pertains to LOS.

Additionally, a commenter questioned why the Project's truck traffic (which was incorrectly stated as comprising 300 daily trips), would not result in significant air quality impacts. As shown in Draft EIR Table 4.10-3, *Project Net New Daily Trips*, the Project would generate 168 total daily truck trip, but a net increase of only 61 daily truck trips when taking credit for the elimination of truck trips from the existing onsite uses that would be demolished/cease operation as a result of the Project. Refer below to the discussion related to air quality impacts, which the Draft EIR accurately concludes would be less than significant. The Draft EIR adequately addresses both transportation and air quality impacts and no additions, revisions, or corrections to the Draft EIR are necessary.

Air Quality

Comments were made related to the Project's air quality impacts and it was suggested that air filters be provided to nearby school and residents. As discussed in Draft EIR Section 4.2, *Air Quality*, the Project Site is primarily surrounded by industrial uses. The residential land use with the greatest potential exposure to Project's operational-source air pollutant emissions is located approximately 8,840 feet northwest of the Project Site (represented by an existing residence at 11210 Fourth Street) on the opposite side of I-15 and I-10 from the Project Site. At this Maximally Exposed Individual Resident (MEIR), the maximum incremental cancer risk attributable to Project operational-source DPM emissions is calculated at 0.01 in one million, which is far less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were calculated to be <0.01, which also fall far below the applicable significance threshold of 1.0. All other residential receptors are located at a greater distance from the Project Site than the MEIR and therefore would be exposed to less emissions and therefore less risk than the MEIR. There are no residential receptors located in immediate, close proximity to the Project Site. As concluded by the Draft EIR, the Project will not cause a significant human health or cancer risk to nearby residences. Moreover, there are no schools within one-quarter mile of the Project Site. The nearest school is Chaparral Elementary School, which is located approximately 11,200 feet southeast of the Project Site (over 2 miles away). Because there is no reasonable potential that the Project's air pollutant emissions would cause significant health impacts at distances to existing sensitive receptors, the Project would result in less-than-significant impacts (refer to Draft EIR pp. 4.2-35 to 4.2-36). Thus, the City determines that additional mitigation in the form of supplying air filters to residents and schools, or in any other form, is not warranted.

Electric Trucks

A comment was made suggesting that the truck fleet serving the Project Site be electric powered. Refer to Final EIR response to comment B-53, which explains the infeasibility of requiring zero emissions trucks. The City has determined that the suggestion is not feasible.

Cumulative Effects

A representative from CARECA incorrectly stated that the Draft EIR did not analyzed cumulative impacts in the surrounding areas as required by State law and only provided Project-level analysis. Refer to Final EIR response to comments A-12 to A-16, which is the comment letter submitted by Adams Broadwell Joseph & Cardozo on behalf of CARECA related to the Draft EIR's cumulative impacts discussion. The response was complete and no further response is required.

GHG Emission Impacts

A representative from CARECA claimed that the Draft EIR was inadequate due to conflicts with the State Attorney General's approach for analyzing air quality and GHG impacts. Refer to Final EIR response to comments A-14 to A-

15, and A-18 related to the methodology on determining impacts. The response was complete and no further response is required.

Subject: DAB Agenda Item D for March 18, 2024

Ms. Mejia,

- ***Please include this email as part of the public record.***

I would like to express several concerns I have about the referenced project as presented in the Board packet published on the City website. I hope you can clear these up for me.

1. Greenhouse Gas Emissions

It has been clearly demonstrated that our air pollution may be among the worst in the nation. As such it is in the best interest of the citizens of Ontario to reduce local pollution sources wherever possible. The recent warehouse approvals regularly refer to the city policy (CCAP) of limiting new projects to 3000 metric tons of CO2 equivalents per year. The proposal seems to claim that this project will only create 2590.77 metric tons. (pages 333, 334) In reality it is creating 4236.54 metric tons and wants to take credit for 1645.77 no longer emitted by the current occupants. This is their basis for saying no mitigation is needed. Why would they be entitled to claim this credit. They are generating 4236.54 units which exceeds the 3000 max proscribed by the city guidelines. Am I mistaken?

1-1

2. SCAQMD guidelin

On page 560 the consultant says the 2022 AQMP plan is not ready and does not need to be considered. I attach the cover sheet of said plan actually adopted in December of 2022.

1-2

3. Health & Equity (pages 770, 771)

It seems self-evident in reading these pages that we live in deplorable circumstances. It is incumbent on City leaders to give more consideration to the health of our citizens than to 100,000 sq ft warehouses. To wit:

a. Ozone in the 91st percentile in the State
b. Air Quality in the 95th percentile
c. Traffic in the 89th percentile

1-3

4. Mitigation Measures

It seems the least the City could do would be to mandate even the bare minimum of mitigation measures for all these projects as mentioned several times in the documents. (For example, Letter to Thomas Grahn from SQAQMD, page 495, "In the event that the Proposed Project results in significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize these impacts." These could include:

a. Roof top solar
b. Reflective roofing
c. Electric charging stations
d. No or limited on site truck idling
e. Night time deliveries
f. Require deliveries via ZE of NZE vehicles
g. Energy Star appliances

Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Mr. Ochoa, Development Advisory Board Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant"), including the Final Environmental Impact Report ("FEIR") prepared by the City of Ontario ("City"). The FEIR and development plan will be considered at the April 15, 2024 Development Advisory Board meeting as Agenda Item B. The Board will make a recommendation to the Planning Commission regarding certification of the EIR and approval of the Development Plan application.[1]

CARE CA submitted comments on the Draft EIR ("DEIR") on October 5, 2023, accompanied by expert comments, showing that the DEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant cumulative impacts, air quality and public health impacts,

[1] Staff Report, pg. 1. The Staff Report incorrectly states that the Board recommendation to the Planning Commission is to "adopt the draft EIR." (pg. 8). However, the operative CEQA document for the Project is currently the FEIR, which includes both the Draft EIR and the City's responses to comments on the Draft EIR.

printed on recycled paper

greenhouse gas ("GHG") emissions, energy and transportation impacts. We reviewed the Board Staff Report, the FEIR, and its technical appendices with the assistance of transportation expert Norm Marshall[2] and air quality expert Dr. James Clark.[3] The FEIR contains responses to CARE CA's comments. However, it fails to meaningfully address or correct major flaws CARE CA and its experts identified in the DEIR.

As explained herein, the FEIR still underestimates the number of trips generated by the Project and the distance of Project-related truck trips, thus continuing to underestimate the severity of the Project's public health, air quality, GHG, and transportation impacts. The FEIR also continues to assume that cold storage uses would be limited to 10% of the Project, reasoning that a condition of approval will limit cold storage to 10% of the Project's square footage, but no such condition of approval is included in the conditions of approval attached to the Staff Report. The FEIR still fails to provide an adequate cumulative impacts analysis that considers the Project's combined impacts with other existing and proposed industrial developments near the Project, in violation of CEQA. And the FEIR's quantified health risk analysis still underestimates impacts. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

The Staff Report incorrectly concludes that the "draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[4] The Staff Report recommends that the Planning Commission adopt the draft EIR[5] and approve the Project's Development Plan Application.[6] These recommendations are unsupported due to the major flaws in the Project's environmental review.

CARE CA urges the Board to recommend that the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

A. CARE CA Has a Direct Interest in Enforcing Compliance with CEQA and Land Use Laws

The City, in FEIR Response A-3, claims that CARE CA's "primary interest is securing jobs through a project labor agreement."[7] This statement is an improper ad hominem attack on members of the public who submitted comments on the Draft EIR. It is also incorrect, unsupported by any facts in the record, and contrary to the purpose of an FEIR's responses to comments, which is to "describe the disposition of each significant environmental issue that is raised by commenters,"[8] not to attack the commenter.

The FEIR's statement appears intended solely to influence City decisionmakers to disregard the valid environmental concerns raised in CARE CA's

[7] FEIR, pg. 2-37.
[8] Pub Res. Code §21091(d); 14 Cal Code Regs §§15088(c), 15132(d), 15204(a); *City of Long Beach v Los Angeles Unified Sch. Dist.* (2009) 176 Cal. App. 4th 889, 904.

printed on recycled paper

comments, and distract from the substantial evidence presented by CARE CA's experts regarding the Project's unmitigated environmental and public health impacts. This is an improper use of an FEIR, which is intended to ensure that "public participation in the environmental review process is meaningful."[9] It is also irrelevant, because community groups, labor organizations, and other members of the public have standing under CEQA to participate in the public comment period required by law, and California courts have explained that ad hominem responses are irrelevant.[10]

The FEIR's statement is also factually incorrect. For decades, labor organizations like the union members of CARE CA have relied on the CEQA process to enforce environmental and public health protections – *including worker health protections* – for new development projects as a means of ensuring a safe working and living environment for the public, including themselves and their families. CEQA is especially important to union members who construct projects because they are the first in line to be exposed to health and safety impacts that exist onsite – impacts like soil contamination, air pollution from construction equipment, and excess noise. For many, CEQA has become the only place where communities of color, which includes workers represented by labor unions, have a voice in the process of developing projects in their communities.

California unions regularly participate as interested members of the public in the CEQA process. Their participation has led to decades of stronger air quality and toxic material controls at construction sites and housing developments, lowered emissions at industrial sites, increased electrification and renewable gas and fuels, reductions in GHG emissions, reduced construction noise and traffic in residential areas, improved water quality, water conservation, and protections for natural landscapes and sensitive biological resources. Union participation in the CEQA process has resulted in improved analysis and mitigation in agencies' CEQA documents, and, in some cases, successful litigation requiring agencies to comply with CEQA where the issues unions raised were not resolved during the administrative process. In short, ***union participation in the CEQA process leads to cleaner, safer, and more sustainable development in the State***. This is exactly what CEQA is designed to accomplish – protecting people and the environment through active public engagement in the environmental process.

[9] *City of Long Beach,* 176 Cal. App. 4th at 904.

[10] *Bakersfield Citizens for Local Control v. City of Bakersfield* (Cal. Ct. App. 2004) 124 Cal.App.4th 1184, 1196 ("[W]e will not dignify with extended comment [developer]'s complaint that BCLC is just a 'front' for a grocery worker's union whose disgruntled members feel threatened by nonunionized Wal-Mart's entry into the grocery business. As will be explained, BCLC has standing to pursue this litigation and it exhausted its administrative remedies. This is sufficient.")

printed on recycled paper

Public agencies have also acknowledged unions for their valuable contribution to the environmental review process. For example, when approving the Elk Hills project, the California Energy Commission Presiding Commissioner Michal Moore praised and thanked union coalition California Unions for Reliable Energy ("CURE") for its participation in the proceeding: **"We never would've gotten to some of the places that we did, and the resolution that we did, if it hadn't been for the – the dogged efforts of [CURE]…we came to a good place, and probably couldn't have gotten to that good place without some of the tension and – and rigor that was applied. So, thank you very much**."[11] During the evidentiary hearings, a Commissioner "**thank[ed] CURE for the technical help that Phyllis Fox [CURE expert] offered us, and certainly offered me an education that I wasn't going to get any other place**."[12]

Some unions work on constructing and operating projects after they participate in the environmental permitting process. Some developers and critics allege this means that unions are using CEQA to induce developers to enter into project labor agreements, then abandon the environmental issues – just as the FEIR does here. These allegations are not only false, they demonstrate a fundamental misunderstanding of union participation. When the unions work on projects they have challenged, ***they do not walk away from the environmental and public health issues they raise. They enforce them through binding mitigation and environmental settlement agreements***. This is consistent with CEQA's environmental purpose, and with the historic values of organized labor to solve problems, engage in civic discourse and activism, advocate for safe working conditions, and effect changes that improve their members' lives and communities.[13]

CARE CA asks that the City revise the EIR to remove this inaccurate and improper statement about CARE CA, and any other unsupported statements of dislike made about other members of the public who commented on the DEIR.

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[14] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[15]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by law.[16] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[17] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[18]

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[19]

CEQA requires that a lead agency evaluate and prepare written responses to comments in an FEIR.[20] Agencies are required to provide "detailed written response to comments . . . to ensure that the lead agency will fully consider the environmental consequences of a decision before it is made, that the decision is well informed and open to public scrutiny, and the public participation in the environmental review process is meaningful."[21] When a comment raises a "significant environmental issue," the written responses must describe the

printed on recycled paper

disposition of each such issue raised by commentators.[22] Specifically, the lead agency must address the comment "in detail giving reasons why" the comment was "not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice."[23]

A. The FEIR Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the DEIR showed that the DEIR underestimated trips generated by the Project by relying on inappropriate Institute of Transportation Engineers ("ITE") land use codes, thus underestimating the Project's GHG and VMT impacts. Specifically, the DEIR relied on ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse), when other land use codes are applicable to the Project that have much higher trip generation rates. In particular, Mr. Marshall explained that the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[24]

The FEIR responds that the Project's design would not support a high-cube (sort) fulfillment center or high-cube parcel hub, pointing to the Project's square footage and number of parking spaces.[25] The FEIR states that the Project's anticipated use and size (270,377 sf) most closely aligns with the ITE Warehousing land use category. But Mr. Marshall explains that the Project's size equally aligns with ITE Land Use 156: High Cube Parcel Hub Warehouse, which accounts for warehouses with at least 200,000 gross square feet of floor area.[26] Mr. Marshall also explains that the Project's proposed number of parking spaces would further enable the Project to function as a High Cube Parcel Hub Warehouse.

In sum, the FEIR offers no support for is continued reliance on low trip generation rates. As a result, the City continues to rely on potentially underestimated trip generation rates which do not accurately reflect the Project's operational impacts. To the contrary, substantial evidence shows that trip generation rates could be 2.6 times greater than analyzed. To ensure adequate analysis and mitigation of this impact, Mr. Marshall recommends either applying a

printed on recycled paper

significantly more conservative trip generation rate, or implementing a condition of approval that trip generation will not exceed the number assumed in the EIR.[27] The EIR must be revised and recirculated to provide an accurate analysis of trip generation.

B. The FEIR Still Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

CARE CA's comments on the DEIR showed that the City lacked substantial evidence to assume that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space).[28] In Response A-7, the FEIR states that the City has added a condition of approval to the Project limiting cold storage to 27,034 sf (10% of the total sf).[29] But there is currently no indication any such condition of approval will be required. The April 15, 2024 Development Advisory Board agenda packet contains a Draft Development Advisory Board decision,[30] Land Development Division conditions of approval,[31] Landscape Planning Division conditions of approval,[32] Engineering Division conditions of approval,[33] and City of Ontario memoranda containing conditions of approval.[34] None of these documents contain a condition limiting the Project's cold storage uses. The FEIR's conclusion that the environmental impacts associated with cold storage would be limited to just 10% of the Project site therefore remains unsupported.

As explained in CARE CA's comments on the DEIR, cold storage warehouses generate greater environmental impacts than other types of warehouse.[35] CARE CA urges the City to revise and recirculate the EIR to analyze the impacts of additional cold storage use at the Project site, or to add a mitigation measure with a title restriction limiting cold storage to 10%.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the DEIR fails to consider the cumulative impacts of past, present, and probable future projects producing related or cumulative

printed on recycled paper

impacts. The DEIR's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[36] CARE CA's comments explained that rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and information requirements of CEQA, per caselaw such as *Kings County Farm Bureau v. City of Hanford*.[37] CARE CA also explained that SCAQMD's cumulative impacts significance thresholds, adopted in 2003, are being revised to reflect current conditions. The updated cumulative impacts significance thresholds will reflect projects' existing background MATES cancer risk and additional criteria such as whether the project would generate a high volume of diesel-fueled trucks.[38] CARE CA also discussed the Attorney General's guidance on cumulative impacts, which states that best practices include "thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[39]

In Responses 14, 15, and 16, the FEIR responds that "The Draft EIR and underlying technical studies were prepared in a matter consistent to the SCAQMD recommendation for determining cumulative impacts." The FEIR's response is non-responsive because it does not address the City's failure to comply with CEQA's legal standards for evaluating cumulative impacts that were discussed in CARE CA's comments. The FEIR also does not address the pending updates to SCAQMD's cumulative impacts methodology, which are statedly prepared in response to recent CEQA cases such as *People of the State of California v. City of Fontana.*[40]

In *People of the State of California v. City of Fontana,* the Attorney General's petition for writ of mandate challenged a Mitigated Negative Declaration ("MND")

printed on recycled paper

that erroneously applied SCAQMD guidance in the same way as the instant EIR. The petition explained:

> [T]he MND's cumulative air quality impact analysis does not account for—or even acknowledge—the multitude of other warehouses near the Project. Rather than consider the environmental setting within which the Project will be situated, the MND simply states that the Project will not result in a cumulatively considerable increase in emissions because the Project's individual air quality impacts will be less than significant. The MND even applies this reasoning to its analysis of health impacts from localized emissions, despite making no attempt to determine or disclose the severity of the existing health impacts from localized emissions in the community.[41]

The petition further explained that merely citing to SCAQMD guidance does not justify a failure to analyze a Project's cumulative impacts:

> The MND cites Appendix D of an August 2003 white paper published by the South Coast Air Quality Management District ("SCAQMD") entitled "White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution" ("2003 SCAQMD White Paper"). **To the extent that the 2003 SCAQMD White Paper asserts that any project with less than significant individual air quality impacts also necessarily has less than significant cumulative air quality impacts, it is inconsistent with CEQA** for at least the reasons stated above. Moreover, the 2003 SCAQMD White Paper lacks substantial evidence to support such a contention, and thus the MND's reliance on it violates CEQA. (Cal. Code Regs., tit. 14, § 15064.7, subd. (c).) The MND further violated CEQA by failing to provide substantial evidence to support its reliance on the 2003 SCAQMD White Paper, Appendix D as "guidance." (Ibid.) Finally, even if the MND's reliance on the 2003 SCAQMD White Paper were proper and supported by substantial evidence, the MND did not consider other evidence—such as public comments and the existence of many other sources of pollution near the Project site—showing that the Project could have a significant cumulative air quality impact. (See Cal. Code Regs., tit. 14, § 15064, subd. (b).) [emphasis added][42]

[42] *People of the State of California v. City of Fontana,* Case No. CIVSB2121829, Petition for Writ of Mandate, pg. 13, paragraph 49.

printed on recycled paper

The Attorney General's litigation resulted in a settlement which requires compliance with an ordinance adopted on April 12, 2022 that establishes sustainability standards for warehouses in Fontana, including standards intended to address cumulative air quality impacts. For example, the standards include requirements that rooftop solar panels supply 100% of power for non-refrigerated portions of facilities with buildings over 400,000 square feet, trees in automobile parking areas, zero emission motorized operational equipment, other equipment electrification requirements, and solar-ready buildings roofs.[43] These are just a few examples of feasible mitigation available to reduce cumulative air quality impacts, in compliance with CEQA.

The FEIR for the instant Project suffers from the same lack of analysis and legal errors as the MND in the Attorney General's Fontana litigation. As a result of its refusal to analyze cumulative impacts, the FEIR fails to disclose or mitigate potentially significant local and regional cumulative impacts. In sum, the FEIR has not responded to CARE CA's comments on this issue and fails to remedy the City's inadequate cumulative impacts analysis. The Project cannot be approved until the City revises and recirculates an EIR that analyzes the Project's potentially significant cumulative impacts.

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

The City prepared a Mobile Source Health Risk Assessment ("HRA") to analyze health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project.[44]

The HRA underestimates the Project's operational health risk impacts on residential receptors and workers by failing to account for building downwash in the AERMOD analysis.[45] Dr. Clark explains that building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution.[46] This downwash effect leads to higher ground-level concentration of chemicals emitted from sources.[47]

---

[43] *Id.*, Stipulation For Entry Of Final Judgment On Consent, available at https://climatecasechart.com/wp-content/uploads/case-documents/2022/20220414_docket-CIVSB2121605-CIVSB2121829_stipulation.pdf.
[44] DEIR, Appendix B2, pg. 25.
[45] Clark Comments, pg. 3.
[46] *Id.*
[47] *Id.*

printed on recycled paper

The HRA also underestimates the Project's health risk impacts by relying on non-standard daily breathing rates for sensitive receptors. Dr. Clark explains that the HRA unjustifiably relies on breathing rates lower than recommended by the Office of Environmental Health Hazard Assessment's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.[48]

CEQA requires an accurate analysis of human health impacts. CEQA Guidelines Section 15065(a)(4) provides that the City is required to find a project will have a significant impact on the environment and require an EIR if the environmental effects of a project will cause a substantial adverse effect on human beings. The Supreme Court has also explained that CEQA requires the lead agency to disclose the health consequences that result from exposure to a project's air emissions.[49] Courts have held that an environmental review document must disclose a project's potential health risks to a degree of specificity that would allow the public to make the correlation between the project's impacts and adverse effects to human health.[50]

Because the City's analysis underestimates the Project's health risk impacts, the City fails to meet CEQA's requirement to accurately disclose the Project's impacts on public health and support its conclusions with substantial evidence. A revised HRA must be included in a recirculated EIR.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the DEIR underestimates truck trip lengths by applying a truck trip length of 15.3 miles for 2-axle trucks, 14.2 miles for 3-axle trucks, and 40 miles for 4+-axle trucks. The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explained that the City must consider the reasonably foreseeable distance to the Project's likely trip destinations.[51] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The FEIR responds in Response A-18:

> The commenter fails to provide any evidentiary basis for the arbitrary number of 60 miles it suggests using… In fact, these recommendations are in direct opposition of the SCAQMD's recommended truck travel distance for warehousing projects within its jurisdiction (based on SCAG regional travel

[51] Marshall Comments, pg. 7.

printed on recycled paper

> demand data)… The commenter's recommended trip lengths are not supported by any substantial evidence provided by the SCAQMD and contradicts published material from SCAQMD that was utilized in the underlying analysis.[52]

The FEIR misinterprets the SCAQMD guidance. SCAQMD itself regularly comments on warehouse projects that it is essential to analyze the distance from warehouse projects to likely destinations and has emphasized that agencies should not rely solely on the 40-mile average trip length identified in its guidance. For example, SCAQMD recently commented on a warehouse project proposed for a location at a similar distance from the Ports as the instant Project:

> South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan. However, it is essential to note that **the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way**. Thus, **South Coast AQMD staff is concerned about underestimating truck emissions** due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the **more conservative trip length between 40 to 70 miles**, of which 40 miles could be used for local and **70 miles for Port trips** and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.[53]

---

[52] FEIR, pg. 2-43.

[53] **Exhibit C**, containing the following comment letters: SCAQMD, Comments on the Draft Subsequent Environmental Impact Report for the Hemlock Warehouse Development Project (SCH No.: 2009091089) (November 22, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/november-2023/SBC231011-05.pdf; also attached as Attachment B to Mr. Marshall's comments; SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf; SCAQMD, Comments on Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2 (September 11, 2015), pg. 3, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/september/deiroptimus.pdf?sfvrsn=2 ("Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances

printed on recycled paper

In sum, the FEIR is incorrect when it states that CARE CA's recommendation to use a 60-mile truck trip length for trips to Ports of Los Angeles and Long Beach is not supported by substantial evidence. Rather, it is the FEIR's truck trip length assumptions which are not supported by substantial evidence – SCAQMD does not recommend blind reliance on truck trip lengths of 15.3 miles, 14.2 miles, and 40 miles for warehouse projects such as the instant Project for which longer trips to and from the ports are reasonably foreseeable.

Dr. Clark's comments also discuss the relationship between the ports and warehouses like this Project. Dr. Clark discusses the large percentage of goods passing through the ports, the number of truck trips generated by the ports, and observes that the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.[54] Substantial evidence therefore demonstrates that the Project's truck trip lengths are underestimated, resulting in underestimation of transportation, air quality, and GHG impacts. The Project cannot be approved until this error is corrected in a revised and recirculated EIR.

F. The FEIR Fails to Include Sufficient Investigation into Energy Conservation Measures

The DEIR and FEIR do not include sufficient investigation into energy conservation measures that might be available or appropriate for the Project. In the DEIR, the City concludes that energy impacts of the Project would be less than significant because the Project's construction and operations would comply with state regulations.[55] But as discussed below, the Project's environmental review does not sufficiently consider energy conservation measures like solar facilities, use of alternate fuel sources, and passive energy efficiency measures to ensure the Project's energy consumption would not be wasteful, inefficient, or unnecessary. The FEIR briefly addresses some energy conservation measures in Responses B-59, B-56, and B-53, but only to explain that none are required because air quality impacts are less than significant. This analysis fails to meet CEQA's requirements.

CEQA requires an environmental document to discuss mitigation measures for significant environmental impacts, including "measures to reduce the wasteful,

printed on recycled paper

inefficient, and unnecessary consumption of energy."[56] The CEQA Guidelines require discussion of energy conservation measures when relevant, and provide examples in Appendix F:[57]

1) Potential measures to reduce wasteful, inefficient and unnecessary consumption of energy during construction, operation, maintenance and/or removal. The discussion should explain why certain measures were incorporated in the project and why other measures were dismissed.
2) The potential of siting, orientation, and design to minimize energy consumption, including transportation energy, increase water conservation and reduce solid waste.
3) The potential for reducing peak energy demand.
4) Alternate fuels (particularly renewable ones) or energy systems.
5) Energy conservation which could result from recycling efforts.

Courts have rejected EIRs that fail to include adequate analysis investigation into energy conservation measures that might be available or appropriate for a project.[58] In *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[59] the Court of Appeal reviewed an EIR for a shopping center on undeveloped agricultural land. The EIR concluded that, due to the proposed project's compliance with Title 24 guidelines and regulations, the project would be expected to have a less-than-significant impact regarding the wasteful, inefficient, or unnecessary consumption of energy. But the lead agency's EIR did not include discussion regarding the different renewable energy options that might be available or appropriate for the project. The Court held "the City's EIRs failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options."[60] The lead agency argued that compliance with the Building Code sufficed to address energy impact concerns for the project.[61] But the Court explained:

> Although the Building Code addresses energy savings for components of a new commercial construction, it does not address many of the considerations required under Appendix F of the CEQA Guidelines… These considerations include whether a building should be constructed at all, how large it should

[56] Pub. Resources Code, § 21100(b)(3); *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912, 930.
[57] 14 Cal. Code Regs., § 15126.4(a)(1)(C) (stating "'Energy conservation measures, as well as other appropriate mitigation measures, shall be discussed when relevant.").

printed on recycled paper

> be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Here, a requirement that Gateway II comply with the Building Code does not, by itself, constitute an adequate assessment of mitigation measures that can be taken to address the energy impacts during construction and operation of the project.[62]

Here, the FEIR lacks analysis of common energy consumption measures in violation of CEQA Guidelines Appendix F. The FEIR fails to analyze the feasibility of onsite solar facilities, such as rooftop, parking lot, or ground-level solar photovoltaics. This analysis must address considerations such as the technical and economic feasibility of installing solar facilities on the Project site, the potential size of the Project's solar zone, and the potential magnitude of mitigation provided by installing solar facilities. The FEIR also fails to evaluate the extent to which mobile source energy consumption could be reduced during Project operations through electric vehicle charging infrastructure (above what is required by existing regulations).

The FEIR acknowledges that a diesel backup generator may be required for Project operations,[63] but fails to evaluate measures to reduce this source of energy consumption, such as use of alternative fuel sources.

The FEIR also fails to evaluate the feasibility of more stringent idling requirements over existing requirements.[64]

The FEIR's discussion of construction energy conservation measures also violates CEQA Guidelines Appendix F. The City's energy analysis fails to evaluate the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators.[65]

The FEIR contains responses briefly addressing the measures discussed above.[66] But the responses simply state: "[a]s concluded in Section 4.2, Air Quality, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking

---

printed on recycled paper

into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32)… Thus, the City determines that additional mitigation is not warranted."[67] This type of response does not evaluate the feasibility or effectiveness of energy-conservation measures, and thus does not provide the analysis required by CEQA Guidelines Appendix F.

In sum, the FEIR's energy analysis fails adequately analyze measures to reduce the wasteful, inefficient, and unnecessary consumption of energy, and fails to meaningfully address Appendix F's considerations of whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope.[68] This analysis must be provided in a revised and recirculated EIR.

III. THE BOARD CANNOT MAKE THE REQUISITE FINDINGS TO RECOMMEND APPROVAL OF THE PROJECT

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[69]

The Staff Report states that the Project meets this requirement, but this finding lacks support.[70] The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project.

[67] FEIR, Response B-57.
[68] *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 CA4th 256, 264.
[69] Section 4.02.025(D)(3).
[70] Staff Report, PDEV22-017, Part 3, Section 4.

printed on recycled paper

For the same reason, the Staff Report lacks support to make the following finding in recommending adoption of the FEIR: "[t]he draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project."[71]

A revised EIR must be recirculated before the Project can be recommended for approval.

IV. CONCLUSION

As is explained herein, the FEIR's air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to recommend certification of the FEIR or under the City of Ontario Municipal Code to approve the Project's development plan. CARE CA urges the Board to recommend that the City revise and recirculate the EIR before any further action is taken on the Project.

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

In October 2023, I reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I made the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

Now, I have reviewed the responses to these comments made in the project's Final Environmental Impact Review ("FEIR") dated February 2024.

Truck trip lengths – The FEIR repeats the false assertion that the truck trip lengths follow SCAQMD's recommendations (FEIR, A-18, p. 2-43). In my October 2023 comments, I addressed this, writing:

> The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[1] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[2] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

To prove that this is not a general SCAQMD recommendation for all warehouses, I attach SCAQMD's November 22, 2023 comments on the Hemlock Warehouse Development Project Draft SEIR in the City of Fontana. That Draft SEIR applied the same truck trip lengths as used in the 5355 East Airport Drive DEIR and FEIR. SCAQMD's comments state:

> However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project. (p. 2)

SCAQMD is making the same point I made in my October 2023 comments where I wrote:

> it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The FEIR does not use SCAQMD- recommended truck trip lengths. SCAQMD instead recommends: "**Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project**."

[1] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf
[2] https://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/sclc_warehouse-presentation-final.pdf

VMT mitigation – The FEIR continues to state that the proposed project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.

However, the FEIR states that these impacts cannot be mitigated because "measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant." (FEIR A-24, p. 2-44)

My October 2023 comments recommended requiring CAPCOA T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – that can provide up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

A smaller mandatory reduction may be appropriate for this project, with this requirement passed on to the tenant, but it is not sufficient to claim that no significant mitigation is possible.

In addition, the attached SCAQMD comments on the Hemlock Warehouse Development Project recommends several mitigation measures targeting truck emissions, including:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks,
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the final CEQA document, and
- Provide electric vehicle (EV) charging stations and electrical hookups for truckers. (p.3)

Trip generation

In my October 2023 comments, I provided data on different types of warehouses that have significantly higher trip generation rates than the 1.75 trips per 1000 sq. ft. assumed in the DEIR and FEIR. These include:

> The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

The FEIR argues that the highest generators that I discussed in my October 2023 comments could not be accommodated because ". . . the layout of the site with 251 parking spaces would not reasonable accommodate the on-site parking required to support these uses."

This point about parking may be valid for the highest generators per 1000 sq. ft. but not for the intermediate generators. The DEIR and FEIR estimate only 270 passenger car trips per day (DEIR Appendix K, p. 5), i.e., 135 vehicles in and 135 cars out. Therefore, if all cars were employees and they all worked the same single shift, the parking lot utilization would never exceed 54%. With multiple shifts and non-employee passenger car trips, the parking lot utilization would be much

lower. Therefore, the parking lot is designed to support many more trips than assumed in the DEIR and FEIR.

The 251 parking spaces are consistent with ITE Land Use 156: High Cube Parcel Hub Warehouse. This use is described:

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. A high-cube warehouse can be free-standing or located in an industrial park. A high-cube parcel hub warehouse typically serves as a regional and local freight-forwarder facility for time sensitive shipments via airfreight and ground carriers. A site can also include truck maintenance, wash, or fueling facilities. Some limited assembly and repackaging may occur within the facility.

Given the uncertainty concerning the proposed project and its size, 270,377 sq. ft., it could foreseeably end up being a High-Cube-Parcel-Hub Warehouse as defined above.

The number of parking spaces provided also is consistent with this usage. The trip generation rate for this category is 4.63 trips per 1000 sq. ft., i.e. 2.6 times the rate used in the DEIR and FEIR. This rate includes 0.58 truck trips per 1000 sq. ft. Therefore, the passenger car rate is 4.05 trips per 1000 sq. ft. As a High-Cube-Parcel-Hub Warehouse, the proposed project would generate 1095 passenger car trips per day.

The DEIR states:

> For the purposes of this EIR, the Project is assumed to be operational 24 hours per day, seven days per week, with exterior loading and parking areas illuminated at night. (DEIR, p. 3-13)

This suggests multiple shifts each day.

Some of the passenger car trips would not be parking long term, including trips dropping off and picking up workers, and miscellaneous service trips, all of which include both and entering trip and an exiting trip. However, even if all passenger car trips involved parking long-term, all the trips could be accommodated with the planned 251 parking spaces if each space is occupied an average of 2.18 times per day.

As I stated in my October 2023 comment letter:

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Aidan Marshall

Subject: Comments On Final Environmental Impact Report (FEIR) 5355 East Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the City of Ontario (the City) FEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the Project consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

Specific Comments

1. The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.

A review of the AQ Analysis and the Mobile Source Health Risk Assessment show that building downwash was not incorporated into the AERMOD analysis of the Project. Building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from nearby stacks. A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity. This downwash effect leads to higher ground-level concentration of chemicals emitted from sources. The downwash effect increases as the relative difference between the release height and top of the building increases.[1] Using a lower height for the building will underestimate the potential ground level concentrations of pollutants associated with the Project operation.

For the closest receptors to the site, this difference will create an additional air quality impact that is not accounted for in the City's analysis. In addition to incorporating the building downwash impacts of the Project buildings, the AERMOD model should also incorporate the building downwash for receptors near the Project. Receptors farther away will still be subject to the downwash effect given the assumed emission height release incorporated into the model. Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[2] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). The City should address the impact of this issue in a revised DEIR.

[1] The so-called good engineering practice height (GEP) of the source. The GEP is defined in Section 123 of the Clean Air Act as "the height necessary to ensure that emissions from a stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies or wakes which may be created by the source itself, nearby structures or nearby terrain obstacles."

[2] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

2. The Air Quality Analysis Relies On An Input Value From AP-42 That Is Rated As Poor And May Be Unreliable

The CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42. According to the AP-42 FAQ - E = Poor. Factor is developed from C and D rated test data from a very few number of facilities, and there may be reason to suspect that the facilities tested do not represent a random sample of the industry. There also may be evidence of variability within the source category population. This means that there is a lot of uncertainty in the AQ analysis regarding the amount of particulate matter that will be emitted from the construction phase of the Project. The City should assess the impacts of this variable in a revised DEIR.

3. The Health Risk Analysis Incorporates Non-Standard Daily Breathing Rates For Sensitive Receptors Analyzed In The HRA

According to the FEIR, a health risk assessment was prepared in accordance with SCAQMD's guidance. For purposes of this Health Risk Assessment, receptors include both residential and non-residential (worker) land uses in the vicinity of the Project. These receptors are included in the Health Risk Assessment since residents and workers may be exposed at these locations over a long-term duration of 30 and 25 years, respectively.[3]

The input values utilized in the HRA analysis included a variety of daily breathing rates that are favorable to reducing the potential health impacts. The HRA states that "Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines."[4] The values listed in Table 2-7 include both the 95 percent upper confidence limit (95% UCL) values (for age *in utero* exposure and age 0 to 2) and the 80th percentile values for the remaining age groups (age 2 to 16 and age 16 to 30).

[3] Urban Crossroads. 2022. 5355 East Airport Drive Mobile Source Health Risks Assessment. Prepared by Urban Crossroads. August 30, 2022. pg 5

[4] Urban Crossroads. 2022. 5355 East Airport Drive Mobile Source Health Risks Assessment. Prepared by Urban Crossroads. August 30, 2022. pg 19-20

The risk estimates for ages 2 to 30 is off by a factor of 1.3.

TABLE 2-7: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	0.85	350	24
0 to 2	1,090	10	2	0.85	350	24
2 to 16	572	3	14	0.72	350	24
16 to 30	261	1	14	0.73	350	24

Figure 2: Daily Breathing Rates Utilized In HRA

The 2015 Air Toxic Hot Spots Program Guidance Manual [5] notes that residential estimates use 95th percentile breathing rates in Table 5.6. Table 5.6 shows values of 745 L/kg BW-day for children age 2 to 16 and 335 L/kg BW-day for adults age 16 to 30.

Table 5.6 Point Estimates of Residential Daily Breathing Rates for 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years (L/kg BW-day)

	3rd Trimester[a]	0<2 years	2<9 years	2<16 years	16<30 years	16<70 years
	L/kg-day					
Mean	225	658	535	452	210	185
95th Percentile	361	1090	861	745	335	290

[a] 3rd trimester **breathing rates** based on breathing rates of pregnant women using the assumption that the dose to the fetus during the 3rd trimester is the same as that to the mother.

The City's analysis is therefore incomplete, is not consistent with the guidance from OEHHA, and must be corrected in a revised final environmental impact report for the Project.

4. The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to the operations air quality analysis of Project,[6] the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for

[5] Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, http://oehha.ca.gov/air/hot_spots/hotspots2015.html

[6] Urban Crossroads. 2022. 5355 East Airport Drive Air Quality Impact Analysis. August 30. 2022. Pg 37

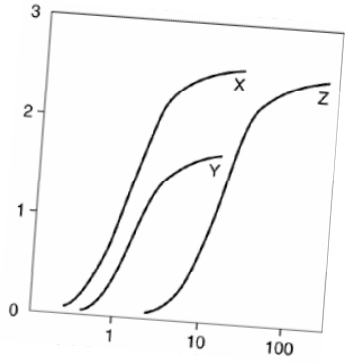
3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.

This statement does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately 700 million square feet, an increase of 20 percent over the last five years"),[7] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[8] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[9] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the Regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised final environmental impact report should be prepared to address these substantial concerns.



Sincerely,

[7] Available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well recognized toxicologist, air modeler, and health scientist. He has 20 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

Significant projects performed by Dr. Clark include the following:

LITIGATION SUPPORT

Case: James Harold Caygle, et al, v. Drummond Company, Inc. Circuit Court for the Tenth Judicial Circuit, Jefferson County, Alabama. Civil Action. CV-2009

Client: Environmental Litgation Group, Birmingham, Alabama

Dr. Clark performed an air quality assessment of emissions from a coke factory located in Tarrant, Alabama. The assessment reviewed include a comprehensive review of air quality standards, measured concentrations of pollutants from factory, an inspection of the facility and detailed assessment of the impacts on the community. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Rose Roper V. Nissan North America, et al. Superior Court of the State Of California for the County Of Los Angeles – Central Civil West. Civil Action. NC041739

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to multiple chemicals, including benzene, who later developed a respiratory distress. A review of the individual's medical and occupational history was performed to prepare an exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to respiratory irritants. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: O'Neil V. Sherwin Williams, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to petroleum distillates who later developed a bladder cancer. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Summary judgment for defendants.

Case: Moore V., Shell Oil Company, et al. Superior Court of the State Of California for the County Of Los Angeles

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to chemicals while benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Raymond Saltonstall V. Fuller O'Brien, KILZ, and Zinsser, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Richard Boyer and Elizabeth Boyer, husband and wife, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-7G.

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: JoAnne R. Cook, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-9R

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of an individual exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Patrick Allen And Susan Allen, husband and wife, and Andrew Allen, a minor, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-W

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Michael Fahey, Susan Fahey V. Atlantic Richfield Company, et al. United States District Court Central District of California Civil Action Number CV-06 7109 JCL.

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Constance Acevedo, et al., V. California Spray-Chemical Company, et al., Superior Court of the State Of California, County Of Santa Cruz. Case No. CV 146344

Dr. Clark performed a comprehensive exposure assessment of community members exposed to toxic metals from a former lead arsenate manufacturing facility. The former manufacturing site had undergone a DTSC mandated removal action/remediation for the presence of the toxic metals at the site. Opinions were presented regarding the elevated levels of arsenic and lead (in attic dust and soils) found throughout the community and the potential for harm to the plaintiffs in question.

Case Result: Settlement in favor of defendant.

Case: Michael Nawrocki V. The Coastal Corporation, Kurk Fuel Company, Pautler Oil Service, State of New York Supreme Court, County of Erie, Index Number I2001-11247

Client: Richard G. Berger Attorney At Law, Buffalo, New York

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the

known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Judgement in favor of defendant.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model will be used to estimate acute and chronic exposure concentrations to multiple contaminants and will be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

Client – Los Angeles Alliance for a New Economy (LAANE), Los Angeles, California

Dr. Clark is advising the LAANE on air quality issues related to current flight operations at the Los Angeles International Airport (LAX) operated by the Los Angeles World Airport (LAWA) Authority. He is working with the LAANE and LAX staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client – City of Santa Monica, Santa Monica, California

Dr. Clark is advising the City of Santa Monica on air quality issues related to current flight operations at the facility. He is working with the City staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client: Omnitrans, San Bernardino, California

Dr. Clark managed a public health survey of three communities near transit fueling facilities in San Bernardino and Montclair California in compliance with California Senate Bill 1927. The survey included an epidemiological survey of the effected communities, emission surveys of local businesses, dispersion modeling to determine potential emission concentrations within the communities, and a comprehensive risk assessment of each community. The results of the study were presented to the Governor as mandated by Senate Bill 1927.

Client: Confidential, San Francisco, California

Summarized cancer types associated with exposure to metals and smoking. Researched the specific types of cancers associated with exposure to metals and smoking. Provided causation analysis of the association between cancer types and exposure for use by non-public health professionals.

Client: Confidential, Minneapolis, Minnesota

Prepared human health risk assessment of workers exposed to VOCs from neighboring petroleum storage/transport facility. Reviewed the systems in place for distribution of petroleum hydrocarbons to identify chemicals of concern (COCs), prepared comprehensive toxicological summaries of COCs, and quantified potential risks from carcinogens and non-carcinogens to receptors at or adjacent to site. This evaluation was used in the support of litigation.

Client – United Kingdom Environmental Agency

Dr. Clark is part of team that performed comprehensive evaluation of soil vapor intrusion of VOCs from former landfill adjacent residences for the United Kingdom's Environment

Agency. The evaluation included collection of liquid and soil vapor samples at site, modeling of vapor migration using the Johnson Ettinger Vapor Intrusion model, and calculation of site-specific health based vapor thresholds for chlorinated solvents, aromatic hydrocarbons, and semi-volatile organic compounds. The evaluation also included a detailed evaluation of the use, chemical characteristics, fate and transport, and toxicology of chemicals of concern (COC). The results of the evaluation have been used as a briefing tool for public health professionals.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: Ameren Services, St. Louis, Missouri

Managed the preparation of a comprehensive human health risk assessment of workers and residents at or near an NPL site in Missouri. The former operations at the Property included the servicing and repair of electrical transformers, which resulted in soils and groundwater beneath the Property and adjacent land becoming impacted with PCB and chlorinated solvent compounds. The results were submitted to U.S. EPA for evaluation and will be used in the final ROD.

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark is managing the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark is assisting the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of perchlorate in environment. Dr. Clark evaluated the production, use, chemical characteristics, fate and transport, toxicology, and remediation of perchlorate. Perchlorates form the basis of solid rocket fuels and have recently been detected in water supplies in the United States. The results of this research

were presented to the USEPA, National GroundWater, and ultimately published in a recent book entitled *Perchlorate in the Environment*.

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Confidential, San Francisco, California

Identified and analyzed fifty years of epidemiological literature on workplace exposures to heavy metals. This research resulted in a summary of the types of cancer and non-cancer diseases associated with occupational exposure to chromium as well as the mortality and morbidity rates.

Client: Confidential, San Francisco, California

Summarized major public health research in United States. Identified major public health research efforts within United States over last twenty years. Results were used as a briefing tool for non-public health professionals.

Client: Confidential, San Francisco, California

Quantified the potential multi-pathway dose received by humans from a pesticide applied indoors. Part of team that developed exposure model and evaluated exposure concentrations in a comprehensive report on the plausible range of doses received by a specific person. This evaluation was used in the support of litigation.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client – United Kingdom Environmental Agency

Oversaw a comprehensive toxicological evaluation of methyl-*tertiary* butyl ether (M*t*BE) for the United Kingdom's Environment Agency. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of M*t*BE. The results of the evaluation have been used as a briefing tool for public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of *tertiary* butyl alcohol (TBA) in municipal drinking water system. TBA is the primary breakdown product of M*t*BE, and is suspected to be the primary cause of M*t*BE toxicity. This evaluation will include available information on the production, use, chemical characteristics, fate and transport in the environment, absorption, distribution, routes of detoxification, metabolites, carcinogenic potential, and remediation of TBA. The results of the evaluation were used as a briefing tool for non-public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of methyl *tertiary* butyl ether (MTBE) in municipal drinking water system. MTBE is a chemical added to gasoline to increase the octane

rating and to meet Federally mandated emission criteria. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of MTBE. The results of the evaluation have been were used as a briefing tool for non-public health professionals.

Client – Ministry of Environment, Lands & Parks, British Columbia

Dr. Clark assisted in the development of water quality guidelines for methyl tertiary-butyl ether (MTBE) to protect water uses in British Columbia (BC). The water uses to be considered includes freshwater and marine life, wildlife, industrial, and agricultural (e.g., irrigation and livestock watering) water uses. Guidelines from other jurisdictions for the protection of drinking water, recreation and aesthetics were to be identified.

Client: Confidential, Los Angeles, California

Prepared physiologically based pharmacokinetic (PBPK) assessment of lead risk of receptors at middle school built over former industrial facility. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Client: Confidential, Atlanta, Georgia

Researched potential exposure and health risks to community members potentially exposed to creosote, polycyclic aromatic hydrocarbons, pentachlorophenol, and dioxin compounds used at a former wood treatment facility. Prepared a comprehensive toxicological summary of the chemicals of concern, including the chemical characteristics, absorption, distribution, and carcinogenic potential. Prepared risk characterization of the carcinogenic and non-carcinogenic chemicals based on the exposure assessment to quantify the potential risk to members of the surrounding community. This evaluation was used to help settle class-action tort.

Client: Confidential, Escondido, California

Prepared comprehensive Preliminary Endangerment Assessment (PEA) of dense non-aqueous liquid phase hydrocarbon (chlorinated solvents) contamination at a former printed circuit board manufacturing facility. This evaluation was used for litigation support and may be used as the basis for reaching closure of the site with the lead regulatory agency.

Client: Confidential, San Francisco, California

Summarized epidemiological evidence for connective tissue and autoimmune diseases for product liability litigation. Identified epidemiological research efforts on the health effects of medical prostheses. This research was used in a meta-analysis of the health effects and as a briefing tool for non-public health professionals.

Client: Confidential, Bogotá, Columbia

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of a 13.7 hectares plastic manufacturing facility in Bogotá, Colombia The risk assessment was used as the basis for the remedial goals and closure of the site.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally cadmium) and VOCs from soil and soil vapor at 12-acre former crude oilfield and municipal landfill. The site is currently used as a middle school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and was used as the basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Managed remedial investigation (RI) of heavy metals and volatile organic chemicals (VOCs) for a 15-acre former manufacturing facility. The RI investigation of the site included over 800 different sampling locations and the collection of soil, soil gas, and groundwater samples. The site is currently used as a year round school housing approximately 3,000 children. The Remedial Investigation was performed in a manner

that did not interrupt school activities and met the time restrictions placed on the project by the overseeing regulatory agency. The RI Report identified the off-site source of metals that impacted groundwater beneath the site and the sources of VOCs in soil gas and groundwater. The RI included a numerical model of vapor intrusion into the buildings at the site from the vadose zone to determine exposure concentrations and an air dispersion model of VOCs from the proposed soil vapor treatment system. The Feasibility Study for the Site is currently being drafted and may be used as the basis for granting closure of the site by DTSC.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally lead), VOCs, SVOCs, and PCBs from soil, soil vapor, and groundwater at 15-acre former manufacturing facility. The site is currently used as a year round school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and will be basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of VOC vapor intrusion into classrooms of middle school that was former 15-acre industrial facility. Using the Johnson-Ettinger Vapor Intrusion model, the evaluation determined acceptable soil gas concentrations at the site that did not pose health threat to students, staff, and residents. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client –Dominguez Energy, Carson, California

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of 6-acre portion of a 500-acre oil and natural gas production facility in Carson, California. The risk assessment was used as the basis for closure of the site.

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Draft Subsequent Environmental Impact Report (Draft SEIR) for the Hemlock Warehouse Development Project (Proposed Project) (SCH No.: 2009091089)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The City of Fontana is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Draft SEIR

Based on the Draft SEIR, the Lead Agency proposes demolishing the existing development to construct and operate a warehouse facility for 882,000 square feet on the 40.01-acre site at 11115 Hemlock Avenue, Fontana.[1] A portion of the warehouse facility would be used for cold storage, approximately 220,500 square feet or 25 percent of the warehouse.[2] The Proposed Project would have 114 dock doors on the east and west sides of the building[3] associated with 562 truck trips per day.[4] Regional access to the Proposed Project site via Interstate 10, State Route 60, and Interstate 15, and local access via Santa Ana Avenue and Jurupa Avenue. [5] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (e.g., residential units) is approximately 900 feet southeast and southwest of the Proposed Project site. Construction of the Proposed Project is anticipated to take approximately 15 months.[6]

South Coast AQMD Staff's Comments on the Draft SEIR

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

In the Draft SEIR, the Lead Agency discusses the determination of truck emissions for the Proposed Project and states that "…*CalEEMod defaults were utilized for trip length and the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2) trucks, 14.2*

[1] Draft SEIR. Page 3-1 and 3-2.
[2] *Ibid*. Page 3-9.
[3] *Ibid*.
[4] *Ibid*. Appendix F- Traffic Impact Analysis. Page 40.
[5] *Ibid*. Page 3-1.
[6] *Ibid*. Page 3-10.

miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages from the Traffic Impact Analysis prepared for the Project (Appendix F), which resulted in an overall truck trip length of 29.9 miles with an assumption of 100% primary trips for the proposed warehouse.[7]"

South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan.[8] However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

User-Defined Land Use Subtype in the California Emissions Estimator Model (CalEEMod) Analysis

In the operational CalEEMod output files, besides the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes, "user-defined industrial" is added.[9] According to the CalEEMod User Guide, the "user-defined" may be selected to characterize project land use subtypes not included in CalEEMod. If selected, all data on the Land Use screen will need to be input manually. [10] However, lot acreage and the floor square area use are all set to zero under the "user-defined industrial" land use subtype.

In addition, the truck information (e.g., truck trips) is input under the "user-defined industrial" but not in the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes for the Proposed Project. This possibly leads to underestimating the heavy-duty truck emissions for warehouse activities since no data is filled under this "user-defined industrial" land use subtype. Therefore, it is recommended that the Lead Agency explain why the land use is separated in the CalEEMod analysis and why the truck information is not under the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtype and revise the analysis as necessary in the final CEQA document.

Additional Recommended Air Quality and Greenhouse Gases Mitigation Measures

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. To further reduce the Proposed Project's air quality impacts, and in addition to SWIP SP FEIR Mitigation Measures

[7] *Ibid*. Page 5.1-22
[8] South Coast Air Quality Management District, Preliminary Draft Staff Report: Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce.
[9] *Ibid*. Appendix B - Air Quality Impact Analysis. CalEEMod Operational and LST Output Files.
[10] California Emissions Estimator Model (CalEEMod) Version 2022.1 User Guide. Access at: https://www.caleemod.com/documents/user-guide/CalEEMod_User_Guide_v2022.1.pdf

MM 4.2-1a to MM 4.2-1f, MM 4.2-2a to MM4.2-2l, and MM 4.2-5a, South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in the Final EIR.

Mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft SEIR may include the following:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks, such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. Given the state's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks, such as the Advanced Clean Trucks Rule[11] and the Heavy-duty Low NOx Omnibus Regulation,[12] ZE and NZE trucks will become increasingly more available to use. The Lead Agency should require a phase-in schedule to incentivize the use of these cleaner operating trucks to reduce any significant adverse air quality impacts. South Coast AQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency. At a minimum, require the use of a 2010 model year[13] that meets CARB's 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks. All heavy-duty haul trucks should meet CARB's lowest optional low-NO_x standard starting in 2022.[14] Where appropriate, include environmental analyses to evaluate and identify sufficient electricity and supportive infrastructures in the Energy and Utilities and Service Systems Sections in the CEQA document. Include the requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with project construction to document that each truck used meets these emission standards and make the records available for inspection. The Lead Agency should conduct regular inspections to the maximum extent feasible to ensure compliance.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.
- Provide electric vehicle (EV) charging stations or, at a minimum, provide electrical infrastructure, and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

Mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft SEIR may include the following:

[11] CARB. June 25, 2020. Advanced Clean Trucks Rule. Accessed at: https://ww2.arb.ca.gov/our-work/programs/advanced-cleantrucks.

[12] CARB has recently passed a variety of new regulations that require new, cleaner heavy-duty truck technology to be sold and used in the state. For example, on August 27, 2020, CARB approved the Heavy-Duty Low NOx Omnibus Regulation, which will require all trucks to meet the adopted emission standard of 0.05 g/hp-hr starting with engine model year 2024. Accessed at: https://ww2.arb.ca.gov/rulemaking/2020/hdomnibuslownox.

[13] CARB adopted the statewide Truck and Bus Regulation in 2010. The Regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. More information on the CARB's Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.

[14] CARB's optional low-NOx emission standard is available at: https://ww2.arb.ca.gov/our-work/programs/optional-reduced-nox-standards.

- Maximize the use of solar energy by installing solar energy arrays.
- Use light-colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices and appliances.

Design considerations for the Proposed Project that the Lead Agency should consider reducing air quality and health risk further impacts include the following:

- Clearly mark truck routes with trailblazer signs so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, daycare centers, etc.).
- Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.
- Design the Proposed Project such that any truck check-in point is inside the Proposed Project site to ensure no trucks are queuing outside.
- Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.
- Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

The South Coast AQMD staff also suggests the Lead Agency review the references (listed below) and consider including the additional recommended mitigation measures in the final CEQA document:

- State of California – Department of Justice: Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act[15]
- South Coast AQMD 2022 South Coast Air Quality Management Plan,[16] specifically:
    - Appendix IV-A – South Coast AQMD's Stationary and Mobile Source Control Measures
    - Appendix IV-B – CARB's Strategy for South Coast
    - Appendix IV-C – SCAG's Regional Transportation Strategy and Control Measures
- United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation[17]

South Coast AQMD Air Permits and Role as a Responsible Agency

The Draft SEIR assumes in the analysis that an emergency diesel-powered fire pump and emergency diesel-powered generator would be used for the Proposed Project.[18] Hence, air permits from South Coast AQMD would be required, and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead

[15] State of California – Department of Justice. Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act. Access at: https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf
[16] 2022 South Coast AQMP. Access at: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan
[17] United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation. Access at: https://www.epa.gov/mobile-source-pollution/environmental-justice-and-transportation
[18] *Ibid*. Page 5.2-13.

Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to review the above-mentioned document. The City of Jurupa Valley is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments which are organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Recirculated Draft EIR

Based on the Recirculated Draft EIR, the Proposed Project is comprised of the development of the 80.8-acre property with five industrial buildings ("Building 1," "Building 2," "Building 3," "Building 4," and "Building 5") totaling 1,118,102 square feet (s.f.). Building 1 would include 309,870 s.f. of building area, Building 2 would include 388,222 s.f. of building area, Building 3 would include 174,364 s.f. of building area, Building 4 would include 275,958 s.f. of building area, and Building 5 would include 35,688 s.f. of building area. The Recirculated Draft EIR states that although the future tenant(s) of the building is not known, industrial uses would allow for high-cube fulfillment, manufacturing, and general light industrial services.[1] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (residential development) is located adjacent to the Proposed Project site, approximately 240 feet southeast of the Proposed Project. Construction of the Proposed Project is anticipated to occur in a single phase, commence in January 2023, and be completed in June 2024.[2] The Proposed Project is located on the southeast corner of Montana Avenue and 25th Street.[3]

South Coast AQMD Staff's Comments

> *The CalEEMod Land Use(s) Subtype Assumptions (Combining Manufacturing and General Light Industrial) in the Appendix B- Air Quality Impact Analysis May Have Underestimated the Worst-Case Operational Air Quality Impacts*

In accordance with the project description outlined in the Recirculated Draft EIR, the construction of five industrial buildings totaling 1,194,170 square feet is proposed on 80.8 acres

[1] Recirculated Draft EIR Page 26.
[2] Appendix B, Air Quality Impact Analysis. Page 146.
[3] Recirculated Draft EIR Page 26.

of land. It is important to note that the document does not currently specify the future tenants for these five buildings.[4] However, based on the footnote in Appendix B- Air Quality Impact Analysis of the Recirculated Draft EIR, the analysis assumes that the project site will be divided into two equal parts for analytical purposes. Specifically, half of the site, totaling 597,085 square feet, is designated for manufacturing land uses, while the remaining half, also 597,085 square feet, is allocated for general light industrial land uses.[5]

According to the CalEEMod User Guide - Version 2022.1, it explicitly states the characteristics of "Light Industrial Land Use Subtype: *"Light industrial use facilities are free-standing facilities devoted to a single use, the facilities that have an emphasis on activities other than manufacturing and typically have minimal office space. Typical light industrial activities include printing, material testing, and assembly of data processing equipment. This land use subtype must be less than 50,000 square feet".*[6] Therefore, the allocation of 597,085 square feet for this purpose contradicts the guidelines provided in the CalEEMod User Guide. Moreover, the general light industrial activities are expected to generate less emissions and involve fewer total daily truck trips[7] compared to the manufacturing or other industrial land uses. The current assumption has led to an underestimation of emissions. South Coast AQMD staff recommends that the Lead Agency conduct a more conservative analysis using the "worst-case" scenario in CalEEMod modeling and correct the land use sub-type used in CalEEMod to ensure accuracy and compliance with guidelines.

Potential Underestimation of Emissions Due to Inaccurate On-site Distance for the Trucks and Passenger Vehicles During Project Operation

The Recirculated Draft EIR notes that CalEEMod Version 2022 lacks the capacity to distinguish between On-site and Off-site emissions during operation. Consequently, the analysis relies on the assumption that 0.5 mile is the maximum allowable On-site distance for both trucks and passenger vehicles. However, the aerial map of the On-site vehicle route (truck movements) as identified in Exhibit 2-B in Appendix C of the Recirculated Draft EIR indicates that the actual On-site distance of the route exceed 0.7 mile, which is greater than the 0.5-mile assumption upon which the emission estimates are based. Therefore, the On-site emissions appear to have been underestimated. For this reason, T the Lead Agency is recommended to either revise the calculations to reflect an On-site route distance of 0.7 mile or provide a comprehensive explanation and justification of the methodology employed in relying on the 0.5-mile On-site assumption parameter.

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

Appendix B of the Recirculated Draft EIR, explains that air quality impact analysis was based on the assumption that the average truck trip length is 30.34 miles for general light industrial and manufacturing uses. However, the project site is located 70 to 80 miles away from the Ports of Los Angeles and Long Beach which means that the air quality analysis underestimated the

[4] Recirculated Draft EIR Page 26.
[5] Appendix B, Air Quality Impact Analysis. Page 14 in PDF.
[6] *CalEEMod User Guide - Version 2022.1.
[7] Appendix Q, VMT Analysis. Page 12.

emissions from trucks traveling from the Ports to the project site. For this reason, the Lead Agency is recommended to revise the calculations in the Final EIR by taking a project-specific approach to the vehicle trip length and trip rates by applying more conservative trip lengths such as designating 40 miles for local trips and 80 miles for Port-related trips. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

Warehouse Cold Storage Land Use and the Associated Emissions from Transport Refrigeration Units (TRU)

The project description in the Recirculated Draft EIR does not explain whether the Proposed Project intends to allocate a portion of the warehouse land use for cold storage. Cold storage warehouses utilize more trucks and trailers equipped with TRUs than warehouses without cold storage. As a result, the Lead Agency is recommended to revise the project description in the Final EIR to explain whether cold storage would be a part of the Proposed Project and provide an estimate for the number of TRU trucks and trailers associated with the operation of the warehouses with cold storage. If there are potential uses for TRUs, the Lead Agency is recommended to revise the calculations in the Final EIR to quantify the emissions from the TRUs in addition to the operational truck emissions.

Incorrect Pollutant Averaging Time and Underestimation of Ground-Level Pollutants Near Buildings in Health Risk Assessment (HRA),

South Coast AQMD staff's review of the construction and operational HRA modeling files noted that the ANNUAL[8] keyword was selected for the pollutant averaging time in the control pathway in the AERMOD model. However, according to the South Coast AQMD Risk Assessment Procedures v8.1 and South Coast AQMD Modeling Guidance for AERMOD,[9] a detailed HRA utilizing AERMOD should be run using the pollutant averaging time PERIOD and 1-hour.

In addition, South Coast AQMD staff's review of the modeling files noted that industrial buildings were not included in the building downwash option in the AERMOD dispersion model during operation which resulted in an underestimation of the ground-level pollutant concentrations near the buildings.

Thus, the Lead Agency is recommended to: 1) re-run the construction and operational HRAs to utilize PERIOD and 1-hour averaging time to determine the health risk impacts to the sensitive receptors and off-site workers and include the industrial buildings in the building downwash to analyze more accurate ground-level concentrations; and 2) include the results in the Final EIR.

Inconsistent Emission Rates (lb/day) Calculated from CalEEMod vs. AERMOD

[8] South Coast AQMD Risk Assessment Procedures v8.1. Access at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf
[9] South Coast AQMD Modeling Guidance for AERMOD. Access at: South Coast AQMD Modeling Guidance for AERMOD

South Coast AQMD staff's review of the AERMOD files noted that the diesel particulate matter (DPM) emission rates do not match the data reported in Table 13: Localized Significant Summary of Operations (Onsite Emissions) in Appendix B of the Recirculated Draft EIR which were estimated using CalEEMod. For example, the operational PM10 emission rates presented in Table 13 d are 0.88 pounds per day (lb/day) but the PM10 emissions calculated via AERMOD modeling (including Idling and Onsite emissions) are 0.014 lb/day. This lack of continuity in the emission estimates raises questions about the accuracy of the calculations and warrants a more comprehensive and careful examination of the underlying factors and route causes contributing to this disparity. The Lead Agency is recommended to re-review these calculations and update the Final EIR accordingly with the appropriate corrections.

South Coast AQMD Air Permits and Role as a Responsible Agency

If the implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, spray booths, and etc., air permits from South Coast AQMD will be required and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this

comment letter. Please contact Sahar Ghadimi, Air Quality Specialist, at sghadimi@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the lead agency and should be incorporated into the Final CEQA document.

In the project description, the lead agency proposes the construction of two buildings for warehouse distribution and office space uses totaling approximately 1,037,811 square feet on a 48.4 acre site. The lead agency has projected 1,744 total daily vehicle trips including at least 357 daily truck trips operating at the site. In the Air Quality Section, the lead agency quantified the project's construction and operation air quality impacts and has compared those impacts with the SCAQMD's recommended regional and localized daily significance thresholds. Based on its analyses, the Lead Agency has determined that operational air quality impacts will exceed the recommended regional daily significance threshold for NOx.

The SCAQMD staff has concerns regarding the assumptions used in the air quality analysis, specifically the operational portion of the CalEEMod land use model. Since the proposed project will result in significant NOx impacts, all feasible mitigation measures should be included in the Final CEQA document to further reduce the significant impacts. Details are included in the attachment.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the lead agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. Further, staff is available to work with the lead agency to address these issues and any other questions that may arise. Please contact Jack Cheng, Air Quality Specialist, at (909) 396-2448, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Siting of an Incompatible Land Use

1. Based on information in the DEIR (air quality analyses, the project truck distribution, and by aerial map inspection), the lead agency shows a minimum distance of 15 meters to the nearest sensitive receptor; a residence located southeast of the project site. The SCAQMD staff is concerned that the existing sensitive receptors will be exposed to significant regional and localized operational impacts, mostly from the daily truck activities that will likely operate using diesel fuel.

   As a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land-use decision making process, the California Air Resources Board (CARB) has provided the CARB Air Quality and Land Use Handbook (CARB Land Use Handbook). Based on guidance from thin e CARB Land Use Handbook, CARB recommends a buffer of at least 1,000 feet between land uses that will have 100 or more trucks per day. [1]

   In accordance with the state CEQA Guidelines §15126.4 (a)(1)(D), the lead agency should discuss the proposed siting of this land use and any potential impacts resulting from any proposed mitigation related to the CARB Land Use Handbook guidance in the Final EIR.

Air Quality Analysis

Daily Truck Trip Rate

2. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars and trucks totaling approximately 1,744 daily vehicles) for the proposed Project, but does not use the 0.64 (38.1%) daily truck trip rate from this same reference. Rather, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 (20.43%) daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) to estimate project air quality operational impacts in the CalEEMod modeling. By using the 0.343 Fontana Study daily truck trip rate, trucks are estimated at 357 daily truck trips in the DEIR instead of approximately 664 daily truck trips using the ITE 0.64 daily truck trip rate.

   Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and Final EIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

   Absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

[1] CARB Air Quality and Land Use Handbook: http://www.arb.ca.gov/ch/handbook.pdf

On-Road Truck Trip Length

3. In the CalEEMod output sheets provided in Appendix E of the DEIR appendices, the modeling used a 60 mile one-way trip distance and a 20% trip percentage for trucks moving goods for perspective tenants (C-W) and a 6.9 one-way trip distance and an 80% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). In electronic file "LOG 2 4.03 Air Quality – 7-15 Table 4.3-E Operational Vehicle Trip Assumption", the table indicates a 16.6 mile one-way trip distance and an 80% trip percentage for trucks moving goods for perspective tenants (C-W) and a 60 mile one-way trip distance and a 20% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). The Air Quality Analysis is inconsistent and under estimates air quality impacts. A 60 mile one-way trip distance and 80% trip percentage should be used to model trucks moving goods for the perspective tenants (C-W) and a 6.9 – 16.6 one-way trip distance and 20 % trip percentage should be used by trucks supporting the operations of the proposed facility(C-NW).

   On page 3.0-8 in the project description, the lead agency describes potential truck activities that involve the proposed warehouse trucks. "Goods imported from the Ports of Long Beach and Los Angeles as well as other locations will be delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations." Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

4. Based on a review of the project's emissions calculations in Appendix E – RK Revised AQ, GHG, HRA: Air Quality Analysis[2] (CalEEMod Output Sheets), the lead agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM Air-12 to reduce operational emissions, the lead agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the lead agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the lead agency chooses to include refrigerated warehouses in the air quality analysis then MM Air-12 should be incorporated into the project and remain in the Final EIR.

LST and Health Risk Assessment (HRA) Modeling

5. The lead agency used AERMOD (version 12345) to prepare the dispersion modeling for the HRA even though AERMOD (version 14134) was available for at the time of analysis (10/20/2014). Therefore, SCAQMD staff recommends using AERMOD (version 15181), the most recent available version, to revise the dispersion modeling for this project.

6. The HRA analysis involved the use of separate discrete receptors placed randomly for the sensitive receptors. SCAQMD staff recommends that the lead agency revise the HRA using a receptor grid over the existing residences and areas zoned or planned for residential development, in order to ensure that the maximum impacts to a residential receptor are properly analyzed.

[2] Appendix A: CalEEMod Emissions Model Output.

7. SLINE1, SLINE2, and SLINE3 onsite travel line volume sources do not span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a series of volume sources that spans the entire docking area to ensure that impacts are properly analyzed.

8. STCK1, STCK2, and STCK3 onsite idling point sources should span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a line volume that spans the entire docking area to ensure that impacts are properly analyzed.

9. Based on the site plan in the project description, there are two driveways that access Webster Street where residences are located across from the proposed project site. Traffic exiting the site from Webster Street can then access Ramona Expressway to get on the freeway. Although the project description in the Notice of Availability, the site plan and the computer modeling show truck traffic using only Patterson Avenue north towards Harvey Knox Boulevard to access the 215 Freeway, there is nothing, however, to preclude trucks from using the driveways on Webster Street, passing by existing residences and then accessing Ramona Expressway to get on the freeway. The SCAQMD staff recommends that the Final EIR include a discussion of how the project will stop trucks from using Webster Avenue or include a restriction that would formally restrict Webster Street to passenger vehicles only. If trucks are not formally restricted, then project impacts from truck movement on Webster Street and beyond (i.e., north on Webster Street, or south to Ramona Expressway to access the 215 Freeway) would have been underestimated in the DEIR. These potential impacts should therefore be analyzed in the HRA and included in the Final EIR.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

10. Because the California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic and during project operations, the lead agency has determined that project operation emissions are significant for Oxides of Nitrogen (NOx), primarily from truck activity emissions, the SCAQMD staff therefore recommends the following changes and additional measures that should be incorporated in the Final EIR to reduce exposure to sensitive receptors and reduce potential significant project air quality impacts:

Recommended Changes

MM AQ 4.3H

- Prior to issuance of a building permit, the Project proponent shall provide the City with project specifications, drawings, and calculations that demonstrate that main electrical supply lines and panels have been sized to support heavy truck charging facilities~~ when these trucks become available. The calculations shall be based on reasonable predictions from currently available truck manufacturer's data. Electrical system upgrades that exceed reasonable costs shall not be required. In addition, the Project will incorporate 2 electric vehicle charging stations for light-duty vehicles.~~ Electrical lines shall be designed and sized to add additional charging stations when a demand is demonstrated. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations.[3] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

[3] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Additional Mitigation Measures

- Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.

- Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors.
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.
- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Should the proposed Project generate significant regional emissions, the lead agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the lead agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the lead agency and project applicant.

Mitigation Measures for Operational Air Quality Impacts (Other)

11. In addition to the mobile source mitigation measures identified above the Lead Agency should incorporate the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from NOx emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Fontana, CA 92335

Draft Environmental Impact Report (DEIR)
for the Proposed Westgate Specific Plan (SCH No. 1995052002)

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document.

The Lead Agency proposes construction within four village areas that will be divided into 68 total planning development areas on an approximately 964-acre site. Included are up to 6,410 residential units, 50.9 acres of commercial/retail uses, 179.9 acres of business park and professional office uses, 71.6 acres and up to 1.2 million square feet of warehouse/distribution uses, open space/public and private parks, two elementary schools, a high school, landscaping and infrastructure. The four project areas are located by the Interstate 15 (I-15) and State Route 210 (SR-15) Freeways. The air quality analysis assumes a construction period starting in July 2015 showing Phase 1 construction completed as early as 2016, but based on market conditions, overall construction will continue over an approximately 20-year period until project buildout planned for year 2035.

The Lead Agency has determined that estimated construction, operation emissions and cancer risks substantially exceed the SCAQMD recommended thresholds of significance during construction (NOx), operations (VOC, NOx, CO, PM10 and PM2.5, mostly from vehicle operations) and for Toxic Air Contaminants (potential cancer risk from sensitive receptors being sited near diesel particulate emissions (DPM) from vehicles operating on the two freeways). The unmitigated cancer risk of up to 47 in one million from the DPM freeway vehicle would remain 33 in one million with mitigation, which is still substantially above the SCAQMD's recommended CEQA significance threshold for Maximum Incremental Cancer Risk (MICR): 10 in one million or greater lifetime probability of contracting cancer.

Based on its review, the SCAQMD staff has concerns about the assumptions made in the health risk assessment and air quality analyses. The SCAQMD also notes that localized significant emission impacts from on-site project uses were not estimated in the DEIR although emissions from on-site mobile sources at proposed the warehouse/distribution, light industry, commercial/retail and other land uses potentially impact nearby sensitive receptors (i.e., residents, students, school staff, etc.). Therefore, these impacts should be analyzed, compared with appropriate significance thresholds and incorporated into the Project and applicable analyses in the Final EIR to demonstrate the Lead Agency's findings. Finally, since the Lead Agency has determined that project air quality impacts from construction, operations and cancer risk are significant and unavoidable, the SCAQMD staff is concerned that all feasible mitigation pursuant to Section 15126.4 of the CEQA Guidelines has not been incorporated into the project and should be included in the Final CEQA document. Further details are included in the attached pages.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the Lead Agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. The SCAQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist CEQA Section, at (909) 396-3302, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Control Number

Health Risk Assessment

1. As of December 9, 2006, AERMOD is fully promulgated as a replacement to ISC3, in accordance with Appendix W (http://www.epa.gov/ttn/scram/dispersion_prefrec.htm). AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. AERMOD-ready meteorological data for various meteorological stations within the South Coast Air Basin (SCAB) are available for download free of charge at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/data-for-aermod. The Lead Agency used AERMOD (version 13350) to prepare the dispersion modeling for the Warehouse Health Risk Assessment (HRA) but used AERMOD (version 12060) for the Freeway HRA analysis. Furthermore, while the meteorological data from the SCAQMD Fontana meteorological station was used for both HRA analyses, two different versions of the meteorological data were used. Font2.pfl and Font2.sfc (meteorological data for 2005-2007) and Font7.sfc and Font7.pfl (meteorological data for 2008-2012) are for different years. Given the advancements and bug fixes that occurred in AERMOD between version 12060 and 13350 and 14134 (today's current version), SCAQMD staff recommends that the Lead Agency revise the HRA analyses for both warehouse and freeway using the latest version of AERMOD (version 14134) without the use of Lakes AERMOD-MPI. SCAQMD's modeling guidance for AERMOD can be found at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/modeling-guidance. Please note that when using AERMOD, the regulatory default option should be used (i.e. without the use of the "FASTALL" or "FLAT" options) and the Lakes MPI should not be used without prior SCAQMD or EPA Region 9 approval.

2. The electronic files for the HRA analyses provided by the Lead Agency to SCAQMD staff were incomplete and did not include the receptor file. Therefore, SCAQMD staff was unable to verify the placement of receptors in the HRA analyses. In the event that receptors were not placed in the correct location using a receptor grid of no more than 100-meter spacing over the existing residences and areas zoned or planned for residential development, the health risks reported in the HRA analyses and DEIR could be underestimated. Therefore, SCAQMD staff recommends that the Lead Agency provide a graphic showing the receptor grid placement in the Final EIR.

3. The proposed project includes both two elementary schools and one high school. However, in the analysis, no receptors were placed in those locations to estimate the health risks to the students, teachers and administrative staff at those locations. SCAQMD staff recommends the Lead Agency update the HRA analyses to include the schools as receptors and estimate the health risks at those locations.

4. In the Warehouse HRA analysis, the Lead Agency assumed only 10 minutes of idling for each truck. Since trucks may idle several times on-site, the SCAQMD staff

recommends assuming 15-minutes idling per truck in the HRA analysis, e.g., five minutes entering, five minutes on-site and five minutes exiting, etc.

5. In the DEIR, the Lead Agency analyzed health risk impacts for residential exposure separately from TAC emissions coming from vehicles operating on the I-15 and State SR-15 Freeways. Since residents will be exposed to adverse health impacts from both the freeways (diesel-fueled vehicles operating on the freeways) and project warehouse distribution uses (diesel-fueled trucks operating at the sites), the combined risk from both sources should be totaled and disclosed in the Final EIR, in addition to the separate Maximum Incremental Cancer Risk (MICR) estimates for both sources already included in the DEIR. Otherwise, the potential combined risk is underestimated.

Air Quality Analysis - Operations

Daily Truck Trip Rate

6. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars + trucks totally approximately 2,046 daily vehicles) for the proposed Project, but does not use the 0.64 daily truck trip rate from this same reference.[1] Rather, the Trip Generation Rates use a passenger car daily trip rate of 1.337 vehicles per day and a daily truck trip rate of 0.343 truck trips per day.[2] By using the 0.343 daily truck trip rate, trucks are estimated at 418 daily truck trips in the DEIR instead of approximately 780 daily truck trips using the ITE 0.64 daily truck trip rate. Therefore, absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

Vehicle Fleet Mixture Percentages

7. In the DEIR, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) [3] to estimate project air quality operational impacts in the CalEEMod modeling. Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily

[1] ITE Manual, High Cube Warehouse Distribution Center (ITE Land Use – 152), 0.64 weighted average Truck Trip Generation Rate (trip ends per 1,000 square feet of gross floor area), Page 267.
[2] 1.337 + 0.343 = 1.68.
[3] DEIR, Traffic Impact Analysis, Project Trip Generation, Pages 31 and 37 Project (High Cube Warehouse Distribution Center) Trip Generation (Table 5, (3 of 3).

truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. Specifically, the number of daily trucks using the ITE 0.64 trip rate results in a greater number of daily truck trips: approximately 780 with the ITE 0.64 rate compared with approximately 418 daily trucks using the 0.343 daily truck trip rate based on the trip generation rates used in the Traffic and Circulation Section. Therefore, based on the increase numbers of trucks, the CalEEMod fleet mixture truck subcategories should be proportionally adjusted with the higher numbers of trucks after using the recommended ITE 0.64 daily truck trip rate. In the modeling inputs, however, the individual vehicle category percentages totaled 6.74 percent, which is lower than the percentage of trucks in the Traffic Study. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and FEIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

On-Road Truck Trip Lengths

8. In the DEIR, the Lead Agency does not describe potential truck activities that involve the proposed warehouse trucks. Since goods can be brought from the Ports of Long Beach and Los Angeles as well as other locations and delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations, the Final EIR should include more detailed discussion to justify the trip lengths used in the air quality and health risk affect analyses. In the CalEEMod output sheets provided in Appendix B of the DEIR appendices, the modeling used a 16.6 mile one-way trip distance was used by trucks employed by perspective tenants and an 8.4 one-way trip distance was used by trucks not employed by perspective tenants was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR. If the Lead Agency is uncertain of the types of tenants or the trip lengths, the Lead Agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

9. Based on a review of the project's emissions calculations in Appendix B: Air Quality Technical Appendix [4] (CalEEMod Output Sheets), the Lead Agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM C-12 to reduce

[4] Appendix B: Air Quality Technical Appendix.

Operational Emissions starting on Page 4.C-69, the Lead Agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the Lead Agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the Lead Agency chooses to include refrigerated warehouses in the air quality analysis then MM C-12 should be incorporated into the project and remain in the Final EIR.

Mitigation During Operations (MERV Filters and HVAC Systems)

10. Starting on page 4.C-54, the Lead Agency discusses Health Risk results concluding that during occupancy, adverse air quality impacts from vehicles traveling on the existing I-10 and SR-210 freeways would expose sensitive receptors to substantially significant levels of Toxic Air Contaminants (TACs) even with mitigation due to existing ambient air pollution in the vicinity. The SCAQMD staff recognizes the many factors lead agencies must consider when siting new housing. On page 4.C-70, the Lead Agency is proposing mitigation to reduce the proposed project's significant health impacts. Further, many mitigation measures should be considered in the Final CEQA document that have been proposed for other projects as well to reduce exposure, including building filtration systems, placing the residential units furthest from the freeway, making any windows facing the freeway inoperable, building sound walls, planting vegetation barriers, etc. However, because of the potentially significant health risks involved, it is critical that any proposed mitigation must be carefully evaluated prior to determining if those health risks would be brought below recognized significance thresholds.

Limits to Enhanced Filtration Units

11. The Lead Agency should consider the limitations of the proposed enhanced filtration mitigation (Measure C-16) on page for this project on the housing residents. For example, in a study that SCAQMD conducted to investigate filters[5] similar to those proposed for this project, costs were expected to range from $120 to $240 per year to replace each filter. In addition, because the filters would not have any effectiveness unless there is a HVAC system that draws enough air to support eh filter system and that the HVAC system is fully operable throughout the life of the project. In addition, there may be increased energy costs to the resident. The proposed mitigation also assumes that the filters operate 100 percent of the time while residents are indoors to reduce significant TAC impacts up to 33 in one million compared with the SCAQMD

[5] http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf?sfvrsn=0 . This study evaluated filters rated MERV 13+ while the proposed mitigation calls for less effective MERV 12 or better filters. See also CARB link for the "Status of Research on Potential Mitigation Concepts to Reduce Exposure to Nearby Traffic Pollution" (August 23, 2012): http://www.arb.ca.gov/db/search/search_result.htm?q=Potentiaal+Mitigation+Concepts+to+Reduce+Exposure+to+Nearby+Traffic+Polltion&which=arb_google&cx=006180681887686055858%3Abew1c4wl8hc&srch_words=&cof=FORID%3A11 .

threshold of 10 in one million. It should be noted that these filters have no ability to filter out any toxic gasses from vehicle exhaust and would not reduce exposure when residents are outside of their homes, e.g. children playing outdoors, being around a pool area, residents relaxing or walking outside, working outside on a balcony, cleaning a vehicle, etc. In the Final CEQA document, the presumed effectiveness and feasibility of this mitigation should therefore be evaluated in more detail prior to assuming that it will sufficiently alleviate near truck exhaust exposures. Otherwise, impacts to residents from exposure to TACs will remain substantially significant and unavoidable.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

12. The California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic. During project operations, the Lead Agency has determined that project operation emissions are significant for Volatile Organic Compounds (VOC) and Oxides of Nitrogen (NOx), Carbon Monoxide (CO), Particulate Matter (PM10) and PM2.5, primarily from on-road mobile sources including truck activity emissions. The SCAQMD staff therefore recommends the following change and additional measures that should be incorporated into the Final EIR to reduce exposure to sensitive receptors and reduce project air quality impacts:

    Recommended Change:

    MM C-13

    - The City shall require future commercial and industrial projects (to) promote the expanded use of renewable fuel and low-emission vehicles by including ~~one or both of~~ the following project components: provide preferential parking for ultra-low emission, zero-emission, and alternative-fuel vehicle; and provide electric vehicle charging stations within the development.

    Additional Mitigation Measures:

    - Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.

    - Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors based on guidance from the California Air Resource Board (CARB) guidance.[6]
    - Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site,

[6] CARB: Air Quality and Land Use Handbook: A Community Health Perspective, April 2005, Page4 for Distribution Centers.

the Lead Agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Because the proposed Project generates significant regional emissions, the Lead Agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the Lead Agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency and project applicant.

  At a minimum, require upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the occupant should also be required to accept and use them.

Electric Vehicle (EV) Charging Stations

13. Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2012 Regional Transportation Plan. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, the SCAQMD staff recommends the Lead Agency require the proposed facility and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include

EV charging stations.[7] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

CNG Fueling Station and Convenience Site

14. Because proposed project generate significant regional NOx operational impacts, the SCAQMD staff recommends that the project pro-actively take measures that could reduce emissions sooner rather than later. The SCAQMD staff therefore recommends that the Lead Agency ensure the availability of alternative fueling facility (e.g., natural gas) to serve the project site prior to operation of any large truck operation uses within the project area.

Mitigation Measures for Operational Air Quality Impacts (Other)

15. In addition to the mobile source mitigation measures identified above, the SCAQMD staff recommends the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from VOC, CO, NOx, PM10 and PM2.5 emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Transportation

- Make a commitment to install electric car charging stations (not just wiring infrastructure) for both non-residential and residential uses at the project site.
- Create local "light vehicle" networks, such as neighborhood electric vehicle (NEV) systems.

[7] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Energy

- Make a commitment that the project site will include a solar photovoltaic or an alternate system with means of generating renewable electricity.

Other

- Provide outlets for electric and propane barbecues in residential areas.

Mitigation Measures for Construction Air Quality Impacts

16. Based on a review of the DEIR the Lead Agency determined that the proposed project will result in significant air quality impacts during construction. Specifically, the air quality analysis demonstrated that the proposed project will exceed the SCAQMD's CEQA regional construction significance thresholds for NOx. Therefore, the SCAQMD staff recommends the following changes and additional measures be incorporated into the proposed project and FEIR to reduce significant project impacts in addition to the measures included in the Draft EIR starting on page 4.C-67.

Recommended Change:

MM C-2 During project construction, the City shall require internal combustion engines/construction equipment operating on all future project sites ~~greater than five acres~~ to meet the following:

- ~~At least 50 percent of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 3 emissions standards or better and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

- Consistent with measures that other lead agencies in the region (including Port of Los Angeles, Port of Long Beach, Metro and City of Los Angeles)[8] have enacted, require all on-site construction equipment to meet EPA Tier 3 or higher emissions standards according to the following:

- Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

[8] For example see the Metro Green Construction Policy at: http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

- ~~Post-January 1, 2016, in addition to the Tier 3 standards specified above, an additional 20 percent or more of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 4 emissions standards or better and be outfitted with BACT devices (e.g., and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

Recommended Additions

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NOx emissions requirements.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Encourage construction contractors to apply for SCAQMD "SOON" funds. Incentives could be provided for those construction contractors who apply for SCAQMD "SOON" funds. The "SOON" program provides funds to accelerate clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/home/programs/business/business-detail?title=vehicle-engine-upgrades

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies .

South Coast
Air Quality Management District
21865 Copley Drive, Diamond Bar, CA 91765-4182
(909) 396-2000 • www.aqmd.gov

E-MAILED: FEBRUARY 1, 2013 February 1, 2013

Mr. Mark Tomich, Director, MTomich@ci.colton.ca.us
Development Services, Planning Division
City of Colton
659 N. La Cadena Drive
Colton, CA 92324

**Draft Mitigated Negative Declaration (Draft MND)
for the Proposed Colton – DEXUS Project**

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document. In the project description, the lead agency proposes demolition of the existing 28,000 square foot truck terminal and 18,000 square foot office building. Building construction would include a high-cube warehouse building on the 34.36 acre site. The proposed facility would have 600,046 square feet of building area (12,000 square feet of office area and 588,048 square feet of warehouse/distribution space). The proposed project would include 116 dock doors with parking for 425 standard and handicap spaces, and 42 trailer spaces. Construction is expected to last approximately 10 months and 2014 is the proposed opening year. Although basically zoned for industrial uses, there is a single-family residence located less than a quarter mile northwest of the project site along Agua Mansa Road.

The AQMD staff requests that the lead agency provide additional information regarding the fate of the existing facility. The CEQA analysis assumes it will cease its operations within the boundaries of the South Coast Air Basin (SCAB) by applying the emissions from the current operation to the baseline thus offsetting the projected emissions from the proposed high-cube warehouse use. In addition, the baseline itself may be overestimated by using generalized trip generation estimates instead of the on-site traffic count data to account for vehicle activity and the resulting air quality impacts for the existing operation. Because the determination of significance under CEQA is based on the difference between existing baseline and future project impacts, we recommend that the lead agency provide further substantial evidence for, and re-evaluate where necessary, the baseline and future impacts of this project. If impacts are found to be significant, then additional mitigation may be required to reduce these impacts to a less than significant level. Details regarding these comments and others follow in the attachment.

Please provide the AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. The AQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist – CEQA Section, at (909) 396-3302, if you have any questions regarding these comments.

Sincerely,

Ian MacMillan
Program Supervisor, Inter-Governmental Review
Planning, Rule Development & Area Sources

Control Number

Baseline Emissions and the Status of the Existing Use

1. In a telephone conversation staff on or about January 15, 2013, the lead agency staff expressed uncertainty to AQMD staff whether the existing truck terminal business would cease operations completely within the SCAB boundaries or continue its current operations at the site but at a lower level of activity. The lead agency's operational air quality analysis uses the emissions from the existing use as a baseline to offset the estimated long-term air quality impacts from the proposed warehouse use. It is unclear to AQMD staff if the incremental emissions benefit derived from the existing use would actually be realized. Unless there is assurance that the previous facility activities will cease and not move to another location within the SCAB, the lead agency should not include these emissions as a baseline when calculating regional impacts. AQMD staff requests that the lead agency provide additional discussion of the fate of the existing operations and revise the air quality and greenhouse gas analyses, if necessary.

Potential Overestimation of the Existing Facility Baseline Emissions

2. The lead agency has estimated project emissions for the existing truck terminal building activity using the California Emissions Estimator Model (CalEEMod) and using trip rates based on land uses shown in the Institute of Traffic Engineers (ITE) Trip Generation, 8th Edition (2008) and the Truck Trip Generation Study (City of Fontana, August 2003). In addition to these sources, the lead agency included traffic count worksheets in the Revised Traffic Impact Analysis (Kunzman Associates, Inc., October 2012). It is not clear to the AQMD staff why available project-specific traffic count data included in the Draft MND that could be used to analyze vehicle activity and associated emissions for the existing facility were not used to estimate baseline emissions.

   The AQMD staff believes that using the ITE trip rate to calculate baseline vehicle activity may substantially overestimate project vehicle activity and related on-road mobile source emissions compared with the data supplied in the traffic analysis. This is demonstrated, for example, by looking at the volumes supplied in the Traffic Impact Analysis (TIA) for vehicles entering the facility during the AM peak hour shown on page 11 (Figure 5, Existing Morning Peak Hour Intersection Turning Movement Volumes). For Intersection Six (the main entrance into the facility) in Figure 5, the number of vehicles entering and exiting the facility totals 70. From Table 3 of the TIA (Current Development {Truck Maintenance Facility}), the lead agency has estimated, using the ITE trip rate for the General Light Industrial (110) land use, 259 vehicles per hour. This is more than three times the 70 vehicles per hour found from actual traffic counts. Using the ITE trip rate instead of the vehicle data shown from the traffic counts appears to significantly overestimate the existing project baseline emissions. This results in the incremental emissions, i.e., the difference between the existing facility emissions and the emissions for the proposed warehouse facility being

underestimated. The AQMD staff therefore recommends that applicable analyses be revised in the Final MND using the project-specific traffic count data. Alternatively, the lead agency could explain why the project-specific traffic counts should be ignored.

On-Road Truck Trip Length

3. In the CalEEMod input files provided to AQMD staff by the lead agency, an average one-way trip length of 8.3 miles was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Trucks operating from these kinds of facilities often handle goods coming directly from the port areas over 70 miles away as well as potentially serving out of state destinations. Absent tenant-specific trip length information, the AQMD staff recommends a one-way trip length from the project site to the port areas as more appropriate trip length for on-road truck emissions and that applicable analyses in the Final MND be revised. If the lead agency is uncertain of the types of tenants or the trip lengths, the lead agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of Non-Default Truck Trip Rate

4. In the air quality and health effect analyses, the lead agency based its estimates on trip generation rates from the 8th Edition of the Institute of Transportation Engineers (ITE) Report using a non-default trip rate of 1.44 per thousand square of gross floor area (Land Use Code 152 – High-Cube Warehouse). Based on guidance from the California CalEEMod User's Guide, the AQMD staff recommends using a more conservative trip rate of 2.59 per 1,000 square feet. AQMD staff believes a more conservative trip rate is appropriate as the tenant is unknown, and there are no conditions on the project limiting activity to what is analyzed in the MND.

CalEEMod Fleet Mixture Percentage

5. On page 28 of the Draft IS/MND, the lead agency's narration lists the fleet mixture percentages used in the CalEEMod land use model to estimate operational emissions. The narration states that the estimated fleet mixture is approximately 37 percent truck traffic for the proposed warehouse use including 17 percent heavy-heavy duty (HHD); 8 percent medium-heavy duty (MND); and 12 percent light-heavy duty 1 (LHD1). The CalEEMod inputs, however, also include the 3.4 percent Light-Heavy Duty 2 (LHD2) category that was omitted in the narration total. The 3.4 percent LHD2 percentage would therefore increase the overall truck percentage from 37 to 40 percent. In the Final MND, the narration should be revised to be consistent with the CalEEMod fleet percentages shown in the actual modeling.

Localized Significance Thresholds Analysis: Construction and Operations

6. Under Sensitive receptors on page 13 of the Air Quality & Climate Change Assessment and upon an aerial map inspection, a single-family residential property appears to be located within one-quarter mile of the proposed warehouse. We therefore recommend that the lead agency evaluate localized air quality impacts. The AQMD staff requests this evaluation to ensure that any nearby sensitive receptors are not adversely affected by the construction and operational activities that are occurring in close proximity. AQMD guidance for performing a localized air quality analysis can be found at the following web address: http://www.aqmd.gov/ceqa/handbook/LST/LST.html .

Operational Mitigation Measures

7. In the event the lead agency determines that project air quality impacts (regional or localized) for operations will exceed recommended significance thresholds (mostly attributed to mobile source tailpipe emissions from vehicles operating at the proposed facility), the AQMD staff encourages the lead agency to develop a common set of enforceable mitigation measures to reduce those emissions to the maximum extent feasible. As the lead agency is aware, heavy-duty trucks are the largest source of NOx emissions in our basin and NOx emissions must be reduced by approximately two thirds beyond existing rules and regulations in order to meet air quality standards as required by 2023. Without meeting air quality standards, our region faces federally mandated sanctions, including possible loss of transportation funding. AQMD staff therefore recommends that the lead agency consider the feasibility of the following measures to reduce project impacts. Other lead agencies that have imposed these and similar measures include the City of Banning[1], Riverside County[2], City of San Bernardino[3], and the San Pedro Bay Ports[4], among others.

   Recommended additional measures:

   - Lease/purchase documents shall identify that tenants required to implement the following:
   - At project start, all heavy duty trucks entering the property must meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.
   - If the above clean truck requirements are infeasible, a phase-in schedule should be put forth that will feasibly achieve emission reductions as soon as possible, and faster than existing regulations. Should an alternative

[2] Mira Loma Commerce Center: http://www.rctlma.org/online/content/conditions_of_approval.aspx?PERMITNO=pp17788 .
[3] Palm/Industrial Distribution Center http://www.ci.san-bernardino.ca.us/civica/filebank/blobdload.asp?BlobID=11793
[4] Clean Trucks Program http://www.cleanairactionplan.org/cleantrucks/ .

schedule be found necessary, the AQMD staff should be consulted prior to approving the schedule.

- Provide a phase-in schedule and goals for the introduction of zero or near-zero technology trucks (e.g., 10% by 2020, 20% by 2025, etc.) that visit warehouses.

The facility operator will maintain a log of all trucks entering the facility to ensure that on average, the daily truck fleet meets the quantities and emission standards listed in the Draft MND. This log should be available for inspection by city staff at any time.

- The facility operator will ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies [for example, by requiring attendance at CARB approved courses (such as the free, one-day Course #512)].

- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final MND. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Require at least a portion of the fleet to utilize alternative fueled technologies.

- The 2012 Regional Transportation Plan includes a zero-near-zero emissions truck corridor along the SR-60 freeway west of I-15. Because at least a portion of the trucks serving this project may be expected to travel along this route, the project should consider providing onsite alternative fueling infrastructure, such as electric charging stations or natural gas fueling that will help facilitate these low-emitting trucks. This could include ensuring electrical panels and wiring are sufficiently sized to accommodate future needs.

- At a minimum, require tenants upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the tenant should also be required to accept and use them.

- Restrict overnight parking in residential areas. Establish overnight parking within the warehouse/distribution center where trucks can rest overnight.

- Establish area(s) within the facility for repair needs.

- Post signs outside of the facility providing a phone number where neighbors can call if there is a specific issue.

- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.

- Have truck routes clearly marked with trailblazer signs, so trucks will not enter residential areas.
- Identify or develop secure locations outside of residential neighborhoods where truckers that live in the community can park their truck, such as a Park & Ride.
- Provide food options, fueling, truck repair and or convenience store on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Requiring all on-site vehicles (hostlers, forklifts, etc.) to utilize zero or near-zero emission technology.
- Use street sweepers that comply with SCAQMD Rules 1186 and 1186.1.
- Install solar panels on all available roof space. If this isn't feasible, then at a minimum all buildings and electrical infrastructure should be designed to accommodate potential future solar panel upgrades.

Off-Road Construction Equipment Reduced Load Factors

8. In Appendix B (CalEEMod Output) in the air quality assessment, the lead agency estimated project construction impacts using the CalEEMod land use emissions computer model. This model uses default and user-defined settings to estimate emissions based on the land use settings. In the CalEEMod inputs under User Entered Comments, the lead agency has reduced the Construction Phase Off-Road Equipment load factors by 33 percent citing the California Air Resources Board (CARB) as authority for the changes. For example, the default load factor in the CalEEMod model for rubber tired loaders of 54 percent was reduced to 36 percent.

   Based on communication with ARB staff[5] regarding this issue, the AQMD staff confirmed that CARB staff does not recommend reducing the default settings in the current OFFROAD2007 without considering all parameters besides the load factor. Other parameters such as activity level, horsepower, and population all contribute to the emission factor estimate, and selectively changing only one parameter will lead to inaccurate estimates at a project level. For some equipment types, OFFROAD2007 may underestimate emissions while others may be overestimated. Because of these revisions (and others), CARB developed the new OFFROAD2011. The AQMD staff therefore recommends that the lead agency either use existing OFFROAD2007 defaults until OFFROAD2011 is incorporated into CalEEMod later this year or run OFFROAD2011 outside CalEEMod and use those results to modify the CalEEMod construction calculations. Therefore, even though the reductions might not change the lead agency's determination of significance for construction air quality impacts, these reductions related to

[5] Personal communication with Nicole Dolney, June 1, 2012.

reduced off-road equipment load factors are not recommended by the AQMD staff without further substantial evidence to support those emission reductions resulting from their use. Otherwise, the lead agency should commit to enforcing the assumed lower non-substantiated emission factors.

Construction Mitigation Measures

9. Should the lead agency determine that project localized construction air quality impacts will exceed the AQMD recommended daily significance thresholds, the AQMD staff therefore recommends the following mitigation measures during the projected 10 month construction period to reduce adverse air quality impacts from on-site construction emission sources, if applicable and feasible.

   Recommended additions:

   - Limit the amounts of daily soil disturbance to the amounts analyzed in the Draft MND.
   - All clearing, grading, earth-moving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.
   - Apply non-toxic soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more).
   - All trucks hauling dirt, sand, soil, or other loose materials are to be covered.
   - Sweep streets at the end of the day if visible soil is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water).

   Further, other lead agencies in the region including LA County Metro, the Port of Los Angeles, and the Port of Long Beach have also enacted the following mitigation measures. AQMD staff recommends the following measures to further reduce air quality impacts from construction equipment exhaust:

   - Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
   - Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by

the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or AQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html .

MEMORANDUM

TO: Thomas Grahn, Senior Planner
City of Ontario
303 East B Street
Ontario, CA 91764

FROM: Tracy Zinn, Principal
Tracy Chu, Assistant Project Manager

DATE: May 20, 2024

RE: 5355 East Airport Drive (PDEV22-017) – Response to April 15, 2024 Comment Letter from CARE CA

T&B Planning, Inc. is the environmental consulting firm that prepared the Environmental Impact Report (EIR; SCH No. 2022090006) for the 5355 East Airport Drive Project (hereafter "Project"). The Project Applicant, Prologis, Inc., proposes to demolish the existing buildings and structures on the Project site and redevelop the property with a 270,337 square foot (s.f.) warehouse building. The Project's design also includes the installation of associated site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detention facilities, exterior lighting, walls/fencing, and signage as well as site-adjacent improvements to East Airport Drive. The Draft EIR for the Project was published on August 22, 2023, for a 45 day review period, with the local review period and State review period ending on October 5, 2023.

On April 15, 2024, a letter was sent to the City from Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy (CARECA). In response, T&B Planning prepared this memorandum for the purpose of responding to the comments received alleging deficiencies in the Draft EIR and Final EIR. The responses contained herein demonstrate that the Draft EIR's analyses and conclusions are correct and that the Final EIR has been appropriately prepared to satisfy CEQA compliance requirements. For the reasons outlined in this memorandum, the comments do not present substantial new information, do not necessitate revisions to the Draft EIR or Final EIR, and do not trigger the need for recirculation of the Draft EIR or Final EIR, or the conduct of additional environmental review pursuant to CEQA Guidelines § 15088.5.

Commenter Letter: Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy dated April 16, 2024.

1-1 This comment consists of introductory remarks and identifies that the comments in this letter are being provided by Adams Broadwell Joseph & Cardozo on behalf of the Californians Allied for a Responsible Economy (CARECA) and provides a summary of the past comments submitted on the Project during the Draft's EIR public review period. This comment also introduces the comment's supporting documents drafted by Norm Mashall and Dr. James Clark, and asserts that the Staff Report, Final EIR, and technical appendices fails to meaningfully address or correct major flaws CARECA identified in the Draft EIR. Response to the comments made are provided below in this memorandum. Thus, no further response is required.

1-2 The commenter provides a summary of the issues raised in the body of the comment letter. The commenter asserts that the Final EIR underestimates the number of vehicle trips that would be generated by the Project, the distance that Project-related truck trips would travel, and the quantified health risks and fails to provide an adequate cumulative impacts analysis. Additionally, the commenter states that the City did not add a condition of approval for the Project addressing a 10% limitation to cold storage uses. As described in the following responses, the commenter's assertions are incorrect. Refer to Response to Comments 1-8 to 1-27.

1-3 The commenter recommends that the City revise and recirculate the Draft EIR. As presented in this response memorandum, no additions, revisions, or corrections to the Draft EIR are necessary and no recirculation of the Draft EIR or Final EIR would thus be required.

1-4 The comment includes a statement of interest describing CARECA's organization, role, members, and purposes. The statement of interest is noted. Employment and business concerns raised in this comment do not raise any associated environmental issues and are therefore not within the purview of CEQA; however, this comment will be provided to the City's decision makers for their review and consideration of the Project as a whole. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

1-5 The commenter claims that a statement made about CARECA's business interests in Final EIR Response to Comment A-3 was improper and appears intended solely to influence City decisionmakers to disregard the valid environmental concerns raised in CARECA's comments. Irrespective of the statement, all comments submitted to the City on the Draft EIR and Final EIR about environmental topics have been thoughtfully considered and appropriately addressed. This comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

1-6 The commenter continues to state that the statement made about CARECA's business interests in Final EIR Response to Comment A-3 is incorrect and summarizes the past efforts that organized labor unions have made in the environmental review process. The commenter further requests that the EIR be revised to remove the statement. The Final EIR was published in the agenda packet for the Project's DAB meetings and Planning Commission hearing. The request for removal is acknowledge and this comment will be provided to the City's decision makers for their review and consideration of the Project as a whole. This

comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

1-7 The commenter summarizes Section 15064 of the CEQA Guidelines and case law related to CEQA processes and procedures. This comment is informational does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

1-8 The commenter reiterates previous statements alleging inadequacy of the Project's trip generation estimates disclosed in the Draft EIR. The City disagrees with the commenter's statements. The commenter's statements have been previously addressed in the Final EIR. Please refer to Response to Comment A-6 of the Final EIR (FEIR, pp. 2-38, 2-39). Response to Comment A-6 substantiates the EIR preparers' expertise and qualifications in preparing trip generation estimates as follows: "Urban Crossroads, a firm of professional traffic consultants and transportation engineers, was the author of the Project's traffic study and the study was reviewed and independently accepted by the City for accuracy" (FEIR, p. 2-38).

The basis for the EIR trip generation estimates is also fully substantiated at Final EIR Response A-6. As noted at Final EIR Response A-6:

"Although the Project's anticipated use and size most closely aligns with the ITE Warehousing land use category, a mix with the High-Cube Cold Storage Warehouse rate was selected because the overall daily trip rate would be more conservative (higher) as compared to the ITE Warehousing rate and would account for refrigerated vehicles for the purposes of other technical studies (air quality, health risk assessment, greenhouse gas, etc.) in the event that up to 10% of the building was used for a cold storage purpose. The Project (warehousing use) evaluates the trip generation based on a mix of the Warehousing (ITE 150) and High-Cube Cold Storage (ITE 157) rates which is a reasonable and conservative representation of the mix of potential uses for the Project" (FEIR, p. 2-39).

As indicated above, rather than an underestimation of Project trip generation asserted by the commenter, the Draft EIR trip generation estimates likely overstate Project trip generation. Moreover, the Draft EIR trip generation estimates assume Project development and occupancy at maximum allowable development intensities. Thus, irrespective of whether the Project is fully developed or fully occupied, the trip generation projection is a reasonable forecast. Additionally, the EIR trip generation estimates do not assume or take any credit for trip reduction that may be achieved through the EIR VMT mitigation measures. Based on the conservative trip generation rates and assumed maximum development intensity and occupancy, trip generation estimates presented in the EIR represent ta reasonable forecast of the likely maximum impact condition.

With regard to the commenter's suggested condition of approval to limit Project trip generation to the trip generation estimates presented in the Draft EIR, it is first important to recognize the purpose of trip generation modeling. The purpose of the Draft EIR trip generation modeling is to describe likely aggregate maximum impact conditions. It is not the intent or purpose of trip generation modeling to establish empirical limits on development trip generation. Further, trip generation for any development is periodically variable and is not practically monitored or controlled as means of effecting change. Trip

generation for the Project considered here would vary over the course of a day, a week, seasonally, and yearly. Trip generation would also vary as uses are occupied, vacated, and reoccupied. A "condition of approval limiting trip generation to the number assumed in the EIR" as offered by the commenter is not functionally meaningful. That said, should uses be proposed that could result in effects (e.g., trip generation) substantially different than are considered and addressed in the EIR, the City would evaluate those proposals as required under CEQA.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project trip generation. No additions, revisions, or corrections are necessary and no further response is required.

1-9 The commenter summarizes the previous comment made during the Draft EIR's period review period and the responses provided in the Final EIR related to the proposed 10% of high-cube cold storage uses. The commenter states that the condition of approval to limit cold storage use to no more than 27,034 square feet was not found in the agenda packet for the DAB meetings. In response, at the April 15, 2024 DAB meeting, the DAB recommended the Project for approval with an added condition of approval to limit cold storage warehouse use to no more than 27,034 square feet. If more than 27,034 square feet of cold storage square footage is proposed as part of building permits or tenant improvements and would produce greater adverse environmental effects than those disclosed in the EIR, an amendment to the Project approvals would be required, which would be subject to additional CEQA review.

1-10 The commenter reiterates previous comments alleging inadequacy of the Draft EIR analyses of cumulative air quality impacts. The City disagrees with the commenter's statements. The commenter's statements have been previously addressed in the Final EIR. Please refer to Final EIR Response to Comment A-14 (FEIR, pp. 2-41, 2-42). Response to Comment A-14 substantiates the Draft EIR basis for assessment of cumulative air quality impacts. In summary, Response A-14 clearly states and demonstrates that:

- The EIR air quality analysis, including the analysis of cumulative air quality impacts has been prepared by certified experts in the field; and

- The EIR analysis of cumulative air quality impacts conforms with South Coast Air Quality Management District (SCAQMD) protocols and methodology for evaluating cumulative air quality impacts.

The commenter is again advised that the SCAQMD is the regulatory authority on air quality charged with the responsibility of ensuring the improvement of air quality in the South Coast Air Basin. The commenter speculates on "updated thresholds" for air quality impacts. Absent these "updated thresholds" the EIR properly evaluates air quality impacts in the context of existing thresholds, protocols, and methodologies.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts

including analysis of cumulative air quality impacts. No additions, revisions, or corrections are necessary and no further response is required

1-11 The commenter asserts that Final EIR Responses to Comments A-14, A-15, and A-16 are non-responsive to the commenter's remarks related to cumulative impacts analysis and summarizes recent case law in the City of Fontana on SCAQMD's cumulative impacts methodology. Refer to Response to Comment 1-10 above regarding the Project's methodology in determining cumulative air quality impacts, which follows SCAQMD directives. The City's experts disagree with the commenter and no further response is required.

1-12 The commenter states that the Project's Mobile Source Health Risk Assessment (HRA; *Technical Appendix B2 of the Draft EIR*) underestimates the Project's operational health risk impacts on residential receptors and workers by failing to account for building downwash in the AERMOD analysis. The City disagrees with the commenter's statements. Adequacy and accuracy of the HRA is substantiated in detail in the Draft EIR, Final EIR, and the whole record before the Lead Agency. Specific responses to various alleged inadequacies regarding the HRA and its modeling inputs and protocols are presented in detail at Final EIR Response to Comment A-17, B-34, B-35, B-36, et. al. (FEIR, pp. 2-43, 2-92, 2-93, et al.)

With specific regard to effects of building downwash, for the Project, idling emissions are effectively line volume sources and have been modeled as consistent with applicable AERMOD protocols. Per the User's Guide for the AMS/EPA Regulatory Model (AERMOD), Section 3.3.9, Specifying Building Downwash Information, the building downwash algorithms do not apply to volume or area sources. The Project's Air Quality Impact Analysis experts (*Technical Appendix B1 of the Draft EIR*) have therefore concluded that truck idling emissions sources resulting from the Project would not be materially affected by downwash. Further, it should be noted that the Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of health risk impacts including any effects of building downwash. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

1-13 The commenter asserts that the Project's HRA underestimates the Project's health risk impacts by relying on non-standard daily breathing rates for sensitive receptors. The commenter reiterates comments alleging inadequacy of the HRA, citing inconsistency with OEHHA guidance. Adequacy and accuracy of the HRA in total are addressed previously at Final EIR Response to Comment A-16, A-17, B-35, B-36, et. al. (FEIR, pp. 2-42, 2-43, 2-92, 2-93, et al.). First, it is important to note that the Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site. Conformance with applicable OEHHA guidance and exposure rates is extensively documented in the Project's HRA pp. 19 to 21, and Mobile Source Health Risk Assessment Appendix 2.4 (*Technical Appendix B2 of the Draft EIR*). The Project air quality analysis experts have amassed more than 30 years of

experience in the field of Health Risk Analysis and are fully knowledgeable in the application of OEHHA guidance and all its nuances.

Moreover, the commenter's assertion that an alternative interpretation and application of OEHHA guidance would somehow materially affect the EIR conclusions regarding health risks is not supported by substantial evidence. In this latter regard, as presented in the Draft EIR:

- "At the Maximally Exposed Individual Resident (MEIR), the maximum incremental cancer risk attributable to Project construction-source DPM emissions is estimated at <0.01 in one million, which is far less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable threshold of 1.0" (DEIR, p. 4.2-35).

- "At the MEIR, the maximum incremental cancer risk attributable to Project operational-source DPM emissions is estimated at 0.01 in one million, which is far less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0" (DEIR, p. 4.2-35).

- "At the Maximally Exposed Individual Worker (MEIW), the maximum incremental cancer risk impact is 0.25 in one million which is far less than the SCAQMD's threshold of 10 in one million. Maximum non-cancer risks at this same location were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0" (DEIR, p. 4.2-36).

- "There are no schools within one-quarter mile of the Project Site. The nearest school is Chaparral Elementary School, which is located approximately 11,200 feet southeast of the Project Site. Because there is no reasonable potential that TAC emissions would cause significant health impacts at distances of more than one-quarter mile from the air pollution source, the Project would result in less-than-significant impacts to any schools in the vicinity of the Project" (DEIR, p. 4.2-36).

As summarized above, none of the evaluated health risk scenarios even approach applicable significance thresholds. Project-source health risks are effectively orders of magnitude below applicable thresholds. Any variant in interpretation of OEHHA guidance such as is suggested by the commenter would not materially affect the EIR health risk significance conclusions.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of health risk impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

1-14 The commenter quotes Section 15065(a)(4) of the CEQA Guidelines and opines that the City failed to meet CEQA's requirement to accurately disclose the Project's impacts on public health and support its

conclusions with substantial evidence. The City and its experts disagree. Refer to Response to Comment 1-12 and 1-13 above regarding the Project's HRA analysis. No further response is required.

1-15 The commenter summarizes the previous comments made during the Project's Draft EIR public review period and Final EIR Response to Comment A-18 regarding the Draft EIR's alleged underestimation of truck trip lengths. The comment does not identify any specific concerns or provide evidence related to alleged deficiencies in the Draft and Final EIR. Refer to Response to Comment 1-16 for a response to the commenter's allegation about an underestimation of truck trip lengths and trip rates. Thus, no further response is required.

1-16 The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, *Project Description*, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages. Commenter statements regarding truck trip lengths have been previously addressed in detail at Final EIR Response to Comments A-18, A-19, A-28 (FEIR, pp. 2-43, 2-44, 2-45). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of vehicle trip lengths and all impacts related to or attributable vehicle trip lengths. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

1-17 The commenter repeats comments made by Dr. Clark regarding the relationship between the Ports and warehouses and the alleged underestimation of trips, leading to alleged underestimations of transportation, air quality, and greenhouse gas emissions (GHG) impacts. Refer to Response to Comment 1-16 above regarding sufficiency of the Project's truck trip assumptions as reasonable projections. The City's experts disagree with the commenter and no further response is required.

1-18 The commenter states that the Draft and Final EIR do not include sufficient investigation into energy conservation measures that might be available or appropriate for the Project. Refer to Response to Comment 1-20 below for a detailed discussion of energy conservation measures.

1-19 The commenter states that CEQA requires an environmental document to discuss mitigation measures for significant environmental impacts, including "measures to reduce the wasteful, inefficient, and unnecessary consumption of energy" and lists recommended mitigation measure listed under Appendix F of the CEQA Guidelines. The comment does not identify any specific concerns or provide evidence related to alleged deficiencies in the Draft and Final EIR. Thus, no further response is required. Refer to Response to Comment 1-20 below for discussion of Appendix F of the CEQA Guidelines.

1-20 The commenter cites *California Clean Energy Commission v. City of Woodland* for the proposition that the Project's EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options and that the Final EIR fails to analyze the feasibility of common energy consumption measures such as solar photovoltaics. As stated in Appendix F of the CEQA Guidelines, "potentially significant energy implications of a project shall be considered in an EIR to the extent relevant and applicable to the project. The following list of energy impact possibilities and potential conservation measures is designed to assist in the preparation of an EIR. In many instances specific items may not apply or additional items may be needed. Where items listed below are applicable or relevant to the project, they should be considered in the EIR." As discussed in Draft EIR Section 4.4, *Energy*, substantial evidence is provided that the Project would not result in significant energy impacts and impacts would be less than significant (refer to Draft EIR pp. 4.4-5 to 4.4-6). Nevertheless, an analysis of the factors identified in CEQA Guidelines Appendix F is provided in Table 1-1, *CEQA Guidelines Appendix F Energy Analysis*. As shown, the Project would not result in potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation; and impacts would be less than significant.

Table 1-1 CEQA Guidelines Appendix F Energy Analysis

CEQA Guidelines Appendix F Factors	Analysis
The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project, including construction, operation, maintenance and/or removal. If appropriate, the energy intensiveness of materials may be discussed. The effects of the project on energy resources. The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.	The Project's energy requirements by fuel type during construction and operation are analyzed in Section 4.4, *Energy*, of the Draft EIR (refer to Draft EIR pp. 4.4-5 to 4.4-6). As discussed, construction equipment fuel use would be typical for the type of construction proposed because there are no aspects of the Project's proposed construction process that are unusual or energy intensive, and Project construction equipment would conform to the applicable CARB emissions standards. Construction contractors would be required to comply with applicable CARB regulation regarding retrofitting, repowering, or replacement of diesel off-road construction equipment. The Project is located on an infill site that is surrounded by existing urban uses; the existing transportation facilities and infrastructure would provide future employees and visitors associated with the Project access to a mix of land uses near the Project, thus further reducing fuel consumption demand. Additionally, the Project would implement sidewalks, facilitating and encouraging pedestrian access as well as providing 25 electric vehicle parking stalls that would further promote fuel efficient vehicles. In compliance with the

CEQA Guidelines Appendix F Factors	Analysis
	California Green Building Standards Code and City requirements, the Project would promote the use of bicycles as an alternative means of transportation by providing bike racks near the building entrances and adjacent to the electrical room. For these reasons, both construction-related and operational-related transportation fuel consumption would not result in a significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources. Therefore, impacts related to vehicle fuel consumption would be less than significant.
The effects of the project on local and regional energy supplies and on requirements for additional capacity. The effects of the project on energy resources.	Project building operations would result in the consumption of electricity, which would be supplied to the Project by SCE. The Project site is an infill development, and electricity was previously provided to the site by SCE for the prior industrial use. As disclosed in Draft EIR Section 4.4, *Energy*, operations for the Project are projected to result in 1,774,048 kWh of electricity use annually and demand a net of 746,675 kWh of electricity annually when taking account of energy consumption of existing uses on the Project site that would cease operation to develop the Project. Furthermore, the Project would be required to obtain a commitment of service from SCE, which would ensure that there would be no adverse and significant environmental effects on local or regional energy supplies beyond those appropriately planned for by SCE. Therefore, the Project would not result in a significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, and impacts would be less than significant.
The effects of the project on peak and base period demands for electricity and other forms of energy.	The Project consists of a proposed warehouse development on a site that would be redeveloped and was previously used for industrial uses. The Project would not adversely affect peak and base period demands for electricity that would be atypical of other industrial uses. Furthermore, the Project would be required to obtain a will serve

CEQA Guidelines Appendix F Factors	Analysis
	letter/commitment of service from SCE to ensure that SCE will serve the Project's electricity requirements per the California Public Utilities Commission and Federal Energy Regulatory Commission tariffs. SCE considers effects on peak and base period demands for electricity when issuing will serve letters. Impacts would thus be less than significant.
The degree to which the project complies with existing energy standards.	As analyzed under Threshold b of Section 4.4 of the Draft EIR, the Project would comply with and not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. During construction, the Project would be obligated to comply with California Code of Regulations Title 13, Sections 2449 and 2485, which limit idling from both on- road and off-road diesel-powered equipment and are enforced by the Air Resources Board (ARB). During operation, the Project is required to be designed and constructed in accordance with California Building Standards Code Title 24 energy efficiency standards. Title 24 standards are widely regarded as the most advanced energy efficiency standards in the United States, and would help reduce the amount of energy required for lighting, water heating, and heating and air conditioning in buildings and promote energy conservation. Additionally, the Project would be constructed to achieve Leadership in Energy and Environmental Design (LEED) standards. The Project would comply with existing energy standards and impacts would be less than significant.

1-21 The commenter states that the Final EIR acknowledges that a diesel backup generator may be required for Project operations, but fails to evaluate measures to reduce this source of energy consumption, such as use of alternative fuel sources. As discussed in Final EIR Response to Comment A-10, if Project operations would require the use of an emergency water pump and generator, emissions would be negligible and less than SCAQMD's regional thresholds. Additionally, the intermittent use of a backup generator would not result in a substantial or measurable amount of emissions, since by the very nature of the activity, it would be short-term, intermittent, and infrequent. Thus, contrary to the commenter's assertion, measures to reduce this source of temporary and intermittent use of energy is not required. The City's experts disagree with the commenter and no further response is required.

1-22 The commenter states that the Final EIR fails to evaluate the feasibility of more stringent idling requirements over existing requirements. Although the Project Applicant can place signs on the Project site to advertise an on-site idling restriction that is shorter in duration than the current CARB requirement of 5 minutes, there would be no enforcement mechanism that the City can assure to enforce adherence. As such, a mitigation measure to this effect has not been added to the Final EIR.

1-23 The commenter asserts that the Final EIR discussion on construction energy conservation measures violates CEQA Guidelines Appendix F due to not evaluating the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators. The commenter is incorrect in stating that the Project did not analyze the use of existing power source. As discussed in Section 3.0, *Project Description*, of the Draft EIR, new dry utility infrastructure would be installed underground and within the Project Site with the exception of any electrical lines carrying voltages that SCE does not allow to be undergrounded (refer to Draft EIR p. 3-10). Contrary to the commenter's assertion, the construction energy demands for the Project are based on using existing power sources. Thus, no additions, revisions, or corrections to the Draft EIR are necessary.

1-24 The commenter states that Final Response to Comment B-59, B-56, and B-53 does not evaluate the feasibility or effectiveness of energy conservation measures, and thus does not provide the analysis required by CEQA Guidelines Appendix F. The City recognizes that CEQA requires the incorporation of all feasible mitigation measures where there are significant and unavoidable impacts identified. An EIR must describe feasible measures that could minimize the project's significant adverse impacts. 14 Cal Code Regs §15126.4(a)(1). An EIR may decline to propose a mitigation measure that would not effectively address a significant impact. As discussed in Section 4.4, *Energy*, of the Draft EIR, the Project would not result in significant energy impacts and impacts would be than significant (refer to Draft EIR pp. 4.4-5 to 4.4-6). Additionally, refer to Response to Comment 1-20 above for the discussion of Appendix F of the CEQA Guidelines. Thus, no additions, revisions, or corrections to the Draft EIR are necessary.

1-25 The commenter states that the Final EIR's energy analysis fails adequately analyze measures to reduce the wasteful, inefficient, and unnecessary consumption of energy, and fails to meaningfully address Appendix F's considerations of whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Refer to Response to Comment 1-20 to 1-24 above. Thus, no additions, revisions, or corrections to the Draft EIR are necessary.

1-26 The commenter states the staff report stating that the Project does not meet the finding under Section 4.02.025(D) of the City's Municipal Code which states "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project." As presented in this memorandum and Final EIR, the Draft EIR adequately estimates the Project's health risk, air quality, GHG, and energy impacts and the City's experts disagree with the commenter. Thus, no additions, revisions, or corrections to the Draft EIR are necessary.

1-27 The commenter states the staff report lacks support to make the following finding in recommending adoption of the FEIR: the draft EIR contains a complete and accurate reporting of the environmental

impacts associated with the Project. Contrary to the commenter's assertion, this memorandum and Final EIR demonstrates that the Draft EIR's analyses and conclusions are correct and satisfy CEQA compliance requirements. Thus, no additions, revisions, or corrections to the Draft EIR are necessary.

1-28 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

1-29 This comment consists of introductory remarks from Smart Mobility and summarizes the findings of the commenter's letter, stating that the Draft EIR acknowledges a significant and unavoidable VMT impact, asserting that the proposed VMT mitigation measure is not fully specified or quantified, and claiming that the Project's trip generation and GHG emissions could be much higher than assumed. As described in the following responses, the commenter's assertions are incorrect. Refer to Response to Comments 1-30 to 1-36. Thus, no further response is required.

1-30 The commenter claims that the truck trip lengths relied upon in the Draft EIR do not follow SCAQMD's recommendations. Refer to response to Comment 1-16 regarding the Project's assumed truck trip lengths and demonstrating that the trip lengths are a reasonable and reliable assumption.

1-31 The commenter reiterates previous comments presented by CARECA alleging inadequacy of the Draft EIR's VMT mitigation measures. The commenter misstates the previous Final EIR response. In context, the commenter's statements have been previously addressed at Final EIR Response to Comment A-24, excerpted in pertinent part below:

In response to the commenter's assertions, a supplemental VMT mitigation assessment has been prepared for the Project to evaluate further potential trip reduction measures under the California Air Pollution Control Officers Association (CAPCOA)'s Handbook (Attachment B to this Final EIR). As stated under the supplemental VMT mitigation assessment, when considering which transportation measures are applicable from the Handbook, factors such as project type, scale and locational context are each important considerations for determining measure applicability. Based on these factors, measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant (Final EIR, p. 2-44).

The Draft EIR does not state that the Project VMT impacts cannot be mitigated. Rather, the Draft EIR identifies feasible VMT mitigation measures available to the Project, and requires implementation of those feasible measures. Here, the Draft EIR has evaluated commenter-recommended CAPCOA VMT mitigation measures, and has determined that the recommended measures are of limited applicability to the Project, and would not substantially or demonstrably reduce the Project VMT impacts. Accordingly, CAPCOA measures recommended by the commentor are not included in the Draft EIR.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead

Agency maintains its position regarding accuracy and adequacy of the EIR analysis of VMT impacts and VMT mitigation. No additions, revisions, or corrections are necessary and no further response is required.

1-32 The commenter suggests requiring zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks. Refer to response to Comment B-53 in the Final EIR regarding the infeasibility of using zero-emission vehicles. Thus, the City determines that additional mitigation is not warranted.

1-33 The commenter suggests to limit the daily number of trucks allowed at the Project site to levels analyzed in the EIR. The recommendation to impose and enforce a truck trip cap is not feasible or practical nor required by CEQA. The Project entails the establishment of one warehouse building and the Project Applicant intends for the building to be occupied by a warehouse use with potentially up to 27,034 sf used for cold storage (chilled, cooled, or freezer space). CEQA requires that an EIR evaluate the proposed Project based on reasonable assumptions and foreseeable actions. The number of passenger vehicle and truck trips that the Project is expected to generate is based on Institute of Transportation Engineers (ITE) in their Trip Generation Manual (10th Edition), and SCAQMD recommendations for vehicle mix, which rely on surveyed data from other operating industrial warehouse buildings, which is reasonable and reliable information. The comment does not present any evidence that truck trips associated with the proposed Project would be greater than disclosed in the DEIR. There is no substantive information presented by this comment or by any of the information in the Project's administrative record that contradicts the reasonable assumptions made in the Draft EIR about the expected number of truck trips. Instituting a cap on the number of trucks that can access the Project's building is not required under CEQA, nor would it be reasonable or feasible for the City to monitor and enforce such a requirement. The Draft EIR has made reasonable assumptions based on substantial evidence by using ITE and SCAQMD recommendations based on a reasonable type of building occupant that would be permitted by the site's zoning. For this reason, the City respectfully rejects the commenter's recommendation to impose and enforce a numerical cap on the number of trucks that the Project attracts during its operation.

1-34 The commenter suggests to provide electric vehicle charging stations and hookups for truckers. Refer to response to Comment B-60 in the Final EIR regarding the infeasibility of using zero-emission vehicles. Thus, the City determines that additional mitigation is not warranted.

1-35 The commenter reiterates previous statements alleging inadequacy of the Draft EIR's trip generation estimates. The Lead Agency disagrees with the commenter's statements. The commenter's statements have been previously addressed in the Final EIR. Please refer to Final EIR Response to Comment A-6 (FEIR, pp. 2-38, 2-39). Further evidence supporting the EIR's trip generation methodology and results are presented in this response memorandum, including in Response to Comment 1-8.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project trip generation. No additions, revisions, or corrections are necessary and no further response is required

1-36 The commenter notes that the Draft EIR assumes that the Project would operate 24 hours per day, 7 days per week. By assuming 24 hours per day, 7 day per week operations, the Draft EIR appropriately assumes likely maximum impact conditions. This is not determinant of how the Project uses would function at their completion and occupancy.

Commenter speculation regarding parking space occupancy rates and term lengths is noted. Commenter statements regarding trip generation have been previously addressed herein. Basis for the EIR trip generation is extensively substantiated in the Draft EIR, Final EIR, the Responses provided in this response memorandum, including in Response to Comment 1-18. and the whole record before the Lead Agency. Refer also to Response to Comment 1-8.

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of Project trip generation, and all impacts related to or attributable to Project trip generation. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

1-37 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

1-38 The commenter Clark & Associates provides introductory comments and does not raise any issues concerning the environmental analysis provided in the Draft EIR. Thus no further response is required.

1-39 The commenter provides a summary of the Project. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

1-40 The commenter states that the Project's Mobile Source Health Risk Assessment (HRA; *Technical Appendix B2 of the Draft EIR*) shows that building downwash was not incorporated into the AERMOD analysis of the Project and the AERMOD model should also incorporate the building downwash for receptors near the Project. Refer to Response to Comment 1-12 regarding the discussion of building downwash. Thus, no further response is required.

1-41 The commenter states that air quality analysis relies on an input value from ap-42 that is rated as poor and may be unreliable. The commenter speculates on inadequacy of the Draft EIR construction-source emissions analysis based on the analysis' emissions factor for stone crushing. The Lead Agency disagrees. First, the commenter's speculative remarks regarding increased emissions due to an alternative "emission factor for crushing stones" are not supported by facts or quantified analysis. In contrast, the Draft EIR construction-source emissions analysis accurately calculates and quantifies all construction-source

emissions based on established and accepted CalEEMod protocols and methodologies.[1] The Project's air quality analysis experts have amassed more than 30 years in the field of air quality analyses, including construction-source emissions analyses, and are fully knowledgeable in the application of CalEEMod and all its nuances.

Moreover, the commenter's assertion that an alternative "emission factor for crushing stones" would somehow materially affect the EIR conclusions regarding construction-source emissions is not supported by substantial evidence. In this latter regard, as presented at Draft EIR Table 4.2-8, *Peak Construction Emissions Summary*, and Draft EIR Table 4.2-10, *Localized Construction-Source Emissions Summary* (both reproduced below for ease of reference), none of the Project construction source-emissions levels even approach applicable significance thresholds. Any variant in "emission factors for crushing stones" would not materially affect construction-source emissions levels or related significance conclusions.

Draft EIR Table 4.2-8 Peak Construction Emissions Summary

Year	Emissions (lbs./day)[1]					
	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Summer						
2023	1.77	39.60	71.80	0.13	9.9	4.32
2024	47.20	30.20	56.60	0.07	2.58	0.89
Winter						
2023	1.48	21.70	39.80	0.06	1.98	0.65
2024	47.10	30.40	53.50	0.07	2.58	0.89
Maximum Daily Emissions	**47.20**	**39.60**	**71.80**	**0.13**	**9.97**	**4.32**
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

[1] PM_{10} and $PM_{2.5}$ emissions include fugitive dust from crushing activities.
CalEEMod construction-source (unmitigated) emissions are presented in Appendix 4.1 of the Project's AQIA. **Source**: (Urban Crossroads, 2022a, Table 4-5)

[1] The **Cal**ifornia **E**missions **E**stimator **Mod**el® (CalEEMod) is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects. The model quantifies direct emissions from construction and operation activities (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. Further, the model identifies mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from measures chosen by the user.
The model was developed for the California Air Pollution Officers Association (CAPCOA) in collaboration with the California Air Districts. Default data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California Air Districts to account for local requirements and conditions. The model is free of charge and will be periodically updated when modifications are warranted.
CalEEMod is a comprehensive tool for quantifying air quality impacts from land use projects located throughout California. The model can be used for a variety of situations where an air quality analysis is necessary or desirable such as preparing California Environmental Quality Act (CEQA) or National Environmental Policy Act (NEPA) documents, conducting pre-project planning, and, verifying compliance with local air quality rules and regulations, etc.

Draft EIR Table 4.2-10 Localized Construction-Source Emissions Summary

Construction Activity	Year	Scenario	Emissions (lbs./day)			
			NO_X	CO	SO_X	PM_{10}
Demolition/ Crushing	2023	Summer	12.70	18.70	0.70	0.29
		Winter	n/a	n/a	n/a	n/a
		Maximum Daily Emissions	**12.70**	**18.70**	**0.70**	**0.29**
		SCAQMD Localized Threshold	118	863	280	141
		Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**
Site Preparation	2023	Summer	15.70	30.00	5.76	2.79

CalEEMod unmitigated localized construction-source emissions are presented in Appendix 4.1 of the Project's AQIA.
Source: (Urban Crossroads, 2022a, Table 4-11).

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of construction-source air quality impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

1-42 The commenter claims that Project's HRA incorporates non-standard daily breathing rates for sensitive receptors. Refer to Response to Comment 1-13 regarding appropriateness of the Project's HRA analysis and a discussion of non-standard daily breathing rates. No further response is required.

1-43 The commenter states that the average truck trip length of 40 miles used in the air quality analysis does not match the length(s) used to support other warehouse projects. The commenter reiterates previous statements alleging inadequacy of the EIR air quality analysis based on the commenter's assumed Project truck trip lengths. The Lead Agency disagrees with these statements. Commenter statements regarding truck trip lengths have been previously addressed in detail at Final EIR Response to Comments A-18, A-19, A-28 (FEIR, pp. 2-43, 2-44, 2-45).

The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of vehicle trip lengths and all impacts related to or attributable vehicle trip lengths. No additions, revisions, or corrections to the EIR are necessary and no further response is required

1-44 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Mr. Ochoa, Development Advisory Board Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant"), including the Final Environmental Impact Report ("FEIR") prepared by the City of Ontario ("City"). The FEIR and development plan will be considered at the April 15, 2024 Development Advisory Board meeting as Agenda Item B. The Board will make a recommendation to the Planning Commission regarding certification of the EIR and approval of the Development Plan application.[1] 1-1

CARE CA submitted comments on the Draft EIR ("DEIR") on October 5, 2023, accompanied by expert comments, showing that the DEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant cumulative impacts, air quality and public health impacts,

[1] Staff Report, pg. 1. The Staff Report incorrectly states that the Board recommendation to the Planning Commission is to "adopt the draft EIR." (pg. 8). However, the operative CEQA document for the Project is currently the FEIR, which includes both the Draft EIR and the City's responses to comments on the Draft EIR.

printed on recycled paper

greenhouse gas ("GHG") emissions, energy and transportation impacts. We reviewed the Board Staff Report, the FEIR, and its technical appendices with the assistance of transportation expert Norm Marshall[2] and air quality expert Dr. James Clark.[3] The FEIR contains responses to CARE CA's comments. However, it fails to meaningfully address or correct major flaws CARE CA and its experts identified in the DEIR. 1-1

As explained herein, the FEIR still underestimates the number of trips generated by the Project and the distance of Project-related truck trips, thus continuing to underestimate the severity of the Project's public health, air quality, GHG, and transportation impacts. The FEIR also continues to assume that cold storage uses would be limited to 10% of the Project, reasoning that a condition of approval will limit cold storage to 10% of the Project's square footage, but no such condition of approval is included in the conditions of approval attached to the Staff Report. The FEIR still fails to provide an adequate cumulative impacts analysis that considers the Project's combined impacts with other existing and proposed industrial developments near the Project, in violation of CEQA. And the FEIR's quantified health risk analysis still underestimates impacts. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR. 1-2

The Staff Report incorrectly concludes that the "draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[4] The Staff Report recommends that the Planning Commission adopt the draft EIR[5] and approve the Project's Development Plan Application.[6] These recommendations are unsupported due to the major flaws in the Project's environmental review. 1-3

CARE CA urges the Board to recommend that the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker 1-4

[2] Mr. Marshall's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit B**.

printed on recycled paper

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite. 1-4

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

A. CARE CA Has a Direct Interest in Enforcing Compliance with CEQA and Land Use Laws

The City, in FEIR Response A-3, claims that CARE CA's "primary interest is securing jobs through a project labor agreement."[7] This statement is an improper ad hominem attack on members of the public who submitted comments on the Draft EIR. It is also incorrect, unsupported by any facts in the record, and contrary to the purpose of an FEIR's responses to comments, which is to "describe the disposition of each significant environmental issue that is raised by commenters,"[8] not to attack the commenter. 1-5

The FEIR's statement appears intended solely to influence City decisionmakers to disregard the valid environmental concerns raised in CARE CA's

[7] FEIR, pg. 2-37.
[8] Pub Res. Code §21091(d); 14 Cal Code Regs §§15088(c), 15132(d), 15204(a); *City of Long Beach v Los Angeles Unified Sch. Dist.* (2009) 176 Cal. App. 4th 889, 904.

printed on recycled paper

comments, and distract from the substantial evidence presented by CARE CA's experts regarding the Project's unmitigated environmental and public health impacts. This is an improper use of an FEIR, which is intended to ensure that "public participation in the environmental review process is meaningful."[9] It is also irrelevant, because community groups, labor organizations, and other members of the public have standing under CEQA to participate in the public comment period required by law, and California courts have explained that ad hominem responses are irrelevant.[10]

1-5

The FEIR's statement is also factually incorrect. For decades, labor organizations like the union members of CARE CA have relied on the CEQA process to enforce environmental and public health protections – *including worker health protections* – for new development projects as a means of ensuring a safe working and living environment for the public, including themselves and their families. CEQA is especially important to union members who construct projects because they are the first in line to be exposed to health and safety impacts that exist onsite – impacts like soil contamination, air pollution from construction equipment, and excess noise. For many, CEQA has become the only place where communities of color, which includes workers represented by labor unions, have a voice in the process of developing projects in their communities.

1-6

California unions regularly participate as interested members of the public in the CEQA process. Their participation has led to decades of stronger air quality and toxic material controls at construction sites and housing developments, lowered emissions at industrial sites, increased electrification and renewable gas and fuels, reductions in GHG emissions, reduced construction noise and traffic in residential areas, improved water quality, water conservation, and protections for natural landscapes and sensitive biological resources. Union participation in the CEQA process has resulted in improved analysis and mitigation in agencies' CEQA documents, and, in some cases, successful litigation requiring agencies to comply with CEQA where the issues unions raised were not resolved during the administrative process. In short, ***union participation in the CEQA process leads to cleaner, safer, and more sustainable development in the State***. This is exactly what CEQA is designed to accomplish – protecting people and the environment through active public engagement in the environmental process.

[9] *City of Long Beach,* 176 Cal. App. 4th at 904.
[10] *Bakersfield Citizens for Local Control v. City of Bakersfield* (Cal. Ct. App. 2004) 124 Cal.App.4th 1184, 1196 ("[W]e will not dignify with extended comment [developer]'s complaint that BCLC is just a 'front' for a grocery worker's union whose disgruntled members feel threatened by nonunionized Wal-Mart's entry into the grocery business. As will be explained, BCLC has standing to pursue this litigation and it exhausted its administrative remedies. This is sufficient.")

printed on recycled paper

Public agencies have also acknowledged unions for their valuable contribution to the environmental review process. For example, when approving the Elk Hills project, the California Energy Commission Presiding Commissioner Michal Moore praised and thanked union coalition California Unions for Reliable Energy ("CURE") for its participation in the proceeding: **"We never would've gotten to some of the places that we did, and the resolution that we did, if it hadn't been for the – the dogged efforts of [CURE]…we came to a good place, and probably couldn't have gotten to that good place without some of the tension and – and rigor that was applied. So, thank you very much**."[11] During the evidentiary hearings, a Commissioner "**thank[ed] CURE for the technical help that Phyllis Fox [CURE expert] offered us, and certainly offered me an education that I wasn't going to get any other place**."[12]

Some unions work on constructing and operating projects after they participate in the environmental permitting process. Some developers and critics allege this means that unions are using CEQA to induce developers to enter into project labor agreements, then abandon the environmental issues – just as the FEIR does here. These allegations are not only false, they demonstrate a fundamental misunderstanding of union participation. When the unions work on projects they have challenged, ***they do not walk away from the environmental and public health issues they raise. They enforce them through binding mitigation and environmental settlement agreements***. This is consistent with CEQA's environmental purpose, and with the historic values of organized labor to solve problems, engage in civic discourse and activism, advocate for safe working conditions, and effect changes that improve their members' lives and communities.[13] 1-6

CARE CA asks that the City revise the EIR to remove this inaccurate and improper statement about CARE CA, and any other unsupported statements of dislike made about other members of the public who commented on the DEIR.

printed on recycled paper

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[14] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[15]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by law.[16] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[17] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[18] 1-7

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[19]

CEQA requires that a lead agency evaluate and prepare written responses to comments in an FEIR.[20] Agencies are required to provide "detailed written response to comments . . . to ensure that the lead agency will fully consider the environmental consequences of a decision before it is made, that the decision is well informed and open to public scrutiny, and the public participation in the environmental review process is meaningful."[21] When a comment raises a "significant environmental issue," the written responses must describe the

printed on recycled paper

disposition of each such issue raised by commentators.[22] Specifically, the lead agency must address the comment "in detail giving reasons why" the comment was "not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice."[23] 1-7

A. The FEIR Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the DEIR showed that the DEIR underestimated trips generated by the Project by relying on inappropriate Institute of Transportation Engineers ("ITE") land use codes, thus underestimating the Project's GHG and VMT impacts. Specifically, the DEIR relied on ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse), when other land use codes are applicable to the Project that have much higher trip generation rates. In particular, Mr. Marshall explained that the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[24]

The FEIR responds that the Project's design would not support a high-cube (sort) fulfillment center or high-cube parcel hub, pointing to the Project's square footage and number of parking spaces.[25] The FEIR states that the Project's anticipated use and size (270,377 sf) most closely aligns with the ITE Warehousing land use category. But Mr. Marshall explains that the Project's size equally aligns with ITE Land Use 156: High Cube Parcel Hub Warehouse, which accounts for warehouses with at least 200,000 gross square feet of floor area.[26] Mr. Marshall also explains that the Project's proposed number of parking spaces would further enable the Project to function as a High Cube Parcel Hub Warehouse. 1-8

In sum, the FEIR offers no support for is continued reliance on low trip generation rates. As a result, the City continues to rely on potentially underestimated trip generation rates which do not accurately reflect the Project's operational impacts. To the contrary, substantial evidence shows that trip generation rates could be 2.6 times greater than analyzed. To ensure adequate analysis and mitigation of this impact, Mr. Marshall recommends either applying a

[22] PRC §21091(d); 14 CCR §§15088(c), 15132(d), 15204(a).

printed on recycled paper

significantly more conservative trip generation rate, or implementing a condition of approval that trip generation will not exceed the number assumed in the EIR.[27] The EIR must be revised and recirculated to provide an accurate analysis of trip generation. 1-8

B. The FEIR Still Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

CARE CA's comments on the DEIR showed that the City lacked substantial evidence to assume that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space).[28] In Response A-7, the FEIR states that the City has added a condition of approval to the Project limiting cold storage to 27,034 sf (10% of the total sf).[29] But there is currently no indication any such condition of approval will be required. The April 15, 2024 Development Advisory Board agenda packet contains a Draft Development Advisory Board decision,[30] Land Development Division conditions of approval,[31] Landscape Planning Division conditions of approval,[32] Engineering Division conditions of approval,[33] and City of Ontario memoranda containing conditions of approval.[34] None of these documents contain a condition limiting the Project's cold storage uses. The FEIR's conclusion that the environmental impacts associated with cold storage would be limited to just 10% of the Project site therefore remains unsupported. 1-9

As explained in CARE CA's comments on the DEIR, cold storage warehouses generate greater environmental impacts than other types of warehouse.[35] CARE CA urges the City to revise and recirculate the EIR to analyze the impacts of additional cold storage use at the Project site, or to add a mitigation measure with a title restriction limiting cold storage to 10%.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the DEIR fails to consider the cumulative impacts of past, present, and probable future projects producing related or cumulative 1-10

[27] Marshall FEIR Comments, pg. 4.

printed on recycled paper

impacts. The DEIR's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[36] CARE CA's comments explained that rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and information requirements of CEQA, per caselaw such as *Kings County Farm Bureau v. City of Hanford*.[37] CARE CA also explained that SCAQMD's cumulative impacts significance thresholds, adopted in 2003, are being revised to reflect current conditions. The updated cumulative impacts significance thresholds will reflect projects' existing background MATES cancer risk and additional criteria such as whether the project would generate a high volume of diesel-fueled trucks.[38] CARE CA also discussed the Attorney General's guidance on cumulative impacts, which states that best practices include "thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[39] 1-10

In Responses 14, 15, and 16, the FEIR responds that "The Draft EIR and underlying technical studies were prepared in a matter consistent to the SCAQMD recommendation for determining cumulative impacts." The FEIR's response is non-responsive because it does not address the City's failure to comply with CEQA's legal standards for evaluating cumulative impacts that were discussed in CARE CA's comments. The FEIR also does not address the pending updates to SCAQMD's cumulative impacts methodology, which are statedly prepared in response to recent CEQA cases such as *People of the State of California v. City of Fontana.*[40] 1-11

In *People of the State of California v. City of Fontana,* the Attorney General's petition for writ of mandate challenged a Mitigated Negative Declaration ("MND")

printed on recycled paper

that erroneously applied SCAQMD guidance in the same way as the instant EIR. The petition explained:

> [T]he MND's cumulative air quality impact analysis does not account for—or even acknowledge—the multitude of other warehouses near the Project. Rather than consider the environmental setting within which the Project will be situated, the MND simply states that the Project will not result in a cumulatively considerable increase in emissions because the Project's individual air quality impacts will be less than significant. The MND even applies this reasoning to its analysis of health impacts from localized emissions, despite making no attempt to determine or disclose the severity of the existing health impacts from localized emissions in the community.[41]

The petition further explained that merely citing to SCAQMD guidance does not justify a failure to analyze a Project's cumulative impacts:

> The MND cites Appendix D of an August 2003 white paper published by the South Coast Air Quality Management District ("SCAQMD") entitled "White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution" ("2003 SCAQMD White Paper"). **To the extent that the 2003 SCAQMD White Paper asserts that any project with less than significant individual air quality impacts also necessarily has less than significant cumulative air quality impacts, it is inconsistent with CEQA** for at least the reasons stated above. Moreover, the 2003 SCAQMD White Paper lacks substantial evidence to support such a contention, and thus the MND's reliance on it violates CEQA. (Cal. Code Regs., tit. 14, § 15064.7, subd. (c).) The MND further violated CEQA by failing to provide substantial evidence to support its reliance on the 2003 SCAQMD White Paper, Appendix D as "guidance." (Ibid.) Finally, even if the MND's reliance on the 2003 SCAQMD White Paper were proper and supported by substantial evidence, the MND did not consider other evidence—such as public comments and the existence of many other sources of pollution near the Project site—showing that the Project could have a significant cumulative air quality impact. (See Cal. Code Regs., tit. 14, § 15064, subd. (b).) [emphasis added][42]

printed on recycled paper

The Attorney General's litigation resulted in a settlement which requires compliance with an ordinance adopted on April 12, 2022 that establishes sustainability standards for warehouses in Fontana, including standards intended to address cumulative air quality impacts. For example, the standards include requirements that rooftop solar panels supply 100% of power for non-refrigerated portions of facilities with buildings over 400,000 square feet, trees in automobile parking areas, zero emission motorized operational equipment, other equipment electrification requirements, and solar-ready buildings roofs.[43] These are just a few examples of feasible mitigation available to reduce cumulative air quality impacts, in compliance with CEQA. 1-11

The FEIR for the instant Project suffers from the same lack of analysis and legal errors as the MND in the Attorney General's Fontana litigation. As a result of its refusal to analyze cumulative impacts, the FEIR fails to disclose or mitigate potentially significant local and regional cumulative impacts. In sum, the FEIR has not responded to CARE CA's comments on this issue and fails to remedy the City's inadequate cumulative impacts analysis. The Project cannot be approved until the City revises and recirculates an EIR that analyzes the Project's potentially significant cumulative impacts.

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

The City prepared a Mobile Source Health Risk Assessment ("HRA") to analyze health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project.[44]

1-12

The HRA underestimates the Project's operational health risk impacts on residential receptors and workers by failing to account for building downwash in the AERMOD analysis.[45] Dr. Clark explains that building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution.[46] This downwash effect leads to higher ground-level concentration of chemicals emitted from sources.[47]

[44] DEIR, Appendix B2, pg. 25.
[45] Clark Comments, pg. 3.
[46] *Id.*
[47] *Id.*

printed on recycled paper

The HRA also underestimates the Project's health risk impacts by relying on non-standard daily breathing rates for sensitive receptors. Dr. Clark explains that the HRA unjustifiably relies on breathing rates lower than recommended by the Office of Environmental Health Hazard Assessment's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.[48] 1-13

CEQA requires an accurate analysis of human health impacts. CEQA Guidelines Section 15065(a)(4) provides that the City is required to find a project will have a significant impact on the environment and require an EIR if the environmental effects of a project will cause a substantial adverse effect on human beings. The Supreme Court has also explained that CEQA requires the lead agency to disclose the health consequences that result from exposure to a project's air emissions.[49] Courts have held that an environmental review document must disclose a project's potential health risks to a degree of specificity that would allow the public to make the correlation between the project's impacts and adverse effects to human health.[50] 1-14

Because the City's analysis underestimates the Project's health risk impacts, the City fails to meet CEQA's requirement to accurately disclose the Project's impacts on public health and support its conclusions with substantial evidence. A revised HRA must be included in a recirculated EIR.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the DEIR underestimates truck trip lengths by applying a truck trip length of 15.3 miles for 2-axle trucks, 14.2 miles for 3-axle trucks, and 40 miles for 4+-axle trucks. The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explained that the City must consider the reasonably foreseeable distance to the Project's likely trip destinations.[51] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The FEIR responds in Response A-18: 1-15

> The commenter fails to provide any evidentiary basis for the arbitrary number of 60 miles it suggests using… In fact, these recommendations are in direct opposition of the SCAQMD's recommended truck travel distance for warehousing projects within its jurisdiction (based on SCAG regional travel

[51] Marshall Comments, pg. 7.

printed on recycled paper

> demand data)… The commenter's recommended trip lengths are not supported by any substantial evidence provided by the SCAQMD and contradicts published material from SCAQMD that was utilized in the underlying analysis.[52]

1-15

The FEIR misinterprets the SCAQMD guidance. SCAQMD itself regularly comments on warehouse projects that it is essential to analyze the distance from warehouse projects to likely destinations and has emphasized that agencies should not rely solely on the 40-mile average trip length identified in its guidance. For example, SCAQMD recently commented on a warehouse project proposed for a location at a similar distance from the Ports as the instant Project:

> South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan. However, it is essential to note that **the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way**. Thus, **South Coast AQMD staff is concerned about underestimating truck emissions** due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the **more conservative trip length between 40 to 70 miles**, of which 40 miles could be used for local and **70 miles for Port trips** and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.[53]

1-16

[52] FEIR, pg. 2-43.

[53] **Exhibit C**, containing the following comment letters: SCAQMD, Comments on the Draft Subsequent Environmental Impact Report for the Hemlock Warehouse Development Project (SCH No.: 2009091089) (November 22, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/november-2023/SBC231011-05.pdf; also attached as Attachment B to Mr. Marshall's comments; SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf; SCAQMD, Comments on Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2 (September 11, 2015), pg. 3, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/september/deiroptimus.pdf?sfvrsn=2 ("Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances

printed on recycled paper

In sum, the FEIR is incorrect when it states that CARE CA's recommendation to use a 60-mile truck trip length for trips to Ports of Los Angeles and Long Beach is not supported by substantial evidence. Rather, it is the FEIR's truck trip length assumptions which are not supported by substantial evidence – SCAQMD does not recommend blind reliance on truck trip lengths of 15.3 miles, 14.2 miles, and 40 miles for warehouse projects such as the instant Project for which longer trips to and from the ports are reasonably foreseeable. 1-16

Dr. Clark's comments also discuss the relationship between the ports and warehouses like this Project. Dr. Clark discusses the large percentage of goods passing through the ports, the number of truck trips generated by the ports, and observes that the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.[54] Substantial evidence therefore demonstrates that the Project's truck trip lengths are underestimated, resulting in underestimation of transportation, air quality, and GHG impacts. The Project cannot be approved until this error is corrected in a revised and recirculated EIR. 1-17

F. The FEIR Fails to Include Sufficient Investigation into Energy Conservation Measures

The DEIR and FEIR do not include sufficient investigation into energy conservation measures that might be available or appropriate for the Project. In the DEIR, the City concludes that energy impacts of the Project would be less than significant because the Project's construction and operations would comply with state regulations.[55] But as discussed below, the Project's environmental review does not sufficiently consider energy conservation measures like solar facilities, use of alternate fuel sources, and passive energy efficiency measures to ensure the Project's energy consumption would not be wasteful, inefficient, or unnecessary. The FEIR briefly addresses some energy conservation measures in Responses B-59, B-56, and B-53, but only to explain that none are required because air quality impacts are less than significant. This analysis fails to meet CEQA's requirements. 1-18

CEQA requires an environmental document to discuss mitigation measures for significant environmental impacts, including "measures to reduce the wasteful, 1-19

described in the DEIR."); SCAQMD, Comments on Draft Environmental Impact Report (DEIR) for the Proposed Westgate Specific Plan (SCH No. 1995052002) (March 5, 2015), pg. 5, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/march/deirwestgate.pdf?sfvrsn=4; SCAQMD, Comments on Draft Mitigated Negative Declaration (Draft MND) for the Proposed Colton – DEXUS Project (February 1, 2013), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2013/february/colton-dexus.pdf.

[54] Clark Comments, pg. 6.

[55] DEIR, pg. 4.4-5, 6.

printed on recycled paper

inefficient, and unnecessary consumption of energy."[56] The CEQA Guidelines require discussion of energy conservation measures when relevant, and provide examples in Appendix F:[57]

1) Potential measures to reduce wasteful, inefficient and unnecessary consumption of energy during construction, operation, maintenance and/or removal. The discussion should explain why certain measures were incorporated in the project and why other measures were dismissed.
2) The potential of siting, orientation, and design to minimize energy consumption, including transportation energy, increase water conservation and reduce solid waste.
3) The potential for reducing peak energy demand.
4) Alternate fuels (particularly renewable ones) or energy systems.
5) Energy conservation which could result from recycling efforts.

1-19

Courts have rejected EIRs that fail to include adequate analysis investigation into energy conservation measures that might be available or appropriate for a project.[58] In *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[59] the Court of Appeal reviewed an EIR for a shopping center on undeveloped agricultural land. The EIR concluded that, due to the proposed project's compliance with Title 24 guidelines and regulations, the project would be expected to have a less-than-significant impact regarding the wasteful, inefficient, or unnecessary consumption of energy. But the lead agency's EIR did not include discussion regarding the different renewable energy options that might be available or appropriate for the project. The Court held "the City's EIRs failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options."[60] The lead agency argued that compliance with the Building Code sufficed to address energy impact concerns for the project.[61] But the Court explained:

1-20

> Although the Building Code addresses energy savings for components of a new commercial construction, it does not address many of the considerations required under Appendix F of the CEQA Guidelines… These considerations include whether a building should be constructed at all, how large it should

printed on recycled paper

> be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Here, a requirement that Gateway II comply with the Building Code does not, by itself, constitute an adequate assessment of mitigation measures that can be taken to address the energy impacts during construction and operation of the project.[62]

Here, the FEIR lacks analysis of common energy consumption measures in violation of CEQA Guidelines Appendix F. The FEIR fails to analyze the feasibility of onsite solar facilities, such as rooftop, parking lot, or ground-level solar photovoltaics. This analysis must address considerations such as the technical and economic feasibility of installing solar facilities on the Project site, the potential size of the Project's solar zone, and the potential magnitude of mitigation provided by installing solar facilities. The FEIR also fails to evaluate the extent to which mobile source energy consumption could be reduced during Project operations through electric vehicle charging infrastructure (above what is required by existing regulations). 1-20

The FEIR acknowledges that a diesel backup generator may be required for Project operations,[63] but fails to evaluate measures to reduce this source of energy consumption, such as use of alternative fuel sources. 1-21

The FEIR also fails to evaluate the feasibility of more stringent idling requirements over existing requirements.[64] 1-22

The FEIR's discussion of construction energy conservation measures also violates CEQA Guidelines Appendix F. The City's energy analysis fails to evaluate the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators.[65] 1-23

The FEIR contains responses briefly addressing the measures discussed above.[66] But the responses simply state: "[a]s concluded in Section 4.2, Air Quality, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking 1-24

---

printed on recycled paper

into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32)… Thus, the City determines that additional mitigation is not warranted."[67] This type of response does not evaluate the feasibility or effectiveness of energy-conservation measures, and thus does not provide the analysis required by CEQA Guidelines Appendix F. 1-24

In sum, the FEIR's energy analysis fails adequately analyze measures to reduce the wasteful, inefficient, and unnecessary consumption of energy, and fails to meaningfully address Appendix F's considerations of whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope.[68] This analysis must be provided in a revised and recirculated EIR. 1-25

III. THE BOARD CANNOT MAKE THE REQUISITE FINDINGS TO RECOMMEND APPROVAL OF THE PROJECT

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[69]

1-26

The Staff Report states that the Project meets this requirement, but this finding lacks support.[70] The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project.

[67] FEIR, Response B-57.
[68] *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 CA4th 256, 264.
[69] Section 4.02.025(D)(3).
[70] Staff Report, PDEV22-017, Part 3, Section 4.

printed on recycled paper

For the same reason, the Staff Report lacks support to make the following finding in recommending adoption of the FEIR: "[t]he draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project."[71] 1-27

A revised EIR must be recirculated before the Project can be recommended for approval.

IV. CONCLUSION

As is explained herein, the FEIR's air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to recommend certification of the FEIR or under the City of Ontario Municipal Code to approve the Project's development plan. CARE CA urges the Board to recommend that the City revise and recirculate the EIR before any further action is taken on the Project. 1-28

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

In October 2023, I reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I made the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

1-29

Now, I have reviewed the responses to these comments made in the project's Final Environmental Impact Review ("FEIR") dated February 2024.

1-30

Truck trip lengths – The FEIR repeats the false assertion that the truck trip lengths follow SCAQMD's recommendations (FEIR, A-18, p. 2-43). In my October 2023 comments, I addressed this, writing:

> The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[1] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[2] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

To prove that this is not a general SCAQMD recommendation for all warehouses, I attach SCAQMD's November 22, 2023 comments on the Hemlock Warehouse Development Project Draft SEIR in the City of Fontana. That Draft SEIR applied the same truck trip lengths as used in the 5355 East Airport Drive DEIR and FEIR. SCAQMD's comments state:

> However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project. (p. 2)

1-30

SCAQMD is making the same point I made in my October 2023 comments where I wrote:

> it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The FEIR does not use SCAQMD- recommended truck trip lengths. SCAQMD instead recommends: "**Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project**."

[1] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf
[2] https://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/sclc_warehouse-presentation-final.pdf

VMT mitigation – The FEIR continues to state that the proposed project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.

However, the FEIR states that these impacts cannot be mitigated because "measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant." (FEIR A-24, p. 2-44)

1-31

My October 2023 comments recommended requiring CAPCOA T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – that can provide up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

A smaller mandatory reduction may be appropriate for this project, with this requirement passed on to the tenant, but it is not sufficient to claim that no significant mitigation is possible.

1-32

In addition, the attached SCAQMD comments on the Hemlock Warehouse Development Project recommends several mitigation measures targeting truck emissions, including:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks,
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the final CEQA document, and

1-33

- Provide electric vehicle (EV) charging stations and electrical hookups for truckers. (p.3)

1-34

Trip generation

In my October 2023 comments, I provided data on different types of warehouses that have significantly higher trip generation rates than the 1.75 trips per 1000 sq. ft. assumed in the DEIR and FEIR. These include:

> The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

The FEIR argues that the highest generators that I discussed in my October 2023 comments could not be accommodated because ". . . the layout of the site with 251 parking spaces would not reasonable accommodate the on-site parking required to support these uses."

1-35

This point about parking may be valid for the highest generators per 1000 sq. ft. but not for the intermediate generators. The DEIR and FEIR estimate only 270 passenger car trips per day (DEIR Appendix K, p. 5), i.e., 135 vehicles in and 135 cars out. Therefore, if all cars were employees and they all worked the same single shift, the parking lot utilization would never exceed 54%. With multiple shifts and non-employee passenger car trips, the parking lot utilization would be much

lower. Therefore, the parking lot is designed to support many more trips than assumed in the DEIR and FEIR.

The 251 parking spaces are consistent with ITE Land Use 156: High Cube Parcel Hub Warehouse. This use is described:

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. A high-cube warehouse can be free-standing or located in an industrial park. A high-cube parcel hub warehouse typically serves as a regional and local freight-forwarder facility for time sensitive shipments via airfreight and ground carriers. A site can also include truck maintenance, wash, or fueling facilities. Some limited assembly and repackaging may occur within the facility.

1-35

Given the uncertainty concerning the proposed project and its size, 270,377 sq. ft., it could foreseeably end up being a High-Cube-Parcel-Hub Warehouse as defined above.

The number of parking spaces provided also is consistent with this usage. The trip generation rate for this category is 4.63 trips per 1000 sq. ft., i.e. 2.6 times the rate used in the DEIR and FEIR. This rate includes 0.58 truck trips per 1000 sq. ft. Therefore, the passenger car rate is 4.05 trips per 1000 sq. ft. As a High-Cube-Parcel-Hub Warehouse, the proposed project would generate 1095 passenger car trips per day.

The DEIR states:

> For the purposes of this EIR, the Project is assumed to be operational 24 hours per day, seven days per week, with exterior loading and parking areas illuminated at night. (DEIR, p. 3-13)

1-36

This suggests multiple shifts each day.

Some of the passenger car trips would not be parking long term, including trips dropping off and picking up workers, and miscellaneous service trips, all of which include both and entering trip and an exiting trip. However, even if all passenger car trips involved parking long-term, all the trips could be accommodated with the planned 251 parking spaces if each space is occupied an average of 2.18 times per day.

As I stated in my October 2023 comment letter:

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

1-37

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

April 15, 2024

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Aidan Marshall

Subject: Comments On Final Environmental Impact Report (FEIR) 5355 East Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the City of Ontario (the City) FEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item. 1-38

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the Project consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive. 1-39

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

1-39

Specific Comments

1. The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.

A review of the AQ Analysis and the Mobile Source Health Risk Assessment show that building downwash was not incorporated into the AERMOD analysis of the Project. Building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from nearby stacks. A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity. This downwash effect leads to higher ground-level concentration of chemicals emitted from sources. The downwash effect increases as the relative difference between the release height and top of the building increases.[1] Using a lower height for the building will underestimate the potential ground level concentrations of pollutants associated with the Project operation.

For the closest receptors to the site, this difference will create an additional air quality impact that is not accounted for in the City's analysis. In addition to incorporating the building downwash impacts of the Project buildings, the AERMOD model should also incorporate the building downwash for receptors near the Project. Receptors farther away will still be subject to the downwash effect given the assumed emission height release incorporated into the model. Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[2] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). The City should address the impact of this issue in a revised DEIR.

1-40

[1] The so-called good engineering practice height (GEP) of the source. The GEP is defined in Section 123 of the Clean Air Act as "the height necessary to ensure that emissions from a stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies or wakes which may be created by the source itself, nearby structures or nearby terrain obstacles."

[2] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

2. The Air Quality Analysis Relies On An Input Value From AP-42 That Is Rated As Poor And May Be Unreliable

The CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42. According to the AP-42 FAQ - E = Poor. Factor is developed from C and D rated test data from a very few number of facilities, and there may be reason to suspect that the facilities tested do not represent a random sample of the industry. There also may be evidence of variability within the source category population. This means that there is a lot of uncertainty in the AQ analysis regarding the amount of particulate matter that will be emitted from the construction phase of the Project. The City should assess the impacts of this variable in a revised DEIR. 1-41

3. The Health Risk Analysis Incorporates Non-Standard Daily Breathing Rates For Sensitive Receptors Analyzed In The HRA

According to the FEIR, a health risk assessment was prepared in accordance with SCAQMD's guidance. For purposes of this Health Risk Assessment, receptors include both residential and non-residential (worker) land uses in the vicinity of the Project. These receptors are included in the Health Risk Assessment since residents and workers may be exposed at these locations over a long-term duration of 30 and 25 years, respectively.[3] 1-42

The input values utilized in the HRA analysis included a variety of daily breathing rates that are favorable to reducing the potential health impacts. The HRA states that "Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines."[4] The values listed in Table 2-7 include both the 95 percent upper confidence limit (95% UCL) values (for age *in utero* exposure and age 0 to 2) and the 80th percentile values for the remaining age groups (age 2 to 16 and age 16 to 30).

[3] Urban Crossroads. 2022. 5355 East Airport Drive Mobile Source Health Risks Assessment. Prepared by Urban Crossroads. August 30, 2022. pg 5

[4] Urban Crossroads. 2022. 5355 East Airport Drive Mobile Source Health Risks Assessment. Prepared by Urban Crossroads. August 30, 2022. pg 19-20

The risk estimates for ages 2 to 30 is off by a factor of 1.3.

TABLE 2-7: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	0.85	350	24
0 to 2	1,090	10	2	0.85	350	24
2 to 16	572	3	14	0.72	350	24
16 to 30	261	1	14	0.73	350	24

Figure 2: Daily Breathing Rates Utilized In HRA

The 2015 Air Toxic Hot Spots Program Guidance Manual [5] notes that residential estimates use 95th percentile breathing rates in Table 5.6. Table 5.6 shows values of 745 L/kg BW-day for children age 2 to 16 and 335 L/kg BW-day for adults age 16 to 30. 1-42

Table 5.6 Point Estimates of Residential Daily Breathing Rates for 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years (L/kg BW-day)

	3rd Trimester[a]	0<2 years	2<9 years	2<16 years	16<30 years	16<70 years
	L/kg-day					
Mean	225	658	535	452	210	185
95th Percentile	361	1090	861	745	335	290

[a] 3rd trimester **breathing rates** based on breathing rates of pregnant women using the assumption that the dose to the fetus during the 3rd trimester is the same as that to the mother.

The City's analysis is therefore incomplete, is not consistent with the guidance from OEHHA, and must be corrected in a revised final environmental impact report for the Project.

4. The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects. 1-43

According to the operations air quality analysis of Project,[6] the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for

[5] Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, http://oehha.ca.gov/air/hot_spots/hotspots2015.html

[6] Urban Crossroads. 2022. 5355 East Airport Drive Air Quality Impact Analysis. August 30. 2022. Pg 37

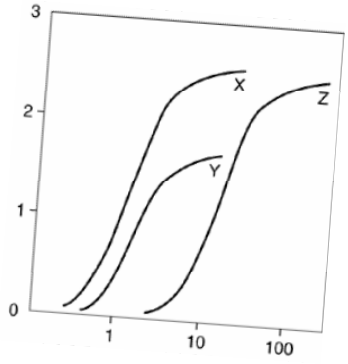
3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.

This statement does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately 700 million square feet, an increase of 20 percent over the last five years"),[7] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[8] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[9] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710. 1-43

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the Regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised final environmental impact report should be prepared to address these substantial concerns. 1-44



Sincerely,

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well recognized toxicologist, air modeler, and health scientist. He has 20 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

Significant projects performed by Dr. Clark include the following:

LITIGATION SUPPORT

Case: James Harold Caygle, et al, v. Drummond Company, Inc. Circuit Court for the Tenth Judicial Circuit, Jefferson County, Alabama. Civil Action. CV-2009

Client: Environmental Litgation Group, Birmingham, Alabama

Dr. Clark performed an air quality assessment of emissions from a coke factory located in Tarrant, Alabama. The assessment reviewed include a comprehensive review of air quality standards, measured concentrations of pollutants from factory, an inspection of the facility and detailed assessment of the impacts on the community. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Rose Roper V. Nissan North America, et al. Superior Court of the State Of California for the County Of Los Angeles – Central Civil West. Civil Action. NC041739

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to multiple chemicals, including benzene, who later developed a respiratory distress. A review of the individual's medical and occupational history was performed to prepare an exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to respiratory irritants. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: O'Neil V. Sherwin Williams, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to petroleum distillates who later developed a bladder cancer. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Summary judgment for defendants.

Case: Moore V., Shell Oil Company, et al. Superior Court of the State Of California for the County Of Los Angeles

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to chemicals while benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Raymond Saltonstall V. Fuller O'Brien, KILZ, and Zinsser, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Richard Boyer and Elizabeth Boyer, husband and wife, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-7G.

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: JoAnne R. Cook, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-9R

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of an individual exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Patrick Allen And Susan Allen, husband and wife, and Andrew Allen, a minor, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-W

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Michael Fahey, Susan Fahey V. Atlantic Richfield Company, et al. United States District Court Central District of California Civil Action Number CV-06 7109 JCL.

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Constance Acevedo, et al., V. California Spray-Chemical Company, et al., Superior Court of the State Of California, County Of Santa Cruz. Case No. CV 146344

Dr. Clark performed a comprehensive exposure assessment of community members exposed to toxic metals from a former lead arsenate manufacturing facility. The former manufacturing site had undergone a DTSC mandated removal action/remediation for the presence of the toxic metals at the site. Opinions were presented regarding the elevated levels of arsenic and lead (in attic dust and soils) found throughout the community and the potential for harm to the plaintiffs in question.

Case Result: Settlement in favor of defendant.

Case: Michael Nawrocki V. The Coastal Corporation, Kurk Fuel Company, Pautler Oil Service, State of New York Supreme Court, County of Erie, Index Number I2001-11247

Client: Richard G. Berger Attorney At Law, Buffalo, New York

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the

known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Judgement in favor of defendant.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model will be used to estimate acute and chronic exposure concentrations to multiple contaminants and will be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

Client – Los Angeles Alliance for a New Economy (LAANE), Los Angeles, California

Dr. Clark is advising the LAANE on air quality issues related to current flight operations at the Los Angeles International Airport (LAX) operated by the Los Angeles World Airport (LAWA) Authority. He is working with the LAANE and LAX staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client – City of Santa Monica, Santa Monica, California

Dr. Clark is advising the City of Santa Monica on air quality issues related to current flight operations at the facility. He is working with the City staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client: Omnitrans, San Bernardino, California

Dr. Clark managed a public health survey of three communities near transit fueling facilities in San Bernardino and Montclair California in compliance with California Senate Bill 1927. The survey included an epidemiological survey of the effected communities, emission surveys of local businesses, dispersion modeling to determine potential emission concentrations within the communities, and a comprehensive risk assessment of each community. The results of the study were presented to the Governor as mandated by Senate Bill 1927.

Client: Confidential, San Francisco, California

Summarized cancer types associated with exposure to metals and smoking. Researched the specific types of cancers associated with exposure to metals and smoking. Provided causation analysis of the association between cancer types and exposure for use by non-public health professionals.

Client: Confidential, Minneapolis, Minnesota

Prepared human health risk assessment of workers exposed to VOCs from neighboring petroleum storage/transport facility. Reviewed the systems in place for distribution of petroleum hydrocarbons to identify chemicals of concern (COCs), prepared comprehensive toxicological summaries of COCs, and quantified potential risks from carcinogens and non-carcinogens to receptors at or adjacent to site. This evaluation was used in the support of litigation.

Client – United Kingdom Environmental Agency

Dr. Clark is part of team that performed comprehensive evaluation of soil vapor intrusion of VOCs from former landfill adjacent residences for the United Kingdom's Environment

Agency. The evaluation included collection of liquid and soil vapor samples at site, modeling of vapor migration using the Johnson Ettinger Vapor Intrusion model, and calculation of site-specific health based vapor thresholds for chlorinated solvents, aromatic hydrocarbons, and semi-volatile organic compounds. The evaluation also included a detailed evaluation of the use, chemical characteristics, fate and transport, and toxicology of chemicals of concern (COC). The results of the evaluation have been used as a briefing tool for public health professionals.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: Ameren Services, St. Louis, Missouri

Managed the preparation of a comprehensive human health risk assessment of workers and residents at or near an NPL site in Missouri. The former operations at the Property included the servicing and repair of electrical transformers, which resulted in soils and groundwater beneath the Property and adjacent land becoming impacted with PCB and chlorinated solvent compounds. The results were submitted to U.S. EPA for evaluation and will be used in the final ROD.

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark is managing the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark is assisting the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of perchlorate in environment. Dr. Clark evaluated the production, use, chemical characteristics, fate and transport, toxicology, and remediation of perchlorate. Perchlorates form the basis of solid rocket fuels and have recently been detected in water supplies in the United States. The results of this research

were presented to the USEPA, National GroundWater, and ultimately published in a recent book entitled *Perchlorate in the Environment*.

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Confidential, San Francisco, California

Identified and analyzed fifty years of epidemiological literature on workplace exposures to heavy metals. This research resulted in a summary of the types of cancer and non-cancer diseases associated with occupational exposure to chromium as well as the mortality and morbidity rates.

Client: Confidential, San Francisco, California

Summarized major public health research in United States. Identified major public health research efforts within United States over last twenty years. Results were used as a briefing tool for non-public health professionals.

Client: Confidential, San Francisco, California

Quantified the potential multi-pathway dose received by humans from a pesticide applied indoors. Part of team that developed exposure model and evaluated exposure concentrations in a comprehensive report on the plausible range of doses received by a specific person. This evaluation was used in the support of litigation.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client – United Kingdom Environmental Agency

Oversaw a comprehensive toxicological evaluation of methyl-*tertiary* butyl ether (M*t*BE) for the United Kingdom's Environment Agency. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of M*t*BE. The results of the evaluation have been used as a briefing tool for public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of *tertiary* butyl alcohol (TBA) in municipal drinking water system. TBA is the primary breakdown product of M*t*BE, and is suspected to be the primary cause of M*t*BE toxicity. This evaluation will include available information on the production, use, chemical characteristics, fate and transport in the environment, absorption, distribution, routes of detoxification, metabolites, carcinogenic potential, and remediation of TBA. The results of the evaluation were used as a briefing tool for non-public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of methyl *tertiary* butyl ether (MTBE) in municipal drinking water system. MTBE is a chemical added to gasoline to increase the octane

rating and to meet Federally mandated emission criteria. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of MTBE. The results of the evaluation have been were used as a briefing tool for non-public health professionals.

Client – Ministry of Environment, Lands & Parks, British Columbia

Dr. Clark assisted in the development of water quality guidelines for methyl tertiary-butyl ether (MTBE) to protect water uses in British Columbia (BC). The water uses to be considered includes freshwater and marine life, wildlife, industrial, and agricultural (e.g., irrigation and livestock watering) water uses. Guidelines from other jurisdictions for the protection of drinking water, recreation and aesthetics were to be identified.

Client: Confidential, Los Angeles, California

Prepared physiologically based pharmacokinetic (PBPK) assessment of lead risk of receptors at middle school built over former industrial facility. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Client: Confidential, Atlanta, Georgia

Researched potential exposure and health risks to community members potentially exposed to creosote, polycyclic aromatic hydrocarbons, pentachlorophenol, and dioxin compounds used at a former wood treatment facility. Prepared a comprehensive toxicological summary of the chemicals of concern, including the chemical characteristics, absorption, distribution, and carcinogenic potential. Prepared risk characterization of the carcinogenic and non-carcinogenic chemicals based on the exposure assessment to quantify the potential risk to members of the surrounding community. This evaluation was used to help settle class-action tort.

Client: Confidential, Escondido, California

Prepared comprehensive Preliminary Endangerment Assessment (PEA) of dense non-aqueous liquid phase hydrocarbon (chlorinated solvents) contamination at a former printed circuit board manufacturing facility. This evaluation was used for litigation support and may be used as the basis for reaching closure of the site with the lead regulatory agency.

Client: Confidential, San Francisco, California

Summarized epidemiological evidence for connective tissue and autoimmune diseases for product liability litigation. Identified epidemiological research efforts on the health effects of medical prostheses. This research was used in a meta-analysis of the health effects and as a briefing tool for non-public health professionals.

Client: Confidential, Bogotá, Columbia

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of a 13.7 hectares plastic manufacturing facility in Bogotá, Colombia The risk assessment was used as the basis for the remedial goals and closure of the site.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally cadmium) and VOCs from soil and soil vapor at 12-acre former crude oilfield and municipal landfill. The site is currently used as a middle school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and was used as the basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Managed remedial investigation (RI) of heavy metals and volatile organic chemicals (VOCs) for a 15-acre former manufacturing facility. The RI investigation of the site included over 800 different sampling locations and the collection of soil, soil gas, and groundwater samples. The site is currently used as a year round school housing approximately 3,000 children. The Remedial Investigation was performed in a manner

that did not interrupt school activities and met the time restrictions placed on the project by the overseeing regulatory agency. The RI Report identified the off-site source of metals that impacted groundwater beneath the site and the sources of VOCs in soil gas and groundwater. The RI included a numerical model of vapor intrusion into the buildings at the site from the vadose zone to determine exposure concentrations and an air dispersion model of VOCs from the proposed soil vapor treatment system. The Feasibility Study for the Site is currently being drafted and may be used as the basis for granting closure of the site by DTSC.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally lead), VOCs, SVOCs, and PCBs from soil, soil vapor, and groundwater at 15-acre former manufacturing facility. The site is currently used as a year round school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and will be basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of VOC vapor intrusion into classrooms of middle school that was former 15-acre industrial facility. Using the Johnson-Ettinger Vapor Intrusion model, the evaluation determined acceptable soil gas concentrations at the site that did not pose health threat to students, staff, and residents. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client –Dominguez Energy, Carson, California

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of 6-acre portion of a 500-acre oil and natural gas production facility in Carson, California. The risk assessment was used as the basis for closure of the site.

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Draft Subsequent Environmental Impact Report (Draft SEIR) for the Hemlock Warehouse Development Project (Proposed Project) (SCH No.: 2009091089)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The City of Fontana is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Draft SEIR

Based on the Draft SEIR, the Lead Agency proposes demolishing the existing development to construct and operate a warehouse facility for 882,000 square feet on the 40.01-acre site at 11115 Hemlock Avenue, Fontana.[1] A portion of the warehouse facility would be used for cold storage, approximately 220,500 square feet or 25 percent of the warehouse.[2] The Proposed Project would have 114 dock doors on the east and west sides of the building[3] associated with 562 truck trips per day.[4] Regional access to the Proposed Project site via Interstate 10, State Route 60, and Interstate 15, and local access via Santa Ana Avenue and Jurupa Avenue. [5] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (e.g., residential units) is approximately 900 feet southeast and southwest of the Proposed Project site. Construction of the Proposed Project is anticipated to take approximately 15 months.[6]

South Coast AQMD Staff's Comments on the Draft SEIR

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

In the Draft SEIR, the Lead Agency discusses the determination of truck emissions for the Proposed Project and states that "…*CalEEMod defaults were utilized for trip length and the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2) trucks, 14.2*

[1] Draft SEIR. Page 3-1 and 3-2.
[2] *Ibid*. Page 3-9.
[3] *Ibid*.
[4] *Ibid*. Appendix F- Traffic Impact Analysis. Page 40.
[5] *Ibid*. Page 3-1.
[6] *Ibid*. Page 3-10.

miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages from the Traffic Impact Analysis prepared for the Project (Appendix F), which resulted in an overall truck trip length of 29.9 miles with an assumption of 100% primary trips for the proposed warehouse.[7]"

South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan.[8] However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

User-Defined Land Use Subtype in the California Emissions Estimator Model (CalEEMod) Analysis

In the operational CalEEMod output files, besides the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes, "user-defined industrial" is added.[9] According to the CalEEMod User Guide, the "user-defined" may be selected to characterize project land use subtypes not included in CalEEMod. If selected, all data on the Land Use screen will need to be input manually. [10] However, lot acreage and the floor square area use are all set to zero under the "user-defined industrial" land use subtype.

In addition, the truck information (e.g., truck trips) is input under the "user-defined industrial" but not in the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes for the Proposed Project. This possibly leads to underestimating the heavy-duty truck emissions for warehouse activities since no data is filled under this "user-defined industrial" land use subtype. Therefore, it is recommended that the Lead Agency explain why the land use is separated in the CalEEMod analysis and why the truck information is not under the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtype and revise the analysis as necessary in the final CEQA document.

Additional Recommended Air Quality and Greenhouse Gases Mitigation Measures

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. To further reduce the Proposed Project's air quality impacts, and in addition to SWIP SP FEIR Mitigation Measures

[7] *Ibid*. Page 5.1-22
[8] South Coast Air Quality Management District, Preliminary Draft Staff Report: Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce.
[9] *Ibid*. Appendix B - Air Quality Impact Analysis. CalEEMod Operational and LST Output Files.
[10] California Emissions Estimator Model (CalEEMod) Version 2022.1 User Guide. Access at: https://www.caleemod.com/documents/user-guide/CalEEMod_User_Guide_v2022.1.pdf

MM 4.2-1a to MM 4.2-1f, MM 4.2-2a to MM4.2-2l, and MM 4.2-5a, South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in the Final EIR.

Mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft SEIR may include the following:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks, such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. Given the state's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks, such as the Advanced Clean Trucks Rule[11] and the Heavy-duty Low NOx Omnibus Regulation,[12] ZE and NZE trucks will become increasingly more available to use. The Lead Agency should require a phase-in schedule to incentivize the use of these cleaner operating trucks to reduce any significant adverse air quality impacts. South Coast AQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency. At a minimum, require the use of a 2010 model year[13] that meets CARB's 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks. All heavy-duty haul trucks should meet CARB's lowest optional low-NO_x standard starting in 2022.[14] Where appropriate, include environmental analyses to evaluate and identify sufficient electricity and supportive infrastructures in the Energy and Utilities and Service Systems Sections in the CEQA document. Include the requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with project construction to document that each truck used meets these emission standards and make the records available for inspection. The Lead Agency should conduct regular inspections to the maximum extent feasible to ensure compliance.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.
- Provide electric vehicle (EV) charging stations or, at a minimum, provide electrical infrastructure, and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

Mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft SEIR may include the following:

[11] CARB. June 25, 2020. Advanced Clean Trucks Rule. Accessed at: https://ww2.arb.ca.gov/our-work/programs/advanced-cleantrucks.

[12] CARB has recently passed a variety of new regulations that require new, cleaner heavy-duty truck technology to be sold and used in the state. For example, on August 27, 2020, CARB approved the Heavy-Duty Low NOx Omnibus Regulation, which will require all trucks to meet the adopted emission standard of 0.05 g/hp-hr starting with engine model year 2024. Accessed at: https://ww2.arb.ca.gov/rulemaking/2020/hdomnibuslownox.

[13] CARB adopted the statewide Truck and Bus Regulation in 2010. The Regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. More information on the CARB's Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.

[14] CARB's optional low-NOx emission standard is available at: https://ww2.arb.ca.gov/our-work/programs/optional-reduced-nox-standards.

- Maximize the use of solar energy by installing solar energy arrays.
- Use light-colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices and appliances.

Design considerations for the Proposed Project that the Lead Agency should consider reducing air quality and health risk further impacts include the following:

- Clearly mark truck routes with trailblazer signs so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, daycare centers, etc.).
- Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.
- Design the Proposed Project such that any truck check-in point is inside the Proposed Project site to ensure no trucks are queuing outside.
- Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.
- Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

The South Coast AQMD staff also suggests the Lead Agency review the references (listed below) and consider including the additional recommended mitigation measures in the final CEQA document:

- State of California – Department of Justice: Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act[15]
- South Coast AQMD 2022 South Coast Air Quality Management Plan,[16] specifically:
    - Appendix IV-A – South Coast AQMD's Stationary and Mobile Source Control Measures
    - Appendix IV-B – CARB's Strategy for South Coast
    - Appendix IV-C – SCAG's Regional Transportation Strategy and Control Measures
- United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation[17]

South Coast AQMD Air Permits and Role as a Responsible Agency

The Draft SEIR assumes in the analysis that an emergency diesel-powered fire pump and emergency diesel-powered generator would be used for the Proposed Project.[18] Hence, air permits from South Coast AQMD would be required, and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead

[15] State of California – Department of Justice. Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act. Access at: https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf
[16] 2022 South Coast AQMP. Access at: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan
[17] United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation. Access at: https://www.epa.gov/mobile-source-pollution/environmental-justice-and-transportation
[18] *Ibid*. Page 5.2-13.

Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to review the above-mentioned document. The City of Jurupa Valley is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments which are organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Recirculated Draft EIR

Based on the Recirculated Draft EIR, the Proposed Project is comprised of the development of the 80.8-acre property with five industrial buildings ("Building 1," "Building 2," "Building 3," "Building 4," and "Building 5") totaling 1,118,102 square feet (s.f.). Building 1 would include 309,870 s.f. of building area, Building 2 would include 388,222 s.f. of building area, Building 3 would include 174,364 s.f. of building area, Building 4 would include 275,958 s.f. of building area, and Building 5 would include 35,688 s.f. of building area. The Recirculated Draft EIR states that although the future tenant(s) of the building is not known, industrial uses would allow for high-cube fulfillment, manufacturing, and general light industrial services.[1] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (residential development) is located adjacent to the Proposed Project site, approximately 240 feet southeast of the Proposed Project. Construction of the Proposed Project is anticipated to occur in a single phase, commence in January 2023, and be completed in June 2024.[2] The Proposed Project is located on the southeast corner of Montana Avenue and 25th Street.[3]

South Coast AQMD Staff's Comments

> *The CalEEMod Land Use(s) Subtype Assumptions (Combining Manufacturing and General Light Industrial) in the Appendix B- Air Quality Impact Analysis May Have Underestimated the Worst-Case Operational Air Quality Impacts*

In accordance with the project description outlined in the Recirculated Draft EIR, the construction of five industrial buildings totaling 1,194,170 square feet is proposed on 80.8 acres

[1] Recirculated Draft EIR Page 26.
[2] Appendix B, Air Quality Impact Analysis. Page 146.
[3] Recirculated Draft EIR Page 26.

of land. It is important to note that the document does not currently specify the future tenants for these five buildings.[4] However, based on the footnote in Appendix B- Air Quality Impact Analysis of the Recirculated Draft EIR, the analysis assumes that the project site will be divided into two equal parts for analytical purposes. Specifically, half of the site, totaling 597,085 square feet, is designated for manufacturing land uses, while the remaining half, also 597,085 square feet, is allocated for general light industrial land uses.[5]

According to the CalEEMod User Guide - Version 2022.1, it explicitly states the characteristics of "Light Industrial Land Use Subtype: *"Light industrial use facilities are free-standing facilities devoted to a single use, the facilities that have an emphasis on activities other than manufacturing and typically have minimal office space. Typical light industrial activities include printing, material testing, and assembly of data processing equipment. This land use subtype must be less than 50,000 square feet".*[6] Therefore, the allocation of 597,085 square feet for this purpose contradicts the guidelines provided in the CalEEMod User Guide. Moreover, the general light industrial activities are expected to generate less emissions and involve fewer total daily truck trips[7] compared to the manufacturing or other industrial land uses. The current assumption has led to an underestimation of emissions. South Coast AQMD staff recommends that the Lead Agency conduct a more conservative analysis using the "worst-case" scenario in CalEEMod modeling and correct the land use sub-type used in CalEEMod to ensure accuracy and compliance with guidelines.

Potential Underestimation of Emissions Due to Inaccurate On-site Distance for the Trucks and Passenger Vehicles During Project Operation

The Recirculated Draft EIR notes that CalEEMod Version 2022 lacks the capacity to distinguish between On-site and Off-site emissions during operation. Consequently, the analysis relies on the assumption that 0.5 mile is the maximum allowable On-site distance for both trucks and passenger vehicles. However, the aerial map of the On-site vehicle route (truck movements) as identified in Exhibit 2-B in Appendix C of the Recirculated Draft EIR indicates that the actual On-site distance of the route exceed 0.7 mile, which is greater than the 0.5-mile assumption upon which the emission estimates are based. Therefore, the On-site emissions appear to have been underestimated. For this reason, T the Lead Agency is recommended to either revise the calculations to reflect an On-site route distance of 0.7 mile or provide a comprehensive explanation and justification of the methodology employed in relying on the 0.5-mile On-site assumption parameter.

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

Appendix B of the Recirculated Draft EIR, explains that air quality impact analysis was based on the assumption that the average truck trip length is 30.34 miles for general light industrial and manufacturing uses. However, the project site is located 70 to 80 miles away from the Ports of Los Angeles and Long Beach which means that the air quality analysis underestimated the

[4] Recirculated Draft EIR Page 26.
[5] Appendix B, Air Quality Impact Analysis. Page 14 in PDF.
[6] *CalEEMod User Guide - Version 2022.1.
[7] Appendix Q, VMT Analysis. Page 12.

emissions from trucks traveling from the Ports to the project site. For this reason, the Lead Agency is recommended to revise the calculations in the Final EIR by taking a project-specific approach to the vehicle trip length and trip rates by applying more conservative trip lengths such as designating 40 miles for local trips and 80 miles for Port-related trips. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

Warehouse Cold Storage Land Use and the Associated Emissions from Transport Refrigeration Units (TRU)

The project description in the Recirculated Draft EIR does not explain whether the Proposed Project intends to allocate a portion of the warehouse land use for cold storage. Cold storage warehouses utilize more trucks and trailers equipped with TRUs than warehouses without cold storage. As a result, the Lead Agency is recommended to revise the project description in the Final EIR to explain whether cold storage would be a part of the Proposed Project and provide an estimate for the number of TRU trucks and trailers associated with the operation of the warehouses with cold storage. If there are potential uses for TRUs, the Lead Agency is recommended to revise the calculations in the Final EIR to quantify the emissions from the TRUs in addition to the operational truck emissions.

Incorrect Pollutant Averaging Time and Underestimation of Ground-Level Pollutants Near Buildings in Health Risk Assessment (HRA),

South Coast AQMD staff's review of the construction and operational HRA modeling files noted that the ANNUAL[8] keyword was selected for the pollutant averaging time in the control pathway in the AERMOD model. However, according to the South Coast AQMD Risk Assessment Procedures v8.1 and South Coast AQMD Modeling Guidance for AERMOD,[9] a detailed HRA utilizing AERMOD should be run using the pollutant averaging time PERIOD and 1-hour.

In addition, South Coast AQMD staff's review of the modeling files noted that industrial buildings were not included in the building downwash option in the AERMOD dispersion model during operation which resulted in an underestimation of the ground-level pollutant concentrations near the buildings.

Thus, the Lead Agency is recommended to: 1) re-run the construction and operational HRAs to utilize PERIOD and 1-hour averaging time to determine the health risk impacts to the sensitive receptors and off-site workers and include the industrial buildings in the building downwash to analyze more accurate ground-level concentrations; and 2) include the results in the Final EIR.

Inconsistent Emission Rates (lb/day) Calculated from CalEEMod vs. AERMOD

[8] South Coast AQMD Risk Assessment Procedures v8.1. Access at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf
[9] South Coast AQMD Modeling Guidance for AERMOD. Access at: South Coast AQMD Modeling Guidance for AERMOD

South Coast AQMD staff's review of the AERMOD files noted that the diesel particulate matter (DPM) emission rates do not match the data reported in Table 13: Localized Significant Summary of Operations (Onsite Emissions) in Appendix B of the Recirculated Draft EIR which were estimated using CalEEMod. For example, the operational PM10 emission rates presented in Table 13 d are 0.88 pounds per day (lb/day) but the PM10 emissions calculated via AERMOD modeling (including Idling and Onsite emissions) are 0.014 lb/day. This lack of continuity in the emission estimates raises questions about the accuracy of the calculations and warrants a more comprehensive and careful examination of the underlying factors and route causes contributing to this disparity. The Lead Agency is recommended to re-review these calculations and update the Final EIR accordingly with the appropriate corrections.

South Coast AQMD Air Permits and Role as a Responsible Agency

If the implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, spray booths, and etc., air permits from South Coast AQMD will be required and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this

comment letter. Please contact Sahar Ghadimi, Air Quality Specialist, at sghadimi@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the lead agency and should be incorporated into the Final CEQA document.

In the project description, the lead agency proposes the construction of two buildings for warehouse distribution and office space uses totaling approximately 1,037,811 square feet on a 48.4 acre site. The lead agency has projected 1,744 total daily vehicle trips including at least 357 daily truck trips operating at the site. In the Air Quality Section, the lead agency quantified the project's construction and operation air quality impacts and has compared those impacts with the SCAQMD's recommended regional and localized daily significance thresholds. Based on its analyses, the Lead Agency has determined that operational air quality impacts will exceed the recommended regional daily significance threshold for NOx.

The SCAQMD staff has concerns regarding the assumptions used in the air quality analysis, specifically the operational portion of the CalEEMod land use model. Since the proposed project will result in significant NOx impacts, all feasible mitigation measures should be included in the Final CEQA document to further reduce the significant impacts. Details are included in the attachment.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the lead agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. Further, staff is available to work with the lead agency to address these issues and any other questions that may arise. Please contact Jack Cheng, Air Quality Specialist, at (909) 396-2448, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Siting of an Incompatible Land Use

1. Based on information in the DEIR (air quality analyses, the project truck distribution, and by aerial map inspection), the lead agency shows a minimum distance of 15 meters to the nearest sensitive receptor; a residence located southeast of the project site. The SCAQMD staff is concerned that the existing sensitive receptors will be exposed to significant regional and localized operational impacts, mostly from the daily truck activities that will likely operate using diesel fuel.

   As a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land-use decision making process, the California Air Resources Board (CARB) has provided the CARB Air Quality and Land Use Handbook (CARB Land Use Handbook). Based on guidance from thin e CARB Land Use Handbook, CARB recommends a buffer of at least 1,000 feet between land uses that will have 100 or more trucks per day. [1]

   In accordance with the state CEQA Guidelines §15126.4 (a)(1)(D), the lead agency should discuss the proposed siting of this land use and any potential impacts resulting from any proposed mitigation related to the CARB Land Use Handbook guidance in the Final EIR.

Air Quality Analysis

Daily Truck Trip Rate

2. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars and trucks totaling approximately 1,744 daily vehicles) for the proposed Project, but does not use the 0.64 (38.1%) daily truck trip rate from this same reference. Rather, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 (20.43%) daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) to estimate project air quality operational impacts in the CalEEMod modeling. By using the 0.343 Fontana Study daily truck trip rate, trucks are estimated at 357 daily truck trips in the DEIR instead of approximately 664 daily truck trips using the ITE 0.64 daily truck trip rate.

   Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and Final EIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

   Absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

[1] CARB Air Quality and Land Use Handbook: http://www.arb.ca.gov/ch/handbook.pdf

On-Road Truck Trip Length

3. In the CalEEMod output sheets provided in Appendix E of the DEIR appendices, the modeling used a 60 mile one-way trip distance and a 20% trip percentage for trucks moving goods for perspective tenants (C-W) and a 6.9 one-way trip distance and an 80% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). In electronic file "LOG 2 4.03 Air Quality – 7-15 Table 4.3-E Operational Vehicle Trip Assumption", the table indicates a 16.6 mile one-way trip distance and an 80% trip percentage for trucks moving goods for perspective tenants (C-W) and a 60 mile one-way trip distance and a 20% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). The Air Quality Analysis is inconsistent and under estimates air quality impacts. A 60 mile one-way trip distance and 80% trip percentage should be used to model trucks moving goods for the perspective tenants (C-W) and a 6.9 – 16.6 one-way trip distance and 20 % trip percentage should be used by trucks supporting the operations of the proposed facility(C-NW).

   On page 3.0-8 in the project description, the lead agency describes potential truck activities that involve the proposed warehouse trucks. "Goods imported from the Ports of Long Beach and Los Angeles as well as other locations will be delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations." Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

4. Based on a review of the project's emissions calculations in Appendix E – RK Revised AQ, GHG, HRA: Air Quality Analysis[2] (CalEEMod Output Sheets), the lead agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM Air-12 to reduce operational emissions, the lead agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the lead agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the lead agency chooses to include refrigerated warehouses in the air quality analysis then MM Air-12 should be incorporated into the project and remain in the Final EIR.

LST and Health Risk Assessment (HRA) Modeling

5. The lead agency used AERMOD (version 12345) to prepare the dispersion modeling for the HRA even though AERMOD (version 14134) was available for at the time of analysis (10/20/2014). Therefore, SCAQMD staff recommends using AERMOD (version 15181), the most recent available version, to revise the dispersion modeling for this project.

6. The HRA analysis involved the use of separate discrete receptors placed randomly for the sensitive receptors. SCAQMD staff recommends that the lead agency revise the HRA using a receptor grid over the existing residences and areas zoned or planned for residential development, in order to ensure that the maximum impacts to a residential receptor are properly analyzed.

[2] Appendix A: CalEEMod Emissions Model Output.

7. SLINE1, SLINE2, and SLINE3 onsite travel line volume sources do not span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a series of volume sources that spans the entire docking area to ensure that impacts are properly analyzed.

8. STCK1, STCK2, and STCK3 onsite idling point sources should span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a line volume that spans the entire docking area to ensure that impacts are properly analyzed.

9. Based on the site plan in the project description, there are two driveways that access Webster Street where residences are located across from the proposed project site. Traffic exiting the site from Webster Street can then access Ramona Expressway to get on the freeway. Although the project description in the Notice of Availability, the site plan and the computer modeling show truck traffic using only Patterson Avenue north towards Harvey Knox Boulevard to access the 215 Freeway, there is nothing, however, to preclude trucks from using the driveways on Webster Street, passing by existing residences and then accessing Ramona Expressway to get on the freeway. The SCAQMD staff recommends that the Final EIR include a discussion of how the project will stop trucks from using Webster Avenue or include a restriction that would formally restrict Webster Street to passenger vehicles only. If trucks are not formally restricted, then project impacts from truck movement on Webster Street and beyond (i.e., north on Webster Street, or south to Ramona Expressway to access the 215 Freeway) would have been underestimated in the DEIR. These potential impacts should therefore be analyzed in the HRA and included in the Final EIR.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

10. Because the California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic and during project operations, the lead agency has determined that project operation emissions are significant for Oxides of Nitrogen (NOx), primarily from truck activity emissions, the SCAQMD staff therefore recommends the following changes and additional measures that should be incorporated in the Final EIR to reduce exposure to sensitive receptors and reduce potential significant project air quality impacts:

Recommended Changes

MM AQ 4.3H

- Prior to issuance of a building permit, the Project proponent shall provide the City with project specifications, drawings, and calculations that demonstrate that main electrical supply lines and panels have been sized to support heavy truck charging facilities. ~~when these trucks become available. The calculations shall be based on reasonable predictions from currently available truck manufacturer's data. Electrical system upgrades that exceed reasonable costs shall not be required. In addition, the Project will incorporate 2 electric vehicle charging stations for light-duty vehicles.~~ Electrical lines shall be designed and sized to add additional charging stations when a demand is demonstrated. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations.[3] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

[3] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Additional Mitigation Measures

- Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.

- Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors.
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.
- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Should the proposed Project generate significant regional emissions, the lead agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the lead agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the lead agency and project applicant.

Mitigation Measures for Operational Air Quality Impacts (Other)

11. In addition to the mobile source mitigation measures identified above the Lead Agency should incorporate the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from NOx emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Draft Environmental Impact Report (DEIR)
for the Proposed Westgate Specific Plan (SCH No. 1995052002)

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document.

The Lead Agency proposes construction within four village areas that will be divided into 68 total planning development areas on an approximately 964-acre site. Included are up to 6,410 residential units, 50.9 acres of commercial/retail uses, 179.9 acres of business park and professional office uses, 71.6 acres and up to 1.2 million square feet of warehouse/distribution uses, open space/public and private parks, two elementary schools, a high school, landscaping and infrastructure. The four project areas are located by the Interstate 15 (I-15) and State Route 210 (SR-15) Freeways. The air quality analysis assumes a construction period starting in July 2015 showing Phase 1 construction completed as early as 2016, but based on market conditions, overall construction will continue over an approximately 20-year period until project buildout planned for year 2035.

The Lead Agency has determined that estimated construction, operation emissions and cancer risks substantially exceed the SCAQMD recommended thresholds of significance during construction (NOx), operations (VOC, NOx, CO, PM10 and PM2.5, mostly from vehicle operations) and for Toxic Air Contaminants (potential cancer risk from sensitive receptors being sited near diesel particulate emissions (DPM) from vehicles operating on the two freeways). The unmitigated cancer risk of up to 47 in one million from the DPM freeway vehicle would remain 33 in one million with mitigation, which is still substantially above the SCAQMD's recommended CEQA significance threshold for Maximum Incremental Cancer Risk (MICR): 10 in one million or greater lifetime probability of contracting cancer.

Based on its review, the SCAQMD staff has concerns about the assumptions made in the health risk assessment and air quality analyses. The SCAQMD also notes that localized significant emission impacts from on-site project uses were not estimated in the DEIR although emissions from on-site mobile sources at proposed the warehouse/distribution, light industry, commercial/retail and other land uses potentially impact nearby sensitive receptors (i.e., residents, students, school staff, etc.). Therefore, these impacts should be analyzed, compared with appropriate significance thresholds and incorporated into the Project and applicable analyses in the Final EIR to demonstrate the Lead Agency's findings. Finally, since the Lead Agency has determined that project air quality impacts from construction, operations and cancer risk are significant and unavoidable, the SCAQMD staff is concerned that all feasible mitigation pursuant to Section 15126.4 of the CEQA Guidelines has not been incorporated into the project and should be included in the Final CEQA document. Further details are included in the attached pages.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the Lead Agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. The SCAQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist CEQA Section, at (909) 396-3302, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Health Risk Assessment

1. As of December 9, 2006, AERMOD is fully promulgated as a replacement to ISC3, in accordance with Appendix W (http://www.epa.gov/ttn/scram/dispersion_prefrec.htm). AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. AERMOD-ready meteorological data for various meteorological stations within the South Coast Air Basin (SCAB) are available for download free of charge at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/data-for-aermod. The Lead Agency used AERMOD (version 13350) to prepare the dispersion modeling for the Warehouse Health Risk Assessment (HRA) but used AERMOD (version 12060) for the Freeway HRA analysis. Furthermore, while the meteorological data from the SCAQMD Fontana meteorological station was used for both HRA analyses, two different versions of the meteorological data were used. Font2.pfl and Font2.sfc (meteorological data for 2005-2007) and Font7.sfc and Font7.pfl (meteorological data for 2008-2012) are for different years. Given the advancements and bug fixes that occurred in AERMOD between version 12060 and 13350 and 14134 (today's current version), SCAQMD staff recommends that the Lead Agency revise the HRA analyses for both warehouse and freeway using the latest version of AERMOD (version 14134) without the use of Lakes AERMOD-MPI. SCAQMD's modeling guidance for AERMOD can be found at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/modeling-guidance. Please note that when using AERMOD, the regulatory default option should be used (i.e. without the use of the "FASTALL" or "FLAT" options) and the Lakes MPI should not be used without prior SCAQMD or EPA Region 9 approval.

2. The electronic files for the HRA analyses provided by the Lead Agency to SCAQMD staff were incomplete and did not include the receptor file. Therefore, SCAQMD staff was unable to verify the placement of receptors in the HRA analyses. In the event that receptors were not placed in the correct location using a receptor grid of no more than 100-meter spacing over the existing residences and areas zoned or planned for residential development, the health risks reported in the HRA analyses and DEIR could be underestimated. Therefore, SCAQMD staff recommends that the Lead Agency provide a graphic showing the receptor grid placement in the Final EIR.

3. The proposed project includes both two elementary schools and one high school. However, in the analysis, no receptors were placed in those locations to estimate the health risks to the students, teachers and administrative staff at those locations. SCAQMD staff recommends the Lead Agency update the HRA analyses to include the schools as receptors and estimate the health risks at those locations.

4. In the Warehouse HRA analysis, the Lead Agency assumed only 10 minutes of idling for each truck. Since trucks may idle several times on-site, the SCAQMD staff

recommends assuming 15-minutes idling per truck in the HRA analysis, e.g., five minutes entering, five minutes on-site and five minutes exiting, etc.

5. In the DEIR, the Lead Agency analyzed health risk impacts for residential exposure separately from TAC emissions coming from vehicles operating on the I-15 and State SR-15 Freeways. Since residents will be exposed to adverse health impacts from both the freeways (diesel-fueled vehicles operating on the freeways) and project warehouse distribution uses (diesel-fueled trucks operating at the sites), the combined risk from both sources should be totaled and disclosed in the Final EIR, in addition to the separate Maximum Incremental Cancer Risk (MICR) estimates for both sources already included in the DEIR. Otherwise, the potential combined risk is underestimated.

Air Quality Analysis - Operations

Daily Truck Trip Rate

6. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars + trucks totally approximately 2,046 daily vehicles) for the proposed Project, but does not use the 0.64 daily truck trip rate from this same reference.[1] Rather, the Trip Generation Rates use a passenger car daily trip rate of 1.337 vehicles per day and a daily truck trip rate of 0.343 truck trips per day.[2] By using the 0.343 daily truck trip rate, trucks are estimated at 418 daily truck trips in the DEIR instead of approximately 780 daily truck trips using the ITE 0.64 daily truck trip rate. Therefore, absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

Vehicle Fleet Mixture Percentages

7. In the DEIR, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) [3] to estimate project air quality operational impacts in the CalEEMod modeling. Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily

[1] ITE Manual, High Cube Warehouse Distribution Center (ITE Land Use – 152), 0.64 weighted average Truck Trip Generation Rate (trip ends per 1,000 square feet of gross floor area), Page 267.
[2] 1.337 + 0.343 = 1.68.
[3] DEIR, Traffic Impact Analysis, Project Trip Generation, Pages 31 and 37 Project (High Cube Warehouse Distribution Center) Trip Generation (Table 5, (3 of 3).

truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. Specifically, the number of daily trucks using the ITE 0.64 trip rate results in a greater number of daily truck trips: approximately 780 with the ITE 0.64 rate compared with approximately 418 daily trucks using the 0.343 daily truck trip rate based on the trip generation rates used in the Traffic and Circulation Section. Therefore, based on the increase numbers of trucks, the CalEEMod fleet mixture truck subcategories should be proportionally adjusted with the higher numbers of trucks after using the recommended ITE 0.64 daily truck trip rate. In the modeling inputs, however, the individual vehicle category percentages totaled 6.74 percent, which is lower than the percentage of trucks in the Traffic Study. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and FEIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

On-Road Truck Trip Lengths

8. In the DEIR, the Lead Agency does not describe potential truck activities that involve the proposed warehouse trucks. Since goods can be brought from the Ports of Long Beach and Los Angeles as well as other locations and delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations, the Final EIR should include more detailed discussion to justify the trip lengths used in the air quality and health risk affect analyses. In the CalEEMod output sheets provided in Appendix B of the DEIR appendices, the modeling used a 16.6 mile one-way trip distance was used by trucks employed by perspective tenants and an 8.4 one-way trip distance was used by trucks not employed by perspective tenants was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR. If the Lead Agency is uncertain of the types of tenants or the trip lengths, the Lead Agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

9. Based on a review of the project's emissions calculations in Appendix B: Air Quality Technical Appendix [4] (CalEEMod Output Sheets), the Lead Agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM C-12 to reduce

[4] Appendix B: Air Quality Technical Appendix.

Operational Emissions starting on Page 4.C-69, the Lead Agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the Lead Agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the Lead Agency chooses to include refrigerated warehouses in the air quality analysis then MM C-12 should be incorporated into the project and remain in the Final EIR.

Mitigation During Operations (MERV Filters and HVAC Systems)

10. Starting on page 4.C-54, the Lead Agency discusses Health Risk results concluding that during occupancy, adverse air quality impacts from vehicles traveling on the existing I-10 and SR-210 freeways would expose sensitive receptors to substantially significant levels of Toxic Air Contaminants (TACs) even with mitigation due to existing ambient air pollution in the vicinity. The SCAQMD staff recognizes the many factors lead agencies must consider when siting new housing. On page 4.C-70, the Lead Agency is proposing mitigation to reduce the proposed project's significant health impacts. Further, many mitigation measures should be considered in the Final CEQA document that have been proposed for other projects as well to reduce exposure, including building filtration systems, placing the residential units furthest from the freeway, making any windows facing the freeway inoperable, building sound walls, planting vegetation barriers, etc. However, because of the potentially significant health risks involved, it is critical that any proposed mitigation must be carefully evaluated prior to determining if those health risks would be brought below recognized significance thresholds.

Limits to Enhanced Filtration Units

11. The Lead Agency should consider the limitations of the proposed enhanced filtration mitigation (Measure C-16) on page for this project on the housing residents. For example, in a study that SCAQMD conducted to investigate filters[5] similar to those proposed for this project, costs were expected to range from $120 to $240 per year to replace each filter. In addition, because the filters would not have any effectiveness unless there is a HVAC system that draws enough air to support eh filter system and that the HVAC system is fully operable throughout the life of the project. In addition, there may be increased energy costs to the resident. The proposed mitigation also assumes that the filters operate 100 percent of the time while residents are indoors to reduce significant TAC impacts up to 33 in one million compared with the SCAQMD

[5] http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf?sfvrsn=0 . This study evaluated filters rated MERV 13+ while the proposed mitigation calls for less effective MERV 12 or better filters. See also CARB link for the "Status of Research on Potential Mitigation Concepts to Reduce Exposure to Nearby Traffic Pollution" (August 23, 2012): http://www.arb.ca.gov/db/search/search_result.htm?q=Potentiaal+Mitigation+Concepts+to+Reduce+Exposure+to+Nearby+Traffic+Polltion&which=arb_google&cx=006180681887686055858%3Abew1c4wl8hc&srch_words=&cof=FORID%3A11 .

threshold of 10 in one million. It should be noted that these filters have no ability to filter out any toxic gasses from vehicle exhaust and would not reduce exposure when residents are outside of their homes, e.g. children playing outdoors, being around a pool area, residents relaxing or walking outside, working outside on a balcony, cleaning a vehicle, etc. In the Final CEQA document, the presumed effectiveness and feasibility of this mitigation should therefore be evaluated in more detail prior to assuming that it will sufficiently alleviate near truck exhaust exposures. Otherwise, impacts to residents from exposure to TACs will remain substantially significant and unavoidable.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

12. The California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic. During project operations, the Lead Agency has determined that project operation emissions are significant for Volatile Organic Compounds (VOC) and Oxides of Nitrogen (NOx), Carbon Monoxide (CO), Particulate Matter (PM10) and PM2.5, primarily from on-road mobile sources including truck activity emissions. The SCAQMD staff therefore recommends the following change and additional measures that should be incorporated into the Final EIR to reduce exposure to sensitive receptors and reduce project air quality impacts:

Recommended Change:

MM C-13

- The City shall require future commercial and industrial projects (to) promote the expanded use of renewable fuel and low-emission vehicles by including ~~one or both of~~ the following project components: provide preferential parking for ultra-low emission, zero-emission, and alternative-fuel vehicle; and provide electric vehicle charging stations within the development.

Additional Mitigation Measures:

- Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.

- Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors based on guidance from the California Air Resource Board (CARB) guidance.[6]
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site,

[6] CARB: Air Quality and Land Use Handbook: A Community Health Perspective, April 2005, Page4 for Distribution Centers.

the Lead Agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Because the proposed Project generates significant regional emissions, the Lead Agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the Lead Agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency and project applicant.

  At a minimum, require upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the occupant should also be required to accept and use them.

Electric Vehicle (EV) Charging Stations

13. Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2012 Regional Transportation Plan. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, the SCAQMD staff recommends the Lead Agency require the proposed facility and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include

EV charging stations.[7] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

CNG Fueling Station and Convenience Site

14. Because proposed project generate significant regional NOx operational impacts, the SCAQMD staff recommends that the project pro-actively take measures that could reduce emissions sooner rather than later. The SCAQMD staff therefore recommends that the Lead Agency ensure the availability of alternative fueling facility (e.g., natural gas) to serve the project site prior to operation of any large truck operation uses within the project area.

Mitigation Measures for Operational Air Quality Impacts (Other)

15. In addition to the mobile source mitigation measures identified above, the SCAQMD staff recommends the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from VOC, CO, NOx, PM10 and PM2.5 emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Transportation

- Make a commitment to install electric car charging stations (not just wiring infrastructure) for both non-residential and residential uses at the project site.
- Create local "light vehicle" networks, such as neighborhood electric vehicle (NEV) systems.

[7] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Energy

- Make a commitment that the project site will include a solar photovoltaic or an alternate system with means of generating renewable electricity.

Other

- Provide outlets for electric and propane barbecues in residential areas.

Mitigation Measures for Construction Air Quality Impacts

16. Based on a review of the DEIR the Lead Agency determined that the proposed project will result in significant air quality impacts during construction. Specifically, the air quality analysis demonstrated that the proposed project will exceed the SCAQMD's CEQA regional construction significance thresholds for NOx. Therefore, the SCAQMD staff recommends the following changes and additional measures be incorporated into the proposed project and FEIR to reduce significant project impacts in addition to the measures included in the Draft EIR starting on page 4.C-67.

Recommended Change:

MM C-2 During project construction, the City shall require internal combustion engines/construction equipment operating on all future project sites ~~greater than five acres~~ to meet the following:

- ~~At least 50 percent of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 3 emissions standards or better and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

- Consistent with measures that other lead agencies in the region (including Port of Los Angeles, Port of Long Beach, Metro and City of Los Angeles)[8] have enacted, require all on-site construction equipment to meet EPA Tier 3 or higher emissions standards according to the following:

- Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

[8] For example see the Metro Green Construction Policy at: http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

- ~~Post-January 1, 2016, in addition to the Tier 3 standards specified above, an additional 20 percent or more of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 4 emissions standards or better and be outfitted with BACT devices (e.g., and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

Recommended Additions

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NOx emissions requirements.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Encourage construction contractors to apply for SCAQMD "SOON" funds. Incentives could be provided for those construction contractors who apply for SCAQMD "SOON" funds. The "SOON" program provides funds to accelerate clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/home/programs/business/business-detail?title=vehicle-engine-upgrades

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies .

South Coast
Air Quality Management District
21865 Copley Drive, Diamond Bar, CA 91765-4182
(909) 396-2000 • www.aqmd.gov

E-MAILED: FEBRUARY 1, 2013 February 1, 2013

Mr. Mark Tomich, Director, MTomich@ci.colton.ca.us
Development Services, Planning Division
City of Colton
659 N. La Cadena Drive
Colton, CA 92324

**Draft Mitigated Negative Declaration (Draft MND)
for the Proposed Colton – DEXUS Project**

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document. In the project description, the lead agency proposes demolition of the existing 28,000 square foot truck terminal and 18,000 square foot office building. Building construction would include a high-cube warehouse building on the 34.36 acre site. The proposed facility would have 600,046 square feet of building area (12,000 square feet of office area and 588,048 square feet of warehouse/distribution space). The proposed project would include 116 dock doors with parking for 425 standard and handicap spaces, and 42 trailer spaces. Construction is expected to last approximately 10 months and 2014 is the proposed opening year. Although basically zoned for industrial uses, there is a single-family residence located less than a quarter mile northwest of the project site along Agua Mansa Road.

The AQMD staff requests that the lead agency provide additional information regarding the fate of the existing facility. The CEQA analysis assumes it will cease its operations within the boundaries of the South Coast Air Basin (SCAB) by applying the emissions from the current operation to the baseline thus offsetting the projected emissions from the proposed high-cube warehouse use. In addition, the baseline itself may be overestimated by using generalized trip generation estimates instead of the on-site traffic count data to account for vehicle activity and the resulting air quality impacts for the existing operation. Because the determination of significance under CEQA is based on the difference between existing baseline and future project impacts, we recommend that the lead agency provide further substantial evidence for, and re-evaluate where necessary, the baseline and future impacts of this project. If impacts are found to be significant, then additional mitigation may be required to reduce these impacts to a less than significant level. Details regarding these comments and others follow in the attachment.

Please provide the AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. The AQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist – CEQA Section, at (909) 396-3302, if you have any questions regarding these comments.

Sincerely,

Ian MacMillan
Program Supervisor, Inter-Governmental Review
Planning, Rule Development & Area Sources

Attachment

LAC130115-02
Control Number

Baseline Emissions and the Status of the Existing Use

1. In a telephone conversation staff on or about January 15, 2013, the lead agency staff expressed uncertainty to AQMD staff whether the existing truck terminal business would cease operations completely within the SCAB boundaries or continue its current operations at the site but at a lower level of activity. The lead agency's operational air quality analysis uses the emissions from the existing use as a baseline to offset the estimated long-term air quality impacts from the proposed warehouse use. It is unclear to AQMD staff if the incremental emissions benefit derived from the existing use would actually be realized. Unless there is assurance that the previous facility activities will cease and not move to another location within the SCAB, the lead agency should not include these emissions as a baseline when calculating regional impacts. AQMD staff requests that the lead agency provide additional discussion of the fate of the existing operations and revise the air quality and greenhouse gas analyses, if necessary.

Potential Overestimation of the Existing Facility Baseline Emissions

2. The lead agency has estimated project emissions for the existing truck terminal building activity using the California Emissions Estimator Model (CalEEMod) and using trip rates based on land uses shown in the Institute of Traffic Engineers (ITE) Trip Generation, 8th Edition (2008) and the Truck Trip Generation Study (City of Fontana, August 2003). In addition to these sources, the lead agency included traffic count worksheets in the Revised Traffic Impact Analysis (Kunzman Associates, Inc., October 2012). It is not clear to the AQMD staff why available project-specific traffic count data included in the Draft MND that could be used to analyze vehicle activity and associated emissions for the existing facility were not used to estimate baseline emissions.

   The AQMD staff believes that using the ITE trip rate to calculate baseline vehicle activity may substantially overestimate project vehicle activity and related on-road mobile source emissions compared with the data supplied in the traffic analysis. This is demonstrated, for example, by looking at the volumes supplied in the Traffic Impact Analysis (TIA) for vehicles entering the facility during the AM peak hour shown on page 11 (Figure 5, Existing Morning Peak Hour Intersection Turning Movement Volumes). For Intersection Six (the main entrance into the facility) in Figure 5, the number of vehicles entering and exiting the facility totals 70. From Table 3 of the TIA (Current Development {Truck Maintenance Facility}), the lead agency has estimated, using the ITE trip rate for the General Light Industrial (110) land use, 259 vehicles per hour. This is more than three times the 70 vehicles per hour found from actual traffic counts. Using the ITE trip rate instead of the vehicle data shown from the traffic counts appears to significantly overestimate the existing project baseline emissions. This results in the incremental emissions, i.e., the difference between the existing facility emissions and the emissions for the proposed warehouse facility being

underestimated. The AQMD staff therefore recommends that applicable analyses be revised in the Final MND using the project-specific traffic count data. Alternatively, the lead agency could explain why the project-specific traffic counts should be ignored.

On-Road Truck Trip Length

3. In the CalEEMod input files provided to AQMD staff by the lead agency, an average one-way trip length of 8.3 miles was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Trucks operating from these kinds of facilities often handle goods coming directly from the port areas over 70 miles away as well as potentially serving out of state destinations. Absent tenant-specific trip length information, the AQMD staff recommends a one-way trip length from the project site to the port areas as more appropriate trip length for on-road truck emissions and that applicable analyses in the Final MND be revised. If the lead agency is uncertain of the types of tenants or the trip lengths, the lead agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of Non-Default Truck Trip Rate

4. In the air quality and health effect analyses, the lead agency based its estimates on trip generation rates from the 8th Edition of the Institute of Transportation Engineers (ITE) Report using a non-default trip rate of 1.44 per thousand square of gross floor area (Land Use Code 152 – High-Cube Warehouse). Based on guidance from the California CalEEMod User's Guide, the AQMD staff recommends using a more conservative trip rate of 2.59 per 1,000 square feet. AQMD staff believes a more conservative trip rate is appropriate as the tenant is unknown, and there are no conditions on the project limiting activity to what is analyzed in the MND.

CalEEMod Fleet Mixture Percentage

5. On page 28 of the Draft IS/MND, the lead agency's narration lists the fleet mixture percentages used in the CalEEMod land use model to estimate operational emissions. The narration states that the estimated fleet mixture is approximately 37 percent truck traffic for the proposed warehouse use including 17 percent heavy-heavy duty (HHD); 8 percent medium-heavy duty (MND); and 12 percent light-heavy duty 1 (LHD1). The CalEEMod inputs, however, also include the 3.4 percent Light-Heavy Duty 2 (LHD2) category that was omitted in the narration total. The 3.4 percent LHD2 percentage would therefore increase the overall truck percentage from 37 to 40 percent. In the Final MND, the narration should be revised to be consistent with the CalEEMod fleet percentages shown in the actual modeling.

Localized Significance Thresholds Analysis: Construction and Operations

6. Under Sensitive receptors on page 13 of the Air Quality & Climate Change Assessment and upon an aerial map inspection, a single-family residential property appears to be located within one-quarter mile of the proposed warehouse. We therefore recommend that the lead agency evaluate localized air quality impacts. The AQMD staff requests this evaluation to ensure that any nearby sensitive receptors are not adversely affected by the construction and operational activities that are occurring in close proximity. AQMD guidance for performing a localized air quality analysis can be found at the following web address: http://www.aqmd.gov/ceqa/handbook/LST/LST.html .

Operational Mitigation Measures

7. In the event the lead agency determines that project air quality impacts (regional or localized) for operations will exceed recommended significance thresholds (mostly attributed to mobile source tailpipe emissions from vehicles operating at the proposed facility), the AQMD staff encourages the lead agency to develop a common set of enforceable mitigation measures to reduce those emissions to the maximum extent feasible. As the lead agency is aware, heavy-duty trucks are the largest source of NOx emissions in our basin and NOx emissions must be reduced by approximately two thirds beyond existing rules and regulations in order to meet air quality standards as required by 2023. Without meeting air quality standards, our region faces federally mandated sanctions, including possible loss of transportation funding. AQMD staff therefore recommends that the lead agency consider the feasibility of the following measures to reduce project impacts. Other lead agencies that have imposed these and similar measures include the City of Banning[1], Riverside County[2], City of San Bernardino[3], and the San Pedro Bay Ports[4], among others.

   Recommended additional measures:

   - Lease/purchase documents shall identify that tenants required to implement the following:
   - At project start, all heavy duty trucks entering the property must meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.
   - If the above clean truck requirements are infeasible, a phase-in schedule should be put forth that will feasibly achieve emission reductions as soon as possible, and faster than existing regulations. Should an alternative

[1] Banning Business Park http://banning.ca.us/archives/30/July%2013,%202010%20City%20Council%20Agenda.pdf .
[2] Mira Loma Commerce Center: http://www.rctlma.org/online/content/conditions_of_approval.aspx?PERMITNO=pp17788 .
[3] Palm/Industrial Distribution Center http://www.ci.san-bernardino.ca.us/civica/filebank/blobdload.asp?BlobID=11793
[4] Clean Trucks Program http://www.cleanairactionplan.org/cleantrucks/ .

schedule be found necessary, the AQMD staff should be consulted prior to approving the schedule.

- Provide a phase-in schedule and goals for the introduction of zero or near-zero technology trucks (e.g., 10% by 2020, 20% by 2025, etc.) that visit warehouses.

The facility operator will maintain a log of all trucks entering the facility to ensure that on average, the daily truck fleet meets the quantities and emission standards listed in the Draft MND. This log should be available for inspection by city staff at any time.

- The facility operator will ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies [for example, by requiring attendance at CARB approved courses (such as the free, one-day Course #512)].

- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final MND. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Require at least a portion of the fleet to utilize alternative fueled technologies.

- The 2012 Regional Transportation Plan includes a zero-near-zero emissions truck corridor along the SR-60 freeway west of I-15. Because at least a portion of the trucks serving this project may be expected to travel along this route, the project should consider providing onsite alternative fueling infrastructure, such as electric charging stations or natural gas fueling that will help facilitate these low-emitting trucks. This could include ensuring electrical panels and wiring are sufficiently sized to accommodate future needs.

- At a minimum, require tenants upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the tenant should also be required to accept and use them.

- Restrict overnight parking in residential areas. Establish overnight parking within the warehouse/distribution center where trucks can rest overnight.

- Establish area(s) within the facility for repair needs.

- Post signs outside of the facility providing a phone number where neighbors can call if there is a specific issue.

- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.

- Have truck routes clearly marked with trailblazer signs, so trucks will not enter residential areas.
- Identify or develop secure locations outside of residential neighborhoods where truckers that live in the community can park their truck, such as a Park & Ride.
- Provide food options, fueling, truck repair and or convenience store on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Requiring all on-site vehicles (hostlers, forklifts, etc.) to utilize zero or near-zero emission technology.
- Use street sweepers that comply with SCAQMD Rules 1186 and 1186.1.
- Install solar panels on all available roof space. If this isn't feasible, then at a minimum all buildings and electrical infrastructure should be designed to accommodate potential future solar panel upgrades.

Off-Road Construction Equipment Reduced Load Factors

8. In Appendix B (CalEEMod Output) in the air quality assessment, the lead agency estimated project construction impacts using the CalEEMod land use emissions computer model. This model uses default and user-defined settings to estimate emissions based on the land use settings. In the CalEEMod inputs under User Entered Comments, the lead agency has reduced the Construction Phase Off-Road Equipment load factors by 33 percent citing the California Air Resources Board (CARB) as authority for the changes. For example, the default load factor in the CalEEMod model for rubber tired loaders of 54 percent was reduced to 36 percent.

   Based on communication with ARB staff[5] regarding this issue, the AQMD staff confirmed that CARB staff does not recommend reducing the default settings in the current OFFROAD2007 without considering all parameters besides the load factor. Other parameters such as activity level, horsepower, and population all contribute to the emission factor estimate, and selectively changing only one parameter will lead to inaccurate estimates at a project level. For some equipment types, OFFROAD2007 may underestimate emissions while others may be overestimated. Because of these revisions (and others), CARB developed the new OFFROAD2011. The AQMD staff therefore recommends that the lead agency either use existing OFFROAD2007 defaults until OFFROAD2011 is incorporated into CalEEMod later this year or run OFFROAD2011 outside CalEEMod and use those results to modify the CalEEMod construction calculations. Therefore, even though the reductions might not change the lead agency's determination of significance for construction air quality impacts, these reductions related to

[5] Personal communication with Nicole Dolney, June 1, 2012.

reduced off-road equipment load factors are not recommended by the AQMD staff without further substantial evidence to support those emission reductions resulting from their use. Otherwise, the lead agency should commit to enforcing the assumed lower non-substantiated emission factors.

Construction Mitigation Measures

9. Should the lead agency determine that project localized construction air quality impacts will exceed the AQMD recommended daily significance thresholds, the AQMD staff therefore recommends the following mitigation measures during the projected 10 month construction period to reduce adverse air quality impacts from on-site construction emission sources, if applicable and feasible.

   Recommended additions:

   - Limit the amounts of daily soil disturbance to the amounts analyzed in the Draft MND.
   - All clearing, grading, earth-moving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.
   - Apply non-toxic soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more).
   - All trucks hauling dirt, sand, soil, or other loose materials are to be covered.
   - Sweep streets at the end of the day if visible soil is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water).

   Further, other lead agencies in the region including LA County Metro, the Port of Los Angeles, and the Port of Long Beach have also enacted the following mitigation measures. AQMD staff recommends the following measures to further reduce air quality impacts from construction equipment exhaust:

   - Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
   - Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by

the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or AQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html .

Re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Planning Commission Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant") in the City of Ontario ("City"). The Project's Final Environmental Impact Report ("FEIR") and development plan will be considered at the May 28, 2024 Planning Commission meeting as Agenda Item D. The Commission will consider certification of the FEIR and approval of the Development Plan application.

CARE CA submitted comments on the DEIR and subsequently on the FEIR, accompanied by expert comments, showing that the FEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant air quality, public health, greenhouse gas ("GHG"), energy, transportation, and cumulative impacts. The Staff Report contains responses[1] to CARE CA's comments on the FEIR. However, the responses fail to resolve the major flaws CARE CA and its experts identified in the DEIR.

[1] Letter from T&B Planning Inc. to City, re: 5355 East Airport Drive (PDEV22-017) – Response to April 15, 2024 Comment Letter from CARE CA (May 20, 2024).

printed on recycled paper

We reviewed the Planning Commission Staff Report with the assistance of air quality expert Dr. James Clark.[2]

The Staff Report fails to meaningfully address the flaws in the Project's environmental review. Regarding hazards, the FEIR identifies significant vapor intrusion impacts due to PCE contamination, but improperly defers formulation of mitigation measures. The FEIR also fails to analyze the full scope of the Project – CEQA requires that an EIR analyze the reasonably foreseeable consequences of the Project, but the Project's FEIR fails to analyze the Project's reasonably foreseeable use as a parcel hub (a use that generates more trips than analyzed), and fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach. Regarding cumulative impacts, the Staff Report still fails to meaningfully respond to the legal authority requiring analysis of the Project's impacts in the context of the numerous other warehouses existing and planned in the area. The Staff Report also fails to resolve flaws in the Project's health risk assessment, which still underestimates impacts on sensitive receptors. Regarding energy, the Staff Report provides an analysis of factors in Appendix F the CEQA Guidelines. But the analysis is wholly inadequate because it fails to address applicable energy consumption measures and renewable energy options. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

The Staff Report incorrectly concludes that the "final EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[3] The Staff Report recommends that the Planning Commission adopt the final EIR and approve the Project's Development Plan Application.[4] These recommendations are unsupported by evidence in the record due to the major flaws in the Project's environmental review.

CARE CA urges the Planning Commission to require the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

[2] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Staff Report, Item D - 2573 of 3296.
[4] Staff Report, Item D - 1 of 3296.

printed on recycled paper

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

A. The FEIR Improperly Defers Formulation of Mitigation Measures for Hazardous Materials

The FEIR's Phase I/II Environmental Site Assessment ("ESA") identifies levels of tetrachloroethene ("PCE") in soil vapor samples in excess of current commercial/industrial calculated soil gas screening levels ("SGSLs").[5] The ESA concludes that "PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Site."[6] The FEIR identifies this contamination as a potentially significant impact.[7] Additionally, the ethylbenzene concentration in one soil vapor sample

[5] FEIR, Phase I/II Environmental Site Assessment, pg. vii.
[6] FEIR, Phase I/II Environmental Site Assessment, pg. 11-2.
[7] DEIR, pg. S-17.

printed on recycled paper

exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.[8] The FEIR fails to disclose this significant impact in the body of the FEIR, in violation of CEQA.

The FEIR states that the potentially significant vapor intrusion impacts would be mitigated through imposition of Mitigation Measure ("MM") 4.7-1. This measure requires future preparation of a Soil Management Plan ("SMP"). he SMP will include instructions for handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. But MM 4.7-1 fails to explain how the PCE contamination at the Project site will actually be addressed – whether it will be remediated, capped in place, etc. – and the FEIR lacks a quantitative analysis of the construction impacts associated with that process. The measure states that contaminated soils will be monitored and provides guidance for proper soil handling, but does not specifically state that PCE-contaminated soil will be removed. Under MM 4.7-1, it is unclear if the City will remove PCE-contaminated soil or adopt passive/engineered vapor intrusion mitigation such as installing a vapor barrier or venting. Without clear performance standards and a quantitative analysis of the impacts of the PCE cleanup phase of construction, MM 4.7-1 remains incomplete and ineffective, and the FEIR's construction impact analysis remains incomplete.

MM 4.7-1 improperly defers formulation of mitigation measures related to PCE contamination to a future date.

CEQA Guidelines Section 15126.4 states that formulation of mitigation measures shall not be deferred until some future time. The Guidelines permit an agency to develop the "specific details of a mitigation measure" after project approval "when it is impractical or infeasible to include those details during the project's environmental review."[9] In such circumstances, deferral of mitigation details is permitted if the agency "(1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will [be] considered, analyzed, and potentially incorporated in the mitigation measure."[10] Compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on

[8] FEIR, Phase I/II Environmental Site Assessment, pg. viii.
[9] Guidelines, § 15126.4, subd. (a)(1)(B) (Section 15126.4).
[10] Section 15126.4, subd. (a)(1)(B); *see Save Our Capitol! v. Department of General Services* (2022) 85 Cal.App.5th 1101, 1134 (*Save Our Capitol!*).)

printed on recycled paper

substantial evidence in the record, to reduce the significant impact to the specified performance standards.[11]

Here, the FEIR defers formulation of the PCE mitigation until after Project approval. But the City fails to present any evidence that it would be impractical or infeasible to do so during the Project's environmental review. Based on the evidence before the City, it should be feasible to require and formulate vapor intrusion mitigation. Even if deferral of formulation of mitigation were reasonable in this case, MM 4.7-1 fails to adopt specific performance standards for remediating PCE contamination and the associated vapor intrusion risks. MM 4.7-1 also fails to clearly identify the types of potential actions that may be taken to mitigate the vapor intrusion risk. Thus, the City improperly defers formulation of PCE contamination and vapor intrusion mitigation.

The City also improperly defers formulation of mitigation for the ethylbenzene contamination. As with the PCE contamination, MM 4.7-1 fails to substantiate how this contaminant will be addressed. The FEIR contains no evidence that formulation of mitigation for ethylbenzene contamination is impractical or infeasible, identifies no performance standards, and fails to identify potential mitigation measures. Mitigation for this impact is thus improperly deferred.

B. The City Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the FEIR showed that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse, which has a trip generation rate 2.6 times the rate used in the FEIR. In Response 1-8, the City reiterates its position that analyzing the Project as a combination of the "Warehousing" and "High-Cube Cold Storage Warehouse" land uses is reasonable due to the Project's anticipated use and size.[12]

The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[13] Here, the Project proposes a 270,337-square-foot industrial

[11] *Id.*

printed on recycled paper

building with a proposed height of 46 feet on 13.08 acres of land. A high-cube parcel hub warehouse is a reasonably foreseeable use of this project because "high-cube parcel hub warehouse" is defined in Institute of Transportation Engineers ("ITE") land use code 156 as a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods prior to their distribution to retail locations or other warehouses. And Mr. Marshall's comments on the FEIR demonstrate that the Project site includes adequate parking to support this use. Even if less-intensive warehouse uses are possible for this Project (such as the FEIR's combination of "Warehousing" and "High-Cube Cold Storage Warehouse"), use as a high-cube parcel hub warehouse is a reasonably foreseeable outcome that must be analyzed.

The City's claim that the Project's "anticipated use" does not include a high-cube parcel hub warehouse is irrelevant to the analysis. Courts have held that in this situation, "the identity of a tenant is irrelevant to CEQA review."[14] The court in *Maintain Our Desert Environment v. Town of Apple Valley* explained that "land use entitlements such as conditional use permits and development approvals run with the land and do not belong to the permittee…. had [the developer] developed the Project and then held it out for sale to any interested buyer, no additional CEQA review would have been necessary for the new owner so long as the use was consistent with that that had already been approved."[15] Here, the project that is the subject of the FEIR is a Development Plan to develop an industrial building totaling 270,337 square feet of gross floor area on 13.08 acres and having a FAR of 0.47. This building could be used as a high-cube parcel hub warehouse, so this level of use must be analyzed in the FEIR.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the FEIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. The City's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[16] CARE CA's

[14] *Am. Canyon Cmty. United for Responsible Growth v. City of Am. Canyon* (2006) 145 Cal. App. 4th 1062, 1074 (citing *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 443–449)).

[16] DEIR, Appendix B, pg. 53.

printed on recycled paper

comments provided a discussion of the controlling caselaw,[17] the Attorney General's recent litigation on this issue in *People of the State of California v. City of Fontana*,[18] and pending updates to the SCAQMD significance thresholds for cumulative impacts in response to this litigation. These authorities explain that the City's "drop in the bucket" approach to cumulative impacts does not comply with CEQA.

In Responses 1-10 and 1-11, the Staff Report states: "[t]he commenter is again advised that the SCAQMD is the regulatory authority on air quality charged with the responsibility of ensuring the improvement of air quality in the South Coast Air Basin… The commenter speculates on 'updated thresholds' for air quality impacts. Absent these 'updated thresholds' the EIR properly evaluates air quality impacts in the context of existing thresholds, protocols, and methodologies."[19]

The Staff Report and the FEIR continue to fail to address any of the controlling legal authority on this issue raised in CARE CA's comments. The court in *Environmental Protection Information Center v. California Dept. of Forestry Fire Protection* stated: "[w]e review an agency's decision regarding the inclusion of information in the cumulative impacts analysis under an abuse of discretion standard. 'The primary determination is whether it was reasonable and practical to include the projects and whether, without their inclusion, the severity and significance of the cumulative impacts were reflected adequately.'"[20] CARE CA's comments demonstrate that the SCAQMD individual project significance threshold fail to reflect the significance of cumulative air quality and public health impacts in areas burdened by extensive warehouse development – this Project would add a substantial number of diesel truck trips to routes in an area with a high existing background MATES cancer risk, combining with the emissions of trucks from numerous other warehouses. Analysis of cumulative impacts from past, present, and probable future warehouse projects is feasible. As an example, Dr. Clark's comments present data from Pitzer College's Warehouse CITY tool, which maps existing and proposed warehouses in Los Angeles, Riverside, and San Bernardino Counties.[21] The tool measures metrics including acreage, square footage, and diesel particulate matter and carbon emissions.[22]

[22] *Id.*; Clark, pg. 7.

printed on recycled paper

The Staff Report's statement that CARE CA speculates as to "updated thresholds" is erroneous because CARE CA's comments link directly to the materials for SCAQMD's working group meetings – these materials discuss updates to the thresholds.[23] The Staff Report's failure to discuss SCAQMD's pending updates is inconsistent with the Staff Report's statement that SCAQMD is the regulatory authority on air quality. In sum, the City's rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and informational requirements of CEQA.

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

CARE CA's comments on the FEIR identify flaws in the City's Mobile Source Health Risk Assessment ("HRA") that underestimate health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project. In Responses 1-12 and 1-13, the Staff Report disputes these flaws. The Staff Report maintains that "[a]ny variant in interpretation of OEHHA guidance such as is suggested by the commenter would not materially affect the EIR health risk significance conclusions" because "the Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site."[24]

The Staff Report's statement regarding distance from sensitive receptors ignores that the Project would generate truck trips impacting sensitive receptors along the City's designated truck routes.[25] The Project's primary truck routes would depend on the Project's future uses. Despite uncertainty regarding the Project's future tenants, the HRA makes an unsubstantiated assumption regarding the Project's primary truck route, shown in the exhibit below.[26]

[26] FEIR, HRA Report, Exhibit 2-C.

printed on recycled paper

EXHIBIT 2-C: MODELED OFF-SITE EMISSION SOURCES

The HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. Trucks could easily travel west on Airport Drive and north along Milliken Avenue, which are both City-designated truck routes.[27] Sensitive receptors including Receptor R6 are located off Milliken Avenue, and could thus be impacted by cumulative truck trips from this Project and other warehouses. The HRA's assumption that trucks would not travel west along Airport Drive underestimates impacts. A revised HRA must be prepared.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the FEIR underestimates truck trip lengths by failing to account for the Project's distance to the Ports of Los Angeles and Long Beach. CARE CA presented numerous comment letters from SCAQMD

[27] The Ontario Plan, Mobility Element, Figure M-04, https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/The%20Ontario%20Plann/Mobility/FIgure%20M-04%20Truck%20Routes.pdf; Clark Comments, pg. 5.

printed on recycled paper

recommending analysis of trips to the Ports, and presented evidence showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario. In Response 1-16, the Staff Report states:

> The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, Project Description, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages.

The Staff Report apparently dismisses the SCAQMD comments as inapplicable without providing any evidence demonstrating that the Project's truck trips would be limited to the local 40-mile average trip lengths analyzed in the FEIR, and without considering the additional guidance from SCAQMD contained in the letters which explains that truck trips to and from the ports should be analyzed. Many of the SCAQMD letters recommending consideration of the distance to the Ports were in regard to "spec" warehouses with unknown tenants, just like the Project.[28] The Staff Report and the FEIR's responses fail to respond to this guidance with good faith, reasoned analysis,[29] and still fail to provide any evidence demonstrating that goods brought in and out of the Project's warehouses would primarily come from short-distance truck trips.

The Staff Report's statement that it is speculative to assume trucks may travel to the Ports of Los Angeles and Long Beach also misstates the applicable legal standard. The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical

[28] SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf ("the future tenant(s) of the building is not known").
[29] CEQA Guidelines, Section 15088 requires "good faith, reasoned analysis in response… Conclusory statements unsupported by factual information will not suffice." The level of detail contained in the response may correspond to the level of detail provided in the comment.

printed on recycled paper

change in the environment."[30] Here, the Project proposes a 270,337-square-foot industrial building with a proposed height of 46 feet on 13.08 acres of land. CARE CA's comments contain evidence showing that trips to the Ports are a reasonably foreseeable outcome of a warehouse like this (citing to the massive volume of goods moving to and from the Ports, and recommendations from SCAQMD).[31] In light of this evidence, the City's assumption that trucks would not travel to the Ports is speculative, unsupported by substantial evidence, and is a failure to analyze a reasonably foreseeable use permitted by the Development Plan.

This letter contains additional substantial evidence showing that trips to the Ports are reasonably foreseeable. The National Center for Sustainable Transportation ("NCST"), sponsored by the California Department of Transportation, prepared a research report titled "Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns" in 2017.[32] The report analyzed Southern California Association of Governments ("SCAG") data on warehouses in the six counties that comprise the SCAG region (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura). The report finds that **56% of the facilities in the SCAG region receive goods from the Port of Los Angeles and Long Beach**, and around 50% deliver to Southern California warehouses, retail stores or manufacturing plants.[33] This data suggests that trips to the Ports are reasonably foreseeable, and that it would be speculative not to account for distance to the Ports.

In June 2014, SCAQMD staff conducted a business survey of warehouse operators in the SCAQMD region.[34] The survey found that **42% of goods going to high-cube warehouses in the SCAQMD region originated from the Ports**, per the figure below.[35]

printed on recycled paper

Origin and Destination of Goods

22 of 34 high cube warehouse respondents provided the origins and destinations of goods flowing to and from their facility. Major trends seen in the charts below include:

- The ports of Los Angeles and Long Beach make up a large share of imported goods yet only a minor component of exported goods
- Approximately 1 in 5 truck trips occurs between warehouses
- Approximately 1 in 7 truck trips involves an out of state location
- Approximately 1 in 10 truck trips involves a rail yard

During discussion at the April 15, 2024 Development Advisory Board hearing, a City consultant suggested that if the Project only makes truck trips to other warehouses, it would not be necessary to evaluate distance to the Ports. The figure above shows that only a small percentage of goods come from other warehouses and that the lion's share of goods are from the Ports. Thus, it would be speculative to disregard the Project's distance from the Ports in analyzing its impacts.

CARE CA's prior comments discussed the volume of goods passing through the Ports. 32 percent of all containers in the U.S. move through the Ports.[36]

[36] SCAG, ConnectSocal, Technical Report re Goods Movement (Adopted September 3, 2020), pg. 9, available at https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_goods-movement.pdf?1606001690.

printed on recycled paper

Approximately 40 percent of the total U.S.-Asia trade is served by the Ports, and 40 percent of the imports entering the Ports are transloaded or cross-docked.[37]

Substantial evidence also demonstrates the demand for port-related warehouse space is expected to expand. SCAG's 2012-2035 Regional Transportation Plan forecasts that "Demand for port-related warehouse space is projected to grow at a faster pace than demand for domestic warehousing… As space near the San Pedro Bay Ports reaches capacity, port warehousing will push out to the Inland Empire…. By 2035, the region may experience a shortfall of more than 228 million square feet in warehouse space relative to demand."[38] The table below reflects SCAG's forecasts for growth in demand for port-related warehouse space. The growth in the port-related market is expected to be much higher than the domestic market.[39]

Table 2.4 2014-2040 Minimum and Maximum Growth in Unconstrained Occupied Warehouse Space by Cargo Market across Alternate Scenarios

	Growth Percentage Range		Annualized Growth Rate Range	
Cargo Market	Min.	Max.	Min.	Max.

Source: SCAG Warehouse Space Forecasting Model, Version 1.0, developed in June 30, 2016.

In sum, substantial evidence demonstrates that trips to the Ports are reasonably foreseeable for a spec warehouse proposed in the SCAG region, like this one. The lack of a specific tenant identified for the Project does not justify omission

[37] SCAG, Industrial Warehousing in the SCAG Region – Task 3: Assessment of Supply Chain Strategies and Implications for Future Development (April 2018), Pg. 1-4, 1-5, https://scag.ca.gov/sites/main/files/file-attachments/task3_supplychaintrends.pdf?1604268170. (Transloading refers to transferring of import cargo from ocean containers into domestic 53-foot containers and trailers for onward movement to U.S. inland destinations via rail or truck. Crossdocking is a type of transloading in which the cargo is transloaded within approximately 24 hours of arriving at the transload facility.).

printed on recycled paper

of this analysis. As a result of this omission, the FEIR underestimates transportation, air quality, and GHG impacts.

F. The FEIR Still Fails to Include Sufficient Investigation into Energy Conservation Measures

CARE CA commented that the FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines.[40] CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[41] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[42]

In Response 1-20, the Staff Report suggests that discussion of energy consumption measures is not required for this Project because its energy impacts are less than significant.[43] The City continues to make the same error as the lead agency in *CCEC* because the EIR in that case also identified a less-than-significant energy impact.[44] The court held that the EIR must nonetheless analyze energy consumption measures.[45]

Response 1-20 provides a "CEQA Guidelines Appendix F Energy Analysis" in Table 1-1.[46] Table 1-1 addresses factors listed in Appendix F, subdv. II(C), but fails to include any discussion of renewable energy options. As explained in *CCEC*, an EIR fails to comply with the requirements of Appendix F by not discussing or analyzing renewable energy options.[47] And as explained in CARE CA's prior comments, this FEIR must analyze the feasibility and effectiveness of measures including onsite solar facilities, electric vehicle charging, alternative fuel sources for the backup generators, more stringent idling requirements, and use of existing power sources during construction rather than generators.

The Staff Report contains additional responses regarding energy in Responses 1-21 to 1-25, but none address the feasibility of reducing energy

---

printed on recycled paper

consumption through onsite solar facilities. Response 1-21 states that the City need not evaluate using alternative fuel sources for backup generators because their emissions would be less-than-significant.[48] Again, the Staff Report makes the same mistake proscribed in *CCEC* by assuming no analysis of energy consumption measures is required if the Project's energy impact is less-than-significant.[49]

In Response 1-22, the City states that it would be infeasible to set more stringent idling requirements over existing requirements because there is no enforcement mechanism that the City can assure to enforce adherence.[50] But the City is authorized under Development Code Section 4.02.025(E) to impose conditions of approval to protect public health and mitigate environmental impacts. Section 4.02.025(E)(3) states that "All conditions of approval or requirements authorized by this Section are enforceable in the same manner and to the same extent as any other applicable requirement of this Development Code." Unenforceability is thus not a valid reason not to consider a more stringent idling requirement.

In Response 1-23, the Staff Report states that the FEIR adequately evaluated the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators during construction. The Response seems to misunderstand the nature of CARE CA's comment by discussing how "new dry utility infrastructure would be installed underground."[51] Instead, the FEIR should have included a discussion on the feasibility of a measuring limiting use of diesel generators during construction.

In Response 1-25, the Staff Report states that it meaningfully addresses Appendix F's considerations of "whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope."[52] But neither the Staff Report nor the FEIR contain this analysis.

In sum, the FEIR's energy analysis remains wholly inadequate. The Staff Report and the FEIR make no attempt to evaluate the feasibility of onsite renewable energy generation and storage, and fail to consider the feasibility of electric vehicle charging beyond existing requirements. And the Staff Report's

printed on recycled paper

responses to proposed energy consumption measures in Responses 1-21 to 1-25 are generally nonresponsive and fail to meet CEQA's requirements.

III. THE COMMISSION CANNOT MAKE THE REQUISITE FINDINGS TO APPROVE THE PROJECT

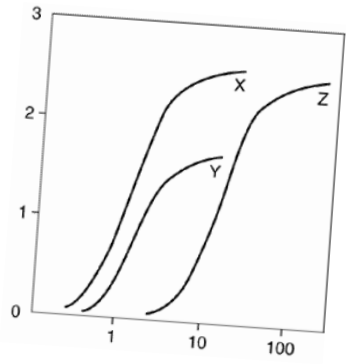
Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[53]

The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant vapor intrusion, health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project. A revised EIR must be recirculated before the Project can be recommended for approval.

IV. CONCLUSION

As is explained herein, the FEIR's hazards, air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to certify the FEIR or under the City of Ontario Municipal Code to approve the Project's Development Plan. CARE CA urges the Commission to require the City revise and recirculate the EIR before any further action is taken on the Project.

Sincerely,



Aidan P. Marshall

Attn: Mr. Aidan Marshall

Subject: Comments On Staff Report For Final Environmental Impact Report (DEIR) 5355 Esat Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the August 2023 City of Ontario's (the City) DEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the draft EIR consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

In the Meeting Agenda for the May 28th, 2024 City of Ontario Planning Commission/Historic Preservation Meeting Agenda, the City included responses from T&B Planning (T&B) to comments on the Final EIR for the Project provided by CARE CA. The responses from T&B for the City in total claim that no new information has been provided within the comments. This assertion is not supported by the information provided within the responses from CARE.

Specific Comments

1. Comment 1-12: The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.

T& B claims that building downwash is not appropriate for volume or area sources. This is incorrect. The choice to model the idling trucks, which are movable discrete point sources onsite below the line of the building roof, is a controllable feature in the AERMOD model. Volume sources are defined in the AERMOD Users Guide as included a variety of industrial sources, such as building roof monitors, multiple vents, and conveyor belts.[1] Volume sources are characterized as having a defined specific release height above the ground, an initial lateral dimension of the volume, and an initial vertical dimension. While the assumption that roadways and idling trucks in the Health Risk Assessment can be modeled as a line of volume sources, it must be pointed out that emissions from idling trucks and moving trucks will come from the exhaust pipe(s) to the engine, releasing diesel particulate matter (DPM) from a raised pipe at a specific rate (a point source). Therefore, the use of building downwash in the model to ensure that the modeled concentrations are not underestimated is appropriate. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). T&B, in Response 1-12, states that the Project's Air Quality Impact Analysis experts (Technical Appendix B1 of the Draft EIR) have concluded that truck idling emissions sources resulting from the Project would not be materially affected by downwash, but it is important to note that the HRA does not quantify the effects of downwash. The City should address the impact of this issue in a Revised DEIR.

2. Comment 1-41: The Air Quality Analysis Relies On An Input Value From AP-42 That

[1] U.S. EPA. 2023. User's Guide for the AMS/EPA Regulatory Model (AERMOD). Pg 3-68

Is Rated As Poor And Maybe Unreliable

T&B's response that the impact from a poorly rated AP-42 value is incorporated into the analysis is not new evidence is not supported by the evidence in the FEIR. As was noted in my prior comments, the CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42, which according to U.S. EPA may not represent a random sample of the industry. The City's response to the questioning of the rating of the emission factor was qualitative at best, failing to show any quantitative analysis of the potential impacts. The City should assess the impacts of this variable in a Revised DEIR.

3. Comment 1-16: The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to T&B's response, the Project is proposed as a speculative development and the user(s) of the building. T&B goes on to state that it is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. This line of reasoning clearly conflicts with the goals of CEQA to analyze the foreseeable and reasonable emissions from the Project.

This statement also does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately

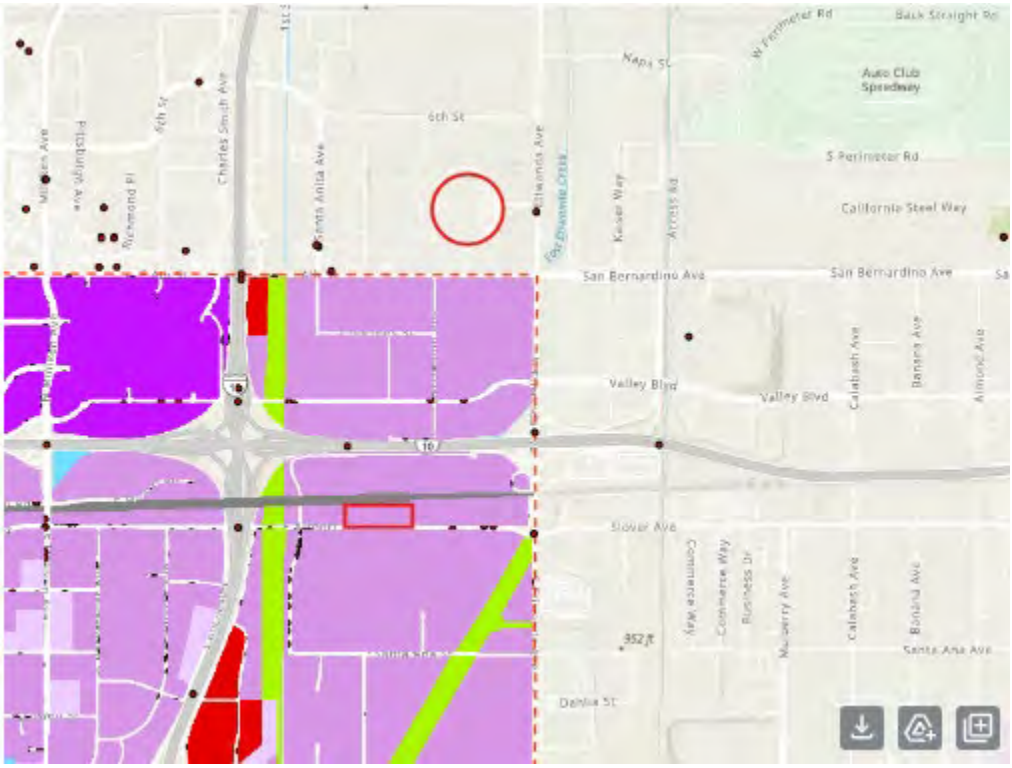
700 million square feet, an increase of 20 percent over the last five years"),[2] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[3] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[4] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a R-FEIR.

4. Additional Comments On The FEIR

a. The Truck Route Assumed For The Project Site Ignores The Traffic Constraints Of The Project Site

The truck route assumed in the FEIR assumes traffic will only exit the Project Site and turn left on East Airport Drive to S. Etiwanda Avenue. This route requires the trucks using the Project Site to cross (turn left out of the Project Site) Airport drive and to cross South Etiwanda Drive (turn left onto S. Etiwanda Avenue). The assumed distance to the 10 freeway is approximately 0.8 mile. An alternate route for traffic was not assessed in the FEIR which is longer than the primary route, but would have fewer traffic challenges for the drivers. Assuming trucks exit the Project Site and turn right (avoiding the delay getting across Airport Drive) then turn right on South Milliken Avenue, the vehicles will also be able to reach the 10 Freeway. The distance for this route is approximately 1.6 miles and is closer to the residential properties identified in the FEIR. The City must consider this alternate route and the air quality impacts in a R-FEIR.

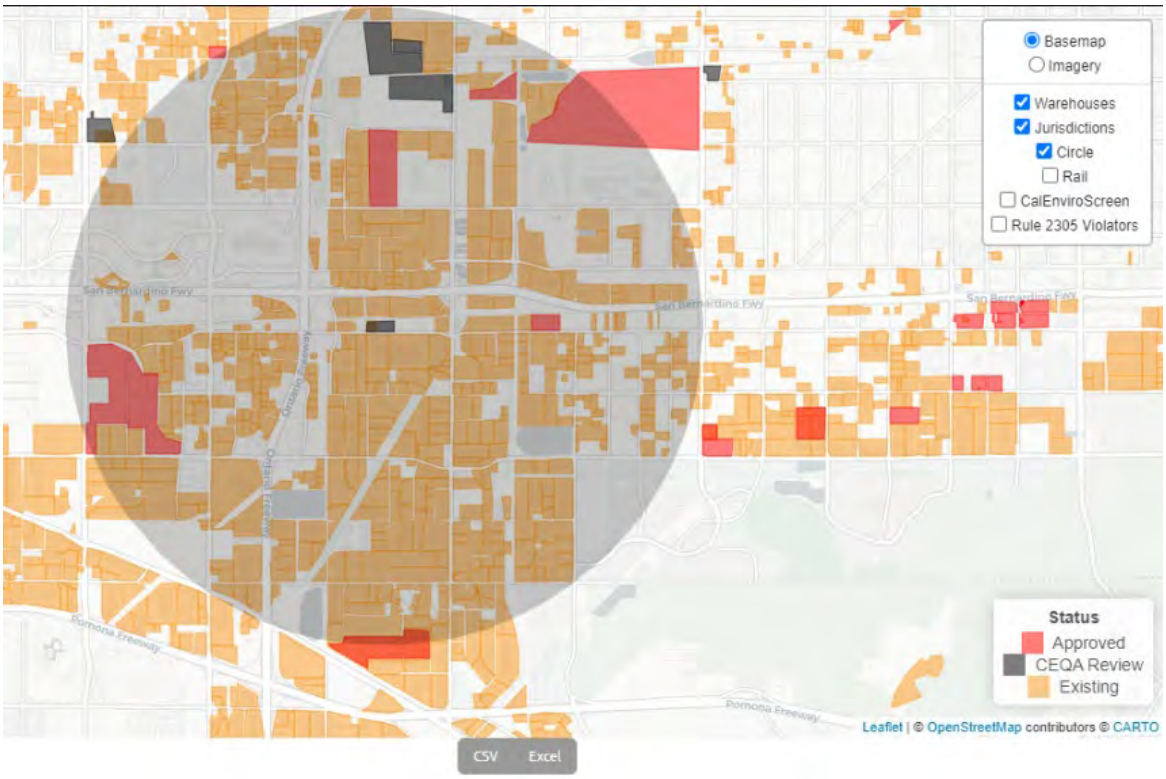


b. The HRA And Air Quality Analysis Failed To Assess A Receptor Closer To The Project Site Than The Residential Properties To The Northwest – The San Bernardino County West Valley Detention Center

[2] Available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf

[3] https://data.bts.gov/stories/s/Container-TEU/x3fb-aeda/

[4] U.S. Dept. of Transportation, Federal Highway Administration, FHWA Operations Support – Port Peak Pricing Program Evaluation (2020), available at https://ops.fhwa.dot.gov/publications/fhwahop09014/sect2.htm



The HRA and Air Quality Analysis failed to consider a significant receptor near the Project Site. The San Bernardino County West Valley Detention Center is located approximately 5,600 feet north northeast of the Project Site at 9500 Etiwanda Ave in Rancho Cucamonga. The Detention Center houses approximately 3,347 inmates and 600 workers.

The Detention Center is nearly 3,000 feet closer to the Project Site, and is nearer the proposed truck route, than the residential property identified in the HRA. The City must assess the impacts of the Project emissions on this receptor center in a revised DEIR.

c. The Cumulative Analysis Of The Project Failed To Consider The Significant Number Of Existing Warehouse Projects In The Vicinity

Based on the current analysis of warehouse projects within a 5-kilometer radius (3.1 miles) of the Project Site, there are 595 current warehouses, totaling 126,400,000 square feet of floor space.

Those projects account for 85,000 truck trips per day, which emit 117.6 lbs of DPM and 13, 243 lbs of NOx per day. There is an additional 7,400,000 square feet of warehousing that is either approved or undergoing CEQA review (includes the Airport Site). The cumulative impacts must be considered in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised draft environmental impact report should be prepared to address these substantial concerns.

Sincerely,

MEMORANDUM

TO: Thomas Grahn, Senior Planner
City of Ontario
303 East B Street
Ontario, CA 91764

FROM: Tracy Zinn, Principal
Tracy Chu, Project Manager

DATE: August 8, 2024

RE: 5355 East Airport Drive (PDEV22-017) – Response to May 28, 2024 Comment Letter from CARE CA

T&B Planning, Inc. is the environmental consulting firm that prepared the Environmental Impact Report (EIR; SCH No. 2022090006) for the 5355 East Airport Drive Project (hereafter "Project"). The Project Applicant, Prologis, Inc., proposes to demolish the existing buildings and structures on the Project site and redevelop the property with a 270,337 square foot (s.f.) warehouse building. The Project's design also includes the installation of associated site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detention facilities, exterior lighting, walls/fencing, and signage as well as site-adjacent improvements to East Airport Drive. The Draft EIR for the Project was published on August 22, 2023, for a 45 day review period, with the local review period and State review period ending on October 5, 2023.

On May 28, 2024, and after publication of the Final EIR, a letter was sent to the City from Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy (CARECA). In response, T&B Planning prepared this memorandum for the purpose of responding to the comments received alleging deficiencies in the Draft EIR and Final EIR. The responses contained herein demonstrate that the Draft EIR's analyses and conclusions are correct and that the Final EIR has been appropriately prepared to satisfy CEQA compliance requirements. There are no CEQA compliance deficiencies as claimed by CARECA. For the reasons outlined in this memorandum, the comments provided by CARECA and the responses thereto contained in this memo do not present substantial new information, do not necessitate revisions to the Draft EIR or Final EIR, and do not trigger the need for recirculation of the Draft EIR or Final EIR, or the conduct of additional environmental review pursuant to CEQA Guidelines § 15088.5.

Commenter Letter: Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy dated May 28, 2024.

CARE-1 This comment consists of introductory remarks and identifies that the comments in this letter are being provided by Adams Broadwell Joseph & Cardozo on behalf of the Californians Allied for a Responsible Economy (CARECA) and provides a summary of prior comments submitted concerning the Project during the Draft's EIR public review period, and on the Final EIR. The commenter claims that the Response to Comment Memorandum (RTC), dated May 20, 2024, failed to resolve asserted flaws that CARE CA and its experts identified in the Draft EIR. Response to the comments made are provided below in this memorandum.

CARE-2 This comment first introduces the comment's supporting documents drafted by Dr. James Clark, and asserts that the Project's Staff Report prepared by the City for the Planning Commission hearing failed to meaningfully address CARECA's claimed flaws in the Project's environmental review. The commenter then provides a summary of the issues raised in the body of the comment letter. The commenter asserts that the Final EIR defers formulation of mitigation measures related to vapor intrusion impacts, does not analyze the claim that the Project could be used as a parcel hub, and does not analyze trucks trips to the Ports of Los Angeles and Long Beach, cumulative analysis, underestimates impacts on sensitive receptors, and fails to address applicable energy consumption measures and renewable energy options. The commenter also recommends that the City revise and recirculate the Draft EIR. As described in the following responses, the commenter's assertions are incorrect and no additions, revisions, or corrections to the Draft EIR or Final EIR are necessary. Refer to Response to Comments CARE-4 to CARE-32.

CARE-3 The comment includes a statement of interest describing CARECA's organization, role, members, and purposes. The statement of interest is noted. Employment and business concerns raised in this comment do not raise any associated environmental issues and are therefore not within the purview of CEQA; however, this comment will be provided to the City's decision makers for their review and consideration of the Project as a whole. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

CARE-4 The commenter summarizes the findings of the Project's Phase I and II Environmental Site Assessment (ESA; *Technical Appendix G* to the Draft EIR) related to tetrachloroethylene (PCE) impacts and asserts that the Final EIR failed to disclose the impacts of ethylbenzene concentration. The commenter is referred to the Media Management Plan (*Attachment F* to the Final EIR), which thoroughly explains the mitigation procedures that will be undertaken for all earthwork that involves chemically impacted soil, intersects groundwater, or leads to the discovery of any unanticipated condition. All activities involving removal of chemically impacted soil, if required, will be performed under the management of a California State Professional Geologist or Professional Engineer. Implementation of the Media Management Plan is required and no additions, revisions, or corrections are necessary to the Final EIR.

CARE-5 The commenter summarizes Mitigation Measure MM 4.7-1 and states that the mitigation measure failed to explain how the tetrachloroethylene (PCE) contamination at the Project site will be addressed. The commenter further states that the Final EIR lacks quantitative analysis of the construction impacts

associated with that process and MM 4.7-1 defers formulative of mitigation measures related to PCE contamination to a future date. The commenter is incorrect and is referred to the Media Management Plan (*Attachment F* to the Final EIR), which thoroughly explains the mitigation procedures that will be undertaken. The Media Management Plan provides protocols for managing confirmed and potentially contaminated media that may be encountered during future improvement activities involving subsurface work at the Project site. Refer also to Response to Comment B-25 of the Final EIR (FEIR, pp. 2-89 and 2-90).

CARE-6 The commenter summarizes Section 15126.4 of the CEQA Guidelines and asserts that the Final EIR defers formulative of mitigation measures related to PCE contamination until after Project approval. Refer to Response to Comment CARE-5. The commenter is referred to the Media Management Plan (*Attachment F* to the Final EIR), which thoroughly explains the mitigation procedures that will be undertaken for all earthwork that involves chemically impacted soil, intersects groundwater, or leads to the discovery of any unanticipated condition. All activities involving removal of chemically impacted soil, if required, will be performed under the management of a California State Professional Geologist or Professional Engineer. Implementation of the Media Management Plan is required and no additions, revisions, or corrections are necessary to the Final EIR.

CARE-7 The commenter reiterates previous statements alleging inadequacy of the Project's trip generation estimates disclosed in the Draft EIR and that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse. This comment is similar to Response to Comment A-6 in the Final EIR and 1-8 in the RTC dated May 20, 2024. Refer to FEIR Response to Comment A-6 (Final EIR, pp. 2-38, 2-39) and Response to Comment 1-8 (RTC, p. 3). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project trip generation. No additions, revisions, or corrections are necessary and no further response is required.

CARE-8 The commenter cites *Maintain Our Desert Environment v. Town of Apple Valley* for the proposition that "the identity of a tenant is irrelevant to CEQA review" and that the proposed building could be used as a high-cube parcel hub warehouse. Refer to Response to Comment CARE-7 above related to the adequacy of the trip generation assumptions used for the Project. Based on the Project's design, there is no reasonable possibility that the Project could be used as a parcel hub. Thus, no further response is required.

CARE-9 The commenter summarizes previous comments made on the Draft EIR analyses of cumulative air quality impacts and Response to Comment 1-10 and 1-11 in the RTC. This comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR. The comments were responded to previously demonstrating that the analyses were properly prepared and thus no further response is required.

CARE-10 The commenter asserts that the Staff Report to the Planning Commission and the Final EIR failed to address any of the controlling legal authority on the issues raised related to cumulative impact analysis

and cites *Environmental Protection Information Center v. California Department of Forestry Fire Protection*. This comment is similar to Response to Comment A-14 in the Final EIR and 1-10 in the RTC dated May 20. Refer to FEIR Response to Comment A-14 (Final EIR, pp. 2-41, 2-42) and Response to Comment 1-8 (RTC, p. 4, 5). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of cumulative air quality impacts. No additions, revisions, or corrections are necessary and no further response is required.

CARE-11 The commenter asserts that that statements in the Staff Report about speculative "updated thresholds" are erroneous because CARECA's comments link directly to materials from South Coast Air Quality Management District (SCAQMD)'s working group meetings. As documented on SCAQMD's website, SCAQMD is in the process of developing an "Air Quality Analysis Guidance Handbook", which includes updating existing and developing new air quality analysis guidance to support public agencies when they evaluate air quality impacts pursuant to the requirements of CEQA. Additionally, SCAQMD is initiating a public process for the development of additional guidance for public agencies when they evaluate cumulative air quality impacts from increased concentrations of air toxics for projects subject to the requirements of the CEQA[1]. At the March 20, 2024 Working Group meeting SCAQMD was still in the process of seeking stakeholders' feedback on the proposed methodology and thresholds. SCAQMD has not formally published a new handbook or updated thresholds for analyzing cumulative air quality impacts. Therefore, the Draft EIR's cumulative analysis which relies on the most recent SCAQMD's published approach for the analysis of cumulative air quality effects is appropriate and adequate. The City of Ontario serving as Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of cumulative air quality impacts. No additions, revisions, or corrections are necessary and no further response is required.

CARE-12 The commenter summarizes previous comments made on the Project's Mobile Source Health Risk Assessment (HRA; *Technical Appendix B2 of the Draft EIR*) and Response to Comment 1-12 and 1-13 in the RTC. This comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

CARE-13 The commenter asserts that the Staff Report's statement regarding distance from sensitive receptors ignores that the Project would generate truck trips impacting sensitive receptors along the City's designated truck routes and states that the HRA's assumption that trucks would not travel west along Airport Drive underestimates impacts. The Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site. Even if trucks travel to and from the Project site along the route as the commenter suggested, it would not materially affect the EIR health risk significance conclusions, as the risks are well below the significance threshold. The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency

[1] https://www.aqmd.gov/home/rules-compliance/ceqa/ceqa-policy-development-(new)

maintains its position regarding accuracy and adequacy of the EIR analysis of health risk impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

CARE-14 The commenter summarizes previous comments made on the Project's truck tip lengths and Response to Comment 1-16 in the RTC. This comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

CARE-15 The commenter states that the Staff Report dismisses the SCAQMD comments as inapplicable without providing any evidence demonstrating that the Project's truck trips would be limited to the local 40-mile average trip lengths analyzed in the Final EIR, and without considering the additional guidance from SCAQMD contained in the letters which explains that truck trips to and from the ports should be analyzed. This comment is similar to Response to Comment A-18, A-19, and A-28 in the Final EIR and 1-16 in the RTC dated May 20. Refer to FEIR Response to Comment A-18, A-19, A-28 (FEIR, pp. 2-43, 2-44, 2-45) and Response to Comment 1-16 (RTC, p. 7). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required.

CARE-16 The commenter provides additional information from the "Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns" by the National Center for Sustainable Transportation (NCST) and the truck trip study conducted by SCAQMD in June 2014 to substantiate that the Project's trips to the Ports are foreseeable. The commenter cites the study from NCST that 56% of the facilities in the SCAG region receive goods from the Port of Los Angeles and Long Beach. However, the study also stated that "around 62% of the facilities in the SCAG region (approximately 4,900 buildings) are facilities larger than 50,000 sf mainly serving non-port related services. Most of the flow of goods by truck (85% of trips) found in the area is associated with local or intra-regional trips while international shippers have a higher use share of rail and air networks. Activities at port-related warehouses which locate in the Gateway cities focus mainly in transloading, deconsolidation and some value added services. National and international distribution centers are found mainly in the Inland Empire region." The Project site is not located in a Gateway cities and is located in the Inland Empire region. Additionally, the sample size from the survey conducted only contained information from 61 businesses in the entire region from a database of 7,600 records. Similarly, the commenter cites from the SCAQMD's study that 42% of goods going to high-cube warehouses in the SCAQMD region originated from the Ports. However, SCAQMD sent out a survey to 400 warehouse operators in the region but only 63 of them participated and 34 of which were operating high cube warehouses. Therefore, due to the low sample size, the results from both studies are not inclusive and an accurate representation of warehouse facilities in the region.

CARE-17 The commenter provides a summary of previous comments made related to energy conservation measures and Response 1-20 in the RTC. This comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

CARE-18 The commenter referenced Responses 1-21 to 1-25 in the RTC and reiterates previous comments made related to energy consumption measures. The Project's building will be solar ready for future solar facilities. The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. No additions, revisions, or corrections are necessary and no further response is required.

CARE-19 The commenter summarizes Response 1-22 in the RTC and states that the it is not true that the City cannot enforce adherence to more stringent idling requirements due to the City's Development Code Section 4.02.025(E) to protect public health and mitigation environmental impacts. The City has added a Condition of Approval to the Project to require the posting of signs in the Project's truck court specifying a 3 minute idling restriction instead of the State-mandated 5 minute restriction.

CARE-20 The commenter summarizes Response 1-23 in the RTC and states that the response misunderstood the nature of the comment. The previous comment made was requesting that the Final EIR should have included a discussion on the feasibility of a measuring limiting use of diesel generators during construction. Refer to Response to Comment A-10 in the Final EIR for the use of diesel generators. The SCAQMD regional threshold for VOC and NOx during construction is higher than operation while the thresholds for all other emissions are the same. As shown in the table in Response to Comment A-10, , emissions would be negligible and less than SCAQMD threshold. The intermittent use of a backup generator during either construction or operation would not result in a substantial or measurable amount of emissions, since by the very nature of the activity, it would be short-term, intermittent, and infrequent. Thus, contrary to the commenter's assertion, measures to reduce this source of temporary and intermittent use of energy is not required. The City's experts disagree with the commenter and no further response is required.

CARE-21 The commenter summarizes Response 1-25 in the RTC and asserts that neither the Staff Report nor the Final EIR contain the analysis on Appendix F's considerations of whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. The commenter is incorrect and Response to Comment 1-20 provides an analysis of the factors identified in CEQA Guidelines Appendix F. The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. No additions, revisions, or corrections are necessary and no further response is required.

CARE-22 The commenter cites to Section 4.02.025(D) of the City's Municipal Code and assets that the Project would have significant and unavoidable VMT impact, potential significant vapor intrusion, health risk, air quality GHG and energy impacts that have been underestimated. The commenter asserts that the City cannot make the requisite findings to approve the Project and a revised EIR must be recirculated before the Project can be recommended for approval. Contrary to the commenter's assertion, this

memorandum, RTC, and Final EIR demonstrates that the Project's impacts have been adequately analyzed and mitigated. Thus, no additions, revisions, or corrections are necessary are necessary.

CARE-23 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

CARE-24 The commenter consists of introductory remarks and does not raise any issues concerning the environmental analysis provided in the Draft EIR. Thus no further response is required.

CARE-25 The commenter provides a general summary of the Project. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

CARE-26 The commenter states that the RTC's assertion that no new information has been provided is not supported. Response to the specific comments made are provided below in this memorandum. Refer to Response to Comment CARE-27 to CARE-32. Thus, no further response is required.

CARE-27 The commenter reiterates previous comments made that the Project's Mobile Source Health Risk Assessment (HRA; *Technical Appendix B2 of the Draft EIR*) failed to account for building downwash in the AERMOD analysis and disagree with Response to Comment 1-12 in the RTC. The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of building downwash. No additions, revisions, or corrections are necessary and no further response is required.

CARE-28 The commenter reiterates previous comments that air quality analysis relies on an input value from AP-42 that is rated as poor and may be unreliable. Refer to Response to Comment 1-41 (RTC, p. 14). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of construction air quality impacts. No additions, revisions, or corrections are necessary and no further response is required.

CARE-29 The commenter reiterates previous comments on the average truck trip length of 40 miles used in the air quality analysis does not match the length used to support other warehouse projects. Refer to Response to Comment CARE-15 regarding the discussion on the Project's truck trip assumptions. Thus, no further response is required.

CARE-30 The commenter states that the truck route assumed in the Draft EIR ignores the traffic constraints of the Project site. Response to Comment CARE-13 regarding the discussion on the Project's truck routes. Thus, no further response is required.

CARE-31 The commenter states that the Project's HRA did not assess the San Bernardino County West Valley Detention Center (WVDC) as a receptor that is located closer to the Project site than the residential properties assessed to the northwest. The WVDC is located approximately 1.0 mile from the Project site and between the Project site and the WVDC is the I-10 freeway and a cluster of industrial and distribution buildings. First, the WVDC does meet the criteria for long-term residential occupancy since the WVDC is a facility where an individual could remain only for a short-term period (not years). With a 3,347 bed capacity, the WVDC completes 50,000 to 60,000 bookings and releases each year, evidencing that stays are short term.[2] The Project's HRA analysis reports air pollutant impacts for residential occupancy based on a 30-year exposure duration, and which would be much more impactful at the residential location analyzed in the DEIR than a short-term exposure duration as would be experienced at the WVDC. Short-term exposure at the WVDC would be less than the emissions reported at Location R5, which represents the adjacent potential worker receptor approximately 58 feet east of the Project Site. At the Maximally Exposed Individual Worker (MEIW), the maximum incremental cancer risk impact is 0.25 in one million which is far less than the SCAQMD's threshold of 10 in one million. With the WVDC being located approximately one mile from the MEIW, the exposure would be much less than 0.25 in one million and clearly less than significant.

CARE-32 The commenter states that the cumulative analysis of the Project failed to consider the significant number of existing and pending warehouses in the vicinity. Refer to Response to Comment CARE-10 for the Project's cumulative analysis. Thus, no additional response is required.

CARE-33 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

Re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Planning Commission Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant") in the City of Ontario ("City"). The Project's Final Environmental Impact Report ("FEIR") and development plan will be considered at the May 28, 2024 Planning Commission meeting as Agenda Item D. The Commission will consider certification of the FEIR and approval of the Development Plan application.

CARE CA submitted comments on the DEIR and subsequently on the FEIR, accompanied by expert comments, showing that the FEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant air quality, public health, greenhouse gas ("GHG"), energy, transportation, and cumulative impacts. The Staff Report contains responses[1] to CARE CA's comments on the FEIR. However, the responses fail to resolve the major flaws CARE CA and its experts identified in the DEIR.

CARE-1

[1] Letter from T&B Planning Inc. to City, re: 5355 East Airport Drive (PDEV22-017) – Response to April 15, 2024 Comment Letter from CARE CA (May 20, 2024).

6752-008acp

We reviewed the Planning Commission Staff Report with the assistance of air quality expert Dr. James Clark.[2]

The Staff Report fails to meaningfully address the flaws in the Project's environmental review. Regarding hazards, the FEIR identifies significant vapor intrusion impacts due to PCE contamination, but improperly defers formulation of mitigation measures. The FEIR also fails to analyze the full scope of the Project – CEQA requires that an EIR analyze the reasonably foreseeable consequences of the Project, but the Project's FEIR fails to analyze the Project's reasonably foreseeable use as a parcel hub (a use that generates more trips than analyzed), and fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach. Regarding cumulative impacts, the Staff Report still fails to meaningfully respond to the legal authority requiring analysis of the Project's impacts in the context of the numerous other warehouses existing and planned in the area. The Staff Report also fails to resolve flaws in the Project's health risk assessment, which still underestimates impacts on sensitive receptors. Regarding energy, the Staff Report provides an analysis of factors in Appendix F the CEQA Guidelines. But the analysis is wholly inadequate because it fails to address applicable energy consumption measures and renewable energy options. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

The Staff Report incorrectly concludes that the "final EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[3] The Staff Report recommends that the Planning Commission adopt the final EIR and approve the Project's Development Plan Application.[4] These recommendations are unsupported by evidence in the record due to the major flaws in the Project's environmental review.

CARE CA urges the Planning Commission to require the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

CARE-2

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

CARE-3

[2] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Staff Report, Item D - 2573 of 3296.
[4] Staff Report, Item D - 1 of 3296.

printed on recycled paper

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

CARE-3 (CONT.)

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

A. The FEIR Improperly Defers Formulation of Mitigation Measures for Hazardous Materials

The FEIR's Phase I/II Environmental Site Assessment ("ESA") identifies levels of tetrachloroethene ("PCE") in soil vapor samples in excess of current commercial/industrial calculated soil gas screening levels ("SGSLs").[5] The ESA concludes that "PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Site."[6] The FEIR identifies this contamination as a potentially significant impact.[7] Additionally, the ethylbenzene concentration in one soil vapor sample

CARE-4

[5] FEIR, Phase I/II Environmental Site Assessment, pg. vii.
[6] FEIR, Phase I/II Environmental Site Assessment, pg. 11-2.
[7] DEIR, pg. S-17.

printed on recycled paper

exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.[8] The FEIR fails to disclose this significant impact in the body of the FEIR, in violation of CEQA.

CARE-4 (CONT.)

The FEIR states that the potentially significant vapor intrusion impacts would be mitigated through imposition of Mitigation Measure ("MM") 4.7-1. This measure requires future preparation of a Soil Management Plan ("SMP"). he SMP will include instructions for handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. But MM 4.7-1 fails to explain how the PCE contamination at the Project site will actually be addressed – whether it will be remediated, capped in place, etc. – and the FEIR lacks a quantitative analysis of the construction impacts associated with that process. The measure states that contaminated soils will be monitored and provides guidance for proper soil handling, but does not specifically state that PCE-contaminated soil will be removed. Under MM 4.7-1, it is unclear if the City will remove PCE-contaminated soil or adopt passive/engineered vapor intrusion mitigation such as installing a vapor barrier or venting. Without clear performance standards and a quantitative analysis of the impacts of the PCE cleanup phase of construction, MM 4.7-1 remains incomplete and ineffective, and the FEIR's construction impact analysis remains incomplete.

MM 4.7-1 improperly defers formulation of mitigation measures related to PCE contamination to a future date.

CARE-5

CEQA Guidelines Section 15126.4 states that formulation of mitigation measures shall not be deferred until some future time. The Guidelines permit an agency to develop the "specific details of a mitigation measure" after project approval "when it is impractical or infeasible to include those details during the project's environmental review."[9] In such circumstances, deferral of mitigation details is permitted if the agency "(1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will [be] considered, analyzed, and potentially incorporated in the mitigation measure."[10] Compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on

CARE-6

[8] FEIR, Phase I/II Environmental Site Assessment, pg. viii.
[9] Guidelines, § 15126.4, subd. (a)(1)(B) (Section 15126.4).
[10] Section 15126.4, subd. (a)(1)(B); *see Save Our Capitol! v. Department of General Services* (2022) 85 Cal.App.5th 1101, 1134 (*Save Our Capitol!*).)

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC WOMEN'S BUSINESS ENTERPRISE

substantial evidence in the record, to reduce the significant impact to the specified performance standards.[11]

Here, the FEIR defers formulation of the PCE mitigation until after Project approval. But the City fails to present any evidence that it would be impractical or infeasible to do so during the Project's environmental review. Based on the evidence before the City, it should be feasible to require and formulate vapor intrusion mitigation. Even if deferral of formulation of mitigation were reasonable in this case, MM 4.7-1 fails to adopt specific performance standards for remediating PCE contamination and the associated vapor intrusion risks. MM 4.7-1 also fails to clearly identify the types of potential actions that may be taken to mitigate the vapor intrusion risk. Thus, the City improperly defers formulation of PCE contamination and vapor intrusion mitigation.

CARE-6 (CONT.)

The City also improperly defers formulation of mitigation for the ethylbenzene contamination. As with the PCE contamination, MM 4.7-1 fails to substantiate how this contaminant will be addressed. The FEIR contains no evidence that formulation of mitigation for ethylbenzene contamination is impractical or infeasible, identifies no performance standards, and fails to identify potential mitigation measures. Mitigation for this impact is thus improperly deferred.

B. The City Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the FEIR showed that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse, which has a trip generation rate 2.6 times the rate used in the FEIR. In Response 1-8, the City reiterates its position that analyzing the Project as a combination of the "Warehousing" and "High-Cube Cold Storage Warehouse" land uses is reasonable due to the Project's anticipated use and size.[12]

CARE-7

The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[13] Here, the Project proposes a 270,337-square-foot industrial

[11] *Id.*
[12] Staff Report, Item D - 2466 of 3296; FEIR, pg. 2-39.
[13] *See* Cal. Code Regs., tit. 14, § 15378; *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376.

printed on recycled paper

building with a proposed height of 46 feet on 13.08 acres of land. A high-cube parcel hub warehouse is a reasonably foreseeable use of this project because "high-cube parcel hub warehouse" is defined in Institute of Transportation Engineers ("ITE") land use code 156 as a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods prior to their distribution to retail locations or other warehouses. And Mr. Marshall's comments on the FEIR demonstrate that the Project site includes adequate parking to support this use. Even if less-intensive warehouse uses are possible for this Project (such as the FEIR's combination of "Warehousing" and "High-Cube Cold Storage Warehouse"), use as a high-cube parcel hub warehouse is a reasonably foreseeable outcome that must be analyzed.

CARE-7 (CONT.)

The City's claim that the Project's "anticipated use" does not include a high-cube parcel hub warehouse is irrelevant to the analysis. Courts have held that in this situation, "the identity of a tenant is irrelevant to CEQA review."[14] The court in *Maintain Our Desert Environment v. Town of Apple Valley* explained that "land use entitlements such as conditional use permits and development approvals run with the land and do not belong to the permittee…. had [the developer] developed the Project and then held it out for sale to any interested buyer, no additional CEQA review would have been necessary for the new owner so long as the use was consistent with that that had already been approved."[15] Here, the project that is the subject of the FEIR is a Development Plan to develop an industrial building totaling 270,337 square feet of gross floor area on 13.08 acres and having a FAR of 0.47. This building could be used as a high-cube parcel hub warehouse, so this level of use must be analyzed in the FEIR.

CARE-8

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the FEIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. The City's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[16] CARE CA's

CARE-9

[14] *Am. Canyon Cmty. United for Responsible Growth v. City of Am. Canyon* (2006) 145 Cal. App. 4th 1062, 1074 (citing *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 443–449)).
[15] *Maintain Our Desert Environment v. Town of Apple Valley, supra,* 124 Cal.App.4th at 444.

comments provided a discussion of the controlling caselaw,[17] the Attorney General's recent litigation on this issue in *People of the State of California v. City of Fontana*,[18] and pending updates to the SCAQMD significance thresholds for cumulative impacts in response to this litigation. These authorities explain that the City's "drop in the bucket" approach to cumulative impacts does not comply with CEQA.

CARE-9 (CONT.)

In Responses 1-10 and 1-11, the Staff Report states: "[t]he commenter is again advised that the SCAQMD is the regulatory authority on air quality charged with the responsibility of ensuring the improvement of air quality in the South Coast Air Basin… The commenter speculates on 'updated thresholds' for air quality impacts. Absent these 'updated thresholds' the EIR properly evaluates air quality impacts in the context of existing thresholds, protocols, and methodologies."[19]

The Staff Report and the FEIR continue to fail to address any of the controlling legal authority on this issue raised in CARE CA's comments. The court in *Environmental Protection Information Center v. California Dept. of Forestry Fire Protection* stated: "[w]e review an agency's decision regarding the inclusion of information in the cumulative impacts analysis under an abuse of discretion standard. 'The primary determination is whether it was reasonable and practical to include the projects and whether, without their inclusion, the severity and significance of the cumulative impacts were reflected adequately.'"[20] CARE CA's comments demonstrate that the SCAQMD individual project significance threshold fail to reflect the significance of cumulative air quality and public health impacts in areas burdened by extensive warehouse development – this Project would add a substantial number of diesel truck trips to routes in an area with a high existing background MATES cancer risk, combining with the emissions of trucks from numerous other warehouses. Analysis of cumulative impacts from past, present, and probable future warehouse projects is feasible. As an example, Dr. Clark's comments present data from Pitzer College's Warehouse CITY tool, which maps existing and proposed warehouses in Los Angeles, Riverside, and San Bernardino Counties.[21] The tool measures metrics including acreage, square footage, and diesel particulate matter and carbon emissions.[22]

CARE-10

[18] San Bernardino Superior Court, Case No. CIVSB2121829; SCAQMD Working Group Meeting # 4, Cumulative Impacts from Air Toxics for CEQA Projects (June 6, 2023) pg. 6;
[19] Staff Report, Item D - 2467 of 3296.
[20] *Id.* at 525 (citing *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 723.
[21] Available at https://www.pitzer.edu/redfordconservancy/mapping-data-visualization/.
[22] *Id.*; Clark, pg. 7.

6752-008acp

The Staff Report's statement that CARE CA speculates as to "updated thresholds" is erroneous because CARE CA's comments link directly to the materials for SCAQMD's working group meetings – these materials discuss updates to the thresholds.[23] The Staff Report's failure to discuss SCAQMD's pending updates is inconsistent with the Staff Report's statement that SCAQMD is the regulatory authority on air quality. In sum, the City's rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and informational requirements of CEQA.

CARE-11

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

CARE CA's comments on the FEIR identify flaws in the City's Mobile Source Health Risk Assessment ("HRA") that underestimate health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project. In Responses 1-12 and 1-13, the Staff Report disputes these flaws. The Staff Report maintains that "[a]ny variant in interpretation of OEHHA guidance such as is suggested by the commenter would not materially affect the EIR health risk significance conclusions" because "the Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site."[24]

CARE-12

The Staff Report's statement regarding distance from sensitive receptors ignores that the Project would generate truck trips impacting sensitive receptors along the City's designated truck routes.[25] The Project's primary truck routes would depend on the Project's future uses. Despite uncertainty regarding the Project's future tenants, the HRA makes an unsubstantiated assumption regarding the Project's primary truck route, shown in the exhibit below.[26]

CARE-13

[25] The Ontario Plan, Mobility Element, Figure M-04, https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/The%20Ontario%20Plann/Mobility/FIgure%20M-04%20Truck%20Routes.pdf.
[26] FEIR, HRA Report, Exhibit 2-C.

6752-008acp

EXHIBIT 2-C: MODELED OFF-SITE EMISSION SOURCES

The HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. Trucks could easily travel west on Airport Drive and north along Milliken Avenue, which are both City-designated truck routes.[27] Sensitive receptors including Receptor R6 are located off Milliken Avenue, and could thus be impacted by cumulative truck trips from this Project and other warehouses. The HRA's assumption that trucks would not travel west along Airport Drive underestimates impacts. A revised HRA must be prepared.

CARE-13 (CONT.)

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the FEIR underestimates truck trip lengths by failing to account for the Project's distance to the Ports of Los Angeles and Long Beach. CARE CA presented numerous comment letters from SCAQMD

CARE-14

[27] The Ontario Plan, Mobility Element, Figure M-04, https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/The%20Ontario%20Plann/Mobility/FIgure%20M-04%20Truck%20Routes.pdf; Clark Comments, pg. 5.

printed on recycled paper

recommending analysis of trips to the Ports, and presented evidence showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario. In Response 1-16, the Staff Report states:

> The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, Project Description, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages.

CARE-14 (CONT.)

The Staff Report apparently dismisses the SCAQMD comments as inapplicable without providing any evidence demonstrating that the Project's truck trips would be limited to the local 40-mile average trip lengths analyzed in the FEIR, and without considering the additional guidance from SCAQMD contained in the letters which explains that truck trips to and from the ports should be analyzed. Many of the SCAQMD letters recommending consideration of the distance to the Ports were in regard to "spec" warehouses with unknown tenants, just like the Project.[28] The Staff Report and the FEIR's responses fail to respond to this guidance with good faith, reasoned analysis,[29] and still fail to provide any evidence demonstrating that goods brought in and out of the Project's warehouses would primarily come from short-distance truck trips.

CARE-15

The Staff Report's statement that it is speculative to assume trucks may travel to the Ports of Los Angeles and Long Beach also misstates the applicable legal standard. The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical

[28] SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf ("the future tenant(s) of the building is not known").

printed on recycled paper

change in the environment."[30] Here, the Project proposes a 270,337-square-foot industrial building with a proposed height of 46 feet on 13.08 acres of land. CARE CA's comments contain evidence showing that trips to the Ports are a reasonably foreseeable outcome of a warehouse like this (citing to the massive volume of goods moving to and from the Ports, and recommendations from SCAQMD).[31] In light of this evidence, the City's assumption that trucks would not travel to the Ports is speculative, unsupported by substantial evidence, and is a failure to analyze a reasonably foreseeable use permitted by the Development Plan.

CARE-15 (CONT.)

This letter contains additional substantial evidence showing that trips to the Ports are reasonably foreseeable. The National Center for Sustainable Transportation ("NCST"), sponsored by the California Department of Transportation, prepared a research report titled "Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns" in 2017.[32] The report analyzed Southern California Association of Governments ("SCAG") data on warehouses in the six counties that comprise the SCAG region (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura). The report finds that **56% of the facilities in the SCAG region receive goods from the Port of Los Angeles and Long Beach**, and around 50% deliver to Southern California warehouses, retail stores or manufacturing plants.[33] This data suggests that trips to the Ports are reasonably foreseeable, and that it would be speculative not to account for distance to the Ports.

CARE-16

In June 2014, SCAQMD staff conducted a business survey of warehouse operators in the SCAQMD region.[34] The survey found that **42% of goods going to high-cube warehouses in the SCAQMD region originated from the Ports**, per the figure below.[35]

6752-008acp

Origin and Destination of Goods

22 of 34 high cube warehouse respondents provided the origins and destinations of goods flowing to and from their facility. Major trends seen in the charts below include:

- The ports of Los Angeles and Long Beach make up a large share of imported goods yet only a minor component of exported goods
- Approximately 1 in 5 truck trips occurs between warehouses
- Approximately 1 in 7 truck trips involves an out of state location
- Approximately 1 in 10 truck trips involves a rail yard

During discussion at the April 15, 2024 Development Advisory Board hearing, a City consultant suggested that if the Project only makes truck trips to other warehouses, it would not be necessary to evaluate distance to the Ports. The figure above shows that only a small percentage of goods come from other warehouses and that the lion's share of goods are from the Ports. Thus, it would be speculative to disregard the Project's distance from the Ports in analyzing its impacts.

CARE CA's prior comments discussed the volume of goods passing through the Ports. 32 percent of all containers in the U.S. move through the Ports.[36]

CARE-16 (CONT.)

printed on recycled paper

Approximately 40 percent of the total U.S.-Asia trade is served by the Ports, and 40 percent of the imports entering the Ports are transloaded or cross-docked.[37]

Substantial evidence also demonstrates the demand for port-related warehouse space is expected to expand. SCAG's 2012-2035 Regional Transportation Plan forecasts that "Demand for port-related warehouse space is projected to grow at a faster pace than demand for domestic warehousing… As space near the San Pedro Bay Ports reaches capacity, port warehousing will push out to the Inland Empire…. By 2035, the region may experience a shortfall of more than 228 million square feet in warehouse space relative to demand."[38] The table below reflects SCAG's forecasts for growth in demand for port-related warehouse space. The growth in the port-related market is expected to be much higher than the domestic market.[39]

CARE-16 (CONT.)

Table 2.4 2014-2040 Minimum and Maximum Growth in Unconstrained Occupied Warehouse Space by Cargo Market across Alternate Scenarios

	Growth Percentage Range		Annualized Growth Rate Range	
Cargo Market	**Min.**	**Max.**	**Min.**	**Max.**
Port-related market	56%	83%	1.7%	2.4%
Border Crossing-related market	75%	165%	2.2%	3.8%
Domestic market	26%	39%	0.9%	1.3%
Total	**31%**	**45%**	**1.1%**	**1.4%**

Source: SCAG Warehouse Space Forecasting Model, Version 1.0, developed in June 30, 2016.

In sum, substantial evidence demonstrates that trips to the Ports are reasonably foreseeable for a spec warehouse proposed in the SCAG region, like this one. The lack of a specific tenant identified for the Project does not justify omission

printed on recycled paper

of this analysis. As a result of this omission, the FEIR underestimates transportation, air quality, and GHG impacts.

CARE-16 (CONT.)

F. The FEIR Still Fails to Include Sufficient Investigation into Energy Conservation Measures

CARE CA commented that the FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines.[40] CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[41] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[42]

In Response 1-20, the Staff Report suggests that discussion of energy consumption measures is not required for this Project because its energy impacts are less than significant.[43] The City continues to make the same error as the lead agency in *CCEC* because the EIR in that case also identified a less-than-significant energy impact.[44] The court held that the EIR must nonetheless analyze energy consumption measures.[45]

Response 1-20 provides a "CEQA Guidelines Appendix F Energy Analysis" in Table 1-1.[46] Table 1-1 addresses factors listed in Appendix F, subdv. II(C), but fails to include any discussion of renewable energy options. As explained in *CCEC*, an EIR fails to comply with the requirements of Appendix F by not discussing or analyzing renewable energy options.[47] And as explained in CARE CA's prior comments, this FEIR must analyze the feasibility and effectiveness of measures including onsite solar facilities, electric vehicle charging, alternative fuel sources for the backup generators, more stringent idling requirements, and use of existing power sources during construction rather than generators.

CARE-17

The Staff Report contains additional responses regarding energy in Responses 1-21 to 1-25, but none address the feasibility of reducing energy

CARE-18

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC WOMEN'S BUSINESS ENTERPRISE

consumption through onsite solar facilities. Response 1-21 states that the City need not evaluate using alternative fuel sources for backup generators because their emissions would be less-than-significant.[48] Again, the Staff Report makes the same mistake proscribed in *CCEC* by assuming no analysis of energy consumption measures is required if the Project's energy impact is less-than-significant.[49]

CARE-18 (CONT.)

In Response 1-22, the City states that it would be infeasible to set more stringent idling requirements over existing requirements because there is no enforcement mechanism that the City can assure to enforce adherence.[50] But the City is authorized under Development Code Section 4.02.025(E) to impose conditions of approval to protect public health and mitigate environmental impacts. Section 4.02.025(E)(3) states that "All conditions of approval or requirements authorized by this Section are enforceable in the same manner and to the same extent as any other applicable requirement of this Development Code." Unenforceability is thus not a valid reason not to consider a more stringent idling requirement.

CARE-19

In Response 1-23, the Staff Report states that the FEIR adequately evaluated the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators during construction. The Response seems to misunderstand the nature of CARE CA's comment by discussing how "new dry utility infrastructure would be installed underground."[51] Instead, the FEIR should have included a discussion on the feasibility of a measuring limiting use of diesel generators during construction.

CARE-20

In Response 1-25, the Staff Report states that it meaningfully addresses Appendix F's considerations of "whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope."[52] But neither the Staff Report nor the FEIR contain this analysis.

In sum, the FEIR's energy analysis remains wholly inadequate. The Staff Report and the FEIR make no attempt to evaluate the feasibility of onsite renewable energy generation and storage, and fail to consider the feasibility of electric vehicle charging beyond existing requirements. And the Staff Report's

6752-008acp

responses to proposed energy consumption measures in Responses 1-21 to 1-25 are generally nonresponsive and fail to meet CEQA's requirements.

CARE-21 (CONT.)

III. THE COMMISSION CANNOT MAKE THE REQUISITE FINDINGS TO APPROVE THE PROJECT

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[53]

The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant vapor intrusion, health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project. A revised EIR must be recirculated before the Project can be recommended for approval.

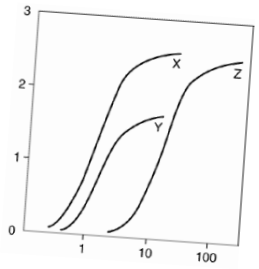
CARE-22

IV. CONCLUSION

As is explained herein, the FEIR's hazards, air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to certify the FEIR or under the City of Ontario Municipal Code to approve the Project's Development Plan. CARE CA urges the Commission to require the City revise and recirculate the EIR before any further action is taken on the Project.

CARE-23

Sincerely,



Aidan P. Marshall

Subject: Comments On Staff Report For Final Environmental Impact Report (DEIR) 5355 Esat Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the August 2023 City of Ontario's (the City) DEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

CARE-24

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the draft EIR consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

CARE-25

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

CARE-25 (CONT.)

In the Meeting Agenda for the May 28th, 2024 City of Ontario Planning Commission/Historic Preservation Meeting Agenda, the City included responses from T&B Planning (T&B) to comments on the Final EIR for the Project provided by CARE CA. The responses from T&B for the City in total claim that no new information has been provided within the comments. This assertion is not supported by the information provided within the responses from CARE.

CARE-26

Specific Comments

1. **Comment 1-12: The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.**

T& B claims that building downwash is not appropriate for volume or area sources. This is incorrect. The choice to model the idling trucks, which are movable discrete point sources onsite below the line of the building roof, is a controllable feature in the AERMOD model. Volume sources are defined in the AERMOD Users Guide as included a variety of industrial sources, such as building roof monitors, multiple vents, and conveyor belts.[1] Volume sources are characterized as having a defined specific release height above the ground, an initial lateral dimension of the volume, and an initial vertical dimension. While the assumption that roadways and idling trucks in the Health Risk Assessment can be modeled as a line of volume sources, it must be pointed out that emissions from idling trucks and moving trucks will come from the exhaust pipe(s) to the engine, releasing diesel particulate matter (DPM) from a raised pipe at a specific rate (a point source). Therefore, the use of building downwash in the model to ensure that the modeled concentrations are not underestimated is appropriate. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). T&B, in Response 1-12, states that the Project's Air Quality Impact Analysis experts (Technical Appendix B1 of the Draft EIR) have concluded that truck idling emissions sources resulting from the Project would not be materially affected by downwash, but it is important to note that the HRA does not quantify the effects of downwash. The City should address the impact of this issue in a Revised DEIR.

CARE-27

2. **Comment 1-41: The Air Quality Analysis Relies On An Input Value From AP-42 That**

[1] U.S. EPA. 2023. User's Guide for the AMS/EPA Regulatory Model (AERMOD). Pg 3-68

Is Rated As Poor And Maybe Unreliable

T&B's response that the impact from a poorly rated AP-42 value is incorporated into the analysis is not new evidence is not supported by the evidence in the FEIR. As was noted in my prior comments, the CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42, which according to U.S. EPA may not represent a random sample of the industry. The City's response to the questioning of the rating of the emission factor was qualitative at best, failing to show any quantitative analysis of the potential impacts. The City should assess the impacts of this variable in a Revised DEIR.

CARE-28

3. **Comment 1-16: The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.**

According to T&B's response, the Project is proposed as a speculative development and the user(s) of the building. T&B goes on to state that it is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. This line of reasoning clearly conflicts with the goals of CEQA to analyze the foreseeable and reasonable emissions from the Project.

This statement also does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately

CARE-29

700 million square feet, an increase of 20 percent over the last five years"),[2] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[3] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[4] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a R-FEIR.

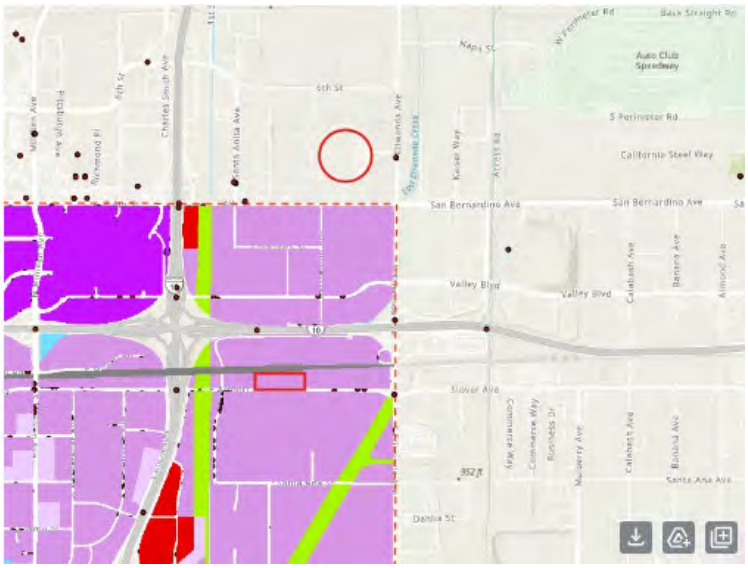
CARE-29 (CONT.)

4. Additional Comments On The FEIR

a. The Truck Route Assumed For The Project Site Ignores The Traffic Constraints Of The Project Site

The truck route assumed in the FEIR assumes traffic will only exit the Project Site and turn left on East Airport Drive to S. Etiwanda Avenue. This route requires the trucks using the Project Site to cross (turn left out of the Project Site) Airport drive and to cross South Etiwanda Drive (turn left onto S. Etiwanda Avenue). The assumed distance to the 10 freeway is approximately 0.8 mile. An alternate route for traffic was not assessed in the FEIR which is longer than the primary route, but would have fewer traffic challenges for the drivers. Assuming trucks exit the Project Site and turn right (avoiding the delay getting across Airport Drive) then turn right on South Milliken Avenue, the vehicles will also be able to reach the 10 Freeway. The distance for this route is approximately 1.6 miles and is closer to the residential properties identified in the FEIR. The City must consider this alternate route and the air quality impacts in a R-FEIR.

CARE-30



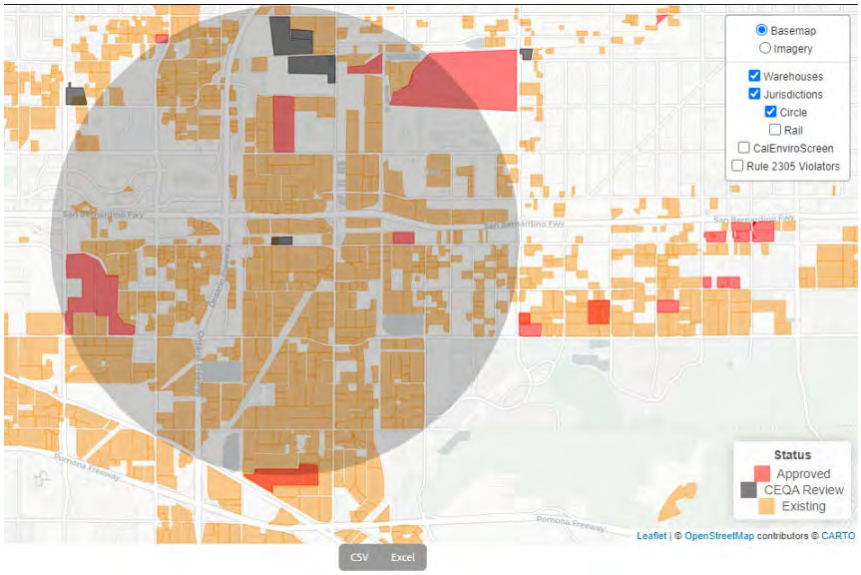
b. The HRA And Air Quality Analysis Failed To Assess A Receptor Closer To The Project Site Than The Residential Properties To The Northwest – The San Bernardino County West Valley Detention Center

[2] Available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf

[3] https://data.bts.gov/stories/s/Container-TEU/x3fb-aeda/

[4] U.S. Dept. of Transportation, Federal Highway Administration, FHWA Operations Support – Port Peak Pricing Program Evaluation (2020), available at https://ops.fhwa.dot.gov/publications/fhwahop09014/sect2.htm

The HRA and Air Quality Analysis failed to consider a significant receptor near the Project Site. The San Bernardino County West Valley Detention Center is located approximately 5,600 feet north northeast of the Project Site at 9500 Etiwanda Ave in Rancho Cucamonga. The Detention Center houses approximately 3,347 inmates and 600 workers.



The Detention Center is nearer to the Project Site, and is nearer the proposed truck route, than the residential property identified in the HRA. The City must assess the impacts of the Project emissions on this receptor center in a revised DEIR.

CARE-31

c. The Cumulative Analysis Of The Project Failed To Consider The Significant Number Of Existing Warehouse Projects In The Vicinity

Based on the current analysis of warehouse projects within a 5-kilometer radius (3.1 miles) of the Project Site, there are 595 current warehouses, totaling 126,400,000 square feet of floor space.

CARE-32

Those projects account for 85,000 truck trips per day, which emit 117.6 lbs of DPM and 13, 243 lbs of NOx per day. There is an additional 7,400,000 square feet of warehousing that is either approved or undergoing CEQA review (includes the Airport Site). The cumulative impacts must be considered in a revised DEIR.

CARE-32 (CONT.)

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised draft environmental impact report should be prepared to address these substantial concerns.

CARE-33

Sincerely,

RESOLUTION NO. PC24-036

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF ONTARIO, CALIFORNIA, CERTIFYING THE 5355 EAST AIRPORT DRIVE FINAL ENVIRONMENTAL IMPACT REPORT (STATE CLEARINGHOUSE NO. 2022090006) FOR A DEVELOPMENT PLAN TO CONSTRUCT A 270,337 SQUARE FOOT INDUSTRIAL BUILDING ON 13.08 ACRES OF LAND FOR PROPERTY LOCATED AT 5355 EAST AIRPORT DRIVE, WITHIN THE IH (HEAVY INDUSTRIAL) ZONING DISTRICT, AND ADOPT ENVIRONMENTAL FINDINGS PURSUANT TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT, A STATEMENT OF OVERRIDING CONSIDERATIONS AND A MITIGATION MONITORING AND REPORTING PROGRAM AND MAKING FINDINGS IN SUPPORT THEREOF—APNS: 0238-052-29 AND 0238-052-20.

WHEREAS, PROLOGIS ("Applicant") has filed an Application for the approval of a Development Plan, File No. PDEV22-017, as described in the title of this Resolution (hereinafter referred to as "Application" or "Project"); and

WHEREAS, the Application applies to 13.08 acres of land located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district, and is presently improved with five industrial structures. All existing structures and improvements will be demolished to allow for construction of the 270,337 square-foot industrial warehouse building; and

WHEREAS, on April 5, 2022, the Applicant submitted a Development Plan (File No. PDEV22-017) to construct a 270,337 square-foot industrial building on 13.08 acres of land located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district; and

WHEREAS, the property abutting the Project site to the north is a Southern Pacific Railroad right-of-way, and properties beyond are developed with existing industrial land uses within the IH (Heavy Industrial) zoning district of the Shea Business Center. The property to the south of the Project site (across Airport Drive Street) is zoned IH (Heavy Industrial) and consists of two existing warehouse buildings. The property to the east of the Project site in the IH (Heavy Industrial) zoning district and is developed with an industrial gas supplier. The property to the west of the Project site in the IH (Heavy Industrial) zoning district and is developed with a Verizon facility; and

WHEREAS, the 5355 East Airport Drive Final Environmental Impact Report (State Clearinghouse No. 2022090006) was prepared (hereinafter referred to as "final EIR"), in which development and use of the Project site was discussed; and

WHEREAS, the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations was made available to the public and to all

interested agencies for review and comment pursuant to CEQA, the State CEQA Guidelines and the City of Ontario Local CEQA Guidelines; and

WHEREAS, the final EIR, for the Project consists of the Draft SEIR and the comments and responses to comments made on the Draft SEIR; and

WHEREAS, the final EIR Statement of Overriding Considerations, and Mitigation Monitoring and Reporting Program for the Project has been prepared in accordance with the California Environmental Quality Act ("CEQA"), the State CEQA Guidelines, and the City of Ontario Guidelines for implementation of CEQA; and

WHEREAS, the DEIR for the Project was circulated for a 45-day public review period and a notice of its availability was published in a local newspaper, submitted to the state clearinghouse, and posted in the Office of the Clerk of the Board of Supervisors of San Bernardino County; and

WHEREAS, copies of the final EIR was distributed to the Planning Commission, City departments, and federal, state, regional, local, and other agencies and individuals; and

WHEREAS, on March 18, 2024, the Development Advisory Board conducted a hearing regarding the subject Application and voted to continue the Project to the next available DAB meeting to allow staff to work with the applicant to revise draft conditions of approval; and

WHEREAS, on April 15, 2024, the Development Advisory Board of the City of Ontario conducted a hearing to consider the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations prepared pursuant to CEQA, the State CEQA Guidelines, and the City of Ontario Local CEQA Guidelines, and concluded said hearing on that date, voting to issue Decision No. DAB24-010, recommending that the Planning Commission approve the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations; and

WHEREAS, on May 28, 2024, the Planning Commission of the City of Ontario conducted a hearing to consider final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations and the Project, and continued the Project for further consideration; and

WHEREAS, on August 27, 2024, the Planning Commission of the City of Ontario conducted a hearing to consider final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations and the Project, and concluded said hearing on that date; and

WHEREAS, all other legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, IT IS HEREBY FOUND, DETERMINED, AND RESOLVED by the Planning Commission of the City of Ontario, as follows:

SECTION 1: ***Environmental Determination and Findings.*** As the decision-making body for the Project, the Planning Commission has reviewed and considered the information contained in the final EIR and supporting documentation. Based upon the facts and information contained in the final EIR and supporting documentation, the Planning Commission makes the following findings:

(1) The final EIR contains a complete and accurate reporting of the environmental impacts associated with the Project; and

(2) The final EIR was completed in compliance with CEQA and the Guidelines promulgated thereunder; and

(3) The final EIR reflects the independent judgment of the Planning Commission.

SECTION 2: ***Planning Commission Action.*** Based on the entire record before the Planning Commission and all written and oral evidence presented, the Planning Commission finds the final EIR complies with CEQA for the following reasons:

(a) The final EIR analyzes the environmental effects of the Development Plan (File No. PDEV22-017), and with the implementation of proposed mitigation measures, the following impact will still be significant and unavoidable: transportation (vehicle miles traveled); and

(b) The Planning Commission further finds that the Findings of Facts and Statement of Overriding Considerations, demonstrates that the benefits of the Development Plan (File No. PDEV22-017) outweigh its significant and unavoidable impact, and therefore the City would be justified in approving Development Plan notwithstanding said significant and unavoidable impact; and

(c) The Planning Commission hereby CERTIFIES the final EIR, adopts a Statement of Overriding Considerations, and the associated Mitigation Monitoring and Reporting Program subject to each and every condition set forth in the Department reports attached hereto as "Attachments A, B, and C" and incorporate by this reference.

SECTION 3: ***Indemnification.*** The Applicant shall agree to defend, indemnify and hold harmless, the City of Ontario or its agents, officers, and employees from any claim, action or proceeding against the City of Ontario or its agents, officers or employees

to attack, set aside, void, or annul this approval. The City of Ontario shall promptly notify the applicant of any such claim, action, or proceeding, and the City of Ontario shall cooperate fully in the defense.

SECTION 4: ***Custodian of Records.*** The documents and materials that constitute the record of proceedings on which these findings have been based are located at the City of Ontario City Hall, 303 East "B" Street, Ontario, California 91764. The custodian for these records is the City Clerk of the City of Ontario.

SECTION 5: ***Certification to Adoption.*** The Secretary shall certify to the adoption of the Resolution.

- - - - - - - - - - - - - -

The Secretary Pro Tempore for the Planning Commission of the City of Ontario shall certify as to the adoption of this Resolution.

I hereby certify that the foregoing Resolution was duly and regularly introduced, passed and adopted by the Planning Commission of the City of Ontario at a regular meeting thereof held on the 27th day of August 2024, and the foregoing is a full, true and correct copy of said Resolution, and has not been amended or repealed.

Section 1.0 Introduction 1-1

1.1 Public Review Process 1-2

1.2 List of EIR Commenters 1-2

Section 2.0 Responses to Comments Received During the Public Review Period 2-1

Section 3.0 Clarifications and Revisions 3-1

SECTION 1.0 INTRODUCTION

In accordance with Section 15088 of the California Environmental Quality Act (CEQA) Guidelines, the City of Ontario, as the Lead Agency, has evaluated the comments received on the Draft Environmental Impact Report (Draft EIR) for the 5355 East Airport Drive Project (Project) (SCH No. 2022040177) and has prepared written responses to these comments. This Final Environmental Impact Report (Final EIR) has been prepared in accordance with the CEQA Statute and Guidelines and represents the independent judgment of the City of Ontario serving in its capacity as the CEQA Lead Agency.

According to CEQA Guidelines Section 15132, the Final EIR shall consist of:

(a) The Draft EIR or a revision of the draft;

(b) Comments and recommendations received on the Draft EIR either verbatim or in summary;

(c) A list of persons, organizations, and public agencies commenting on the Draft EIR;

(d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process; and

(e) Any other information added by the Lead Agency.

The City's Planning Commission will consider certification of the EIR, adoption of a Mitigation Monitoring and Reporting Program, and Findings of Facts as part of the approval process for the Project.

This Final EIR document is organized as follows:

Section 1 provides a brief introduction to this Final EIR document, a summary of the Draft EIR public review process, and a list of commenters.

Section 2 provides responses to the public comments that the City of Ontario received on the Draft EIR during the public review period. Responses are provided in the form of individual responses to each substantive environmental comment made in the comment letters received. Comment letters are presented and are followed by the responses to each substantive comment in each letter.

Section 3 contains revisions and clarifications to the Draft EIR as a result of the comments received. Changes to the Draft EIR that have been made in the Final EIR are presented as an Errata. This information does not constitute significant new information and recirculation of the EIR for further review pursuant to CEQA Guidelines Section 15088.5 is not required.

1.1 PUBLIC REVIEW PROCESS

In compliance with Section 15201 of the CEQA Guidelines, the City of Ontario (City) has taken steps to provide opportunities for public participation in the environmental review process. A Notice of Preparation (NOP) was distributed on September 1, 2022, to responsible agencies, local government agencies, and interested parties for a 30-day public review period (from September 1, 2022, to September 30, 2022) in order to solicit comments and inform agencies and the public of the Project. The NOP was also distributed to the State of California Office of Planning and Research, State Clearinghouse (SCH) for distribution to State agencies. The NOP was posted on the City's website and at the San Bernardino County Clerk's office on September 1, 2022. The Project was described; potential environmental effects associated with Project implementation were identified; and agencies and the public were invited to review and comment on the NOP. A copy of the NOP and comments received are included in *Appendix A* of the Draft EIR. The City received six comment letters in response to the NOP. Table 1-1 of the Draft EIR provides a brief summary of the NOP comments received that address environmental and related issues.

CEQA requires that a Draft EIR have a review period lasting at least 45 days for projects that have been submitted to the SCH for review (CEQA Guidelines§15105(a)). The Draft EIR was distributed to various public agencies, organizations, and individuals on August 22, 2023, for a 45 day review period, with the local review period and State review period ending on October 5, 2023. The City used several methods to elicit comments on the Draft EIR. A Notice of Availability (NOA) and the Draft EIR was distributed to the SCH for distribution to State agencies and was posted on the City's website. The NOA was also posted at the San Bernardino County Clerk's office on August 22, 2023. Also on August 22, 2023, the NOA was mailed to responsible agencies, local government agencies, and interested parties that received the NOP, to individuals who had previously requested the NOA or EIR, and to individuals who provided NOP comments. Finally, the NOA and Draft EIR were made available for review on the City's website at:

https://www.ontarioca.gov/Planning/Reports/EnvironmentalImpact.

The Planning Commission, as the final approval body, is scheduled to hold a public hearing to consider the proposed Project, associated actions, and certification of the Final EIR for the Project. A NOA for the Final EIR and the public hearing notice will be provided to all parties that submitted comments on the Draft EIR.

1.2 LIST OF EIR COMMENTERS

In accordance with Section 15132 of the CEQA Guidelines, following is a list of the parties that submitted comments on the Draft EIR. The City received two comment letters.

Responses to each comment are contained in Section 2.0. The two comment letters are assigned a letter (i.e., A and B) and the comments in each letter are divided into sequential numbered comments (i.e., A-1, A-2, A-3).

	Commenting Party	Date of Letter
A.	Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy	October 5, 2023
B.	Blum, Collins & Ho LLP on behalf of Golden State Environmental Justice Alliance	October 4, 2023

SECTION 2.0 RESPONSES TO COMMENTS RECEIVED DURING THE PUBLIC REVIEW PERIOD

The two comment letters received by the City have been included and responded to in this Final Environmental Impact Report (Final EIR). Comments that address environmental concerns are thoroughly addressed. Comments that do not require a response are indicated below and include those that (1) do not address the adequacy or completeness of the Draft EIR (i.e., are outside the scope of CEQA); (2) do not raise environmental issues; (3) do not address the Project; or (4) request the incorporation of additional information not relevant to environmental issues.

CEQA Guidelines Section 15204(a) outlines the parameters for public agencies and interested parties to submit comments and the Lead Agency's responsibility for responding to specific comments. Per CEQA Guidelines Section 15204(a), comments should be related to:

> *[T]he sufficiency of the document in identifying and analyzing possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. Comments are most helpful when they suggest additional specific alternatives or mitigation measures that would provide better ways to avoid or mitigate the significant environmental effects. At the same time, reviewers should be aware that the adequacy of an EIR is determined in terms of what is reasonably feasible…CEQA does not require a lead agency to conduct every test or perform all research, study, and experimentation recommended or suggested by commenters. When responding to comments, lead agencies need only respond to significant environmental issues and do not need to provide all information requested by reviewers, as long as a good faith effort at full disclosure is made in the EIR.*

CEQA Guidelines Section 15204(c) further advises that, "[r]eviewers should explain the basis for their comments, and should submit data or references offering facts, reasonable assumptions based on facts, or expert opinion supported by facts in support of the comments. Pursuant to CEQA Guidelines Section 15064, an effect shall not be considered significant in the absence of substantial evidence." Additionally, CEQA Guidelines Section 15204(d) notes that, "[e]ach responsible agency and trustee agency shall focus its comments on environmental information germane to that agency's statutory responsibility;" but, pursuant to CEQA Guidelines Section 15204(e), "[t]his section shall not be used to restrict the ability of reviewers to comment on the general adequacy of a document or of the lead agency to reject comments not focused as recommended by this section [CEQA Guidelines Section 15204]."

CEQA Guidelines Section 15088, Evaluation of and Response to Comments, states:

> a) *The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments raising significant environmental issues received during the noticed comment period and any extensions and may respond to late comments.*

b) *The lead agency shall provide a written proposed response, either in a printed copy or in an electronic format, to a public agency on comments made by that public agency at least 10 days prior to certifying an environmental impact report.*

c) *The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, the major environmental issues raised when the Lead Agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail giving reasons why specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice. The level of detail contained in the response, however, may correspond to the level of detail provided in the comment (i.e., responses to general comments may be general). A general response may be appropriate when a comment does not contain or specifically refer to readily available information, or does not explain the relevance of evidence submitted with the comment.*

d) *The response to comments may take the form of a revision to the draft EIR or may be a separate section in the final EIR. Where the response to comments makes important changes in the information contained in the text of the draft EIR, the lead agency should either:*

   1. *Revise the text in the body of the EIR; or*
   2. *Include marginal notes showing that the information is revised in the response to comments.*

This section includes responses to substantive Draft EIR comments received by the City. With respect to comment letters received, aside from certain courtesy statements, introductions, and closings, individual comments within the body of each letter have been identified and numbered. A copy of each comment letter and the City's responses to each applicable comment are included in this section. Brackets delineating the individual comments and a numeric identifier have been added to the right margin of the letter. Responses to each comment identified are included on the page(s) following each comment letter.

In accordance with Public Resources Code Section 21092.5, written responses to public agency comments shall be provided to the public agency at least 10 days prior to certifying an EIR.

As described in Section 3.0, *Draft EIR Clarifications and Revisions*, of this document, the Draft EIR, revisions and information presented in response to comments received do not result in any of the conditions set forth in Section 15088.5 of the CEQA Guidelines requiring recirculation; therefore, the Draft EIR does not need to be recirculated prior to its certification.

Re: Comments on the Draft Environmental Impact Report for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017)

Dear Mr. Grahn and Mr. Zeledon:

We are writing on behalf of Californians Allied for a Responsible Economy ("CARE CA") to provide comments on the Draft Environmental Impact Report ("DEIR") prepared by the City of Ontario ("City") for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant").

The Project site is located on 13.08 acres at 5355 East Airport Drive in the City of Ontario, in San Bernardino County, California (Assessor Parcel Numbers: 0238-052-29 and 0238- 052-20). The Project proposes to demolish all existing on-site structures and redevelop the site as a warehouse distribution facility with approximately 270,337 square feet (sf") of building area and 54 south-facing loading dock doors. Of the total building square footage, the Project design allocates 255,337 sf for ground floor space and 15,000 sf for mezzanine space. Development of the Project site would require demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The proposed building would be a one-story, 49-foot-tall speculative warehouse/distribution facility with ancillary office space.

A-1

6752-004j

printed on recycled paper

The Project design includes surface parking with 251 parking spaces including 126 standard automobile parking stalls, 7 accessible parking stalls, 25 electric vehicle parking stalls, 93 additional standard stalls within the truck court, and 48 truck trailer parking spaces.

A-1 (CONT.)

Based on our review of the DEIR and supporting documentation, we conclude that the DEIR fails to comply with the requirements of the California Environmental Quality Act ("CEQA")[1]. The DEIR fails to adequately analyze the Project's cumulative impacts in light of the community's existing pollution burden resulting from similar warehouse projects, and fails to propose feasible and enforceable mitigation measures to reduce those impacts to a less than significant level, as required by CEQA. The DEIR also underestimates potentially significant air quality, greenhouse gas ("GHG"), and energy impacts by failing to concretely describe the Project – which may have significantly greater cold storage uses, transport refrigeration units ("TRUs"), and backup generators than disclosed in the DEIR. The DEIR also impermissibly fails to identify specific and effective mitigation to reduce the Project's significant Vehicle Miles Traveled ("VMT") impact to the greatest extent feasible before declaring the impact significant and unavoidable.[2] The DEIR's transportation analysis also underestimates VMT and resultant GHG emissions. We reviewed the DEIR and its technical appendices with the assistance of transportation expert Norm Marshall.[3] We reserve the right to supplement these comments at a later date, and at any later proceedings related to this Project.[4]

A-2

As explained in these comments, the DEIR lacks substantial evidence to support its conclusions with regard to the Projects' impacts relating to air quality, health risks, greenhouse gases, energy, and transportation. The City may not approve the Project until the City revises and recirculates the Project's DEIR to adequately analyze the Project's significant direct, indirect and cumulative impacts, and incorporates all feasible mitigation measures to avoid or minimize these impacts to the greatest extent feasible.

6752-004j

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Fontana and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

A-3

II. LEGAL BACKGROUND

CEQA requires public agencies to analyze the potential environmental impacts of their proposed actions in an EIR.[5] "The foremost principle under CEQA is that the Legislature intended the act to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language."[6]

A-4

[5] PRC § 21100.
[6] *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal ("Laurel Heights I")* (1988) 47 Cal.3d 376, 390 (internal quotations omitted).
6752-004j

CEQA has two primary purposes. First, CEQA is designed to inform decisionmakers and the public about the potential significant environmental effects of a project.[7] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'"[8] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return."[9] As the CEQA Guidelines explain, "[t]he EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected."[10]

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring consideration of environmentally superior alternatives and adoption of all feasible mitigation measures.[11] The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced."[12] If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[13]

A-4
(CONT.)

While courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."[14] As the courts have explained, a

Bd. of Port Comm'rs.* (2001) 91 Cal.App.4th 1344, 1354 ("*Berkeley Jets*") (purpose of EIR is to inform the public and officials of environmental consequences of their decisions *before* they are made).
[10] CEQA Guidelines § 15003(b).
[11] CEQA Guidelines § 15002(a)(2), (3); *see also Berkeley Jets*, 91 Cal.App.4th at 1354; *Citizens of Goleta Valley*, 52 Cal.3d at p. 564.
[12] CEQA Guidelines § 15002(a)(2).
[13] PRC § 21081(a)(3), (b); CEQA Guidelines §§ 15090(a), 15091(a), 15092(b)(2)(A), (B); *Covington v. Great Basin Unified Air Pollution Control Dist*. (2019) 43 Cal.App.5th 867, 883.
[14] *Berkeley Jets*, 91 Cal.App.4th at p. 1355 (emphasis added) (quoting *Laurel Heights I*, 47 Cal.3d at 391, 409, fn. 12).
6752-004j

prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process."[15] "The ultimate inquiry, as case law and the CEQA guidelines make clear, is whether the EIR includes enough detail 'to enable who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'"[16]

A-4 (CONT.)

III. THE PROJECT DESCRIPTION IS INADEQUATE

The DEIR does not meet CEQA's requirements because it fails to include an accurate and complete Project description, rendering the entire analysis inadequate. California courts have repeatedly held that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[17] CEQA requires that a project be described with enough particularity that its impacts can be assessed.[18] Without a complete project description, the environmental analysis under CEQA is impermissibly limited, thus minimizing the project's impacts and undermining meaningful public review.[19] Accordingly, a lead agency may not hide behind its failure to obtain a complete and accurate project description.[20]

A-5

CEQA Guidelines section 15378 defines "project" to mean "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[21] "The term "project" refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term project does not mean each separate governmental approval."[22]

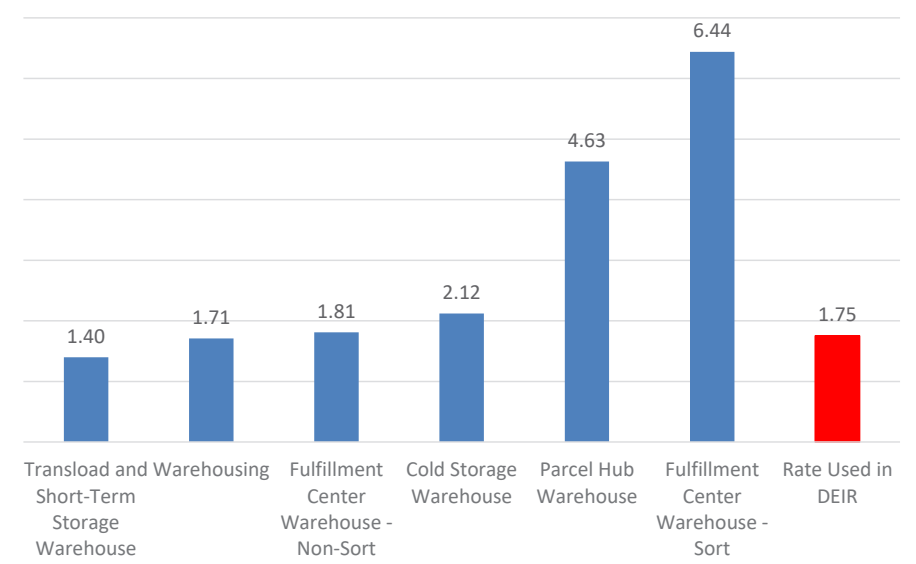
[18] 14 CCR § 15124; *see, Laurel Heights I, supra,* 47 Cal.3d 376, 192-193.
[19] *Id.*
[20] *Sundstrom v. County of Mendocino* ("*Sundstrom*") (1988) 202 Cal.App.3d 296, 311.
[21] CEQA Guidelines § 15378.
[22] *Id.*, § 15378(c).
6752-004j

Courts have explained that a complete description of a project must "address not only the immediate environmental consequences of going forward with the project, but also all "*reasonably foreseeable* consequence[s] of the initial project."[23] "If a[n]…EIR…does not adequately apprise all interested parties of the true scope of the project for intelligent weighing of the environmental consequences of the project, informed decisionmaking cannot occur under CEQA and the final EIR is inadequate as a matter of law."[24]

A-5 (CONT.)



A. The DEIR Fails to Describe the Project's End Uses with Sufficient Particularity to Adequately Evaluate Trips Generated by the Project

The DEIR assumes that the Project would include approximately 27,034 sf of high-cube cold storage uses (10% of the building space), with remaining portions of the building consisting of warehouse uses.[25] The DEIR explains that the Project's end users are unknown.[26] In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the Institute of Transportation Engineers ("ITE") Trip Generation Manual for the proposed Project's land uses was utilized.[27] For purposes of the trip generation assessment, the DEIR used ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse). Transportation expert Norm Marshall explains that these land use codes are just one of many land use codes potentially applicable to the Project.[28] The figure below shows other warehousing land use codes and compares trips generated by each land use.

A-6

Figure 1: Trip Generation Rates for Different Warehouse Categories (Trips Per 1000 Square Feet per Day)[29]

A-6 (CONT.)

The DEIR fails to address why the other land use codes shown above are inapplicable to the Project. And the DEIR fails to provide sufficient information about the Project's expected uses and configuration for the public and decisionmakers to ascertain which of these end uses are possible for the Project. This informational defect affects the entire DEIR, as different types of warehousing have different environmental impacts.

Mr. Marshall explains that the land use code selected by the DEIR may drastically underestimate the Project's GHG and VMT impacts. Specifically, the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[30] A greater number of trips generated results in greater traffic impacts and greater emissions of GHGs. Given the large uncertainty in the trips generated by the Project, the DEIR fails to meet CEQA's requirement that a project be

[29] Marshall Comments, pg. 5.
[30] *Id.*
6752-004j

described with enough particularity that its impacts can be assessed.[31] Mr. Marshall recommends two approaches to resolve this issue: either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.[32] The City should revise and recirculate the DEIR to correct these deficiencies and to present a revised trip generation analysis which reflects reasonably foreseeable conditions at the Project site, or condition Project approval on the limitations assumed in the DEIR.

A-6 (CONT.)

B. The DEIR Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

The DEIR assumes, without support, that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space), with remaining portions of the building consisting of warehouse uses.[33] The DEIR states that a limitation of 10% of the building for potential cold storage is based on the Project Applicant's understanding of the cold storage market demand.[34] However, this assumption, even if based on a reasonable interpretation of current market conditions, is subject to fluctuate during the life of the Project and is not otherwise reflected in any enforceable conditions related to Project use.

A-7

In order for the City to rely on the Applicant's 10% cold storage assumption in the CEQA document, the DEIR would need to include binding measures or conditions which limit warehouse use at the Project to no more than 10% cold storage. Absent such a restriction, the DEIR may substantially estimate the air quality, public health, and energy impacts of cold storage use at the Project site.

Cold storage warehouse generates greater environmental impacts than a high cube warehouse. Cold storage generates more trips per square foot and has higher energy impacts due to the low temperatures required by the facility's transport refrigeration units ("TRUs") and on-site storage. TRUs are refrigeration systems powered by integral diesel engines.[35] The refrigeration systems are used to control the environment of temperature-sensitive products transported in insulated

6752-004j

trucks, trailers, shipping containers, or railcars. The California Air Resources Board ("CARB") states that TRUs emit diesel particulate matter ("DPM"), fine particulate matter ("PM2.5"), oxides of nitrogen ("NOx"), and GHGs while in transit and during stationary operation at refrigerated warehouses or distribution centers, grocery stores, seaport facilities, intermodal railyards, and other locations of operation. CARB explains that communities near facilities where TRUs operate bear a disproportionate health burden:

> PM2.5 pollution contributes to more fatalities than other air pollutants and can lodge deep in the lungs or pass through the lungs to enter the blood stream and affect the heart, brain, and other organs. Adverse health effects from long-term exposure to PM2.5 pollution include increased risk of heart attacks and heart disease, impaired lung development in children, the development and exacerbation of asthma, and premature death. NOx is a precursor to ozone, which can cause irritation and damage lung tissue, worsen asthma and chronic illnesses including obstructive pulmonary disease and reduce lung function.[36]

CARB also explains that TRUs' emissions of GHGs contribute towards climate change,[37] and that TRUs generate noise impacts: "TRU operations produce noise that can be problematic when deliveries that often occur late evening or early morning are near residential neighborhoods, hotels, hospitals, and elder care facilities… One study conducted by LSA Associates found that a diesel-powered TRU operating at high idle produces an A-weighted decibel (dBA) noise rating of 104 dBA, while a diesel truck at idle produces a noise rating of 96 dBA."[38]

By assuming the Project will only include 10% cold storage, the DEIR may drastically underestimate the Project's impacts in each of these areas. The DEIR does not provide supporting evidence demonstrating that cold storage uses would be limited to 10% of the Project site for the duration of the Project's life. Due to ever-increasing population and market demands in Southern California, it is also reasonably foreseeable that the Project may attract end users, either now or in future years of the Project's life, which require more than 10% cold storage. As a result, the DEIR's assumption is not supported by substantial evidence.

In the California Attorney General's ("AG") guidance for warehouse projects, the AG recommends that, unless a developer adopts mitigation measures limiting cold storage impacts, the developer should record a covenant on the title of the underlying property to ensuring that the property cannot be used to provide refrigerated warehouse space.[39] The City should include such a title restriction for the Project unless the DEIR's 10% cold storage assumption is revised to analyze and mitigate impacts associated with a more conservative and fact-based cold-storage use percentage.

A-9

C. The Project Description Fails to Include Reasonably Foreseeable Backup Generators

The DEIR fails to disclose potential backup/emergency stationary generators for the Project's operations. The DEIR's project description does not address whether backup generators are a reasonably foreseeable component of the Project, and the DEIR's technical analyses assume no backup generators will be installed for operations. The DEIR does not disclose any conditions or mitigation measures that limit or prevent use of backup generators. Thus, the DEIR must disclose and analyze the potential use of backup generators because (1) they a reasonably foreseeable consequence of the Project, and (2) the use of backup generators will expand the Project's environmental effects.[40]

In *East Oakland Stadium Alliance v. City of Oakland*,[41] the Court of Appeal upheld an EIR's analysis of emissions from backup generators. The EIR's analysis assumed that generators would operate for 50 hours of testing and maintenance annually, while allocating no time for actual emergency use. In discussing the lead agency's duty to analyze backup generator emissions, the Court stated that "if the annual need for emergency generator use is reasonably foreseeable, the EIR was not entitled to disregard such use merely because it would occur at unpredictable times."[42] The Court explained that use of a generator was reasonably foreseeable because, "[a]s noted in the EIR, some parts of the Bay Area are subject to

A-10

6752-004j

predictable, sustained power outages undertaken to reduce the risk of fire."[43] Thus, "[t]he EIR was required to make neither a generally applicable nor a worst-case assumption; rather it was required to make a reasonable estimate of likely annual use of the generators at the project site."[44]

Here, as in *East Oakland Stadium Alliance*, back-up generators are a reasonably foreseeable consequence of the Project due to increasingly common Public Safety Power Shutoff ("PSPS") events and extreme heat events. Extreme heat events ("EHE") are defined as periods where in the temperatures throughout California exceed 100 degrees Fahrenheit.[45] From January 2019 through December 2019, Southern California Edison reported 158 of their circuits underwent a PSP event.[46] In Los Angeles County, two circuits had 4 PSPS events during that period, lasting an average of 35 to 38 hours. The total duration of the PSPS events lasted between 141 hours to 154 hours in 2019. According to the California Public Utilities Commission (CPUC) de-energization report[47] in October 2019, there were almost 806 PSPS events that impacted almost 973,000 customers (~7.5% of households in California) of which ~854,000 of them were residential customers. The California Air Resources Board estimates that with 973,000 customers impacted by PSPS events in October 2019, approximately 125,000 back-up generators were used by customers to provide electricity during power outage.[48] The widespread use of back-up generators to adapt to PSPS and EHE events suggests that back-up generators are a reasonably foreseeable consequence of the Project.

A-10
(CONT.)

Further demonstrating that backup generators are reasonably foreseeable is that the DEIR assumes that 10% of the building (27,034 sf) would be cold storage.[49] A cold storage warehouse has the ability to keep temperature sensitive items in a

6752-004j

temperature-controlled environment, which requires a constant energy supply to power refrigeration. Cold storage warehouses thus commonly utilize backup generators.[50] Backup generators commonly rely on fuels such as natural gas or diesel,[51] and thus can significantly impact air quality, GHG emissions, and public health through toxic DPM emissions.[52] Since the Project may include cold storage, it is reasonably foreseeable that the Project would require on-site backup generators.

A-10
(CONT.)

Generators can emit criteria air pollutants, greenhouse gases, and toxic air contaminants ("TACs"). Backup generators commonly rely on fuels such as natural gas or diesel,[53] and thus can significantly impact public health through DPM

The majority of DPM is small enough to be inhaled deep into the lungs and make them more susceptible to injury. Much of the back-up power produced during PSPS events is expected to come from engines regulated by CARB and California's 35 air pollution control and air quality management districts (air districts)").

[53] SCAQMD, Fact Sheet on Emergency Backup Generators, http://www.aqmd.gov/home/permits/emergency-generators ("Most of the existing emergency backup generators use diesel as fuel").

6752-004j

emissions.[54] Diesel back-up generators emit significant amounts of Nitrogen Oxides ("NOx"), sulfur dioxides ("SO2"), particulate matter ("PM10"), carbon dioxide ("CO2"), carbon monoxide ("CO"), and volatile organic compounds ("VOC").[55] Omission of a generator system results in an underestimation of the Project's air quality, greenhouse gas, and health risk impacts.

A-10 (CONT.)

In sum, omission of the Project's generator results in an underestimation of the Project's air quality, greenhouse gas, energy, and health risk impacts. The DEIR must be revised to resolve this project description inconsistency and correct the affected impacts analyses to accurately disclose the Project's potentially significant impacts.

IV. THE DEIR FAILS TO DISCLOSE, ANALYZE AND MITIGATE POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a Project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact

6752-004j

must be supported by accurate scientific and factual data.[56] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[57]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by CEQA.[58] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[59] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[60]

A-11
(CONT.)

Additionally, CEQA requires agencies to commit to all feasible mitigation measures to reduce significant environmental impacts.[61] In particular, the lead agency may not make required CEQA findings, including finding that a project impact is significant and unavoidable, unless the administrative record demonstrates that it has adopted all feasible mitigation to reduce significant environmental impacts to the greatest extent feasible.[62]

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[63]

A. The DEIR Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

An EIR must evaluate a cumulative impact if the project's incremental effect combined with the effects of other projects is "cumulatively considerable."[64] This determination is based on an assessment of the project's incremental impacts "viewed in connection with the effects of past project, the effects of other current projects, and the effects of probable future projects."[65] Proper cumulative impact analysis is vital because "the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant when considered individually, but assume threatening dimensions when considered collectively with other sources with which they interact."[66]

A-12

1. The DEIR Fails to Provide a List of Cumulative Projects

The CEQA Guidelines set forth two methods for satisfying the cumulative impacts analysis requirement: the list of projects approach and the summary of projections approach.[67] Under the former, an adequate discussion of cumulative impacts requires "a list of past, present, and probable future projects producing related or cumulative impacts…"[68] Relevant factors when compiling a list of related projects include the environmental resource being examined and the location and type of the project.[69] The Guidelines expressly recognize that project type may be important "when the impact is specialized, such as a particular air pollutant or mode of traffic."[70]

A-13

Here, the DEIR states that it uses a combination of the two methods as appropriate for each impact analysis:

> The summary of projections approach is used in this EIR, except for the evaluation of cumulative transportation effects (for purposes of demonstrating General Plan policy compliance) and vehicular-related air

[64] CEQA Guidelines § 15130(a).

[69] *Id.*, § 15130(b)(2).
[70] *Id.*
6752-004j

quality, greenhouse gas, and noise impacts, for which the analysis combines the summary of projections approach with the manual addition of past, present, and reasonably foreseeable projects ("combined approach"). The City determined the combined approach to be appropriate because long-range planning documents contain a sufficient amount of information to enable an analysis of cumulative effect for all subject areas, with the exception of transportation (and vehicular-related air quality, greenhouse gas, and noise effects), which requires a greater level of detailed study.[71]

A-13 (CONT.)

However, the DEIR fails to provide a list of cumulative projects. And the appendices containing the air quality, greenhouse gas, and noise analyses do not consider past, present, and reasonably foreseeable projects. The air quality, greenhouse gas, and noise analyses should be revised to include consideration of cumulative projects, as recommended by the DEIR itself.

2. The DEIR's Cumulative Air Emissions Analysis Does Not Comply with CEQA or Attorney General Warehouse Guidance

The DEIR fails to adequately analyze the Project's cumulative air quality emissions. The DEIR asserts that, under South Coast Air Quality Management District ("SCAQMD") guidance, any exceedance of a regional or localized threshold for criteria pollutants also is considered to be a cumulatively-considerable effect, while air pollutant emissions that fall below applicable regional and/or localized thresholds are not considered cumulatively-considerable.[72]

A-14

The DEIR fails to note that SCAQMD's approach is outdated, as evidenced by its ongoing process to update its cumulative impacts guidance.[73] The DEIR's approach has been also rejected by the courts for failing to comply with CEQA's requirement that a project mitigate impacts that are "cumulatively considerable."[74] The City's failure to actually examine the Project's cumulative air quality impacts violates CEQA's requirement to analyze cumulative impacts.

[71] DEIR, pg. 4-2.
[72] DEIR, Appendix B, pg. 53.
[73] See e.g., http://www.aqmd.gov/docs/default-source/ceqa/documents/wgm-3_20230124.pdf?sfvrsn=6.
[74] PRC § 21083(b)(2); 14 CCR § 15130; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692, 719-21.
6752-004j

The leading case on this issue is *Kings County Farm Bureau v. City of Hanford*.[75] In *Kings County*, the city prepared an EIR for a 26.4-megawatt coal-fired cogeneration plant. Notwithstanding the fact that the EIR found that the project region was out of attainment for PM_{10} and ozone, the city failed to incorporate mitigation for the project's cumulative air quality impacts from project emissions because it concluded that the Project would contribute "less than one percent of area emissions for all criteria pollutants."[76] The city reasoned that, because the project's air emissions were small in ratio to existing air quality problems, that this necessarily rendered the project's "incremental contribution" minimal under CEQA. The court rejected this approach, finding it "contrary to the intent of CEQA." The court stated:

> We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's "ratio" theory, the greater the over-all problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term "collectively significant" in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development. The EIR improperly focused upon the individual project's relative effects and omitted facts relevant to an analysis of the collective effect this and other sources will have upon air quality.[77]

The DEIR's analysis is similarly flawed because while the DEIR admits that the Project region is out of attainment for ozone, PM_{10}, and $PM_{2.5}$, the City fails to analyze or mitigate the Project's emissions' cumulative air quality impacts.[78] Given that there are multiple existing large warehouses immediately adjacent to the proposed Project site,[79] as well as the proliferation of warehouse projects in the region and San Bernardino County, the DEIR is inadequate in its analysis of the Project's potentially significant cumulative air quality impacts.

A-14
(CONT.)

[78] DEIR, pg. 5.2-17.
[79] DEIR, pg. 2-4, Figure 2-1.
6752-004j

The SCAQMD approach used in the DEIR also directly conflicts with the AG recent guidance document setting forth best practices for evaluating the environmental impacts of warehouse projects like this one under CEQA.[80] With respect to cumulative air quality and GHG emissions analysis, the Attorney General's guidance states that best practices include "[w]hen analyzing cumulative impacts, thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[81]

A-15

The DEIR's cumulative air quality impacts analysis does not comply with CEQA. The City must prepare a revised EIR that properly evaluates and mitigates such impacts.

3. The DEIR's Health Risk Analysis Fails to Consider the Health Impacts of Cumulative Emissions from Nearby Warehouses

The DEIR's analysis of cumulative health risks is flawed for the same reason as the air quality analysis. The DEIR points to guidance from SCAQMD to reason that emissions of TACs are considered significant if a quantified health risk analysis ("HRA") shows an increased risk of greater than 10 in 1 million.[82] And the DEIR provides that Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable, and vice versa.[83] This approach is inadequate because it fails to analyze the Project's cumulative effects with the existing and proposed warehouses surrounding the Project site.

A-16

CEQA provides that the incremental effects of an individual project are cumulatively considerable if the effects are significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."[84] Courts have held that where a community already

[80] *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act* (Updated September 2022), available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf .

[83] *Id.*
[84] CEQA requires a lead agency consider whether the combined effects from both the proposed project and other projects would be "cumulatively considerable." (CEQA Guidelines, § 15130, subd. (a).) The incremental effects of an individual project are cumulatively considerable if the effects are
6752-004j

bears a high pollution burden, a lead agency must consider "whether any additional amount" of pollution caused by the project "should be considered significant in light of the serious nature" of the existing problem.[85]

Here, the DEIR's approach of using a project-level analysis as a substitute for a cumulative impacts analysis fails to address that the Project would be impacting a community already bearing a high pollution burden. The DEIR's CalEEMod output sheets show the community' pollution burden as scoring 91.1 in AQ-Ozone, 95.7 in AQ-PM, and 96.6 in AQ-DPM.[86] A high score reflects a higher pollution burden compared to other census tracts in the state, with a maximum CalEnviroScreen score of 100.[87] Despite this high pollution burden, the DEIR concludes that the Project would not contribute to cumulative impacts because its own impacts would result in an increased risk of less than 10 in 1 million. This analysis violates principles of *Kings County Farm Bureau v. City of Hanford* and guidance from Attorney General. The City must revise and recirculate a DEIR that analyzes the Project's potentially significant cumulative health risk impacts.

A-16 (CONT.)

B. The DEIR's Quantified Health Risk Analysis Underestimates Operational Mobile Source Impacts

The DEIR includes an HRA addressing the Project's construction and operational impacts. The operational HRA is flawed because it omits analysis of TRUs.[88]

As explained above, TRUs emit DPM, PM2.5, NOx, and GHGs while in transit and during stationary operation at refrigerated warehouses or distribution centers, grocery stores, seaport facilities, intermodal railyards, and other locations of operation.[89] CARB explains that communities near facilities where TRUs operate bear a disproportionate health burden:

A-17

significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." (Id., §§ 15065, subd. (a)(3), 15355, subd. (b).)

6752-004j

> PM2.5 pollution contributes to more fatalities than other air pollutants and can lodge deep in the lungs or pass through the lungs to enter the blood stream and affect the heart, brain, and other organs. Adverse health effects from long-term exposure to PM2.5 pollution include increased risk of heart attacks and heart disease, impaired lung development in children, the development and exacerbation of asthma, and premature death. NOx is a precursor to ozone, which can cause irritation and damage lung tissue, worsen asthma and chronic illnesses including obstructive pulmonary disease and reduce lung function.[90]

A-17 (CONT.)

Thus, the omission of TRUs in the DEIR's HRA results in an underestimate of the Project's health risk impacts. The DEIR's significance findings are thus not supported by substantial evidence. The DEIR must be revised to adequately disclose the health risk impacts from TRUs.

C. The DEIR Underestimates Project VMT and Mobile Source GHGs

Transportation expert Norm Marshall explains that the DEIR potentially underestimates average trip lengths for both trucks and passenger vehicles.[91] Longer trip lengths results in greater impacts (including air quality, GHGs, and VMT). As a result, the analyses that rely on these trip lengths lack the support of substantial evidence. The DEIR air quality analysis relies on the follow trip lengths:

> To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.[92]

A-18

The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explains that SCAQMD does not make a recommendation that these trip distances be used for warehouse project EIRs.[93] Rather, the AG's guidance document for warehouse projects states:

[90] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[91] Marshall Comments, pp. 6-7.
[92] DEIR, Appendix B1, pg. 37.
[93] Marshall Comments, pg. 6-7.
6752-004j

> CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur.[94]

A-18 (CONT.)

In contrast to the approach recommended by the AG, the DEIR's estimated trip distances did not account for the Project's likely trip destinations. Mr. Marshall explains that, while it may be too early to determine specific truck trip origins and destinations, it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR.[95] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The DEIR's analysis thus likely underestimates trip distances.

The DEIR also underestimates lengths of passenger trips generated by the Project. Mr. Marshall observes that CalEEMod trip lengths were used for passenger trips.[96] But in the DEIR's VMT analysis, the DEIR acknowledges that the Project's VMT per service population, i.e., the VMT per worker, is significantly higher than the average for the City of Ontario, and therefore, also significantly higher than the regional average.[97] Mr. Marshall explains that the average auto trip lengths should be increased from the default values to account for the VMT-inefficient project location. Thus, the DEIR's analysis lacks the support of substantial evidence, and must be revised.

A-19

D. The DEIR Fails to Identify All Feasible VMT Mitigation Measures

The DEIR concludes that the Project would result in a significant and unavoidable VMT impact despite mitigation included in the DEIR. Specifically, the DEIR estimates that the Project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.[98] The DEIR identifies the following mitigation for this significant impact:

A-20

[94] Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act (Updated September 2022), pg. 7.
[95] Marshall Comments, pg. 7.
[96] *Id.*; DEIR, Appendix F, pg. 56
[97] Marshall Comments, pg. 7.
[98] Marshall Comments, pg. 1.
6752-004j

> MM 4.10-1: Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours).[99]

This measure fails to meet CEQA's standards for mitigation. CEQA provides that if the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[100] Further, EIRs must mitigate significant impacts through measures that are "fully enforceable through permit conditions, agreements, or other legally binding instruments."[101] Deferring formulation of mitigation measures is generally impermissible.[102] If identification of specific mitigation measures is impractical until a later stage in the Project, specific performance criteria must be articulated and further approvals must be made contingent upon meeting these performance criteria.[103] Mitigation that does no more than allow approval by a county department without setting enforceable standards is inadequate.[104]

Here, the measure improperly defers identification of specific VMT-reducing mitigation measures to a future date. MM 4.10-1 does not commit to any particular measures to reduce VMT. Nor does the DEIR articulate specific performance criteria to ensure that impacts would be mitigated to the greatest extent feasible. Mr. Marshall notes that, while MM 4.10-1 lists potential measures to reduce VMT,

A-20
(CONT.)

[99] DEIR, pg. S-24.
[100] PRC § 21081(a)(3), (b); CEQA Guidelines §§ 15090(a), 15091(a), 15092(b)(2)(A), (B); *Covington v. Great Basin Unified Air Pollution Control Dist*. (2019) 43 Cal.App.5th 867, 883.
[101] CEQA Guidelines, § 15126.4, subd. (a)(2).
[102] *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 308-309; Pub. Resources Code, § 21061.
[103] *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359, 1393; *Quail Botanical*, *supra*, 29 Cal.App.4th at pg. 1604, fn. 5.
[104] *Endangered Habitats League, Inc. v. County of Orange,* (2005) 131 Cal.App.4th 777, 794.
6752-004j

there is no clear commitment or description of the measures.[105] Mr. Marshall explains that the measures listed in MM 4.10-1 can be formulated in a variety of ways that determine the magnitude of VMT reductions.[106] MM 4.10-1 is thus improperly deferred mitigation that does no more than allow approval by a county department without setting enforceable standards.[107]

A-20 (CONT.)

As a result of this improper deferral of mitigation, the DEIR also fails to comply with CEQA's requirement to reduce all significant effects on the environment to the greatest extent feasible. MM 4.10-1 must be revised to clearly require the all feasible VMT-reducing measures be adopted until the expected 28.47% excess VMT is mitigated.

V. CONCLUSION

For the reasons discussed above, the DEIR for the Project is inadequate under CEQA. It must be revised to provide legally adequate analysis of, and mitigation for, all of the Project's potentially significant impacts. These revisions will necessarily require that the DEIR be recirculated for additional public review. Until the DEIR has been revised and recirculated, as described herein, the City may not lawfully approve the Project.

A-21

Thank you for your consideration of these comments. Please include them in the record of proceedings for the Project.

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

I have reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I make the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

A-22

1

Significant and Unavoidable VMT impact

The DEIR states that the project would have a "Significant and Unavoidable [VMT] Impact." (DEIR, p. S-24)

DEIR Appendix J, "IE Distribution Center #14 Vehicle Miles Traveled (VMT) Analysis," evaluates the project relative to the City of Ontario's VMT screens and concludes:

- TPA [Transit Priority Area] screening criteria is not met.
- Low VMT Area screening criteria is not met.
- Project Type screening criteria is not met.

As the project fails these screens, a full VMT analysis was performed using the San Bernardino Transportation Analysis Model (SBTAM). The table below copied from DEIR Appendix J, p. 9 summarizes the results of this analysis.

TABLE 10: PROJECT COMPARISON TO CITY OF ONTARIO VMT THRESHOLD

	Baseline	Buildout Year
Impact Threshold	27.61	27.61
Project	33.84	35.47
Percent Change	+22.56%	+28.47%
Potentially Significant?	Yes	Yes

As shown in the reproduced table, the proposed project would exceed the City's VMT threshold by 22.56% in the baseline year and by an even larger 28.47% in the buildout year (2050).

A-23

The VMT Mitigation Described in the VMT is Inadequate

The City of Ontario's VMT Resolution adopted June 16, 2020, reiterates General Plan Mobility Element M1-2: **"Mitigation of impacts. We require development to mitigate its traffic impacts."**

In the case of the proposed project, full mitigation would reduce VMT to below the threshold, i.e., the 28.47% excess VMT in the horizon year would be eliminated. The EIR should quantify the expected VMT reduction from mitigation. Unless the reduction is sufficient to achieve the VMT threshold, the EIR should justify why greater mitigation is infeasible.

The VMT mitigation described in the DEIR is:

> **MM 4.10-1** Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours). (DEIR, p. S-24)

A-24

2

The above wording is ambiguous. Is this a commitment to include all the measures listed, or only to a subset of the measures. For the included measures, what are the magnitudes of the different incentives. Are the included measures voluntary or mandatory? Is monitoring included? What is the total VMT reduction from the package, and is this reduction sufficient to adequately address the expected 28.47% excess VMT in the horizon year? If the planned reduction is not achieved, what are the consequences?

A-24 (CONT.)

The California Air Pollution Control Officers Association (CAPCOA) provides on quantifying VMT mitigation measures in its publication *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity: Designed for Local Governments, Communities, and Project Developers (Final Draft, December 2021)*. It states:

> The Handbook builds on CAPCOA's previous efforts to provide accurate and reliable quantification measures. In 2010, CAPCOA published *Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emissions Reductions from Greenhouse Gas Mitigation Measures* (hereafter referred to as the "2010 Handbook"). Since that time, climate science has evolved and GHG reduction practices have advanced in sophistication. New priorities have also arisen, such as strengthening climate resilience and infusing health and equity into integrated planning efforts. Therefore, CAPCOA decided it was time to develop an updated and expanded resource to provide the latest data and methods to quantify GHG emissions reductions, climate change vulnerability reductions, and equity improvements in a single resource: The Handbook. (p. 2-3)

The Handbook makes a critical distinction between voluntary and mandatory Commuter Trip Reduction ("CTR") programs:

A-25

T-5 Implement Commute Trip Reduction Program (Voluntary) – up to 4% VMT reduction:

> Voluntary CTR programs must include the following elements to apply the VMT reductions reported in literature. ▪ Employer-provided services, infrastructure, and incentives for alternative modes such as ridesharing (Measure T-8), discounted transit (Measure T-9), bicycling (Measure T-10), vanpool (Measure T-11), and guaranteed ride home. ▪ Information, coordination, and marketing for said services, infrastructure, and incentives (Measure T-7). (*Handbook*, p. 83)

T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

3

A 26% reduction at this site may be impossible given the relatively poor transit , bicycle and walk accessibility plus long commute distances that making walking and biking impractical. The DEIR states:

> Public transit service in the region is provided by Omnitrans, a public transit agency that serves various jurisdictions within San Bernardino County. There are no public transit routes that run adjacent to the Project Site under existing conditions. The nearest transit routes to the Project Site are Route 61 which has a stop located along Fourth Street, approximately 0.9 mile north of the Project Site and Route 82 which has a stop located at South Etiwanda and Jurupa Avenue, approximately 1.2 miles southeast of the Project Site. There are no existing bicycle facilities within the vicinity of the Project Site. The closest bike route to the Project Site is a Class III bike route located along Ontario Mills Parkway, approximately 0.4 mile north of the Project Site. There are no sidewalks on either side of East Airport Drive, with the exception of a small portion along the adjacent development frontage directly to the west at 5351 East Airport Drive. (DEIR, p. 2-11)

A-25 (CONT.)

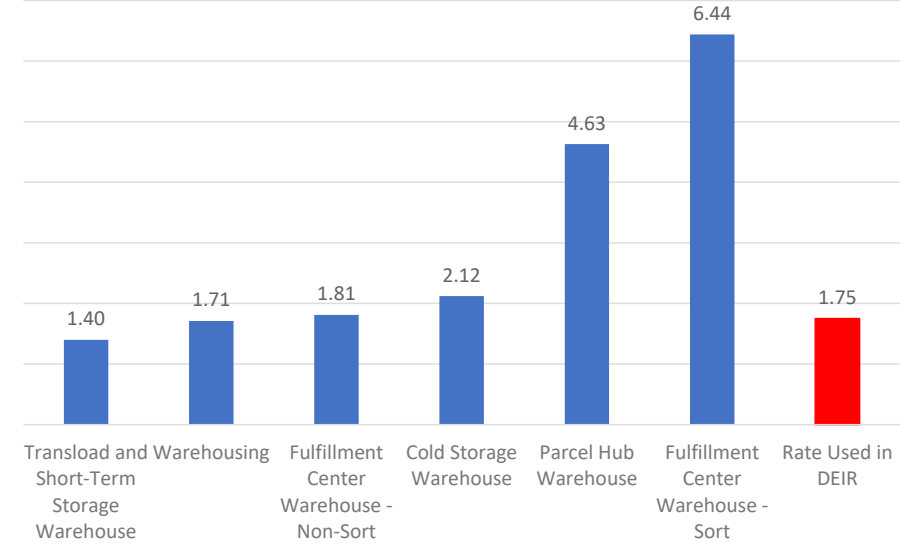
Furthermore, ridesharing and vanpooling would be complicated by a geographically dispersed workforce and likely multiple shifts.

Joining with other employers would be beneficial. The more employers that support these VMT reduction programs, the stronger these programs will be, and the regional benefit of participating may be greater than just the onsite VMT reductions. For example, a vanpool could include multiple employers IE Commuter, a program of the San Bernardino County Transportation Authority in partnership with the Riverside County Transportation Commission, offers a full range of services to help employers set up and manage VMT reduction programs.[1]

Achieving significant VMT mitigation for this project may be impossible – but mitigation must be fully specified and quantified for the project to be properly evaluated.

A-26

Project Trip Generation Could Be Much Higher Than Assumed



The project is comprised of a 270,377 square feet warehouse building. (DEIR, Appendix K, p. 1) The tenants have not been identified, and the nature of the operations are unknown at this time. For the purpose of estimating project trip generation, the DEIR assumes a mix of 90% warehousing and 10% high-cube cold storage. (DEIR, Appendix K, p. 1) This mix is highly speculative, and the project may not even include either of the assumed trip generation categories.

The DEIR estimates trip generation based on the rates in the Institute of Transportation Engineers ("ITE") *Trip Generation* manual. *Trip Generation* includes other categories of warehouses. As shown in the figure below, the trip generation rates applied in the DEIR are much lower than rates for some other warehouse categories.

A-27

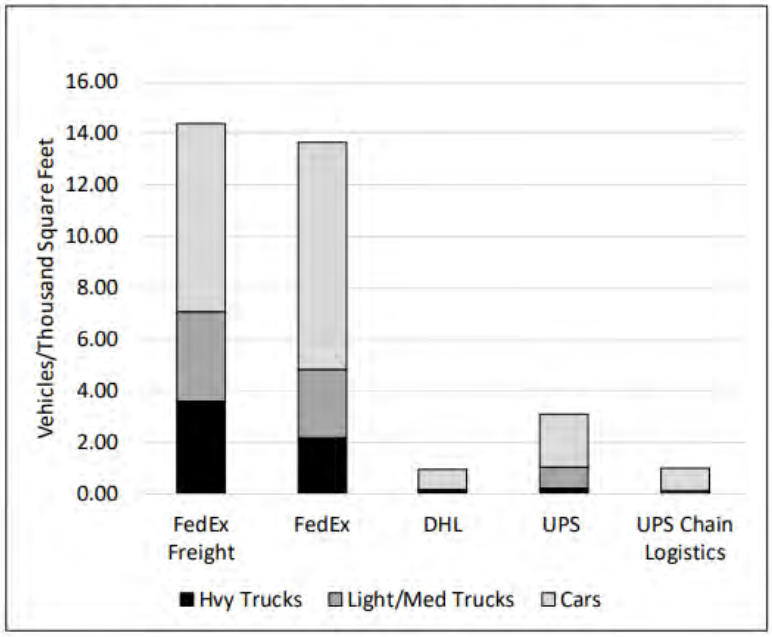
[1] https://www.iecommufter.org/rp2/home/EmployerSupport

Trip Generation Rates for Different Warehouse Categories (Trips Per 1000 Square Feet per Day)

A-27 (CONT.)

The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

A 2019 study of warehouse trip generation done by WSP for the Western Riverside COG documented even higher trip generation rates.[2] This study was based on counts at 16 warehouses, segmented between 11 fulfillment centers and 5 parcel hubs.



The observed trip generation rates at two of the parcel hub sites are even higher than the rates shown in the figure above.. As shown in the figure below, the highest trip generation rates were observed at two of the parcel hubs, with rates of about 14 trips per 1000 square feet per day, i.e., 8 times the rate used in the DEIR.

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

5

Exhibit 11: Daily Trip Generation Rates at Parcel Hubs

A-27 (CONT.)

Project VMT and GHG Emissions Could Be Much Higher Than Assumed

Any underestimate of trip generation translates into underestimated GHG emissions. It is likely that the DEIR also underestimates average trip lengths.

The DEIR air quality analysis (Appendix B1) states:

> To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages. (DEIR, Appendix B1, p. 37)

A-28

The DEIR misstates that these truck trip distances are "recommended" by SCAQMD. The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[3] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any

[3] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf

6

use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[4] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

The Attorney General's September 2022 guidance: *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act*[5] states:

> CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur. (p. 7)

While it is too early to determine truck trip origins and destinations, it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The DEIR states that CalEEMod trip lengths were used for passenger trips:

> In order to determine emissions from passenger car vehicles, CalEEMod defaults for trip length and trip purpose were utilized. (DEIR, Appendix F, p. 56)

In the VMT analysis, the DEIR documents that the project's VMT per service population, i.e., the VMT per worker, is significantly higher than the average for the City of Ontario, and therefore, also significantly higher than the regional average. Therefore, the average auto trip lengths should be increased from the default values to account for the VMT-inefficient project location.

Underestimating truck and passenger vehicle VMT translates to underestimating GHG as well.

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

8

A-29

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

A-29
(CONT.)

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

9

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

Responses to Comment A

Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy dated October 5, 2023.

A-1 This comment consists of introductory remarks and identifies that the comments on the Draft EIR are being provided by Adams Broadwell Joseph & Cardozo on behalf of the Californians Allied for a Responsible Economy (CARECA) and provides a summary of the Project. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

A-2 This comment introduces the comment's supporting documents drafted by Norm Mashall, and asserts that the Draft EIR fails to fails to comply with the requirements of CEQA, adequately analyze the Project's cumulative impacts, proposed feasible and enforceable mitigation measures, underestimates potentially significant air quality, greenhouse gas (GHG) emissions, and energy impacts, fails to identify specific and effective mitigation measure to reduce the Project's significant Vehicle Miles Traveled (VMT) impacts, and underestimates VMT and GHG emissions. As described in the following responses, the commenter's assertions are incorrect. Refer to Response to Comments A-6 to A-28.

A-3 The comment includes a statement of interest describing CARECA's organization, role, members, and purposes. The statement of interest is noted. We note from this comment that the "coalition" is comprised of various labor unions, whose primary interest is securing jobs through a project labor agreement. Employment and business concerns raised in this comment do not raise any associated environmental issues and are therefore not within the purview of CEQA; however, this comment will be provided to the City's decision makers for their review and consideration of the Project as a whole. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

A-4 This comment interprets and provides a summary of CEQA requirements from the Guidelines and case law. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required. The comment incorrectly states that the Draft EIR does not satisfy CEQA's purpose to disclose significant environmental effects and avoid or reduce environmental impacts. This comment does not provide evidence that the Draft EIR does not meet the requirements of CEQA and thus no further response is required.

A-5 The commenter incorrectly asserts that the Draft EIR does not include an accurate and complete Project Description and summarizes CEQA requirements and case law related to describing a project. The comment generally criticizes the Draft EIR, is unsupported and does not identify any specific concerns or provide evidence that the Project Description is incomplete. The City agrees with the commenter that a Project Description must be "accurate, stable, and finite," which is exactly what is provided in the Draft EIR. Response to Comments A-6 through A-9, below, address specific comments related to the Project Description and demonstrate that the

Draft EIR includes an accurate and complete Project Description that adequately meets CEQA requirements.

A-6 The commenter first summarizes the trip generation assumptions used for the Project and provides a graph depicting trip generations rates for different warehouse categories. The commenter then asserts that the Draft EIR fails to address why other land use codes from the Institute of Transportation Engineers (ITE) Trip Generation Manual were inapplicable to the Project, that the land use code used for the Draft EIR underestimated the Project's GHG and VMT impacts, and that the Draft EIR should be revised by applying a significantly higher and more conservative trip generation rate, or requests as a condition of approval that trip generation will not exceed the number assumed in the Draft EIR.

Urban Crossroads, a firm of professional traffic consultants and transportation engineers, was the author of the Project's traffic study and the study was reviewed and independently accepted by the City for accuracy. Urban Crossroads considered a number of different ITE rates for various industrial land use categories, taking into consideration the proposed building size and orientation to determine an ITE rate that would be conservative, but realistic when considering potential future tenants. The Project is a proposed 270,377 square foot warehouse building that has been evaluated assuming 27,034 square feet of high-cube cold storage use (10% of the total square footage) and 243,303 square feet of warehousing use (90% of the total square footage).

The following land uses were considered but not evaluated as the descriptions did not fit the Project's description, size, or anticipated future tenant/use. The ITE General Light Industrial (ITE 110) land use category identifies an average of approximately 80,000 square feet or less for the sites surveyed and used to determine the weekday daily and peak hour of the adjacent street traffic trip generation rates. (Note: the peak hour of the adjacent street traffic refers to the traffic generated during the peak hours of 7-9 AM and 4-6 PM which are the peak commute periods.) Similarly, the ITE Manufacturing (ITE 140) land use category identifies an average of 130,000 to 200,000 square feet for the site surveyed and is used to determine the weekday daily and peak hour of the adjacent street traffic trip generation rates. The General Light Industrial and Manufacturing land use categories are not suitable for the Project as the average building square footage is much smaller than that being proposed for the Project at 230,377 square feet.

The High-Cube Fulfillment Center Warehouse land use category has two sub-categories in ITE: Non-Sort Facility and Sort Facility. The Non-Sort facilities are defined as those warehouses that ship large-boxed items and primarily use automation (as opposed to manual means). The Sort facilities are defined as those that ship out smaller goods/items, which require extensive sorting (manual means). The average size of the sites surveyed for the High-Cube Fulfillment Center Warehouse – Non-Sort land use category range between 780,000 to 820,000 square feet while the Sort land use category identifies an average square footage in excess of 1,300,000 square feet. In addition, the trip generation for the High-Cube Fulfillment Center Warehouse land use category is very low for truck trip generation, with the majority of trips being attributable to passenger cars/employee trips. The Project applicant is not proposing and

the Project's design would not support a high-cube (sort) fulfillment center or high-cube parcel hub user and the layout of the site with 251 parking spaces would not reasonably accommodate the on-site parking required to support these uses. The daily trip generation for these uses would range between 1,096 and 1,690 daily trips for the same 270,377 square feet of development, which is not feasible considering the design functionality of the site.

Although the Project's anticipated use and size most closely aligns with the ITE Warehousing land use category, a mix with the High-Cube Cold Storage Warehouse rate was selected because the overall daily trip rate would be more conservative (higher) as compared to the ITE Warehousing rate and would account for refrigerated vehicles for the purposes of other technical studies (air quality, health risk assessment, greenhouse gas, etc.) in the event that up to 10% of the building was used for a cold storage purpose. The Project (warehousing use) evaluates the trip generation based on a mix of the Warehousing (ITE 150) and High-Cube Cold Storage (ITE 157) rates which is a reasonable and conservative representation of the mix of potential uses for the Project. Thus, the City's experts disagree with the commenter. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

A-7 The commenter asserts that the Draft EIR's assumption for 10% of high-cube cold storage uses is subject to fluctuate during the life of the Project and is not otherwise reflected in any enforceable conditions related to Project use. The commenter further asserts that the Draft EIR would need to include binding measures or conditions which limit warehouse use at the Project to no more than 10% cold storage. In response to this comment, the City has added a condition of approval to the Project to limit cold storage use to no more than 27,034 square feet or a comparable amount of cold storage square footage that produces no greater adverse environmental effects than those disclosed in the EIR unless further studied under CEQA. If more than 27,034 square feet of cold storage square footage is proposed and analyzed and would produce greater adverse environmental effects than those disclosed in the EIR, an amendment to the Project approvals would be required, which would be subject to additional CEQA review.

A-8 The commenter states that cold storage warehouse generates greater environmental impacts than a high cube warehouse and opines that the Draft EIR may have underestimated the Project's air quality and GHG impacts by assuming that only 10% of the building space could include high-cube cold storage uses. As stated in Section 3.0, *Project Description*, of the Draft EIR, because the user(s) is speculative and some building users require small amounts of warehouse space to be temperature controlled, for purposes of analysis within the Draft EIR it is reasonably assumed that the building would include approximately 27,034 s.f. of high-cube cold storage uses (approximately 10% of the building space), with remaining portions of the building consisting of warehouse uses. This reasonable estimate is based on the Project Applicant's understanding of the cold storage space market demand in the Inland Empire for buildings in the Project's size range, which tend to have small cold storage needs for perishable products such as nutritional supplements, flowers and plants, medicines, candles, cosmetics, organic textiles, and specialized products, should the building user need to store these types of

products. (Refer to Draft EIR p. 3-13) Thus, no additions, revisions, or corrections to the Draft EIR are necessary and no further response is required. Regardless, in response to this comment, the City has added a condition of approval to the Project to limit cold storage use to no more than 27,034 square feet or a comparable amount of cold storage square footage that produces no greater adverse environmental effects than those disclosed in the EIR.

A-9 The commenter states a recommendation from the California Attorney General's guidance for warehouse projects that, unless a developer adopts mitigation measures limiting cold storage impacts, the developer should record a covenant on the title of the underlying property to ensuring that the property cannot be used to provide refrigerated warehouse space. The commenter further states that the City should include such a title restriction for the Project unless the Draft EIR's 10% cold storage assumption is revised to analyze and mitigate impacts associated with a more conservative and fact-based cold-storage use percentage. In response to this comment, the City has added a condition of approval to the Project to limit cold storage use to no more than 27,034 square feet or a comparable amount of cold storage square footage that produces no greater adverse environmental effects than those disclosed in the EIR.

A-10 The commenter asserts that the Draft EIR fails to disclose potential backup/emergency stationary generator use for the Project operations. The commenter cites *East Oakland Stadium Alliance v. City of Oakland* for the proposition that "if the annual need for emergency generator use is reasonably foreseeable, the EIR was not entitled to disregard such use merely because it would occur at unpredictable times" and further states that back-up generators are a reasonably foreseeable consequence of the Project due to increasingly common Public Safety Power Shutoff (PSPS) events and extreme heat events that had been occurring in 2019 in the Bay area and Los Angeles County. The commenter further states the omission of a generator system results in an underestimation of the Project's air quality, greenhouse gas, and health risk impacts.

According to the latest data from the California Public Safety Power Shutoff Interactive Map, the census tract containing the Project Site (Census Tract 6071012700) is not subjected to PSPS events with a zero frequency of PSPS outages annually.[1] However, in an event that emergency generators are used for Project operations, the generators would only be used in emergency power failure or for routine testing and maintenance. Such intermittent use would not result in a substantial or measurable amount of emissions, since by the very nature of the activity, it would be short-term, intermittent, and infrequent. Assuming the Project would utilize a 197 horsepower (hp) diesel-powered emergency water pump and a 762 hp diesel-powered emergency backup generator, calculations were performed by Urban Crossroads. For analytical purposes, it is anticipated that the fire pump and emergency generator would each operate for a maximum time of 0.5 hour per day and 26 hours per year for maintenance and testing purposes. As shown in the table below, if the Project operations would require the use of an emergency water pump and generator, emissions would be negligible and less than South Coast

[1] https://www.psehealthyenergy.org/our-work/interactive-tools/california-public-safety-power-shutoff-interactive-map/#frequency

Air Quality Management District (SCAQMD) regional thresholds. Therefore, the Draft EIR adequately estimates the Project's air quality, greenhouse gas, and health risk impacts and the City's experts disagree with the commenter. No revisions to the Draft EIR is required.

Emergency Water Pump and Backup Generator Emissions	Emissions (lbs/day)					
	VOC	NO_X	CO	SOx	PM_{10}	$PM_{2.5}$
Maximum Daily Emissions	0.79	3.25	2.00	0.00	0.11	0.11
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

Source: Urban Crossroads, December 20, 2023.

A-11 The commenter states the requirements from CEQA Guidelines Section 15064(b) and case laws regarding agencies committing to all feasible mitigation measures to reduce significant environmental impacts. The comment incorrectly states that the Draft EIR fails to disclose, analyze, and mitigate significant environmental effects. This comment does not provide evidence that the Draft EIR does not meet the requirements of CEQA. As described in the following responses, the commenter's assertion is incorrect. Refer to Response to Comment A-12 to A-20. Thus, no further response is required.

A-12 The commenter states the requirements from CEQA Guidelines Sections 15130(a), 15065(a)(3), and 15355(b) regarding cumulative impacts and the importance of a proper cumulative impacts analysis. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

A-13 The commenter first states the requirements from CEQA Guidelines Sections 15130(b) regarding methods for satisfying the cumulative impacts analysis requirement. The commenter then cites part of Section 4.1.2, *Scope Of Cumulative Effects Analysis*, in the Draft EIR and further asserts that the Draft EIR fails to provide a list of cumulative projects and that the Draft EIR's air quality, greenhouse gas, and noise analyses should be revised to include consideration of cumulative projects. The Draft EIR relies on a summary of projections approach. Text stating that a combined approach was used for the evaluation of transportation, air quality, GHG, and noise impacts has been stricken in the Final EIR. This minor clarification of the approach in Section 4.1.2 of the Draft EIR does not change any of the analysis methodologies or conclusions drawn in the Draft EIR or its supporting technical studies and recirculation of the Draft EIR is not required pursuant to State CEQA Guidelines Section 15088.5.

A-14 The commenter asserts that the Draft EIR fails to adequately analyze the Project's cumulative air quality emissions, claiming that the South Coast Air Quality Management District (SCAQMD)'s approach is outdated. Commenter is advised that the SCAQMD is the regulatory authority on air quality charged with the responsibility of ensuring the improvement of air quality in the South Coast Air Basin. The SCAQMD's published approach for the analysis of cumulative air quality effects is reliable and has in fact "worked" to improve air quality as shown in the air quality improvement trend discussion included in Draft EIR Section 4.2.1.E,

"Regional Air Quality Improvement." Further, the SCAQMD has adopted and is enforcing Rule 2305 (Warehouse Indirect Source Rule) (DEIR p. 4.2-20) that requires all operators of warehouses having 100,000 square feet of indoor floor space or more to implement measures that reduce nitrogen oxides and particulate matter emissions and/or pay a fee to fund programs to improve regional air quality.

The Draft EIR and underlying technical studies were prepared in a matter consistent to the SCAQMD recommendation for determining cumulative impacts. The SCAQMD published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution.* In this report SCAQMD states (Page D-3):

> "…the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for toxic air contaminant (TAC) emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.
>
> Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

Based on the Draft EIR and underlying technical studies the Project does not result in a cumulatively considerable impact with respect to air quality or greenhouse gas emissions. The City's experts disagree with the commenter and no revisions to the Draft EIR are required.

A-15 The commenter further asserts that the SCAQMD's approach used in the Draft EIR also directly conflicts with the Attorney's General recent guidance document setting forth best practices for evaluating the environmental impacts of warehouse projects like this one under CEQA. Refer to Response to Comment A-14 above regarding the Project's methodology in determining cumulative air quality impacts, which follows SCAQMD directives. The City's experts disagree with the commenter and no further response is required.

A-16 The commenter asserts that the Draft EIR's analysis of cumulative health risks is flawed for the same reason as the air quality analysis and that Draft EIR's approach of using a project-level analysis as a substitute for a cumulative impacts analysis fails to address that the Project would be impacting a community already bearing a high pollution burden. Contrary to the

commenter's assertions, the Project site is primarily surrounded by industrial uses. The residential land use with the greatest potential exposure to Project operational source emissions is located approximately 8,840 feet (1.67 miles) northwest of the Project site on the opposite side of I-15 and I-10. The nearest school is located 11,200 feet (2.12 miles) away from the Project site. The commenter provides no evidence to support its claim that the Project, which is converting an already developed industrial site in an industrial area of the City, to a contemporary industrial use, would in any way have a significant adverse effect to sensitive receptors located more than 1.6 away from the Project site. Refer to Response to Comment A-14 above regarding the Project's methodology in determining cumulative air quality impacts. Thus, the City's experts disagree with the commenter and no further response is required.

A-17 The commenter incorrectly asserts that the Project's operational health risk assessment is flawed because it omits analysis of Transportation Refrigeration Units (TRUs). The TRU emission assumptions used in the Project's Air Quality Impact Analysis (*Technical Appendix B1* to the Draft EIR) are the same assumptions used in the Project's Health Risk Assessment (*Technical Appendix B2* to the Draft EIR) as shown in *Technical Appendix B2* Table 2-4, *DPM Emissions From Project Trucks (2024 Analysis Year)*, under the daily truck emissions column. Therefore, the Draft EIR adequately estimates the Project's operational health risk impacts, which includes the analysis of TRUs and the City's experts disagree with the commenter. No revisions to the Draft EIR are required.

A-18 The commenter states that there is a potential underestimation of emissions due to imprecise assumptions for truck trip lengths and trip rates in emissions analysis and that the analysis understated the travel distance for trucks traveling from the ports to the Project Site and should apply a more conservative trip length of 60 miles for Port-related trips. The commenter fails to provide any evidentiary basis for the arbitrary number of 60 miles it suggests using. In fact, these recommendations are in direct opposition of the SCAQMD's recommended truck travel distance for warehousing projects within its jurisdiction (based on SCAG regional travel demand data).

As noted in the Project's Air Quality Impact Analysis (*Technical Appendix B1* to the Draft EIR), the air quality analysis utilized the average trip length for light-heavy (15.3-miles), medium-heavy (14.2-miles) and heavy-heavy trucks (39.9-miles) which is based on SCAQMD's recommendations outlined in their implementation of the Warehouse Actions and Investments to Reduce Emissions (WAIRE) adopted in 2021. The 30.58- and 28.62-mile trip lengths were derived by weighting the average trip lengths using traffic trip percentages. The commenter's recommended trip lengths are not supported by any substantial evidence provided by the SCAQMD and contradicts published material from SCAQMD that was utilized in the underlying analysis. The City's experts disagree with the commenter. Thus, no additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

A-19 The commenter asserts that the Draft EIR underestimates lengths of passenger trips generated by the Project. The commenter appears to conflate the VMT per worker metric with the trip lengths that were utilized in the underlying AQ/GHG modeling. The commenter is reminded

that the VMT per worker metric is not a trip length and only represents a portion of the trip length assigned to the worker trips. As such, use of CalEEMod for worker trip lengths is appropriate and the City's experts disagree with the commenter. No additions, revisions, or corrections to the Draft EIR are necessary.

A-20 The commenter summarizes the Project's significant and unavoidable VMT impacts and asserts that mitigation measure MM 4.10-1 fails to meet CEQA's standard for mitigation. This comment is thoroughly addressed below in Response to Comments A-24 through A-26. As described in the following responses, the commenter's assertion is incorrect. Thus, no further response is required.

A-21 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

A-22 This comment consists of introductory remarks and summarize the findings of the commenter stating that the Draft EIR acknowledges a significant and unavoidable VMT impact, the commenter's assertion that the proposed VMT mitigation measure is not fully specified or quantified, and the Project's trip generation and GHG emissions could be much higher than assumed. As described in previous and following responses, the commenter's assertions are incorrect. Refer to Response to Comments A-6 to A-28. Thus, no further response is required.

A-23 This comment provides a general summary of the Project's significant and unavoidable VMT impact as provided in the Draft EIR. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

A-24 The commenter states the City's VMT Resolution, which reiterates Policy M-1.2 under the TOP 2050 to require development to mitigate its traffic impacts and summarizes the Project's VMT impacts and mitigation measure MM 4.10-1. The commenter then asserts that the language used in mitigation measure MM 4.10-1 is ambiguous and questions which measures will be implemented. In response to the commenter's assertions, a supplemental VMT mitigation assessment has been prepared for the Project to evaluate further potential trip reduction measures under the California Air Pollution Control Officers Association (CAPCOA)'s Handbook (*Attachment B to this Final EIR*). As stated under the supplemental VMT mitigation assessment, when considering which transportation measures are applicable from the Handbook, factors such as project type, scale and locational context are each important considerations for determining measure applicability. Based on these factors, measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant. However, the proposed Project does have the ability to provide design features that would promote non-motorized transportation alternatives such as measure T-10 End-of-Trip Bicycle Facilities. The Project is required to include building elements for bicycle trip end facilities (i.e., parking) for commuters that choose to bicycle as a mode of travel. This will promote an alternative mode choice of commuting for

employees. As calculated, the Project will reduce VMT by 0.1%. As discussed in Section 4.10, *Transportation*, of the Draft EIR, the Project was found to exceed the City's adopted VMT impact threshold by 22.6% under baseline conditions, while the horizon year buildout condition would exceed the impact threshold by 28.5% (refer to Draft EIR pp. 4.10-11 to 4.10-14) Therefore, with the inclusion of feasible VMT reduction measures, the Project is not able to reduce project generated VMT to a level of less than significant.

A-25 The commenter states that the difference between voluntary and mandatory Commuter Trip Reduction ("CTR") programs listed under the CAPCOA's Handbook and the Project site's existing transit and bicycle facilities setting as stated under the Draft EIR. Refer to Response to Comment A-24 regarding the feasibility of measures under the CAPCOA's Handbook. Thus, no further response is required.

A-26 The commenter states that the benefits for ridesharing and vanpooling to VMT reductions and that achieving significant VMT mitigation for this Project may be impossible – but mitigation must be fully specified and quantified for the Project to be properly evaluated. Refer to Response to Comment A-24 regarding the feasibility of measures under the CAPCOA's Handbook and the Project's supplemental VMT mitigation assessment (*Attachment B* to this Final EIR) for the quantification of reduction for the potential measures. Thus, no further response is required.

A-27 The commenter summarizes the trip generation assumptions used in the Draft EIR and provides a graph depicting trip generations rates for different warehouse categories. The commenter then asserts that that the Draft EIR should be revised by applying a significantly higher and more conservative trip generation rate, or requests as a condition of approval that trip generation will not exceed the number assumed in the Draft EIR. Refer to Response to Comment A-6 regarding the applicability of different ITE land use codes to the Project. The most appropriate and reasonable ITE land use codes were applied in the Project's analyses. It would not be necessary or appropriate, nor does the City have the capacity to enforce the counting of vehicles traveling to and from the Project site, nor would any environmental improvements be achieved from such an exercise. Further, the SCAQMD has adopted and is enforcing Rule 2305 (Warehouse Indirect Source Rule) (refer to Draft EIR p. 4.2-20) that will require the warehouse operator to implement measures that reduce nitrogen oxides and particulate matter emissions and/or pay a fee to fund programs to improve regional air quality. Thus, no further response is required.

A-28 The comment states that there is a potential underestimation of GHG emissions due to underestimation of trip generation and truck trip distance. Refer to Response to Comments A-18 and A-19 regarding the Project's truck trip lengths and passenger trips. The City's experts disagree, and thus, no further response is required.

A-29 This comment provides the resume of Mr. Marshall. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

VIA EMAIL TO:
TGrahn@ontarioca.gov

SUBJECT: COMMENTS ON 5355 EAST AIRPORT DRIVE EIR (SCH NO. 2022090006)

Dear Mr. Grahn,

Thank you for the opportunity to comment on the Environmental Impact Report (EIR) for the proposed 5355 East Airport Drive Project. Please accept and consider these comments on behalf of Golden State Environmental Justice Alliance. Also, Golden State Environmental Justice Alliance formally requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. B-1

1.0 Summary

The project proposes to demolish all existing onsite structures to accommodate the construction and operation of a warehouse building with approximately 270,337 square feet (s.f.) of building floor area, including 255,337 s.f. of warehouse area and 15,000 s.f. of mezzanine area on an approximately 13 acre site. For purposes of environmental analysis within the EIR, it is assumed that the building would include approximately 27,034 s.f. of high-cube cold storage uses (10% of the building space) and the remainder of the building area would be used for dry, non-refrigerated warehousing. B-2

1.2 Project Piecemealing

The EIR does not accurately or adequately describe the project, meaning "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment" (CEQA § 15378). The proposed project is a piecemealed portion of a larger overall project to be developed within the B-3

City by the project applicant, Prologis, including at least one other known project identified as PDEV22-010 & PMTT22-008: East State Street Warehouse Project[1] (336,761 square foot warehouse). The MND for PDEV22-010 was published on December 22, 2022. The Notice of Preparation for the proposed project's EIR was published on September 1, 2022. This indicates that the Lead Agency was aware of both projects and processed them simultaneously but separately under CEQA.

B-3 (CONT.)

CEQA Section 15161 describes project EIRs as examining "the environmental impacts of a specific development project. This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project including planning, construction, and operation." The specific development project is the construction and operation of all Prologis buildings as a whole, including at minimum PDEV22-010 & PMTT22-008: East State Street Warehouse Project.

Additionally, CEQA Section 15146 requires that the degree of specificity in an EIR "will correspond to the degree of specificity involved in the underlying activity which is described in the EIR. (a) An EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the effects of the construction can be predicted with greater accuracy." Because there are at least two developments as part of a single construction project, the project EIR must be more detailed in the specific effects of the project.

A project EIR must be prepared that accurately represents the whole of the action without piecemealing the project into separate, smaller development projects to present unduly low environmental impacts. CEQA Section 15161 describes project EIRs as examining "the environmental impacts of a specific development project. This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project including planning, construction, and operation." The specific development project is the construction and operation of both the proposed project and PDEV22-010. Additionally, CEQA Section 15146 requires that the degree of specificity in an EIR "will correspond to the degree of specificity involved in the underlying activity which is described in the EIR. (a) An EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the effects of the construction can be predicted with greater accuracy." Because there are two proposed buildings as part of a single construction project, the project EIR must be more detailed in the specific effects of the project. The EIR must be revised to comply

B-4

[1] https://ceqanet.opr.ca.gov/2022120581

with CEQA § 15161 by preparing a Project EIR to adequately and accurately disclose the project-specific and cumulative impacts of all Prologis projects.

B-4 (CONT.)

3.0 Project Description

The EIR provides misleading information regarding project grading. The EIR states that "Based on the Project's preliminary grading plan depicted in Figure 3-8, Proposed Grading Plan - West, and Figure 3-9, Proposed Grading Plan – East, the Project's grading operation *would result in 9,000 more cubic yards of cut than fill*, but final earthwork quantities are subject to final civil engineering design and after final engineering, *the earthwork is expected to balance with no import or export of earth material required*." The EIR has provided evidence that 9,000 cy of export is required and simultaneously provides an unsupported claim that the earthwork will balance onsite, pending calculations to be provided after the CEQA public review process. There is no method for the public to verify the claim that the earthwork will balance onsite. Verification of the import/export materials is vital as it directly informs the quantity of necessary truck hauling trips due to soil import/export during the grading phase of construction. A revised EIR must be prepared to remove the misleading statement that earthwork will balance onsite due to Figure 3-8 and Figure 3-9 depicting 9,000 cy of exported material is required to construct the proposed project and ensure that all portions of environmental analysis utilize the fact that 9,000 cy of export is required.

B-5

4.2 Air Quality, 4.4 Energy, and 4.6 Greenhouse Gas Emissions

Please refer to attachments from SWAPE for a complete technical commentary and analysis.

B-6

The EIR does not include meaningful analysis of relevant environmental justice issues in reviewing potential impacts, including cumulative impacts from the proposed project. This is especially significant as the surrounding community is highly burdened by pollution. According to CalEnviroScreen 4.0[2], CalEPA's screening tool that ranks each census tract in the state for pollution and socioeconomic vulnerability, the proposed project's census tract (6071012700) is highly burdened by pollution. The EIR includes a summary of Calenviroscreen rankings and states that the proposed project is a Disadvantaged Community, but does not utilize this information meaningfully in its analysis. The surrounding community bears the impact of multiple sources of pollution and is more polluted than other census tracts in many pollution indicators measured by CalEnviroScreen. For example, the project census tract ranks in the 91st percentile for ozone burden, 96th percentile for particulate matter (PM) 2.5 burden, 97th percentile for diesel PM burden, and 89th percentile for traffic burdens. All of these environmental factors are attributed

B-7

[2] CalEnviroScreen 4.0 https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40

to heavy truck activity in the area. Ozone can cause lung irritation, inflammation, and worsening of existing chronic health conditions, even at low levels of exposure[3]. Exhaust fumes contain toxic chemicals that can damage DNA, cause cancer, make breathing difficult, and cause low weight and premature births[4]. The very small particles of diesel PM can reach deep into the lung, where they can contribute to a range of health problems. These include irritation to the eyes, throat and nose, heart and lung disease, and lung cancer[5].

The census tract also ranks in the 70th percentile for solid waste facility impacts and 79th percentile for hazardous waste facility impacts. Solid waste facilities can expose people to hazardous chemicals, release toxic gases into the air (even after these facilites are closed), and chemicals can leach into soil around the facility and pose a health risk to nearby populations[6]. Hazardous waste generators and facilities contribute to the contamination of air, water and soil near waste generators and facilities can harm the environment as well as people[7].

B-7
(CONT.)

The census tract ranks in the 93rd percentile for contaminated drinking water. Poor communities are exposed to contaminants in their drinking water more often than people in other parts of the state[8]. The census tract ranks in the 79th percentile for toxic releases. People living near facilities that emit toxic releases may breathe contaminated air regularly or if contaminants are released during an accident[9].

Further, the census tract is a diverse community including 60% Hispanic, 5% African-American, and 6% Asian-American residents, whom are especially vulnerable to the impacts of pollution. The community has a high rate of low educational attainment, meaning 40% of the census tract over age 25 has not attained a high school diploma, which is an indication that they may lack health insurance or access to medical care. Medical care is vital for this census tract as it ranks in the 67th percentile for incidence of cardiovascular disease and 47th percentile for incidence of asthma.

Additionally, the project's census tract (6071012700) and the census tracts adjacent to the project site (6071002204 (east), 6071002207 (north), 6065040607 (south), and 6071001600 (west)) are identified as SB 535 Disadvantaged Communities[10], which is not meaningfully discussed or presented for analysis in the EIR. This indicates that cumulative impacts of development and environmental impacts in the City and surrounding area are disproportionately impacting these communities. The EIR provides a brief statement that the project site is located in a Disadvantaged Community. However, it does not utilize this information in its analysis. The negative environmental, health, and quality of life impacts of industrial development in the City have become distinctly inequitable. The severity of environmental impacts particularly on these Disadvantaged Communities must be included for analysis as part of a revised EIR.

B-7 (CONT.)

California's Building Energy Code Compliance Software (CBECC) is the State's only approved energy compliance modeling software for non-residential buildings in compliance with Title 24[11]. CalEEMod is not listed as an approved software. The CalEEMod modeling does not comply with the 2022 Building Energy Efficiency Standards and under-reports the project's significant Energy impacts and fuel consumption to the public and decision makers. Since the EIR did not accurately or adequately model the energy impacts in compliance with Title 24, a finding of significance must be made. A revised EIR with modeling using the approved software (CBECC) must be circulated for public review in order to adequately analyze the project's significant environmental impacts. This is vital as the EIR utilizes CalEEMod as a source in its methodology and analysis, which is clearly not the approved software.

B-8

4.10 Transportation

Table 5: Trip Generation Comparison within Appendix K: Trip Generation Assessment provides trip generation reduction credits for existing uses. Notably, the Trip Counts were taken on March 1, 2, and 3, 2022, six months prior to the issuance of the NOP for the EIR on September 1, 2022. Utilizing trip counts prior to the date established and utilized for the Environmental Setting does not provide the most accurate picture practically possible of the project's impacts pursuant to CEQA Section 15125. Prologis acquired the project site in approximately 2016. Knowing that redevelopment was imminent, the project applicant requested vehicle trip counts be recorded at the project site very early on in the process (March 2022) in order to create artificially inflated trip reduction credits that do not match the Environmental Setting. By April 2023, tenant Verhoeven

B-9

[10] OEHHA SB 535 Census Tracts https://oehha.ca.gov/calenviroscreen/sb535
[11] California Energy Commission 2022 Energy Code Compliance Software https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency-1

Grain filed with the Secretary of State that their principal business address had moved to Hanford, CA[12]. Notably this filling aligned with the company's required annual reporting date and it is highly likely that the date of the company closing operations at the proposed project site aligns with September 2022, rendering the Environmental Setting within the EIR inaccurate. The existing conditions of the site in September 2022 likely generated significantly lower VMT and significantly lower vehicle trips due to the existing site conditions.

Utilizing traffic counts that pre-date the physical conditions at the site in September 2022 serves to artificially reduce the project's significant environmental impacts by observing the businesses onsite as fully operational. The EIR has not provided meaningful evidence, such as business license records to demonstrate that the buildings onsite were occupied and operational at that time. The EIR must be revised to clarify the Environmental Setting and remove trip reduction credits given for traffic counts that pre-date the physical conditions at the site in September 2022.

B-9 (CONT.)

The EIR has not adequately analyzed the project's potential to substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses; or the project's potential to result in inadequate emergency access. There are no exhibits adequately depicting the onsite turning radius available for trucks maneuvering throughout the site. Notably, the truck/trailer parking stalls and an outdoor storage area are adjacent to the south of truck/trailer loading docks on the building. These parking stalls and outdoor storage area may be in use at any time and further restrict truck/trailer movement on the site. The EIR also states that, "The City of Ontario Engineering Department reviewed the Project's application materials and determined that no hazardous transportation design features would be introduced within the City public right-of-way through implementation of the Project." However, the City's determination/review of the project is not included for public review. This does not comply with CEQA's requirements for adequate informational documents and meaningful disclosure (CEQA § 15121 and 21003(b)). Incorporation by reference (CEQA § 15150 (f)) is not appropriate as the City's determination/review of the project contribute directly to analysis of the problem at hand. A revised EIR must be prepared to include the City's determination/review of the project for review, analysis, and comment by the public and decision makers.

B-10

The EIR also states that, "at the time of final grading, landscape, and street improvement plans, the City will review project access points to ensure adequate sight distance," which is deferred mitigation to after the CEQA public review process. Deferring this environmental analysis required by CEQA to the construction permitting phase is improper mitigation, deferred

B-11

[12] Verhoeven Grain Statement of Information April 2023
https://bizfileonline.sos.ca.gov/api/report/GetImageByNum/181123177111106114109212172063229254105192147110

mitigation, and does not comply with CEQA's requirement for meaningful disclosure and adequate informational documents. A revised EIR must be prepared to include a finding of significance due to these significant and unavoidable impacts.

B-11 (CONT.)

Table 4.10-4: SCAG's Connect SoCal Goal Consistency Analysis provides a misleading and erroneous consistency analysis with SCAG's 2020-2045 Connect SoCal RTP/SCS. Due to errors in modeling, modeling without supporting evidence (as noted throughout this comment letter and attachments), and the EIR's conclusion the project will result in significant and unavoidable impacts to Transportation (VMT), the proposed project is directly inconsistent with Goal 5 to reduce greenhouse gas emissions and improve air quality, Goal 6 to support healthy and equitable communities, and Goal 7 to adapt to a changing climate. The EIR must be revised to include a finding of significance due to these direct inconsistencies with SCAG's 2020-2045 Connect SoCal RTP/SCS.

B-12

5.2 Significant Irreversible Environmental Changes Which Would Be Caused By The Project Should It Be Implemented and 5.3 Growth Inducing Impacts

The EIR relies upon erroneous Energy modeling to determine that the project will meet sustainability requirements. As noted above, the EIR did not model the project's energy consumption in compliance with Title 24 modeling software. Further, the EIR states here that "the Project is required by law to comply with the California Building Standards Code which would minimize the Project's demand for nonrenewable resources," which is not relevant to the proposed project and its own contribution to significant irreversible environmental changes. The EIR must be revised to include a finding of significance due to an inaccurate and erroneous analysis regarding the project's Air Quality, Greenhouse Gas, and Energy impacts.

B-13

The EIR does not discuss the project's significant and unavoidable Transportation (VMT) impacts and thus the project's inability to comply with SB 743, which was adopted with legislative intent of SB 743 to reduce greenhouse gas emissions by reducing VMT. The EIR must be revised to include a finding of significance due to the project's significant and unavoidable Transportation (VMT) impacts and direct contribution to climate change.

B-14

The EIR utilizes uncertain and misleading language to support its conclusion that the project will not have growth inducing impacts. The EIR states that "it is *anticipated* that most of the Project's future employees would already be living in the City of Ontario *or the larger Inland Empire area*, the Project's introduction of employment opportunities on the Project Site would not induce substantial growth in the area." The proposed project will rely on the entire labor force within the

B-15

Inland Empire region to fill the project's construction and operational jobs will increase VMT and emissions during all phases of construction and operations and a revised EIR must be prepared to account for longer worker trip distances.

B-15 (CONT.)

The EIR has not provided an adequate or accurate cumulative analysis discussion here to demonstrate the impact of the proposed project in a cumulative setting. For example, the proposed project's 270,337 square feet and piecemealed project PDEV22-010 (336,761 square feet) totals 607,098 square feet, representing 0.33% of the General Plan buildout for this land use designation, which is significant to be attributed to only two recent projects. Further, other recent industrial projects such as PDEV21-003[13] (23,100 square foot industrial building), PDEV21-007[14] (808,639 sf of industrial buildings), PDEV21-010[15] (1,438,926 sf industrial building), PDEV21-016[16] (38,445 sf industrial building), PDEV21-018[17] (168,772 sf of industrial buildings), PDEV21-020[18] (50,121 sf industrial building), PDEV21-024[19] (198,496 sf industrial building), PDEV21-026[20] (45,000 sf industrial building), PDEV21-028[21] (32,425 sf industrial building), PDEV21-029[22] (15,132 sf industrial building), PDEV21-030[23] (175,047 sf industrial building), PDEV21-031[24] (38,155 sf industrial building), PDEV21-034[25] (32,000 sf industrial building), PDEV21-035[26]

(60,455 sf industrial building), PDEV21-040[27] (1,255,320 sf industrial building), PDEV21-047[28] (4,281,128 sf industrial building), PDEV21-037[29] (167,600 sf industrial building), PDEV22-010 & PMTT22-008: East State Street Warehouse Project[30] (336,761 square foot warehouse), and South Ontario Logistics Center Specific Plan[31] (5,333,518 sf industrial space) combined with the proposed project will cumulatively generate 14,769,377 sf of industrial space, which is approximately 8% of General Plan buildout. The EIR has not demonstrated that the proposed project is within the General Plan buildout scenario, including all cumulative development constructed, approved projects not yet constructed, and "projects in the pipeline." A revised EIR must be prepared to include this analysis in order to provide an adequate and accurate environmental analysis.

B-16 (CONT.)

5.4 Effects Found Not To Be Significant During The EIR Scoping Process
5.4.3 Land Use and Planning

The EIR does not provide a consistency analysis with all land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. The project has significant potential to conflict with many of these items, including but not limited to the following from the General Plan:

1. Policy ER4-1 Land Use. We reduce GHG and other local pollutant emissions through compact, mixed use, and transit-oriented development and development that improves the regional jobs-housing balance.

2. Policy ER4-6 Particulate Matter. We support efforts to reduce particulate matter to meet State and Federal Clean Air Standards.

3. Policy CE2-4 Protection of Investment. We require that new development and redevelopment protect existing investment by providing architecture and urban design of equal or greater quality.

[31] https://ceqanet.opr.ca.gov/Project/2021010318

4. Policy CE3-1 Fiscal Impact Disclosure. We require requests for City Council action to disclose the full fiscal impacts, including direct and indirect costs.

5. Policy M1-1. Roadways maintain a peak hour Level of Service (LOS) E or better at all intersections.

6. Policy M1-5 Level of Service. Maintain a peak hour Level of Service (LOS) E or better at all intersections. Maintain Level of Service D or better on arterial streets in the City.

7. Policy CD-2.8 Safe Design. We incorporate defensible space design into new and existing developments to ensure the maximum safe travel and visibility on pathways, corridors, and open space and at building entrances and parking areas by avoiding physically and visually isolated spaces, maintaining visibility and accessibility, and using lighting.

8. Policy CD-2.10 Parking Areas. We require all development, including single-family residential, to minimize the visual impact of surface, structured, and garage parking areas visible from the public realm in an aesthetically pleasing, safe and environmentally sensitive manner.

9. Goal CE-1. A complete community that provides for all incomes and stages of life.

10. Policy CE-1.2 Jobs and Workforce Skills. We use our economic development resources to: 1. attract jobs suited for the skills and education of current and future City residents.

11. Policy CE-2.1 Development Projects. We require new development and redevelopment to create unique, high-quality places that add value to the community.

12. Policy CE-2.2 Development Review. We require those proposing new development and redevelopment to demonstrate how their projects will create appropriately unique, functional, and sustainable places that will compete well with their competition within the region.

13. Policy CE-2.4 Protection of Investment. We require that new development and redevelopment protect existing investment by providing architecture and urban design of equal or greater quality.

14. Policy M-1.6 Reduce Vehicle Miles Traveled. We will strive to reduce VMT through a combination of land use, transportation projects, travel demand management strategies, and other trip reduction measures in coordination with development projects and public capital improvement projects.

B-17
(CONT.)

Several project components, including the outdoor storage area fronting Airport Drive in Figure 3-4: Proposed Site Plan and the EIR's determination that the project will result in significant and unavoidable Transportation (VMT) impacts are directly inconsistent with goals and policies listed above and a finding of significance must be made in a revised EIR.

B-17 (CONT.)

The EIR has not provided any information or analysis on the buildout conditions of the General Plan. Table LU-03 Future Buildout Table of the General Plan[32] states that the Industrial land use designation will have a buildout of 183,596,786 total square feet. The proposed project's 270,337 square feet and piecemealed project PDEV22-010 (336,761 square feet) totals 607,098 square feet, representing 0.33% of the General Plan buildout for this land use designation, which is significant to be attributed to only two recent projects. Further, other recent industrial projects such as PDEV21-003[33] (23,100 square foot industrial building), PDEV21-007[34] (808,639 sf of industrial buildings), PDEV21-010[35] (1,438,926 sf industrial building), PDEV21-016[36] (38,445 sf industrial building), PDEV21-018[37] (168,772 sf of industrial buildings), PDEV21-020[38] (50,121 sf industrial building), PDEV21-024[39] (198,496 sf industrial building), PDEV21-026[40] (45,000 sf industrial building), PDEV21-028[41] (32,425 sf industrial building), PDEV21-029[42] (15,132 sf industrial

building), PDEV21-030[43] (175,047 sf industrial building), PDEV21-031[44] (38,155 sf industrial building), PDEV21-034[45] (32,000 sf industrial building), PDEV21-035[46] (60,455 sf industrial building), PDEV21-040[47] (1,255,320 sf industrial building), PDEV21-047[48] (4,281,128 sf industrial building), PDEV21-037[49] (167,600 sf industrial building), PDEV22-010 & PMTT22-008: East State Street Warehouse Project[50] (336,761 square foot warehouse), and South Ontario Logistics Center Specific Plan[51] (5,333,518 sf industrial space) combined with the proposed project will cumulatively generate 14,769,377 sf of industrial space, which is approximately 8% of General Plan buildout. The EIR has not demonstrated that the proposed project is within the General Plan buildout scenario, including all cumulative development constructed, approved projects not yet constructed, and "projects in the pipeline." A revised EIR must be prepared to include this analysis in order to provide an adequate and accurate environmental analysis.

B-18 (CONT.)

5.4.5 Population and Housing

The EIR utilizes uncertain and misleading language which does not provide any meaningful analysis of the project's impacts to population and employment generation. The EIR relies upon the 3,200 unemployed persons within Ontario to fill all of its jobs without providing any discussion of the City's unemployed population in terms of qualification for and/or interest in work in the industrial sector. A construction worker employment analysis must also be included to adequately and accurately analyze all potentially significant environmental impacts. In order to comply with CEQA's requirements for meaningful disclosure, a revised EIR must be prepared to provide an accurate estimate of employees generated by all uses of the proposed project. It must also provide demographic and geographic information on the location of qualified workers to fill these positions.

Page 13

SCAG's 2020-2045 RTP/SCS Connect SoCal Demographics and Growth Forecast[52] notes that Ontario will add 55,400 jobs between 2016 - 2045. The EIR utilizes uncertain and misleading language in stating generally that SCAG anticipates Ontario to employ approximately 169,300 people by 2045, and "therefore the project generated jobs are well within the employment projections for the City." The EIR does not provide any cumulative analysis discussion of projects approved since 2016 and projects "in the pipeline" to determine if the project will exceed the employment/population growth forecasts by SCAG and/or the General Plan. For example, other recent industrial projects such as PDEV21-003[53] (23,100 square foot industrial building), PDEV21-007[54] (808,639 sf of industrial buildings), PDEV21-010[55] (1,438,926 sf industrial building), PDEV21-016[56] (38,445 sf industrial building), PDEV21-018[57] (168,772 sf of industrial buildings), PDEV21-020[58] (50,121 sf industrial building), PDEV21-024[59] (198,496 sf industrial building), PDEV21-026[60] (45,000 sf industrial building), PDEV21-028[61] (32,425 sf industrial building), PDEV21-029[62] (15,132 sf industrial building), PDEV21-030[63] (175,047 sf industrial building), PDEV21-031[64] (38,155 sf industrial building), PDEV21-034[65] (32,000 sf industrial

building), PDEV21-035[66] (60,455 sf industrial building), PDEV21-040[67] (1,255,320 sf industrial building), PDEV21-047[68] (4,281,128 sf industrial building), PDEV21-037[69] (167,600 sf industrial building), PDEV22-010 & PMTT22-008: East State Street Warehouse Project[70] (336,761 square foot warehouse), and South Ontario Logistics Center Specific Plan[71] (5,333,518 sf industrial space) combined with the proposed project will cumulatively generate 14,769,377 sf of industrial space. This is approximately 12,360 employees, which is 22.3% of the City's employment growth forecast over 29 years. This total increases exponentially when other industrial and commercial development activity is added to the calculation. A revised EIR must be prepared to include this information for analysis, and also provide a cumulative analysis discussion of projects approved since 2016 and projects "in the pipeline" to determine if the proposed project will exceed the employment/population growth forecasts by SCAG and/or the General Plan.

B-20 (CONT.)

6.0 Alternatives

The EIR is required to evaluate a reasonable range of alternatives to the proposed project which will avoid or substantially lessen any of the significant effects of the project (CEQA § 15126.6.) The alternatives chosen for analysis include the CEQA required "No Project" alternative and only two others - Reduced Building Area and Reduced Intensity. The EIR does not evaluate a reasonable range of alternatives as only two alternatives beyond the required No Project alternative is analyzed. The EIR must be revised to include analysis of a reasonable range of alternatives and foster informed decision making (CEQA § 15126.6). This could include alternatives such as development of the site with a mixed-use project that provides affordable housing and local-serving commercial uses that may reduce VMT, GHG emissions, and improve Air Quality.

B-21

Conclusion

For the foregoing reasons, GSEJA believes the EIR is flawed and a revised EIR must be prepared for the proposed project and circulated for public review. Golden State Environmental Justice Alliance requests to be added to the public interest list regarding any subsequent environmental

Subject: Comments on the 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Mr. Ho,

We have reviewed the August 2023 Draft Environmental Impact Report ("DEIR") for the 5355 East Airport Drive Project ("Project") located in the City of Ontario ("City"). The Project proposes to construct a 270,337-square-foot ("SF") warehouse building including 27,034-SF of refrigerated space and 291 parking spaces on the 8.15-acre site.

Our review concludes that the DEIR fails to adequately evaluate the hazards, hazardous materials, air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project may be underestimated and inadequately addressed. A revised EIR should be prepared to adequately assess and mitigate the potential hazards, hazardous materials, air quality, health risk, and greenhouse gas impacts that the project may have on the environment.

B-23

Hazards and Hazardous Materials

Inadequate Disclosure and Analysis of Impacts

The DEIR states with respect to the Hazards and Hazardous Materials section:

> "This information and analysis presented in this Subsection is based in part on the technical study titled Phase I/Phase II Environmental Site Assessment Report (Phase I/II ESA), dated March 31, 2022, that was prepared by Farallon Consulting, L.L.C. (referenced herein as "Farallon") to determine the presence or absence of hazardous materials on the Project Site under existing conditions. The report is provided as *Technical Appendix G* to this EIR," (p. 4.7-1).

B-24

The Hazards and Hazardous Materials section documents tetrachloroethylene (PCE) soil vapor contamination in the vicinity of Building B at concentrations exceeding screening levels. Specifically, the DEIR concludes:

> "Therefore, PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Project Site and impacts would be potentially significant," (p. 4.7-14).

The DEIR provides the following mitigation measure:

> "MM 4.7-1 Prior to the issuance of a grading permit, the Project Applicant shall prepare a Soil Management Plan (SMP). The SMP shall include explicit instructions for the appropriate handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. The general contractor will be required to follow the requirements of the SMP and stop work to make notification to the environmental team if any potential impacts are observed at any time the environmental team is not already on-site," (p. 4.7-19).

With regard to PCE contamination, MM 4.7-1 states:

> "Soil Monitoring: Soils impacted by PCE that are encountered during site redevelopment will be characterized and documented. The monitoring and sampling activities to be performed include:
>
> - Visual observation performed to detect areas of soil that may be impacted by PCE or other non-VOC hazardous materials, if encountered.
> - Screening for PCEs using field instruments to document new or previously undetected sources of PCEs.
> - Soil sampling and chemical testing performed to evaluate concentrations of PCE," (p. 4.7-20).

B-24 (CONT.)

Provisions in MM 4.7-1 fail to include the following recommendation in the Phase I/Phase II ESA:

> "Additionally, because PCE has been documented in soil vapor in the vicinity of Building B at concentrations exceeding calculated screening levels, and PCE was detected at concentrations in shallow soil vapor less than the calculated RSLs in other soil gas samples collected at the Site, the potential for vapor intrusion issues into the planned new Site building should be addressed. Additional investigation and characterization are recommended to delineate and design mitigation measures for PCE in soil vapor that may impact indoor air in the future building," (Appendix G, p. 11-3).

The DEIR fails to include results of any additional sampling to delineate and design mitigation measures for PCE in the indoor air of the future building as recommended in the Phase I/II. These design measures typically include soil vapor extraction, vapor barriers, and air filtration systems. A revised DEIR should be prepared to include mitigation that documents results of the recommended additional investigation and provides measures to address potential PCE vapor intrusion in indoor air as recommend in the Phase I/II.

B-25

Air Quality

Failure to Provide Complete CalEEMod Output Files

Land use development projects under the California Environmental Quality Act ("CEQA") typically evaluate air quality impacts and calculate potential criteria air pollutant emissions using the California Emissions Estimator Model ("CalEEMod").[1] CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but CEQA requires that such changes be justified by substantial evidence. Once all of the values are inputted into the model, the Project's construction and operational emissions are calculated, and "output files" are generated. These output files disclose to the reader what parameters are utilized in calculating the Project's air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

According to the DEIR, CalEEMod Version 2022.1 is relied upon to estimate Project emissions (p. 4.2-20). However, this poses a problem, as the currently available version of CalEEMod 2022.1 is described as a "soft release" which fails to provide complete output files.[2] Specifically, the "User Changes to Default Data" table no longer provides the quantitative counterparts to the changes to the default values (see excerpt below) (Appendix B1, pp. 242):

B-26

8. User Changes to Default Data

Screen	Justification
Land Use	Total Project Area is 13.08 acres
Operations: Vehicle Data	Trip rates based on information provided in ITE 11th Edition
Operations: Fleet Mix	Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY)
Operations: Refrigerants	As of 1 January 2022, new commercial refrigeration equipment may not use refrigerants with a GWP of 150 or greater.

However, previous CalEEMod Versions, such as 2020.4.0, include the specific numeric changes to the model's default values (see example excerpt below):

[1] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide.
[2] "CalEEMod California Emissions Estimator Model Soft Release." California Air Pollution Control Officers Association (CAPCOA), 2022, *available at:* https://caleemod.com/.

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	230.00	167.00
tblConstructionPhase	PhaseEndDate	11/22/2023	8/25/2023
tblConstructionPhase	PhaseEndDate	9/27/2023	6/30/2023
tblConstructionPhase	PhaseEndDate	10/25/2023	7/28/2023

tblConstructionPhase	PhaseStartDate	9/28/2023	7/1/2023
tblLandUse	LandUseSquareFeet	160,000.00	160,371.00
tblLandUse	LandUseSquareFeet	119,000.00	41,155.00
tblLandUse	LotAcreage	3.67	3.68
tblLandUse	LotAcreage	2.73	2.74

B-26 (CONT.)

The output files associated with CalEEMod Version 2022.1 fail to present the exact parameters used to calculate Project emissions. To remedy this issue, the DEIR should have provided access to the model's ".JSON" output files, which allow third parties to review the model's revised input parameters.[3] Without access to the complete output files, including the specific numeric changes to the default values, we cannot verify that the DEIR's air modeling and subsequent analysis is an accurate reflection of the proposed Project. As a result, a revised EIR should be prepared to include an updated air quality analysis that correctly provides the complete output files for CalEEMod Version 2022.1, or includes an updated air model using an older release of CalEEMod.[4]

Unsubstantiated Input Parameters Used to Estimate Project Emissions

As previously discussed, the DEIR relies on CalEEMod Version 2022.1 to estimate the Project's air quality emissions and fails to provide the complete output files required to adequately evaluate model's analysis (p. 40). Regardless, when reviewing the Project's CalEEMod output files, provided Air Quality Impact Analysis ("AQ Analysis") as Appendix B1 to the DEIR, we were able to identify several model inputs that are inconsistent with information disclosed in the DEIR. As such, the Project's construction and operational emissions may be underestimated. A revised EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

B-27

Unsubstantiated Changes to Individual Construction Phase Lengths

Review of the CalEEMod output files demonstrates that the "IE Distribution Center #14 (Construction)" model includes changes to the default construction schedule (see excerpt below) (Appendix B1, pp. 206).

B-28

[3] "Video Tutorials for CalEEMod Version 2022.1." California Air Pollution Control Officers Association (CAPCOA), May 2022, *available at:* https://www.caleemod.com/tutorials.
[4] "CalEEMod Version 2020.4.0." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* http://www.aqmd.gov/caleemod/download-model.

Screen	Justification
Land Use	Total Project Site is 13.08 acres
Construction: Construction Phases	Construction anticipated to end in April 2024
Construction: Off-Road Equipment	Construction equipment based on equipment needed for other industrial projects within the area
Construction: Trips and VMT	Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Demolition, Site Preparation, Grading, and Building Construction
Construction: Architectural Coatings	Rule 1113

As a result of these changes, the model includes the following construction schedule (see excerpt below) (Appendix B1, pp. 195):

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase
Demolition	Demolition	5/2/2023	7/24/2023	5.00	60.0
Site Preparation	Site Preparation	7/25/2023	9/4/2023	5.00	30.0
Grading	Grading	7/25/2023	9/4/2023	5.00	30.0
Building Construction	Building Construction	9/5/2023	4/15/2024	5.00	160
Paving	Paving	2/13/2024	4/15/2024	5.00	45.0
Architectural Coating	Architectural Coating	3/5/2024	4/15/2024	5.00	30.0

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[5] As demonstrated above in the "User Changes to Default Data" table, the justification provided for these changes is:

> "Construction anticipated to end in April 2024" (Appendix B1, pp. 206).

Furthermore, the DEIR provides the following construction schedule (see excerpt below) (p. 3-12, Table 3-1):

Table 3-1 Estimated Construction Schedule

Construction Phase	Duration
Demolition	60 days
Site Preparation & Grading	30 days
Building Construction	160 days
Paving	45 days
Architectural Coating & Landscaping	30 days
Total	**12 months**

However, the changes to the individual construction phase lengths remain unsubstantiated. While the DEIR justifies a total length of Project construction of 12 months, the DEIR fails to provide a source for the individual construction phase lengths outlined in Table 3-1. Until a proper source is provided, the model should have included proportionately altered individual phase lengths to match the proposed construction duration of 12 months.[6]

B-28 (CONT.)

[5] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.
[6] See Attachment A for proportionately altered construction schedule.

5

The construction schedule included in the model presents an issue, as the construction emissions are improperly spread out over a longer period of time for some phases, but not for others. According to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).[7]

> *Demolition* involves removing buildings or structures.
>
> *Site Preparation* involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
>
> *Grading* involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.
>
> *Building Construction* involves the construction of the foundation, structures and buildings.
>
> *Architectural Coating* involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.
>
> *Paving* involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

By disproportionately altering and extending some of the individual construction phase lengths without proper justification, the model assumes there are a greater number of days to complete the construction activities required by the prolonged phases. As a result, there will be less construction activities required per day and, consequently, less pollutants emitted per day. Until we are able to verify the revised construction schedule, the model may underestimate the peak daily emissions associated with some phases of construction and should not be relied upon to determine Project significance.

B-28 (CONT.)

Unsubstantiated Changes to Architectural Coating Emission Factors

Review of the CalEEMod output files demonstrates that the "IE Distribution Center #14 (Construction)" model includes changes to the default architectural coating emission factors (see excerpt below) (Appendix B1, pp. 206).

Screen	Justification
Land Use	Total Project Site is 13.08 acres
Construction: Construction Phases	Construction anticipated to end in April 2024
Construction: Off-Road Equipment	Construction equipment based on equipment needed for other industrial projects within the area
Construction: Trips and VMT	Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Demolition, Site Preparation, Grading, and Building Construction
Construction: Architectural Coatings	Rule 1113

B-29

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[8] As demonstrated above in the "User Changes to Default Data" table, the justification provided for these changes is:

[7] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 32.
[8] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.

"Rule 1113" (Appendix B1, pp. 206).

However, the reductions to the architectural coating emission factors remain unsubstantiated for two reasons.

First, we cannot verify the accuracy of the revised architectural coating emission factors based on SCAQMD Rule 1113 alone. The SCAQMD Rule 1113 Table of Standards provides the required volatile organic compound ("VOC") limits (grams of VOC per liter of coating) for 57 different coating categories.[9] The VOC limits for each coating varies from a minimum value of 50 g/L to a maximum value of 730 g/L. As such, we cannot verify that SCAQMD Rule 1113 substantiates reductions to the default coating values without more information regarding what category of coating will be used. As the DEIR fails to explicitly require the use of a specific type of coating which would adhere to a specific VOC limit, we are unable to verify the model's revised coating emission factors.

B-29 (CONT.)

Second, as previously discussed, the output files for CalEEMod 2022.1 do not present the numeric changes to any model defaults. Upon further review of the output files, Table 5.5 contains the only mention of architectural coatings (see excerpt below) (Appendix B1, pp. 198):

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	415,727	138,576	13,629

As demonstrated above, Table 5.5 only provides the *square footage* of area to be coated. Since the output files fail to demonstrate the architectural coating *emission factors* that the model relies on, we cannot verify that the values included in the model are accurate.

B-30

These unsubstantiated reductions present an issue, as CalEEMod uses the architectural coating emission factors to calculate the Project's VOC emissions.[10] By including unsubstantiated reductions to the default architectural coating emission factors, the model may underestimate the Project's construction-related VOC emissions and should not be relied upon to determine Project significance.

Unsubstantiated Changes to Fleet Mix Values

Review of the CalEEMod output files demonstrates that the "IE Distribution Center #14 (Passenger Car Operations)" and "IE Distribution Center #14 (Truck Operations)" models include changes to the default operational vehicle fleet mix percentages (see excerpt below) (Appendix B1, pp. 242, 274).

B-31

[9] "SCAQMD Rule 1113 Advisory Notice." SCAQMD, February 2016, *available at:* http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/r1113.pdf?sfvrsn=24, p. 1113-14, Table of Standards 1.

[10] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 35, 40.

Screen	Justification
Land Use	Total Project Area is 13.08 acres
Operations: Vehicle Data	Trip rates based on information provided in ITE 11th Edition
Operations: Fleet Mix	Passenger Car Mix estimated based on the CalEEMod default fleet mix and the ratio of the vehicle classes (LDA, LDT1, LDT2, MDV, & MCY)
Operations: Refrigerants	As of 1 January 2022, new commercial refrigeration equipment may not use refrigerants with a GWP of 150 or greater.

These changes remain unsubstantiated. As previously discussed, the output files for CalEEMod 2022.1 do not present the numeric changes to any model defaults. Upon further review of the output files, changes to fleet mix percentages are not mentioned outside of the "User Changes to Default Data" table. Until the DEIR verifies the breakdown of heavy-heavy duty ("HHD"), medium-heavy duty ("MHD"), light-heavy duty ("LHD1, LDH2"), trucks used by the Project, we cannot verify that the values included in the model are accurate.[11]

These unsubstantiated changes present an issue, as CalEEMod uses operational vehicle fleet mix percentages to calculate the Project's operational emissions associated with on-road vehicles.[12] By including several unsubstantiated changes to the default operational vehicle fleet mix percentages, the model may underestimate the Project's mobile-source operational emissions and should not be relied upon to determine Project significance.

B-31 (CONT.)

Incorrect Application of Tier 4 Interim Mitigation

Review of the CalEEMod output files demonstrates that the "IE Distribution Center #14 (Construction)" model includes changes to the default off-road equipment engine tiers (see excerpt below) (Appendix B1, pp. 206).

Screen	Justification
Land Use	Total Project Site is 13.08 acres
Construction: Construction Phases	Construction anticipated to end in April 2024
Construction: Off-Road Equipment	Construction equipment based on equipment needed for other industrial projects within the area
Construction: Trips and VMT	Vendor Trips adjusted based on CalEEMod defaults for Building Construction and number of days for Demolition, Site Preparation, Grading, and Building Construction
Construction: Architectural Coatings	Rule 1113

As a result, the model assumes that the Project's off-road construction equipment fleet would meet Tier 4 interim emissions standards (see excerpt below) (Appendix B1, pp. 196).

B-32

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Demolition	Excavators	Diesel	Tier 4 Interim	3.00	8.00	36.0	0.38
Demolition	Concrete/Industrial Saws	Diesel	Tier 4 Interim	1.00	8.00	33.0	0.73
Site Preparation	Rubber Tired Dozers	Diesel	Tier 4 Interim	3.00	8.00	367	0.40
Grading	Graders	Diesel	Tier 4 Interim	1.00	8.00	148	0.41
Grading	Excavators	Diesel	Tier 4 Interim	2.00	8.00	36.0	0.38
Grading	Scrapers	Diesel	Tier 4 Interim	2.00	8.00	423	0.48
Grading	Rubber Tired Dozers	Diesel	Tier 4 Interim	1.00	8.00	367	0.40

Note: Screenshot does not include all the applicable changes.

[11] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 38.
[12] "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 36.

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.[13] According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

> "Construction equipment based on equipment needed for other industrial projects within the area" (Appendix B1, pp. 206).

The assumption that the Project's off-road construction equipment fleet would meet Tier 4 interim emissions standards remains unsupported as the DEIR fails to explicitly require these standards through a formal mitigation measure. This is incorrect, as according to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on mitigation measures:

> "While not 'mitigation', a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact" (emphasis added).[14]

As discussed above, measures that are not formally included in the mitigation monitoring and reporting program ("MMRP") may be eliminated from the Project's design altogether. As the use of construction equipment with Tier 4 interim emissions standards are not formally included as mitigation measures, we cannot guarantee that these standards would be implemented, monitored, and enforced on the Project site. Consequently, the model's assumption that the off-road construction equipment fleet would adhere to Tier 4 interim emissions standards is incorrect.

B-32 (CONT.)

Updated Analysis Indicates a Potentially Significant Air Quality Impact

In an effort to more accurately estimate the Project's construction-related and operational emissions, we used CalEEMod Version 2020.4.0, as well as the Project-specific information provided by the DEIR.[15] Consistent with the DEIR's models, we included 243,303-SF of "Unrefrigerated Warehouse-No Rail," 27,000-SF of "Refrigerated Warehouse-No Rail," 299 spaces of "Parking Lot," and 161,000-SF of "Other Asphalt Surfaces." Additionally, we omitted the unsubstantiated changes to the architectural and coating emission factors, Tier 4 Interim mitigation, and operational vehicle fleet mix; we also proportionately altered the individual construction phase lengths to match the 12-month construction schedule.[16]

B-33

[13] "CalEEMod User's Guide Version 2020.4.0." California Air Pollution Control Officers Association (CAPCOA), May 2021, *available at:* https://www.aqmd.gov/caleemod/user's-guide, p. 1, 14.
[14] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.
[15] "CalEEMod Version 2020.4.0." California Air Pollution Control Officers Association (CAPCOA), March 2022, *available at:* http://www.aqmd.gov/caleemod/download-model.
[16] See Attachment B for updated air modeling.

Our updated analysis estimates that the Project's construction-related VOC emissions would exceed the applicable SCAQMD threshold of 75-pounds per day ("lbs/day"), as referenced by the DEIR (see table below).[17]

SWAPE Criteria Air Pollutant Emissions	
Construction	**VOC** (lbs/day)
DEIR	47.2
SWAPE	199.0
% Increase	322%
SCAQMD Threshold	**75**
Exceeds?	***Yes***

As demonstrated in the table above, the Project's construction-related VOC emissions, as estimated by SWAPE, increase by approximately 322% and exceed the applicable SCAQMD significance threshold. Our updated model demonstrates that the Project would result in a potentially significant air quality impact that was not previously identified or addressed in the DEIR. A revised EIR should be prepared to adequately assess and mitigate the potential air quality impacts that the Project may have on the surrounding environment.

B-33 (CONT.)

Diesel Particulate Matter Emissions Inadequately Evaluated

The DEIR concludes that the proposed Project would result in a less-than-significant health risk impact based on a quantified construction and operational health risk assessment ("HRA"), as detailed in the Mobile Source Health Risk Assessment ("HRA Report"), provided as Appendix B2 to the DEIR. Specifically, the HRA Report estimates that the cumulative maximum cancer risk posed to nearby, existing residential sensitive receptors associated with construction and operation would be 0.01 in one million, which would not exceed the SCAQMD significance threshold of 10 in one million (p. 4, Table ES-3). The DEIR's evaluation of the Project's potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

First, the DEIR's HRAs are unreliable, as they rely upon emissions estimates from a flawed air model, as discussed above in the section titled "Unsubstantiated Input Parameters Used to Estimate Project Emissions." As such, the HRAs are based on potentially underestimated DPM concentrations to calculate the health risk associated with Project construction. As a result, the DEIR's HRAs and resulting cancer risk should not be relied upon to determine Project significance.

B-34

[17] "South Coast AQMD Air Quality Significance Thresholds." SCAQMD, March 2023, *available at*: https://www.aqmd.gov/docs/default-source/ceqa/handbook/south-coast-aqmd-air-quality-significance-thresholds.pdf?sfvrsn=25.

Second, the DEIR's operational HRA underestimates the Fraction of Time At Home ("FAH") values for the third trimester, infant, and child receptors. Specifically, the HRA Report utilizes an FAH value of 0.85 for the third trimester (age -0.25 to 0) and infant (age 0 to 2) receptors, and an FAH value of 0.72 for the child receptors (age 2 to 16) (see excerpt below) (Appendix B2, Table 2-7, p. 20).

TABLE 2-7: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	0.85	350	24
0 to 2	1,090	10	2	0.85	350	24
2 to 16	572	3	14	0.72	350	24
16 to 30	261	1	14	0.73	350	24

B-35

The FAH values used for the third trimester, infant, and childhood receptors are incorrect, as SCAQMD guidance clearly states:

> "For Tiers 1, 2, and 3 screening purposes, the FAH is assumed to be 1 for ages third trimester to 16. As a default, children are assumed to attend a daycare or school in close proximity to their home and no discount should be taken for time spent outside of the area affected by the facility's emissions. People older than age 16 are assumed to spend only 73 percent of their time at home."[18]

Per SCAQMD guidance, the HRA Report should have used an FAH of 1 for the third trimester, infant, and child receptors. By relying on incorrect FAH values, the DEIR underestimates the cancer risk posed to nearby, existing sensitive receptors as a result of Project operation.

Third, further review of the HRA Report demonstrates that the HRAs may fail to include Age Sensitivity Factors ("ASFs"). Regarding ASFs, OEHHA guidance states:

B-36

> "Studies have shown that young animals are more sensitive than adult animals to exposure to many carcinogens (OEHHA, 2009). Therefore, OEHHA developed age sensitivity factors (ASFs) to take into account the increased sensitivity to carcinogens during early-in-life exposure (Table 8.3). These factors were developed and described in detail in OEHHA (2009). In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years, and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood."

[18] "Risk Assessment Procedures." SCAQMD, August 2017, available at: http://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/1401/riskassessmentprocedures_2017_080717.pdf, p. 7.

However, while the HRA Report includes ASFs in their exposure assumption tables, the equation to produce carcinogenic risk estimates, as shown below, is incorrect and underestimated (p. 21).

$DOSE_{air} = (C_{air} \times [BR/BW] \times A \times EF) \times (1 \times 10^{-6})$

Where:

$DOSE_{air}$	=	chronic daily intake (mg/kg/day)
Cair	=	concentration of contaminant in air (ug/m^3)
[BR/BW]	=	daily breathing rate normalized to body weight (L/kg BW-day)
A	=	inhalation absorption factor
EF	=	exposure frequency (days/365 days)
BW	=	body weight (kg)
1×10^{-6}	=	conversion factors (µg to mg, L to m^3)

$RISK_{air} = DOSE_{air} \times CPF \times ED/AT$

Where:

$DOSE_{air}$	=	chronic daily intake (mg/kg/day)
CPF	=	cancer potency factor
ED	=	number of years within particular age group
AT	=	averaging time

Instead, the HRA Report should have used the following equation that includes ASFs:

$$Cancer\ Risk_{AIR} = Dose_{AIR} \times CPF \times ASF \times FAH \times \frac{ED}{AT}$$

By potentially failing to include ASF values in the carcinogenic risk estimate equation, the DEIR's HRA may underestimate the cancer risk posed to nearby, existing sensitive receptors as a result of Project construction and operation. As such, a revised EIR should be prepared to include an updated analysis correctly accounting for ASF values.

B-36 (CONT.)

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 2,590.77 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") (see excerpt below) (Table 4.6-3, p. 4.6-22).

B-37

Table 4.6-3 Project GHG Emissions

Emission Source	Emissions (MT/yr)				
	CO_2	CH_4	N_2O	Refrigerants	Total CO_2e
Annual construction-related emissions amortized over 30 years	30.43	6.67E-04	3.33E-04	0.01	30.77
Mobile Source	1,536.00	0.11	0.18	2.15	1,596.00
Area Source	5.48	0.00	0.00	0.00	5.64
Energy Source	847.00	0.08	0.00	0.00	850.00
Water Usage	88.10	2.04	0.05	0.00	154.00
Waste	22.70	2.27	0.00	0.00	79.30
Refrigerants	0.00	0.00	0.00	1,078.00	1,078.00
TRU Source					156.68
On-Site Equipment					286.15
Total CO_2e (All Sources)	**4,236.54**				
Subtraction of Emissions from Existing Land Uses	*-1,645.77*				
Total Net CO_2e (All Sources)	**2,590.77**				

(Urban Crossroads, 2022d, p. 58)

The DEIR concludes:

> "Construction and operation of the Project less emissions from the existing onsite uses would result a net total of new GHG emissions of approximately 2,590.77 MTCO2e/yr, which would fall below the significance threshold of 3,000 MTCO2e/yr; therefore, Project-related GHG emissions are considered less than significant" (p. 4.6-22).

The DEIR's analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

(1) The DEIR's quantitative GHG analysis relies upon a flawed air model;
(2) The DEIR's quantitative GHG analysis relies upon an outdated threshold; and
(3) The DEIR's unsubstantiated air model indicates a potentially significant impact.

B-37 (CONT.)

1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

The DEIR estimates that the Project would generate net annual GHG emissions of 2,590.77 MT CO_2e/year (Table 4.6-3, p. 4.6-22). However, the DEIR's quantitative GHG analysis is unsubstantiated because the DEIR relies on CalEEMod Version 2022.1 to estimate the Project's air quality emissions and fails to provide the complete output files required to adequately evaluate model's analysis. When reviewing the CalEEMod output files included in the AQ Analysis, we were able to identify several model inputs that are inconsistent with information disclosed in the DEIR. As a result, the models may underestimate the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. A revised EIR should be prepared that adequately assesses the

B-38

potential GHG impacts that construction and operation of the proposed Project may have on the environment.

B-38 (CONT.)

2) Incorrect Reliance on an Outdated Quantitative GHG Threshold

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,047.49 MT CO_2e/year, which would not exceed the SCAQMD threshold of 3,000 MT CO_2e/year (p. 4-37). However, the guidance that provided the 3,000 MT CO_2e/year threshold, the SCAQMD's 2008 *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules, and Plans* report, was developed when the Global Warming Solutions Act of 2006, commonly known as "AB 32", was the governing statute for GHG reductions in California. AB 32 requires California to reduce GHG emissions to 1990 levels by 2020.[19] Furthermore, AEP guidance states:

> "[F]or evaluating projects with a post 2020 horizon, the threshold will need to be revised based on a new gap analysis that would examine 17 development and reduction potentials out to the next GHG reduction milestone."[20]

B-39

As it is currently September 2023, thresholds for 2020 are not applicable to the proposed Project and should be revised to reflect the current GHG reduction target. As such, the SCAQMD bright-line threshold of 3,000 MT CO_2e/year is outdated and inapplicable to the proposed Project, and the DEIR's less-than-significant GHG impact conclusion should not be relied upon. Instead, we recommend that the Project apply the SCAQMD 2035 service population efficiency target of 3.0 metric tons of carbon dioxide equivalents per service population per year ("MT CO_2e/SP/year"), which was calculated by applying a 40% reduction to the 2020 targets.[21]

3) Failure to Identify a Potentially Significant GHG Impact

In an effort to quantitatively evaluate the Project's GHG emissions, we compared the Project's GHG emissions, as estimated by the DEIR, to the SCAQMD 2035 service population efficiency target of 3.0 MT CO_2e/SP/year. When applying this threshold, the Project's air model indicates a potentially significant GHG impact. As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 2,590.77 MT CO_2e/year (Table 4.6-3, p. 4.6-22). According to CAPCOA's *CEQA & Climate Change* report, a service population ("SP") is defined as "the sum of the number of residents and the number of jobs supported by the project."[22] As the Project does not propose any residential land uses, we estimate that the Project would not support any residents. Furthermore, according to the DEIR, the Project would support approximately 226 employees (p. 4.10-13). Based on this estimate, we calculated

B-40

[19] "Health & Safety Code 38550." California State Legislature, January 2007, *available at:* https://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?lawCode=HSC&sectionNum=38550.
[20] "Beyond Newhall and 2020: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California." Association of Environmental Professionals (AEP), October 2016, *available at:* https://califaep.org/docs/AEP-2016_Final_White_Paper.pdf, p. 39.
[21] "Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #15." SCAQMD, September 2010, *available at:* http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-minutes.pdf, p. 2.
[22] CAPCOA (Jan. 2008) CEQA & Climate Change, p. 71-72, https://www.ourair.org/wp-content/uploads/CAPCOA-CEQA-and-Climate-Change.pdf.

an SP of 226 people. When dividing the Project's net annual GHG emissions, as estimated by the DEIR, by an SP of 226 people, we find that the Project would emit approximately 11.5 MT CO_2e/SP/year (see table below).[23]

DEIR Greenhouse Gas Emissions	
Annual Emissions (MT CO_2e/year)	2,590.77
Service Population	226
Service Population Efficiency (MT CO_2e/SP/year)	11.5
SCAQMD 2035 Threshold	**3.0**
Exceeds?	***Yes***

As demonstrated above, the Project's service population efficiency value, as estimated by the DEIR's provided net annual GHG emission estimates and SP, exceeds the SCAQMD 2035 efficiency target of 3.0 MT CO_2e/SP/year, indicating a potentially significant impact not previously identified or addressed by the DEIR. As a result, the DEIR's less-than-significant GHG impact conclusion should not be relied upon. A revised EIR should be prepared to include an updated GHG analysis which incorporates additional mitigation measures to reduce the Project's GHG emissions to less-than-significant levels.

B-40 (CONT.)

Mitigation

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in potentially significant air quality and GHG impacts that should be mitigated further. In an effort to reduce emissions, the Project should consider the implementation of the following mitigation measures found in the California Department of Justice Warehouse Project Best Practices document.[24]

- Requiring off-road construction equipment to be hybrid electric-diesel or zero emission, where available, and all diesel-fueled off-road construction equipment to be equipped with CARB Tier IV-compliant engines or better, and including this requirement in applicable bid documents, purchase orders, and contracts, with successful contractors demonstrating the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities.
- Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Using electric-powered hand tools, forklifts, and pressure washers, and providing electrical hook ups to the power grid rather than use of diesel-fueled generators to supply their power.

B-41

B-42

B-43

[23] Calculated: (2,590.77 MT CO_2e/year) / (226 service population) = (11.5 MT CO_2e/SP/year).
[24] "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act." State of California Department of Justice, September 2022, *available at*: https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf, p. 8 – 10.

- Designating an area in the construction site where electric-powered construction vehicles and equipment can charge. B-44
- Limiting the amount of daily grading disturbance area. B-45
- Prohibiting grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area. B-46
- Forbidding idling of heavy equipment for more than three minutes. B-47
- Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications. B-48
- Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts. B-49
- Using paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L. B-50
- Providing information on transit and ridesharing programs and services to construction employees. B-51
- Providing meal options onsite or shuttles between the facility and nearby meal destinations for construction employees. B-52
- Requiring all heavy-duty vehicles engaged in drayage to or from the project site to be zero-emission beginning in 2030. B-53
- Requiring all on-site motorized operational equipment, such as forklifts and yard trucks, to be zero-emission with the necessary charging or fueling stations provided. B-54
- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations. B-55
- Forbidding trucks from idling for more than three minutes and requiring operators to turn off engines when not in use. B-56
- Posting both interior- and exterior-facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the local air district, and the building manager. B-57
- Installing solar photovoltaic systems on the project site of a specified electrical generation capacity that is equal to or greater than the building's projected energy needs, including all electrical chargers. B-58
- Designing all project building roofs to accommodate the maximum future coverage of solar panels and installing the maximum solar power generation capacity feasible. B-59
- Constructing zero-emission truck charging/fueling stations proportional to the number of dock doors at the project. B-60
- Running conduit to designated locations for future electric truck charging stations. B-61
- Unless the owner of the facility records a covenant on the title of the underlying property ensuring that the property cannot be used to provide refrigerated warehouse space, constructing electric plugs for electric transport refrigeration units at every dock door and requiring truck operators with transport refrigeration units to use the electric plugs when at loading docks. B-62

- Oversizing electrical rooms by 25 percent or providing a secondary electrical room to accommodate future expansion of electric vehicle charging capability. B-63
- Constructing and maintaining electric light-duty vehicle charging stations proportional to the number of employee parking spaces (for example, requiring at least 10% of all employee parking spaces to be equipped with electric vehicle charging stations of at least Level 2 charging performance) B-64
- Running conduit to an additional proportion of employee parking spaces for a future increase in the number of electric light-duty charging stations. B-65
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project. B-66
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project, and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air. B-67
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel. B-68
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. B-69
- Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking. B-70
- Meeting CalGreen Tier 2 green building standards, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking. B-71
- Designing to LEED green building certification standards. B-72
- Providing meal options onsite or shuttles between the facility and nearby meal destinations. B-73
- Posting signs at every truck exit driveway providing directional information to the truck route. B-74
- Improving and maintaining vegetation and tree canopy for residents in and around the project area. B-75
- Requiring that every tenant train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB-approved courses. Also require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request. B-76
- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants who own, operate, or hire trucking carriers with more than 100 trucks to use carriers that are SmartWay carriers. B-77
- Providing tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets. B-78

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation.

Furthermore, as it is policy of the State that eligible renewable energy resources and zero-carbon resources supply 100% of retail sales of electricity to California end-use customers by December 31, 2045, we emphasize the applicability of incorporating solar power system into the Project design. Until the feasibility of incorporating on-site renewable energy production is considered, the Project should not be approved.

B-79

A revised EIR should be prepared to include all feasible mitigation measures, as well as include updated air quality and GHG analyses to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The revised EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

B-80

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

B-81

Sincerely,

Matt Hagemann, P.G., C.Hg.

Paul E. Rosenfeld, Ph.D.

Responses to Comment B

Blum, Collins & Ho LLP on behalf of Golden State Environmental Justice Alliance dated October 4, 2023.

B-1 This comment consists of introductory remarks and identifies that the comments on the Draft EIR are being provided by Blum Collins & Ho, LLP on behalf of the Golden State Environmental Justice Alliance (GSEJA). The statement of interest is acknowledged and the City will include GSEJA on the mailing list for future CEQA notices related to the Project.

B-2 This comment provides a general summary of the Project Description as provided in the Draft EIR. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

B-3` The commenter asserts that the Draft EIR does not accurately describe the Project and asserts that the Project is associated with another Project (East State Street Warehouse Project - PDEV22-010) that was approved by the City in January 2023. The commenter is incorrect in asserting that the EIR should examine all Prologis buildings as a whole. The East State Street Warehouse Project was approved by the City's Planning Commission on January 24, 2023. The project applicant for the East State Street Warehouse Project was previously Duke Realty Corporation until the acquisition of the company by Prologis, Inc. in October 2022. The East State Street Warehouse Project is separate from and has independent utility from the 5355 East Airport Drive Project. The two projects are in different locations within the City and have been processed under separate entitlements and discretionary approvals. Piecemealing or segmenting means dividing a project into two or more pieces and evaluating each piece in a separate environmental document, rather than evaluating the whole of the project in one environmental document. The East State Street Warehouse Project and the 5355 East Airport Drive Project are independent of each other and are not part of a larger development project. Therefore, the Draft EIR adequately analyzed the Project as a whole. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-4 The commenter states the requirements from CEQA Guidelines Sections 15146 and 15161 regarding the degree of specificity in an EIR and the definition of a Project EIR. The commenter is incorrect in stating that there are two proposed buildings as part of a single construction project. Refer to Response to Comment B-3 above regarding how the proposed Project and East State Street Warehouse Project are separate and independent development projects with independent utility. As stated in Section 1.0, *Introduction*, of the Draft EIR, the Draft EIR serves as an EIR for the proposed 5355 East Airport Drive Project. For purposes of this EIR, the term "Project" refers to all actions associated with implementation of the 5355 East Airport Drive project including its planning, construction, and ongoing operations. Additionally, acting as Lead Agency, the City of Ontario will consider the following items regarding the proposed Project and this Draft EIR: a) evaluation of this EIR to determine if the physical environmental impacts of the Project are adequately disclosed; b) assessment of the adequacy and feasibility of identified mitigation measures; c) consideration of alternatives to

the Project that could reduce or eliminate significant environmental effects of the Project; and, if necessary, d) consideration of Project benefits that override the Project's unavoidable and unmitigable significant effects on the environment. (Refer to Draft EIR pp. 1-1 and 1-5) Therefore, the Draft EIR adequately analyzed the Project as a whole. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-5 The commenter asserts that the Draft EIR provides misleading information regarding project grading stating that earthwork will balance whereas the grading plan shows that 9,000 cy of exported material is required. This assertion is incorrect. Draft EIR p. 3-313 discloses that the Project's grading operation would result in 9,000 more cubic yards of cut than fill, but final earthwork quantities are subject to final civil engineering design and after final engineering, the earthwork is expected to balance with no import or export of earth material required. Nonetheless, as stated in the Project's Air Quality Impact Analysis (*Technical Appendix B1* to this Draft EIR), under Section 4.4.1, *Construction Activities*, the Project is anticipated to require approximately 9,000 cubic yards of export soil. Therefore, even though the exact final earthwork quantities are subjected to final civil engineering design, the environmental analysis provided in the Draft EIR included that 9,000 cubic yards of export soils would be required under the Project's grading activities. The clarification in the Project Description is not substantial new information warranting recirculation, as the analysis in the Draft EIR included the possible export activity.

B-6 The commenter refers to the attachments from the Soil / Water / Air Protection Enterprise (SWAPE) letter. Comments related to potential environmental concerns in the SWAPE letter are responded to below in the response to Comments B-23 to B-82.

B-7 The commenter summarizes existing air quality conditions within the census tract where the Project site is located using data obtained from the California Environmental Protection Agency (CalEnviroScreen 4.0). The commenter also notes that the Project site and its surroundings are located in census tracts that are classified by the State of California as "disadvantaged communities" and states that air pollution from the Project represents an environmental justice issue. As discussed in Section 2.0, *Environmental Setting*, of the Draft EIR, details about the Project site and its surroundings in CalEnviroScreen 4.0 are disclosed in Pages 2-1 through 2-3 of the Draft EIR.

Environmental justice is not a topic that is required to be evaluated or considered pursuant to CEQA Guidelines Sections 15120-15132 (Contents of Environmental Impact Reports). In addition, air quality impacts are not required to be assessed based on census tract locations. Notwithstanding, the air quality analysis contained in the Draft EIR demonstrates that the Project would not expose any sensitive receptor, which includes receptors located in disadvantaged communities, to substantial concentrations of localized criteria pollutants or diesel particulate matter source emissions. To the contrary, the Project would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant (refer to Pages 4.2-35 to 4.2-36 of the Draft EIR).

The commenter is reminded that the Project site is primarily surrounded by industrial uses. The residential land use with the greatest potential exposure to Project operational source emissions is located approximately 8,840 feet (1.67 miles) northwest of the Project site on the opposite side of I-15 and I-10. The nearest school is located 11,200 feet (2.12 miles) away from the Project site. The commenter provides no evidence to support its claim that the Project, which is converting an already developed industrial site in an industrial area of the City, to a contemporary industrial use, would in any way have a significant adverse effect to sensitive receptors located more than 1.6 miles away from the Project site.

B-8 The commenter states that the California Building Energy Code Compliance (CBECC) software is the State's only approved energy compliance software for non-residential buildings in compliance with Title 24. The commenter incorrectly states that CalEEMod-based modeling should not have been used to calculate the Project's potential impacts because it does not comply with 2022 Building Energy Efficiency Standards and underreports the Project's energy impacts and fuel consumption.

The commenter is correct that CBECC software is approved specifically for Title 24 compliance, which would be required to be used for any development project at the time of its physical building construction, which occurs approximately 12-18 months after entitlement. The compliance modeling software referenced by the commenter is used to confirm that a final building design, with detailed information included in its construction drawings, is Title 24 compliant. The proposed Project's final designs and construction drawings are not available at this time and are not typically prepared until after a proposed development project is approved/entitled.

The Draft EIR and underlying technical studies correctly use CalEEMod to estimate energy demand based on average intensity factors for similar land use types based on the Project's site plan provided to the City for entitlement. Since the occupant(s) of the Project's buildings are unknown at this time, and information about the future building user's energy use is also not available at this time, it is appropriate to rely upon the CalEEMod default assumptions which have been derived by the California Air Pollution Control Officers Association (CAPCOA) based on survey data. There is no requirement in CEQA to show specific compliance with 2022 Building Energy Efficiency Standards based on conceptual building designs proposed at the entitlement stage of a project's approval process, but such compliance is a standard regulatory requirement. This will be a requirement pursuant to State law prior to issuance of each building permit and verified by the City's Building and Safety Department.

B-9 The commenter asserts that the Project applicant requested vehicle trip counts be recorded at the project site very early on in the process (March 2022) in order to create artificially inflated trip reduction credits that do not match the Environmental Setting and that the trip reduction credits should be removed in the Draft EIR analysis. The commenter makes an incorrect assumption without substantial evidence that the tenant, Verhoeven Grain, closed its operation on the Project site in September 2022 at the time the Notice of Preparation was released. As discussed in Section 4.1, *Aesthetics*, of the Draft EIR, the Project Site is occupied by

Verhoeven, a grain processing facility (sub-tenant), and The Scoular Company, a corn storage and distribution facility, under existing conditions. (Refer to Draft EIR p. 4.1-1) Verhoeven and The Scoular Company occupied the Project site until April 2023. Therefore, the City's experts disagree with the comment and have determined that the trip counts taken at the Project site are an accurate representation of the Project's environmental setting. Thus, no additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-10 The commenter states that the Draft EIR has not adequately analyzed the project's potential to substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses since there are no exhibits adequately depicting the onsite turning radius available for trucks maneuvering throughout the site. As the commenter's request, the Project's truck turning plan, titled, *Truck Turning Exhibit*, has been added *Attachment C* to the Final EIR. As shown, there is adequate turning radius for trucks to enter and exit the Project site. Therefore, the Project would not create or substantially increase safety hazards due to a design feature or incompatible use and impacts would be less than significant. Thus, no further response is required.

B-11 The commenter asserts that the Draft EIR is deferring analysis related to sight distance. As stated in Section 4.10, *Transportation*, of the Draft EIR, the Project's construction and operation would not create or substantially increase safety hazards due to a design feature or incompatible use. The Project has been designed to provide adequate truck access/circulation and the City of Ontario Engineering Department reviewed the Project's application materials including the Project's preliminary grading, landscape, truck turning, and street improvement plans, and determined that no hazardous transportation design features would be introduced within the City public right-of-way through implementation of the Project. (Refer to Draft EIR p. 4.10-14) The Draft EIR did not defer analysis related to sight distance since the City has already reviewed all Project's plans through the entitlement process, and there is a regulatory requirement for review of detailed construction drawings at the building permit plan check and street improvement plan check stages of Project implementation. Refer to the City of Ontario Municipal Code Sec. 7-3.11. Sight distance. "*No hedge, shrub, or other planting, and no fence or other structure, shall be planted, erected, or maintained in a right-of-way without a permit or upon any sidewalk or shoulder or in such a manner which impedes, obstructs, denies, or impairs the sight distance for safe pedestrian and vehicular traffic.*" Final grading, landscape, and street improvement plans would be submitted to the City for review once the Project's entitlement is approved. Thus, no additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-12 The commenter incorrectly asserts that the Project is not consistent with SCAG's Connect SoCal Goals 5, 6 and 7 due to the alleged error in modeling and significant and unavoidable impacts related to transportation (VMT). Goal 5 of the SCAG's Connect SoCal is to reduce greenhouse gas emissions and improve air quality. As stated in Section 4.10, *Transportation*, of the Draft EIR (refer to Draft EIR p. 4.10-8), the Project is not in conflict with this goal since the Project would have a less than significant impact under the topics of Air Quality (refer to EIR Subsection 4.2) and Greenhouse Gas Emissions (refer to EIR Subsection 4.6).

Additionally, and as discussed in EIR Section 3.0, *Project Description*, and Subsection 4.4, *Energy*, the Project would incorporate various measures required by the California Green Building Standards Code (CALGreen) related to building design, landscaping, and energy systems to promote the efficient use of energy. The Project also would construct roadway frontage improvements, including sidewalks which would encourage walking in the Project area. Therefore, the Project is consistent with Goal 5 of the SCAG's Connect SoCal, and no revisions to the Draft EIR are required.

Goal 6 of the SCAG's Connect SoCal is to support healthy and equitable communities. The proposed building design would support the health of occupants and users by using non-toxic building materials and finishes, and by using windows to maximize natural light and ventilation Additionally, as discussed in the Draft EIR under Threshold c in Section 4.1 (starting on Draft EIR p. 4.2-33), (1) the Project's localized construction and operational emissions would not exceed the SCAQMD localized significance thresholds; (2) based on the Project-specific mobile source health risk assessment (HRA) (*Technical Appendix B2* of the Draft EIR), the Project would not result in significant health impacts due to diesel particulate matter (DPM) emissions; and (3) the Project would not cause or contribute to any CO "hot spots". Therefore, the Project is consistent with Goal 6 of the SCAG's Connect SoCal, and no revisions to the Draft EIR are required.

Goal 7 of the SCAG's Connect SoCal is to adapt to a changing climate and support an integrated regional development. The Project is consistent with this goal because Connect SoCal indicates that since the adoption of the Connect SoCal, there have been significant drivers of change in the goods movement industry including emerging and new technologies, more complex supply chain strategies, evolving consumer demands and shifts in trade policies. Warehouse distribution and ecommerce continues to be one of the most influential factors shaping goods movement. The Project involves the redevelopment of the Project Site, historically used for corn storage and grain mill with a warehouse facility that would diversify the City of Ontario's economy and bring employment opportunities closer to the local workforce. Co-locating jobs near housing reduces greenhouse gas emissions caused by long commutes and contributes to integrated development patterns. Therefore, the Project is consistent with Goal 7 of the SCAG's Connect SoCal, and no revisions to the Draft EIR are required. As such, the Draft EIR provided ample information about the Project's impacts for informed decision-making.

B-13 The commenter states that Draft EIR did not model the Project's energy consumption in compliance with Title 24 modeling software. The Title 24 software is not the appropriate software for use as explained in Response to Comment B-8 regarding the use of the CBECC. The City's experts disagree and thus, no further response is required.

B-14 The commenter incorrectly asserts that the Draft EIR does not discuss the Project's significant and unavoidable Transportation (VMT) impacts and thus the Project's inability to comply with SB 743. The Project's significant and unavoidable VMT impacts are discussed in several sections of the Draft EIR. As discussed in Draft EIR Section 4.10, *Transportation*, the Project

did not meet any of the VMT screening criteria and a project level VMT analysis (*Technical Appendix J* to the Draft EIR) was prepared to assess the Project's potential impact to VMT. As shown in Table 4.10-7, the Project would exceed the City's VMT per SP impact threshold for both the baseline and TOP buildout conditions. Mitigation measure MM 4.10-1 will reduce the Project's VMT per service population by some percentage based on the level of participation achieved, but based on the above-described factors, it is not feasible to reduce VMT to below a level of significance. However, as the Project area and surrounding communities develop as envisioned under the City of Ontario General Plan (TOP), new residential, retail, and industrial development would be implemented. These actions could collectively alter transportation patterns, improve the region's jobs/housing ratio, reduce VMT, and support implementation of new or alternative TDM measures. With the implementation of mitigation measure MM 4.10-1, VMT is expected to be reduced, but the Project's impacts related to VMT would still be significant and unavoidable. (Refer to Draft EIR pp. 4.10-11 to 4.10-14; 4.10-16 to 4.10-17) Therefore, the Draft EIR adequately discloses the Project's significant and unavoidable VMT impacts. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-15 The commenter asserts that the Draft EIR utilizes uncertain and misleading language to support its conclusion that the project will not have growth inducing impacts and that a revised EIR must be prepared to account for longer worker trip distances. The commenter is conflating the Draft EIR's description of the availability of workforce in the area for purposes evaluating growth inducing impacts with worker commute VMT distances. As discussed in the Project's Air Quality Impact Analysis (*Technical Appendix B1* to this Draft EIR), in order to determine emissions from passenger car vehicles, CalEEMod defaults for trip length and trip purpose were utilized. Default vehicle trip lengths for primary trips was populated using data from the local metropolitan planning organizations/Regional Transportation Planning Agencies (MPO/RTPA). Trip type percentages and trip lengths provided by MPO/RTPAs truncate data at their demonstrative borders. Additionally, consistent with City Guidelines and standard VMT calculation methods, total VMT is calculated from San Bernardino Transportation Analysis Model's origin-destination trip matrices and then divided by a project's service population to derive the VMT efficiency metric VMT per service population. Therefore, the City's experts disagree and the Draft EIR adequately analyzes worker trip distances under for air quality, GHG and VMT. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-16 The commenter asserts that an EIR must be prepared to include a cumulative analysis of all cumulative development constructed, approved projects not yet constructed, and "projects in the pipeline" within the City to determine whether the Project would exceed the projected growth determined by The Ontario Plan (TOP 2050). As discussed in in Section 5.4.5, *Population and Housing*, of the Draft EIR, the Project would generate approximately 226 employees and TOP 2050 projected a total of 296,002 jobs in 2050. According to SCAG's 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy, the City of Ontario is anticipated to employ approximately 169,300 persons by 2045 Therefore, the Project's projected employment is well within SCAG's 2045 and the TOP 2050 employment

projection. Further, the Project does not require or include a General Plan Amendment and because the Project is consistent with TOP 2050 land use designation, it is within the growth projections relied upon by the City and other agencies. Additionally, the TOP 2050 growth projection, as analyzed in the City's TOP 2050 SEIR, assumes buildout of all land within the City, which provides a cumulative analysis of the Project in addition to potential projects that will be built in the future. Therefore, the Draft EIR provided an adequate or accurate cumulative analysis and no revisions to the Draft EIR are required.

B-17 The commenter states that the Draft EIR did not provide a consistency analysis for all applicable General Plan goals, policies, and programs. The comment lists a total of 8 goals and policies that should be added to the Draft EIR.

In numerous instances, CEQA case law has held that a project's consistency with a General Plan is not an environmental consideration and does not need to be addressed in a CEQA document (See, e.g., *North Coast Rivers Alliance et al. v. Marin Municipal Water District* (2013) 216 Cal.App.4th 614, 633; *City of Long Beach v. Los Angeles Unified Sch. Dist.*, (2009) 176 Cal. App. 4th 889, 919). What a CEQA document must address is whether the Project would conflict with the General Plan in such a way that it would result in an environmental effect. In the absence of a planning inconsistency that results in an environmental effect, it is adequate to state that no conflict would occur, which was done in the Draft EIR. Separately, as a matter of consistency with City planning documents, the City is required to determine whether the Project is consistent its General Plan, which will be provided in a staff report to the decision makers (Planning Commission and City Council). The commenter does not provide any evidence that the Project would result in an environmental effect due to a conflict with the City's General Plan. Notwithstanding, the reasoning for why each goal and policy was not included are as follows:

- *Policy ER-4.1 Land Use. We reduce GHG and other local pollutant emissions through compact, mixed use, and transit-oriented development and development that improves the regional jobs-housing balance.*

  The Project does not propose mixed use or transit-oriented development. However, as discussed in Draft EIR Section 4.6, *Greenhouse Gas Emissions*, construction and operation of the Project gross emissions from the existing onsite uses would result a net total of new GHG emissions of approximately 2,590.77 $MTCO_2e$/yr, which would fall below the significance threshold of 3,000 $MTCO_2e$/yr; therefore, Project-related GHG emissions are considered less than significant. (Refer to Draft EIR p. 4.6-22.) Therefore, the Project would be consistent with Policy ER-4.1.

- *Policy ER-4.6 Particulate Matter. We support efforts to reduce particulate matter to meet State and Federal Clean Air Standards.*

  As discussed in Draft EIR Section 4.2, *Air Quality*, Project construction and operations would not exceed the applicable SCAQMD thresholds for localized NO_X, CO, and particulate matter

(PM_{10} and $PM_{2.5}$) emissions. (Refer to Draft EIR pp. 4.2-33 to 4.2-34.) Therefore, the Project would be consistent with Policy ER-4.6.

- *Policy CE-2.4 Protection of Investment. We require that new development and redevelopment protect existing investment by providing architecture and urban design of equal or greater quality.*

  As discussed in Draft EIR Section 3.0, *Project Description*, the proposed building would be constructed with concrete tilt-up panels, with special architectural features and colors at the potential office locations at the southwest and southeast corners of the building, which also would feature green reflective glazing. The proposed building's exterior color palette would be comprised of various shades of white, grays, dark grays, and dark green. Moreover, the Project would be conditioned by the City of Ontario to achieve Leadership in Energy and Environmental Design (LEED) standards. (Refer to Draft EIR pp. 3-2 and 3-6.) Therefore, the Project would be consistent with Policy CE-2.4.

- *Policy CE-3.1 Fiscal Impact Disclosure. We require requests for City Council action to disclose the full fiscal impacts, including direct and indirect costs.*

  Policy CE-3.1 is not applicable to the Project since this policy does not mitigate an environmental effect. Thus, no further response is required.

- *Policy M-1.1. Roadways maintain a peak hour Level of Service (LOS) E or better at all intersections. Policy M-1.5 Level of Service. Maintain a peak hour Level of Service (LOS) E or better at all intersections. Maintain Level of Service D or better on arterial streets in the City.*

  Automobile delay, as measured by LOS and other similar metrics, no longer constitutes a significant environmental effect under CEQA. Lead agencies in California are required to use VMT to evaluate project-related transportation impacts. This statewide mandate went into effect July 1, 2020. CEQA Guidelines Section 15064.3, effective January 1, 2019, "describes specific considerations for evaluating a project's transportation impacts" and provides that, except for roadway capacity projects, "a project's effect on automobile delay (or LOS)" shall not constitute a significant environmental impact" (CEQA Guidelines Section 15064.3(a)). Moreover, vehicle congestion is not a CEQA issue as it pertains to LOS. Therefore, Policies M-1.1 and M-1.5 are not applicable to the Project and no revision to the Draft EIR is required.

- *Policy CD-2.8 Safe Design. We incorporate defensible space design into new and existing developments to ensure the maximum safe travel and visibility on pathways, corridors, and open space and at building entrances and parking areas by avoiding physically and visually isolated spaces, maintaining visibility and accessibility, and using lighting.*

  As discussed in Draft EIR Section 4.10, *Transportation*, as a standard condition of approval, the Project would comply with all applicable federal, State, and local design and safety

standards. In addition, the Project would provide sidewalks for pedestrian access and bike racks to meet the needs of multiple transportation modes and users. The Project area is generally surrounded by industrial uses and the Project has been designed to be compatible with the streetscape and surrounding land uses. (Refer to Draft EIR p. 4.10-9.) Therefore, the Project would be consistent with Policy CD-2.8.

- *Policy CD-2.10 Parking Areas. We require all development, including single-family residential, to minimize the visual impact of surface, structured, and garage parking areas visible from the public realm in an aesthetically pleasing, safe and environmentally sensitive manner.*

  As discussed in Draft EIR Section 3.0, *Project Description*, the proposed building would have 54 loading docks and 48 truck trailer parking spaces within the truck court/loading area on the south side of the building. The truck court/loading area would be enclosed and screened from public viewing areas by landscaping and minimum 14-foot-tall concrete tilt screening walls, with 8-foot-tall black tube steel gate used at the access points. (Refer to Draft EIR p. 3-6.) Therefore, the Project would be consistent with Policy CD-2.8.

- *Goal CE-1. A complete community that provides for all incomes and stages of life.*

  Goal CE-1 is not applicable to the Project since this goal does not mitigate an environmental effect. Thus, no further response is required.

- *Policy CE-1.2 Jobs and Workforce Skills. We use our economic development resources to: 1. attract jobs suited for the skills and education of current and future City residents.*

  Policy CE-1.2 is not applicable to the Project since this policy does not mitigate an environmental effect. Thus, no further response is required.

- *Policy CE-2.1 Development Projects. We require new development and redevelopment to create unique, high-quality places that add value to the community.*

  The Project would be subject to applicable development regulations and design standards, including, but not limited to the Ontario Development Code. Mandatory compliance to applicable development regulations and design standards would ensure that developments would incorporate high quality building materials, site design, and landscaping to the Project's design. Therefore, the Project would be consistent with Policy CE-2.1.

- *Policy CE-2.2 Development Review. We require those proposing new development and redevelopment to demonstrate how their projects will create appropriately unique, functional, and sustainable places that will compete well with their competition within the region.*

  Policy CE-2.2 is not applicable to the Project since this policy does not mitigate an environmental effect. Thus, no further response is required.

- *Policy CE-2.4 Protection of Investment. We require that new development and redevelopment protect existing investment by providing architecture and urban design of equal or greater quality.*

  The Project involves the redevelopment of the Project Site (previously used for corn storage and grain mill with a warehouse facility) with a contemporary warehouse facility which has been designed to be visually compatible with the adjacent building field colors. The Project would be conditioned by the City of Ontario to achieve Leadership in Energy and Environmental Design (LEED) standards. Therefore, the Project would be consistent with Policy CE-2.4.

- *Policy M-1.6 Reduce Vehicle Miles Traveled. We will strive to reduce VMT through a combination of land use, transportation projects, travel demand management strategies, and other trip reduction measures in coordination with development projects and public capital improvement projects.*

  As discussed in Draft EIR Section 4.10, *Transportation*, the Project would result in significant and unavoidable VMT impacts. Although the Project would exceed the City's VMT per Service Population impact threshold for both the baseline and TOP buildout conditions, all feasible mitigation measures have been included to reduce VMT impacts. Therefore, the Project would be consistent with Policy M-1.6.

B-18 The commenter asserts that the Draft EIR does not provide information or analysis on the buildout conditions of the TOP 2050 and that the Project and the East State Street Warehouse Project (a separate previously approved project with independent utility from the proposed Project) represents 0.33% of the TOP 2050 buildout for Industrial uses, which is considered significant. Refer to Response to Comment B-4 regarding the relation between the proposed Project and the approved East State Street Warehouse Project and Response to Comment B-16 for a detailed discussion of the Project's cumulative analysis and its consistency with SCAG's and TOP 2050 growth projections. The City's experts disagree and no further response is warranted.

B-19 The commenter asserts that the Draft EIR utilizes uncertain and misleading language which does not provide any meaningful analysis of the Project's impacts to population and employment generation and that the EIR must be prepared to provide an accurate estimate of employees generated by all uses of the Project. As discussed in in Draft EIR Section 5.4.5, *Population and Housing*, the Project would generate approximately 226 employees and TOP 2050 projected a total of 296,002 jobs in 2050. Therefore, the Project's projected employment is well within TOP 2050 employment projection in 2050. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-20 The commenter asserts that a revised EIR must be prepared to provide a cumulative analysis discussion of projects approved since 2016 and projects "in the pipeline" to determine if the Project will exceed the employment/population growth forecasts by SCAG and/or the General

Plan. Refer to Response to Comment B-16 for a detailed discussion of the Project's cumulative analysis and its consistency with SCAG's and TOP 2050 growth projections. The City's experts disagree with the commenter and thus no further response is warranted.

B-21 The commenter incorrectly asserts that the Draft EIR does not evaluate a reasonable range of alternatives as only two alternatives beyond the No Project alternative are analyzed. As discussed in Section 6.0, *Alternatives*, of the Draft EIR, an alternative sites alternative was considered but rejected since an alternative location is not available that would avoid or substantially lessen the significant environmental effects of the Project, and because the Project Applicant does not have ownership control over, and cannot reasonably obtain ownership control over, any other parcels of land of adequate size in the jurisdiction of the City that could accommodate the Project. Pursuant to State CEQA Guidelines Section 15126.6(a) "[a]n EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives which are infeasible. In determining an appropriate range of alternatives to be evaluated in this EIR, a number of possible alternatives were initially considered and, for a variety of reasons, rejected. In accordance with State CEQA Guidelines section 15126.6(c), alternatives were rejected because either: 1) they could not accomplish the basic objectives of the Project, 2) they would not have resulted in a reduction of significant adverse environmental impacts, or 3) they were considered infeasible to construct or operate. (Refer to Draft EIR pp 6.4 to 6.5.) Therefore, contrary to the commenter's assertion, the Draft EIR adequately identities a range of alternatives and no revisions to the Draft EIR are required.

B-22 This comment provides conclusionary remarks. The City acknowledges the statement of interest and will include GSEJA on the mailing list for future CEQA notices related to the Project.

B-23 The commenter summarizes the Project description and incorrectly claims that the Draft EIR's hazards and hazardous materials, air quality, health risk and GHG emissions impacts are underestimated and request preparation of an updated EIR based on subsequent comments. This is a summary of the detailed comments provided in the body of the commenter letter, which are responded to the in following responses to Comments B-18 through 1-82. Thus, the City's experts disagree and no further response is required.

B-24 The commenter summarizes the Draft EIR's analysis related to the potential of tetrachloroethylene (PCE) onsite and mitigation measure MM 4.7-1. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required.

B-25 The commenter asserts that mitigation measure 4.7-1 failed to include the recommendation from the Project's Phase I/Phase II Environmental Site Assessment Report (*Technical Appendix G* to the Draft EIR) related to the potential of PCE in the indoor air of the future building. During additional soil investigations conducted at the site in December 2022 and

September 2023 (as shown in *Attachments D and E* to this Final EIR), tetrachloroethene (PCE) detections in soil gas either were not detected above laboratory reporting limits or were less than the calculated soil gas screening level using a 0.03 attenuation factor. Soil vapor sampling locations were chosen in areas of known impacts and sampling data from the last two sampling rounds at the Project site has not established the potential for an unacceptable vapor intrusion risk in the planned future building footprint. Soil impacts (if any) associated with previous industrial activities and features at the site that may be encountered during site redevelopment will be addressed and managed by the implementation of a Media Management Plan (*Attachment F* to this Final EIR). The purpose of a Media Management Plan is to provide protocols for managing confirmed and potentially contaminated media that may be encountered during future improvement activities involving subsurface work at the Project site. Thus, the City's experts disagree and no additions, revisions, or corrections to the Draft EIR are necessary.

B-26 The commenter states that the use of CalEEMod Version 2022.1 to estimate the Project emissions is an issue since it is a soft release and complete JavaScript Object Notation (JSON) output flies were not presented. The commenter is incorrect as CalEEMod 2022 is no longer a soft release and should be used over 2020 as it is the newest model that more accurately presents emissions as compared to CalEEMod 2020. Additionally, the JSON model input files are available for review and were also provided upon request during the public review process to SCAQMD. Therefore, the City's experts disagree and no additions, revisions, or corrections to the Draft EIR are necessary.

B-27 The commenter asserts that the Draft EIR understates the Project's construction and operational air pollutant emissions due to assumptions that are purported to be unsubstantiated. Refer to Response to Comment B-26 regarding the use of CalEEMod 2022.1 and complete output files. Therefore, the City's experts disagree and no additions, revisions, or corrections to the Draft EIR are necessary.

B-28 The commenter questions the changes made to the CalEEMod defaults used in the Project analysis and states that the changes to the individual construction phase lengths remain unsubstantiated or identified in the Draft EIR. The changes to the Project's construction schedule are summarized and disclosed in the Draft EIR and underlying the Project's Air Quality Impact Analysis (*Technical Appendix B1* to the Draft EIR), which provides a detailed summary of the start and end dates of construction along with the number of working days of activity. To the contrary, Page 33 of the Project's Air Quality Impact Analysis clearly states, that "The duration of construction and associated equipment represents a reasonable approximation of the expected construction fleet as required per CEQA Guidelines." In this case, site-specific information was provided by the Project Applicant relative to the Project's construction schedule and equipment list were reviewed and provided. Therefore, the City's experts disagree and no additions, revisions, or corrections to the Draft EIR are necessary.

B-29 The commenter claims that unsubstantiated architectural coating emissions parameters were used to estimate VOC emissions from Project construction since the accuracy of the revised

architectural coating emission factors based on SCAQMD Rule 1113 cannot be verified. As stated in Section 4.2, *Air Quality*, of the Draft EIR (refer to Draft EIR p. 4.2-19) and the Project's Air Quality Impact Analysis (*Technical Appendix B1* to the Draft EIR, p. 2), the Project would be required to comply with SCAQMD Rule 1113 which limits the VOC content of architectural coatings to 50 g/l for the building envelope. The "building envelope" coating category is appropriate to use for the Project because the primary painting activities would be for the physical interior and exterior structure (walls), which constitute the "building envelope." The SCAQMD's rule also serves as substantial evidence because SCAQMD is the applicable jurisdiction governing air quality in the Project's region. Therefore, the City's experts disagree and the Project's Draft EIR relied on appropriate assumptions to quantify construction-related VOC emissions. No additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-30 The commenter further claims that unsubstantiated architectural coating emissions parameters were used to estimate VOC emissions from Project construction by citing Table 5.5 in the Project's Air Quality Impact Analysis (*Technical Appendix B1* to the Draft EIR). The commenter goes on to cite notes that were added in the modeling output files to substantiate the changes to the model defaults but erroneously dismisses the notes. Refer to Response to Comment B-29 above regarding the assumption used. Thus, the City's experts disagree and no further response is required.

B-31 The commenter asserts that the Draft EIR understates the Project's operational air pollutant emissions due to the model changes to the fleet mix that are purported to be unsubstantiated. Pages 36 through 38 of the Project's Air Quality Impact Analysis clearly states that the Project-specific passenger car fleet mix used in this analysis is based on a proportional split utilizing the default CalEEMod percentages assigned to LDA, LDT1, LDT2, and MDV vehicle types and that the Project-specific truck fleet mix is based on the number of trips generated by each truck type (LHDT1, LHDT2, MHDT, and HHDT) e.g. 2, 3 & 4+ axle trucks, relative to the total number of truck trips. As such, the truck mix was adjusted according to the truck trips taken from the Project's Trip Generation Assessment (*Technical Appendix K* to the Draft EIR). This fleet mix adjustment was made to appropriately account for the emissions from passenger cars vs trucks. The Project's air quality analysis is technically sound and relied on appropriate assumptions and methodologies that are supported by substantial evidence. Also refer to Response to Comment B-26, B-27 and B-28. The City's experts disagree and thus, no additions, revisions, or corrections to the Draft EIR are necessary and no further response is required.

B-32 The commenter claims that the use of Tier 4 construction equipment modeled is not formally included as mitigation measures, and it cannot be guaranteed that these standards would be implemented, monitored, and enforced on the Project site. Contrary to what the commentor states, the Project's Air Quality Impact Analysis (*Technical Appendix B1* to the Draft EIR) state that under the City of Ontario General Plan, construction activities associated with future developments accommodated under the general plan would require the use of construction equipment meeting at least Tier 4 Interim exhaust emission limits (refer to *Technical Appendix*

B1 pp. 3 and 33). As such, the proposed Project will utilize equipment meeting at least Tier 4 Interim standards. The use of Tier 4 as stated above is required under the City of Ontario General Plan and as such will be enforced by the City.

B-33 The commenter provides an alternative air pollution analysis (CalEEMod v. 2020.4.0 with varying defaults set) that claims to demonstrate that the Project would result in a significant impact during construction from VOC emissions. First, the commenter does not provide any substantiation for the assumptions made in the alternative air quality modeling. Second, the version of the air quality analysis model used by the commenter (CalEEMod Version 2020.4.0) is outdated and has been replaced by a subsequent model update (CalEEMod Version 2022.1, which is the model used for the Project's analysis). Use of CalEEMod Version 2020.4.0 is no longer deemed acceptable by the South Coast Air Quality Management District. As demonstrated by Responses to Comments B-26 through B-32, the Project's air quality analysis is technically sound and relied on appropriate assumptions and methodologies that are supported by substantial evidence. Thus, the City's experts disagree and no additions, revisions, or corrections to the Draft EIR are necessary.

B-34 The commenter states that the Draft EIR' potential health risk impacts are incorrect since the Project' Health Risk Assessment (*Technical Appendix B2* of the Draft EIR) rely upon emissions estimates from a flawed air model. Refer to Response to Comment B-26 regarding the use of CalEEMod 2022.1. Thus, the City's experts disagree and no additions, revisions, or corrections to the Draft EIR are necessary.

B-35 The commenter states that Draft EIR's operational Health Risk Assessment underestimates the Fraction of Time At Home ("FAH") values for the third trimester, infant, and child receptors. The Draft EIR and Project' Health Risk Assessment (*Technical Appendix B2* of the Draft EIR), includes a construction and operational HRA, including the total combined risk for Project construction and operation combined. Contrary to the commenter's assertion that this data was not presented. Additionally, the Project correctly evaluates risk based on the fraction of time at home (FAH) based on SCAQMD and OEHHA guidance as discussed and disclosed in the technical Appendix B1.

Further, the analysis was performed based on SCAQMD and CARB RMP guidelines, which recommend using 95th percentile breathing rates for the -0.3<2 age group and 80th percentile breathing rates for all other ages.

Per OEHHA's 2015 Risk Assessment Guidelines, an FAH 0.85 for 3rd trimester and 0<2 years and 0.72 for 2<16 years should be utilized, unless a school is located within the 1.0E-6 cancer risk isopleth, in which case 1.0 should be utilized. As there are no schools located within the 1.0E-6 cancer risk isopleth, FAH values of 0.85 and 0.72 were used for the 3rd Trimester/0<2 years and 2<16 years age groups, respectively (See Air Toxics Hot Spots Program Guidance Manual February 2015, Page 8-5).

The FAH value is utilized in risk assessments to estimate potential exposures to environmental hazards. The conservative approach of using 0.85 provides an additional safety margin by assuming that exposure to hazards is reduced due to time spent away from home. This approach aligns with the principle of protecting public health and minimizing potential risks. Assuming an FAH value of 1.0 may lead to unrealistic scenarios in risk assessments and policy development. It does not accurately reflect real-world conditions and could result in unnecessary burdens. By using 0.85, OEHHA strikes a balance between protective measures and practicality, ensuring that risk assessments are grounded in realistic assumptions. Thus, the City's experts disagree and no further response is required.

B-36 The commenter states that Health Risk Assessment may fail to include Age Sensitivity Factors ("ASFs"). Refer to Response to Comment B-35 above regarding the Project's methodology for calculating health risk analysis. Thus, the City's experts disagree and no further response is required.

B-37 The commenter summarizes the Project's GHG emission impacts and asserts that the analysis is incorrect for three reasons which are discussed below under Response to Comment B-38 through B-40. Thus, the City's experts disagree and no further response is required.

B-38 The commenter states that the Project provides incorrect GHG analysis due to reliance on an outdated threshold and unsubstantiated air model. However, the commenter provides no substantial evidence of a significant environmental impact. The comment does not contain any information requiring further changes to the Draft EIR. Thus, the City's experts disagree and no further response is required.

B-39 The commenter opines that the Draft EIR relies on an outdated GHG threshold (2020) and that the threshold should instead be based on a recommendation discussed at a 2010 SCAQMD working group meeting, which is documented in meeting notes as 3.0 metric tons of carbon dioxide equivalents per service population per year. The City and its experts disagree with the use of the commenter's suggested service population threshold, primarily because it is not an adopted threshold whereas the threshold used in the Draft EIR is in fact adopted by the SCAAQMD and is a statistically sound threshold. The 3,000 $MTCO_2e$ per year threshold is based on a 90 percent emission "capture" rate methodology. Prior to its use by the SCAQMD, the 90 percent emissions capture approach was one of the options suggested by the California Air Pollution Control Officers Association (CAPCOA) in their CEQA and Climate Change white paper (2008). A 90 percent emission capture rate means that unmitigated GHG emissions from the top 90 percent of all GHG-producing projects within a geographic area – the SCAB in this instance – would be subject to a detailed analysis of potential environmental impacts from GHG emissions, while the bottom 10 percent of all GHG-producing projects would be excluded from detailed analysis. In setting the threshold at 3,000 $MTCO_2e$ per year, SCAQMD researched a database of projects kept by the Governor's Office of Planning and Research (OPR). That database contained 798 projects, 87 of which were removed because they were very large projects and/or outliers that would skew emissions values too high, leaving 711 as the sample population to use in determining the 90th percentile capture rate. The SCAQMD

analysis of the 711 projects within the sample population combined commercial, residential, and mixed-use projects. It should be noted that the sample of projects included warehouses and other light industrial land uses but did not include industrial processes (i.e., oil refineries, heavy manufacturing, electric generating stations, mining operations, etc.). Emissions from each of these projects were calculated by SCAQMD to provide a consistent method of emissions calculations across the sample population and from projects within the sample population. In calculating the emissions, the SCAQMD analysis determined that the 90th percentile ranged between 2,983 to 3,143 $MTCO_2e$ per year. The SCAQMD set their significance threshold at the low-end value of the range when rounded to the nearest hundred tons of emissions (i.e., 3,000 MTCO2e per year) to define small projects that are considered less than significant and do not need to provide further analysis.

The City understands that the 3,000 $MTCO_2e$ per year threshold for residential/commercial uses was proposed by SCAQMD a decade ago and was adopted as an interim policy; however, no permanent, superseding policy or threshold has since been adopted. The 3,000 $MTCO_2e$ per year threshold was developed and recommended by SCAQMD, an expert agency, based on substantial evidence as provided in the Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold (2008) document and subsequent Working Group meetings (latest of which occurred in 2010). SCAQMD has not withdrawn its support of the interim threshold and all documentation supporting the interim threshold remains on the SCAQMD website on a page that provides guidance to CEQA practitioners for air quality analysis (and where all SCAQMD significance thresholds for regional and local criteria pollutants and toxic air contaminants also are listed). Further, as stated by SCAQMD, this threshold "uses the Executive Order S-3-05 goal [80 percent below 1990 levels by 2050] as the basis for deriving the screening level" and, thus, remains valid for use in 2022. Lastly, this threshold has been used for hundreds, if not thousands, of GHG analyses performed for projects located within the SCAQMD jurisdiction.[2]

B-40 The commenter states that the Project would result in a significant GHG impact when the suggested SCAQMD 2035 3.0 metric tons threshold is applied. As provided above in Response to Comment B-39, the Project applied the appropriate and SCAQMD adopted GHG threshold. Therefore, the GHG analysis is accurate, and the Project would result in less than significant GHG impacts. The comment does not contain any information requiring further changes to the Draft EIR. Thus, the City's experts disagree and no further response is required.

B-41 The commenter recommends consideration of measures (identified below) found in the Department of Justice Warehouse Project Best Practices document be included in the Draft EIR. The commenter requests requiring off-road construction equipment to be hybrid electric-diesel or zero emission, where available, and all diesel-fueled off-road construction equipment to be equipped with CARB Tier IV-compliant engines or better. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, emissions resulting from the Project construction will not exceed criteria pollutant thresholds established by the SCAQMD for emissions of any criteria pollutant

[2] https://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds

(Refer to Draft EIR p. 4.2-31). Thus, the City determines that additional mitigation is not warranted.

B-42 The commenter requests prohibition of off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, emissions resulting from the Project construction will not exceed criteria pollutant thresholds established by the SCAQMD for emissions of any criteria pollutant (Refer to Draft EIR p. 4.2-31). Thus, the City determines that additional mitigation is not warranted.

B-43 The commenter requests to use electric-powered hand tools, forklifts, and pressure washers, and providing electrical hook ups to the power grid rather than use of diesel-fueled generators to supply their power. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-44 The commenter requests designation of an area in the construction site where electric-powered construction vehicles and equipment can charge. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, emissions resulting from the Project construction will not exceed criteria pollutant thresholds established by the SCAQMD for emissions of any criteria pollutant (Refer to Draft EIR p. 4.2-31). Thus, the City determines that additional mitigation is not warranted.

B-45 The commenter requests mitigation to limit the amount of daily grading disturbance area, but does not provide an exact quantity. The construction analysis included extremely conservative assumptions on the amount of acres that could be actively graded per day to provide a worst case analysis of air quality impacts. Additionally, limiting the amount of grading per day will not change the overall amount of grading required for the Project, which would result in the same overall impact. Therefore, the Draft EIR made reasonable assumptions based on equipment and schedule and disclosed the maximum emissions per day, therefore, no further mitigation is required.

B-46 The commenter requests mitigation to prohibit grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area.

Table 4.2-10, *Localized Construction-Source Emissions Summary*, of the Draft EIR, identifies the localized impacts at the nearest receptor location in the vicinity of the Project. For analytical purposes, emissions associated with peak grading activities are considered for purposes of LSTs since these phases represents the maximum localized emissions that would occur. Any other construction phases of development that overlap would result in lesser emissions and consequently lesser impacts than what is disclosed herein. As shown, Project-related construction emissions would not exceed the applicable SCAQMD LSTs for CO, NO_X, PM_{10}, or $PM_{2.5}$ at the maximally impacted receptor location. All other modeled locations in the study area would experience a lesser concentration and consequently a lesser impact. Accordingly,

construction of the Project would not result in the exposure of any sensitive receptors to substantial pollutant concentrations. Therefore, localized emissions from construction of the Project would result in less than significant impacts.

Furthermore, the land use with the greatest potential exposure to Project construction DPM source emissions is Location R6 which is located approximately 8,840 feet northwest of the Project Site at an existing residence located at 11210 Fourth Street on the opposite side of I-10 and SR-60 from the Project Site. Since there are no private outdoor living areas (backyards) facing the Project Site, receptor R6 is placed at the building façade facing the Project Site. At the maximally exposed individual receptor (MEIR), the maximum incremental cancer risk attributable to Project construction DPM source emissions is estimated at <0.01 in one million, which is less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be (Refer to Draft EIR p. 4.2-35).

Lastly, with respect to the request to limit activities if the Air Quality Index (AQI) exceeds 100, it should be noted that pursuant to EPA documentation, an AQI of over 100 is generally correlated when the ambient air quality standards are exceeded. Further, AQI is monitored at a regional level and not necessarily representative of local conditions that would occur adjacent to the Project site – which is important for determining local construction impacts. As noted above, the Project does not exceed any of the applicable ambient air quality standards during construction activity as evidenced by the modeling conducted in support of the LST analysis. Because the Project would not result in a significant health risk to sensitive receptors during construction, there is no need to limit grading activities. Thus, the City determines that additional mitigation is not warranted.

B-47 The commenter requests mitigation to forbid idling of heavy equipment for more than three minutes. As discussed in Section 4.4, *Energy*, of the Draft EIR, CCR Title 13, Title 13, Motor Vehicles, Section 2449(d)(3) Idling, limits idling times of construction vehicles to no more than 5 minutes, thereby precluding unnecessary and wasteful consumption of fuel due to unproductive idling of construction equipment or potential additional pollutants generated by starting equipment as opposed to idling. Best Available Control Measure (BACMs) inform construction equipment operators of this requirement. Enforcement of idling limitations is realized through periodic site inspections conducted by City building officials, and/or in response to citizen complaints (Refer to Draft EIR p. 4.4-5). Thus, the City determines that additional mitigation is not warranted.

B-48 The commenter requests that the contractor keep a record of all equipment maintenance and data sheets, including design specifications and emission control tier classifications; and furnish such list to the lead agency or other regulators upon request. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-49 The commenter requests the requirement of on-site inspections to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, emissions resulting from the Project construction will not exceed criteria pollutant thresholds established by the SCAQMD for emissions of any criteria pollutant (refer to Draft EIR p. 4.2-31). Thus, the City determines that additional mitigation is not warranted.

B-50 The commenter requests to use paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L. The Project would be required to comply with SCAQMD Rule 1113, which serves to limit the volatile organic compounds (VOC) content of architectural coatings used on projects in the SCAQMD. Any person who supplies, sells, offers for sale, or manufactures any architectural coating for use on projects. Thus, the City determines that additional mitigation is not warranted.

B-51 The commenter requests to provide information on transit and ridesharing programs and services to construction employees. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-52 The commenter requests the provision of meal options onsite or of shuttles between the facility and nearby meal destinations for construction employees. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-53 The commenter suggests requiring that all heavy-duty vehicles engaged in drayage to or from the project site to be zero emission beginning in 2030. As discussed further below, there are several economic and infrastructure constraints that make the suggested mitigation measure infeasible today and likely well into the future. The first major issue that makes requiring all trucks accessing the Project site to be zero-emissions infeasible, is that there is not enough electrical grid power to sustainably charge these trucks. For example, one trucking company tried to electrify just 30 trucks at a terminal in Joliet, Illinois. Shortly after this plan began, local officials shut it down, commenting that it would draw more electricity than is needed to power the entire city.[3] Even more relevant, a California company attempted to electrify 12 forklifts, which require significantly less power than trucks.[4] Local power utilities told the California company that it was not possible.[5] In a May 2023 report by Resources for the Future, titled "Medium- and Heavy-Duty Vehicle Electrification: Challenges, Policy Solutions, and

[3] https://www.trucking.org/news-insights/heavy-dose-reality-electric-truck-mandates
[4] *Id*.
[5] *Id*.

Open Research Questions," the report states that medium- and heavy-duty electric vehicle (MHDEV) charging (which may exceed several MWs of demand for large fleets) could destabilize electricity distribution systems.[6] Therefore, significant investments into the grid, transmission system, and generation capacity is required.[7] If the Project requires each and every truck entering the facility to be zero-emissions, doing so would put a significant strain on California's power grid; and a strain that the grid cannot handle in the short-term, must less sustain in the long run.

Not only can local and state electrical infrastructure not sustain fully electric trucks, the logistical and operational barriers of using such trucks is also extremely prohibitive. To gain widespread use, MHDEVs must be comparable to diesel vehicles in model options, range, recharge time, payloads, and maintenance.[8] However, MHDEVs generally have ranges below 200 miles, versus more than 1,000 miles for diesel vehicles.[9] Additionally recharge times are substantially longer than diesel refueling. For example, a clean diesel truck can spend 15 minutes fueling anywhere in the country and then travel about 1,200 miles before fueling again.[10] In contrast, today's long-haul battery electric trucks have a range of about 150-330 miles and can take up to 10 hours to charge.[11]

Moreover, fleets without a charging depot will need to rely on public charging stations. Unfortunately, significant investment must first be made before widespread public charging is feasible.[12] Lastly, weight of MHDEVs is also a significant issue that will lead to increased operational barriers. Battery-electric trucks, which run on two approximately 8,000 pound lithium ion batteries, are far heavier than clean diesel trucks.[13] Because trucks are subject to strict federal and state weight limits, as seen by weighing stations throughout California and the United States, requiring zero-emission battery electric trucks will significantly decrease the payload of each truck, thus requiring more trucks to be on the road and increasing both traffic congestion and tailpipe emissions.[14]

Finally, if the above challenges were not enough, there is a significant constraint in sourcing enough raw minerals needed to produce the lithium-ion batteries uses in zero-emission trucks. For example, tens of millions of tons of cobalt, graphite, lithium, and nickel will need to be produced.[15] It is estimated that it could take up to 35 years to acquire all the minerals needed to generate enough truck batteries for current levels of global production.[16] Additionally,

[14] *Id*.
[15] https://www.trucking.org/news-insights/heavy-dose-reality-electric-truck-mandates
[16] *Id*.

expanding capacity and sourcing this amount of material creates massive environmental effects, that in some respects could exceed the emissions of current clean-diesel trucks.[17]

An EIR must describe feasible measures that could minimize the project's significant adverse impacts. 14 Cal Code Regs §15126.4(a)(1). An EIR may decline to propose a mitigation measure that would not effectively address a significant impact. An EIR also need not identify and discuss mitigation measures that are infeasible. Nor must an EIR analyze in detail mitigation measures it concludes are infeasible.

Further, SCAQMD recently adopted a Warehouse Indirect Source Rule, Rule 2305, in May 2021. Rule 2305 applies to warehouse operators and owners of warehouses greater than or equal to 100,000 square feet of indoor floor space within a single building that may be used for warehousing activities. The Project includes the development of 270,337 sf speculative warehouse and office building and would be subject to compliance with Rule 2305. Since the proposed Project will not be operated by the current owner, it is not feasible to commit to specific provisions of Rule 2305; however, future tenants will be obligated to comply with its provisions. In general, the Rule establishes the Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, which is a points system that is based upon the actual number of trucks that come to and leave the warehouse. Each year the operator will be obligated to determine how many points the warehouse is required to achieve using a formula set out in the Rule. If the required number of points are not achieved, the warehouse operator would be required to pay a fee to the SCAQMD, which would use collected funds to improve air quality. Although compliance with Rule 2305 is not mitigation and the SCAQMD has not published a nexus study showing how the use of collected funds has nexus to the warehouse's air quality impacts, the program is intended to reduce air quality effects associated with the warehouse industry, including the Project, throughout the Air Basin. Compliance with Rule 2305 would reduce air quality effects associated with the warehouse industry, including the Project, throughout the air basin, although quantification of such reductions is not feasible at this time. Thus, the City determines that additional mitigation is not warranted.

B-54 The commenter requests to require all on-site motorized operational equipment, such as forklifts and yard trucks, to be zero-emission with the necessary charging or fueling stations provided. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-55 The commenter requests mitigation to require tenants to use zero-emission light- and medium-duty vehicles as part of business operations. Refer to response to Comment B-53 regarding the feasibility of using zero-emission vehicles.

[17] *Id*.

B-56 The commenter requests mitigation to forbid trucks from idling for more than three minutes and requiring operators to turn off engines when not in use. The Project shall comply with California Code of Regulations Title 13, Division 3, Chapter 10, Article 1, Section 2485, "Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling, limits nonessential idling to five minutes or less for commercial trucks. Thus, the City determines that additional mitigation is not warranted.

B-57 The commenter requests to post both interior- and exterior-facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the local air district, and the building manager. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-58 The commenter requests installation of solar photovoltaic systems on the project site of a specified electrical generation capacity that is equal to or greater than the building's projected energy needs, including all electrical chargers. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-59 The commenter request to design all project building roofs to accommodate the maximum future coverage of solar panels and installing the maximum solar power generation capacity feasible. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-60 The commenter requests that the Project construct zero-emission truck charging/fueling stations proportional to the number of dock doors at the project. As stated in response to Comment B-53 requiring zero-emission vehicles is currently technologically infeasible; also, such vehicles are not available on a large enough scale to be relied upon. Therefore, the current technology required for EV truck charging stations is unknown and technologically infeasible. Thus, the City determines that additional mitigation is not warranted.

B-61 The commenter requests that the Project run conduit to designated locations for future electric truck charging stations. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-62 The commenter request that unless the owner of the facility records a covenant on the title of the underlying property ensuring that the property cannot be used to provide refrigerated warehouse space, constructing electric plugs for electric transport refrigeration units at every dock door and requiring truck operators with transport refrigeration units to use the electric plugs when at loading docks. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-63 The commenter requests mitigation to oversize electrical rooms by 25 percent or providing a secondary electrical room to accommodate future expansion of electric vehicle charging capability. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-64 The commenter requests the Project construct and maintain electric light-duty vehicle charging stations proportional to the number of employee parking spaces (for example, requiring at least 10% of all employee parking spaces to be equipped with electric vehicle charging stations of at least Level 2 charging performance). As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Additionally, of the 251 on-site passenger vehicle spaces, 25 would be designated as electric vehicle parking stalls (Refer to Draft EIR p. 3-6). Thus, the City determines that additional mitigation is not warranted.

B-65 The commenter requests the Project run conduit to an additional proportion of employee parking spaces for a future increase in the number of electric light-duty charging stations. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-66 The commenter requests the installation and maintenance, at the manufacturer's recommended maintenance intervals, of air filtration systems at sensitive receptors within a certain radius of facility for the life of the project. As discussed in Section 4.2, *Air Quality*, of the Draft EIR, the nearest maximally exposed individual receptor to the Project site is Location R6 which is located approximately 8,840 feet northwest of the Project Site at an existing residence located at 11210 Fourth Street on the opposite side of I-15 and I-10 from the Project Site. As concluded in Table 4.2-10, *Localized Construction-Source Emissions Summary*, construction of the Project would not result in the exposure of any sensitive receptors to substantial pollutant concentrations (refer to Draft EIR p. 4.2-33). Similarly, Table 4.2-11, *Localized Operational-Source Emissions Summary*, concluded that operational emissions would not exceed the

SCAQMD's localized significant thresholds at the maximally impacted receptor location. (refer to Draft EIR p. 4.2-34). Thus, the City determines that additional mitigation is not warranted.

B-67 The commenter requests the installation and maintenance, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project, and making the resulting data publicly available in real time. As stated above in response to Comment B-66, the Project would not result in significant air quality related health risk impacts during construction or operation, therefore additional mitigation is not warranted.

B-68 The commenter requests mitigation to require all stand-by emergency generators to be powered by a non-diesel fuel. Emergency generators would only be used in emergency power failure or for routine testing and maintenance. Such intermittent use would not a substantial amount of emissions, since by the very nature of the activity, it would be short-term, intermittent, and infrequent. Requiring that emergency generators to be powered by non-diesel fuel would not result in a significant reduction in air quality emission impacts. Thus, the City determines that additional mitigation is not warranted.

B-69 The commenter requests facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. Refer to response to Comment B-56 for a detailed discussion on idling of trucks and response to Comment B-74 regarding directional signs to truck routes. Thus, the City determines that additional mitigation is not warranted.

B-70 The commenter requests mitigation to establish and promote a rideshare program that discourages single occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-71 The commenter requests Project buildings meet CalGreen Tier 2 green building standards, including all provisions related to designated parking for clean air vehicles, electric vehicle charging, and bicycle parking. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Additionally, of the 251 on-site passenger vehicle spaces, 25 would be designated as electric vehicle parking stalls. Bike racks would also be provided near the building entrances and adjacent to the electrical room (Refer to Draft EIR p. 3-6). Thus, the City determines that additional mitigation is not warranted.

B-72 The commenter requests the Project design buildings to LEED green building certification standards. As discussed in Section 3.0, *Project Description*, of the Draft EIR, the Project building would be conditioned by the City of Ontario to achieve LEED standards (Refer to Draft EIR p. 3-2). Thus, the City determines that additional mitigation is not warranted.

B-73 The commenter requests mitigation requiring meal options onsite or shuttles between the facility and nearby meal destinations. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-74 The commenter requests mitigation to post signs at every truck exit driveway providing directional information to the truck route. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-75 The commenter requests that the Project Applicant improve and maintain vegetation and tree canopy for residents in and around the project area in order to reduce air quality and GHG emissions. Improving and maintaining vegetation and the tree canopy for residents in and around the Project site would not have any effect on reducing the Project's air quality and GHG emissions. Therefore, this measure is not warranted. However, the Project would provide extensive landscape on the Project site. As depicted on Figure 3-6, *Proposed Landscape Plan*, the Project would include 72,527 (12.72%) square feet of landscaping. Thus, the City determines that additional mitigation is not warranted.

B-76 The commenter requests that the Project Applicant require that every tenant (1) train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB-approved courses; and (2) require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request. The Project would be subject to compliance with SCAQMD Rule 2305. As part of Rule 2305, facilities would be required to report information about facility operations to SCAQMD each year and recordkeeping of onsite operations. Therefore, the City determines that additional mitigation is not warranted.

B-77 The commenter requests that the Project Applicant require tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants who own, operate, or hire trucking carriers with more than 100 trucks to use carriers that are SmartWay carriers. The US EPA SmartWay Program is a voluntary public-private program. The Project Applicant or City cannot control the types of trucks coming to the Project site. Because building occupants/tenants are not yet identified, it is highly speculative to assume that the building occupants/tenants will own or control a fleet of trucks. The large majority of warehouses are

served by contracted trucking companies and independent drivers and the building occupant/tenant may have no control over the truck engine type, in which case the building occupant/tenant would need to comply with Rule 2305's requirements through a suite of equivalent measures or payment of the required fee to reduce Air Quality impacts as required by the Rule. Thus, the City determines that additional mitigation is not warranted.

B-78 The commenter requests to provide tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets. As concluded in Section 4.2, *Air Quality*, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32). Thus, the City determines that additional mitigation is not warranted.

B-79 The commenter makes a concluding, conclusory comment that the suggested mitigation measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. Refer to response to Comments B-41 to B-78 for a detailed discussion on the suggested mitigation measures.

The commenter also emphasizes the applicability of incorporating solar power system into the Project design as it is policy of the State that eligible renewable energy resources and zero-carbon resources supply 100% of retail sales of electricity to California end-use customers by December 31, 2045. Refer to response to Comment B-58 related to solar photovoltaic systems onsite. Thus, no further response is required.

B-80 The commenter states that a revised Draft EIR should be prepared to include all feasible mitigation measures and include updated air quality analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. Refer to response to Comments B-41 to B-78 for a detailed discussion on the suggested mitigation measures. Applicable mitigation measures have been incorporated to the Project at the commenter's request.

B-81 The commenter provides disclaimer remarks about the comment letter. This comment does not raise any issues concerning or relating to the adequacy of the environmental analysis provided in the Draft EIR and thus no further response is required.

This page intentionally left blank.

SECTION 3.0 CLARIFICATIONS AND REVISIONS

Corrections to the Draft Environmental Impact Report (EIR) text generated either from responses to comments or independently by the City, are stated in this section of the Final EIR. The information included in this section does not constitute substantial new information that requires recirculation of the Draft EIR. Section 15088.5 of the State CEQA Guidelines states in part:

> *(a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used in this section, the term "information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation includes, for example, a disclosure showing that:*
>
> *(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.*
>
> *(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.*
>
> *(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.*
>
> *(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.*
>
> *(b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.*

None of the information contained in this section constitutes significant new information or changes to the analysis or conclusions of the Draft EIR. There were no new significant environmental impacts identified following circulation of the Draft EIR. Likewise, there were no substantial increases in the severity of environmental impacts identified after circulation of the Draft EIR. Therefore, recirculation of the Draft EIR is not required because no new information was added to the EIR.

CLARIFICATIONS AND REVISIONS TO THE DRAFT EIR

This section includes recommended clarifications and revisions to the Draft EIR. This section is organized by respective sections of the Draft EIR. Deleted text is shown as ~~strikeout~~ and new text is underlined.

Section 4.1.2

1. Page 4-2 is hereby modified in response to Comment A-13.

The summary of projections approach is used in this EIR.~~, except for the evaluation of cumulative transportation effects (for purposes of demonstrating General Plan policy compliance) and vehicular related air quality, greenhouse gas, and noise impacts, for which the analysis combines the summary of projections approach with the manual addition of past, present, and reasonably foreseeable projects ("combined approach"). The City determined the combined approach to be appropriate because long range planning documents contain a sufficient amount of information to enable an analysis of cumulative effect for all subject areas, with the exception of transportation (and vehicular-related air quality, greenhouse gas, and noise effects), which requires a greater level of detailed study. With the combined approach, the cumulative impact analyses for the air quality, greenhouse gas, noise, and transportation issue areas overstate the Project's potential cumulatively considerable impacts relative to analyses that rely solely on the list of projects approach or solely on the summary of projections approach; therefore, the combined approach provides a conservative, "worst case" analysis for the Project's cumulative air quality, greenhouse gas, noise, and transportation impacts.~~

~~For the cumulative impact analyses that rely on the summary projections approach (i.e., all issue areas with the exception of transportation and vehicular-related air quality, greenhouse gas, and noise – as described above), t~~The cumulative study area primarily includes the City of Ontario, City of Fontana, City of Upland, City of Chino, City of Rancho Cucamonga, City of Jurupa Valley, and small portions of unincorporated San Bernardino County. These jurisdictions encompass the southwestern area of San Bernardino County and nearby portion of Riverside County and have similar environmental characteristics as the Project area.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	243.00	1000sqft	7.08	243,303.00	0
Refrigerated Warehouse-No Rail	27.00	1000sqft	0.79	27,000.00	0
Parking Lot	299.00	Space	1.53	119,600.00	0
Other Asphalt Surfaces	161.00	1000sqft	3.68	161,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	390.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Consistent with DEIR's model.

Land Use - Consistent with DEIR's model.

Construction Phase - See SWAPE comment on "Unsubstantiated Changes to Individual Construction Phase Lengths"

Grading - Consistent with DEIR's model.

Trips and VMT - Consistent with DEIR's model.

Architectural Coating - See SWAPE Comment on "Unsubstantiated Changes to Architectural Coating Emission Factors"

Construction Off-road Equipment Mitigation - See SWAPE comment on "Incorrect Application of Tier 4 Interim Mitigation"

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 100 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Hagemann, M.F., 2005. Use of Electronic Databases in Environmental Regulation, Policy Making and Public Participation. Brownfields 2005, Denver, Coloradao.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Nevada and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Las Vegas, NV (served on conference organizing committee).

Hagemann, M.F., 2004. Invited testimony to a California Senate committee hearing on air toxins at schools in Southern California, Los Angeles.

Brown, A., Farrow, J., Gray, A. and **Hagemann, M.**, 2004. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to the Ground Water and Environmental Law Conference, National Groundwater Association.

Hagemann, M.F., 2004. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in Arizona and the Southwestern U.S. Presentation to a meeting of the American Groundwater Trust, Phoenix, AZ (served on conference organizing committee).

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River and Impacts to Drinking Water in the Southwestern U.S. Invited presentation to a special committee meeting of the National Academy of Sciences, Irvine, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a tribal EPA meeting, Pechanga, CA.

Hagemann, M.F., 2003. Perchlorate Contamination of the Colorado River. Invited presentation to a meeting of tribal repesentatives, Parker, AZ.

Hagemann, M.F., 2003. Impact of Perchlorate on the Colorado River and Associated Drinking Water Supplies. Invited presentation to the Inter-Tribal Meeting, Torres Martinez Tribe.

Hagemann, M.F., 2003. The Emergence of Perchlorate as a Widespread Drinking Water Contaminant. Invited presentation to the U.S. EPA Region 9.

Hagemann, M.F., 2003. A Deductive Approach to the Assessment of Perchlorate Contamination. Invited presentation to the California Assembly Natural Resources Committee.

Hagemann, M.F., 2003. Perchlorate: A Cold War Legacy in Drinking Water. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. From Tank to Tap: A Chronology of MTBE in Groundwater. Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. A Chronology of MTBE in Groundwater and an Estimate of Costs to Address Impacts to Groundwater. Presentation to the annual meeting of the Society of Environmental Journalists.

Hagemann, M.F., 2002. An Estimate of the Cost to Address MTBE Contamination in Groundwater (and Who Will Pay). Presentation to a meeting of the National Groundwater Association.

Hagemann, M.F., 2002. An Estimate of Costs to Address MTBE Releases from Underground Storage Tanks and the Resulting Impact to Drinking Water Wells. Presentation to a meeting of the U.S. EPA and State Underground Storage Tank Program managers.

Hagemann, M.F., 2001. From Tank to Tap: A Chronology of MTBE in Groundwater. Unpublished report.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Focus on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years of experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the Superior Court of the State of California, County of San Bernardino
Billy Wildrick, Plaintiff vs. BNSF Railway Company
Case No. CIVDS1711810
Rosenfeld Deposition 10-17-2022

In the State Court of Bibb County, State of Georgia
Richard Hutcherson, Plaintiff vs Norfolk Southern Railway Company
Case No. 10-SCCV-092007
Rosenfeld Deposition 10-6-2022

In the Civil District Court of the Parish of Orleans, State of Louisiana
Millard Clark, Plaintiff vs. Dixie Carriers, Inc. et al.
Case No. 2020-03891
Rosenfeld Deposition 9-15-2022

In The Circuit Court of Livingston County, State of Missouri, Circuit Civil Division
Shirley Ralls, Plaintiff vs. Canadian Pacific Railway and Soo Line Railroad
Case No. 18-LV-CC0020
Rosenfeld Deposition 9-7-2022

In The Circuit Court of the 13th Judicial Circuit Court, Hillsborough County, Florida Civil Division
Jonny C. Daniels, Plaintiff vs. CSX Transportation Inc.
Case No. 20-CA-5502
Rosenfeld Deposition 9-1-2022

In The Circuit Court of St. Louis County, State of Missouri
Kieth Luke et. al. Plaintiff vs. Monsanto Company et. al.
Case No. 19SL-CC03191
Rosenfeld Deposition 8-25-2022

In The Circuit Court of the 13th Judicial Circuit Court, Hillsborough County, Florida Civil Division
Jeffery S. Lamotte, Plaintiff vs. CSX Transportation Inc.
Case No. NO. 20-CA-0049
Rosenfeld Deposition 8-22-2022

In State of Minnesota District Court, County of St. Louis Sixth Judicial District
Greg Bean, Plaintiff vs. Soo Line Railroad Company
Case No. 69-DU-CV-21-760
Rosenfeld Deposition 8-17-2022

In United States District Court Western District of Washington at Tacoma, Washington
John D. Fitzgerald Plaintiff vs. BNSF
Case No. 3:21-cv-05288-RJB
Rosenfeld Deposition 8-11-2022

In Circuit Court of the Sixth Judicial Circuit, Macon Illinois
Rocky Bennyhoff Plaintiff vs. Norfolk Southern
Case No. 20-L-56
Rosenfeld Deposition 8-3-2022

In Court of Common Pleas, Hamilton County Ohio
Joe Briggins Plaintiff vs. CSX
Case No. A2004464
Rosenfeld Deposition 6-17-2022

In the Superior Court of the State of California, County of Kern
George LaFazia vs. BNSF Railway Company.
Case No. BCV-19-103087
Rosenfeld Deposition 5-17-2022

In the Circuit Court of Cook County Illinois
Bobby Earles vs. Penn Central et. al.
Case No. 2020-L-000550
Rosenfeld Deposition 4-16-2022

In United States District Court Easter District of Florida
Albert Hartman Plaintiff vs. Illinois Central
Case No. 2:20-cv-1633
Rosenfeld Deposition 4-4-2022

In the Circuit Court of the 4th Judicial Circuit, in and For Duval County, Florida
Barbara Steele vs. CSX Transportation
Case No.16-219-Ca-008796
Rosenfeld Deposition 3-15-2022

In United States District Court Easter District of New York
Romano et al. vs. Northrup Grumman Corporation

Rosenfeld Deposition 3-10-2022

In the Circuit Court of Cook County Illinois
Linda Benjamin vs. Illinois Central
Case No. No. 2019 L 007599
Rosenfeld Deposition 1-26-2022

In the Circuit Court of Cook County Illinois
Donald Smith vs. Illinois Central
Case No. No. 2019 L 003426
Rosenfeld Deposition 1-24-2022

In the Circuit Court of Cook County Illinois
Jan Holeman vs. BNSF
Case No. 2019 L 000675
Rosenfeld Deposition 1-18-2022

In the State Court of Bibb County State of Georgia
Dwayne B. Garrett vs. Norfolk Southern
Case No. 20-SCCV-091232
Rosenfeld Deposition 11-10-2021

In the Circuit Court of Cook County Illinois
Joseph Ruepke vs. BNSF
Case No. 2019 L 007730
Rosenfeld Deposition 11-5-2021

In the United States District Court For the District of Nebraska
Steven Gillett vs. BNSF
Case No. 4:20-cv-03120
Rosenfeld Deposition 10-28-2021

In the Montana Thirteenth District Court of Yellowstone County
James Eadus vs. Soo Line Railroad and BNSF
Case No. DV 19-1056
Rosenfeld Deposition 10-21-2021

In the Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al.cvs. Cerro Flow Products, Inc.
Case No. 0i9-L-2295
Rosenfeld Deposition 5-14-2021
Trial October 8-4-2021

In the Circuit Court of Cook County Illinois
Joseph Rafferty vs. Consolidated Rail Corporation and National Railroad Passenger Corporation d/b/a AMTRAK,
Case No. 18-L-6845
Rosenfeld Deposition 6-28-2021

In the United States District Court For the Northern District of Illinois
Theresa Romcoe vs. Northeast Illinois Regional Commuter Railroad Corporation d/b/a METRA Rail
Case No. 17-cv-8517
Rosenfeld Deposition 5-25-2021

In the Superior Court of the State of Arizona In and For the Cunty of Maricopa
Mary Tryon et al. vs. The City of Pheonix v. Cox Cactus Farm, L.L.C., Utah Shelter Systems, Inc.
Case No. CV20127-094749
Rosenfeld Deposition 5-7-2021

In the United States District Court for the Eastern District of Texas Beaumont Division
Robinson, Jeremy et al vs. CNA Insurance Company et al.
Case No. 1:17-cv-000508
Rosenfeld Deposition 3-25-2021

In the Superior Court of the State of California, County of San Bernardino
Gary Garner, Personal Representative for the Estate of Melvin Garner vs. BNSF Railway Company.
Case No. 1720288
Rosenfeld Deposition 2-23-2021

In the Superior Court of the State of California, County of Los Angeles, Spring Street Courthouse
Benny M Rodriguez vs. Union Pacific Railroad, A Corporation, et al.
Case No. 18STCV01162
Rosenfeld Deposition 12-23-2020

In the Circuit Court of Jackson County, Missouri
Karen Cornwell, Plaintiff, vs. Marathon Petroleum, LP, Defendant.
Case No. 1716-CV10006
Rosenfeld Deposition 8-30-2019

In the United States District Court For The District of New Jersey
Duarte et al, Plaintiffs, vs. United States Metals Refining Company et. al. Defendant.

MEMORANDUM

URBAN | CROSSROADS

DATE: November 21, 2023
TO: Tracy Zinn, T&B Planning, Inc.
FROM: Alex So, Urban Crossroads, Inc.
JOB NO: 14539-01 VMT - Mitigation

IE DISTRIBUTION CENTER #14 VEHICLE MILES TRAVELED (VMT) MITIGATION ASSESSMENT

Urban Crossroads, Inc. has prepared the following Vehicle Miles Traveled (VMT) Mitigation Assessment for the IE Distribution Center #14 (**Project**), which is located at 5355 E. Airport Drive in the City of Ontario.

BACKGROUND

The IE Distribution Center #14 Vehicle Miles Traveled (VMT) Analysis (Urban Crossroads, Inc. January 3, 2023) (**VMT Analysis**) previously evaluated a single 270,377 square foot warehouse building.

The VMT Analysis concluded that the Project would result in a potentially significant VMT impact based on project generated VMT. More specifically, the Project was found to exceed the City's adopted impact threshold by 22.6% under baseline conditions, while the horizon year buildout condition would exceed the impact threshold by 28.5%. The purpose of this assessment is to evaluate potential trip reduction measures to reduce VMT to the extent feasible.

VMT REDUCTION MEASURES

The effectiveness of trip reduction measures that have the ability to reduce VMT has been determined based on the California Air Pollution Control Officers Association (CAPCOA) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (December 2021) (**Handbook**) (1). The Handbook provides methods to quantify reductions in greenhouse gas emissions and for transportation related measures associated reductions in VMT. This evaluation will focus on relevant transportation measures as described by the Handbook.

SELECTING MEASURES

When considering which transportation measures are applicable from the Handbook, factors such as project type, scale and locational context are each important considerations for determining measure applicability. Users of the Handbook must review the measure factsheets to determine those measures that align and are applicable with project characteristics.

PROJECT TYPE

Project type is an important consideration when determining which measures are applicable for review. For example, measures associated with neighborhood design are likely not applicable to employment generation land use projects, whereas trip reduction programs to reduce employee commute VMT would not be applicable to a residential land use project.

SCALE

It is important to note that measures can be applied at different scales or geographic levels. The Handbook states that, "some measures may only be applicable at the project-level, whereas others may be more appropriate within a broader planning context such as for a general plan or climate action plan." The geographic levels considered in the Handbook include Project/Site and Plan/Community. Project/Site applies to measures that can reduce VMT at the scale of an individual development project or employer. Plan/Community refers to measures that reduce VMT at the scale of a specific plan, general plan or climate action plan. Transportation measures can be quantified at either the Project/Site scale or the Plan/Community scale, but never both.[1]

LOCATIONAL CONTEXT

The Handbook states locational context is "used to identify trip reduction measures within the transportation sector that are appropriate in certain types of neighborhoods differentiated by transportation characteristics and level of development (e.g., urban, rural, suburban)." More specifically, rural, suburban and urban are defined as follows:

Rural: An area characterized by little development. Compared to urban and suburban areas, rural areas have a lower density of residences, higher numbers of single-family residences, and higher numbers of vehicle dependent land use patterns. Where applicable, the Handbook provides three land use distinctions within the rural locational context category—R_a, R_b, and R_c. R_a refers to rural areas within a master-planned community. These rural areas often include a broad offering of amenities and services, which may be accessed by walking or other alternative forms of transportation. R_b refers to rural areas adjacent to a commuter rail station with convenient rail service to a major employment center. As the name implies, these rural areas have greater access to commuter rail as an alternative mode of transportation. R_c refers to rural areas with transit service and that are near jobs/services.

Suburban: An area characterized by dispersed, low-density, single-use, automobile dependent land use patterns, usually outside of the central city. Also known as a suburb.

Urban: An area located within the central city with higher density land uses than in the suburbs. Often characterized by multi-family housing, tall office buildings and dense retail.

The Project's locational context is determined to be suburban.

TRANSPORTATION MEASURES

As noted in the Handbook, transportation measures "promote transit and alternative transportation, support use of alternatively fueled vehicles, or encourage land use planning

[1] Handbook, Page 37

practices that reduce vehicle trips and vehicle miles traveled (VMT). Measures within the transportation sector are separated into six subsectors: Land Use, Neighborhood Design, Parking or Road Pricing Management, Transit, Trip Reduction Programs, and Clean Vehicles and Fuels."[2] For the purposes of this evaluation, the Trip Reduction Programs subsector is most applicable to reducing employee commute VMT and would apply to the Project's industrial land use.

TRIP REDUCTION PROGRAMS SUBSECTOR

Attachment A lists the measures within the Trip Reduction Programs subsector (i.e., T-5 through T-13 and T-23) as described in the Handbook along with each measure's applicability to the Project. As the Project is being developed as a speculative building without a known tenant (i.e., employer), measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies (e.g., have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced.

The Project does have the ability to provide design features that would promote non-motorized transportation alternatives such as measure T-10 End-of-Trip Bicycle Facilities.

T-10 END-OF-TRIP BICYCLE FACILITIES

Measure T-10 Provide End-of-Trip Bicycle Facilities is listed in the Handbook as available to projects in a suburban setting. As described in the Handbook, "the measure will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers. The provision and maintenance of secure bike parking and related facilities encourages commuting by bicycle, thereby reducing VMT and GHG emissions."[3] The Fact Sheet for T-10 Provide End-of-Trip Bicycle Facilities was utilized to calculate the Project's potential VMT reduction.

TABLE 2: T-10 CALCULATION VARIABLES

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from project/site employee commute VMT	0.1-4.4	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
B	Bike mode adjustment factor	1.78 or 4.86[1]	unitless	Buehler 2012
C	Existing bicycle trip length for all trips in region	2.2	miles	FHWA 2017a
D	Existing vehicle trip length for all trips in region	11.7	miles	FHWA 2017a
E	Existing bicycle mode share for work trips in region	0.4	%	FHWA 2017b
F	Existing vehicle mode share for work trips in region	95.3	%	FHWA 2017b

[1]The bike mode adjustment factor should be provided by the user based on type of bike facility. A study found that commuters with showers, lockers, and bike parking at work are associated with 4.86 times greater likelihood to commute by bicycle when compared to individuals without any bicycle facilities at work. Individuals with bike parking, but no showers and lockers at the workplace, are associated with 1.78 times greater likelihood to cycle to work than those without trip-end facilities.

$$A = \frac{C \times \left(E - (B \times E)\right)}{D \times F}$$

[2] Handbook, Page 30
[3] Handbook, Page 133

$$0.1\% = \frac{2.2 \times \left(0.4\% - (1.78 \times 0.4\%)\right)}{11.7 \times 95.3\%}$$

The Project will include building elements for bicycle trip end facilities (i.e., parking) for commuters that choose to bicycle as a mode of travel. This will promote an alternative mode choice of commuting for employees. As calculated, the Project will reduce VMT by 0.1%.

TOTAL VMT REDUCTIONS

The 2021 Handbook states that effectiveness levels for multiple measures within a subsector may be multiplied to determine a combined effectiveness level. Because the combination of measures and independence of measures are complicated, the 2021 Handbook recommends that measure reductions within a subsector be multiplied unless the user can provide substantial evidence indicating that emission reductions are independent of one another and that they should therefore be added. Each subsector has a maximum allowable reduction. These were derived by combining the maximum allowable reduction of each individual non–mutually-exclusive measure within the subsector. As all the Project Design features above fall under the Subsector of "Trip Reduction Programs", the 2021 Handbook states that the "Trip Reduction Subsector" has a maximum reduction of 45%. Therefore, a project cannot exceed the maximum allowable reduction. 2021 Handbook provides the following equation for combining Subsector reductions:

$$Reduction_{Subsector} = 1 - [(1 - A) \times (1 - B) \times (1 - C) \dots]$$

Project's VMT reduction are as follows:

$$0.1\% = 1 - [(1 - 0.1\%)]$$

As outlined through the VMT reduction calculations presented above, with the inclusion of the VMT mitigation measure the Project is estimated to reduce its VMT impact by 0.1%, which would continue to exceed the City's VMT impact threshold.

Even with the inclusion of feasible VMT reduction measures, the Project is not able to reduce project generated VMT to a level of less than significant.

If you have any questions, please contact me directly at aso@urbanxroads.com.

ATTACHMENT A
TRIP REDUCTION PROGRAMS SUBSECTOR

TABLE A-1: TRIP REDUCTION PROGRAMS SUBSECTOR

Subsector	Measure	Scale of Application	Applicable Locational Context	Applicability to Project
Trip Reduction Programs	**T-5 Implement Commute Trip Reduction Program (Voluntary)** This measure will implement a voluntary commute trip reduction (CTR) program with employers.	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-6 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) This measure will implement a mandatory CTR program with employers. CTR programs discourage single-occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions.	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-7 Implement Commute Trip Reduction Marketing This measure will implement a marketing strategy to promote the project site employer's CTR program. Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions.	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-8 Provide Ridesharing Program This measure will implement a ridesharing program and establish a permanent transportation management association with funding requirements for employers.	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-9 Implement Subsidized or Discounted Transit Program This measure will provide subsidized or discounted, or free transit passes for employees and/or residents.	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-10 Provide End-of-Trip Bicycle Facilities This measure will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers.	Project/ Site	Urban, Suburban	Applicable and Quantifiable
	T-11 Provide Employer-Sponsored Vanpool This measure will implement an employer-sponsored vanpool service. Vanpooling is a flexible form of public transportation that provides groups of 5 to 15 people with a cost-effective and convenient rideshare option for commuting.	Project/ Site	Urban, Suburban, Rural	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-12 Price Workplace Parking This measure will price onsite parking at workplaces. Because free employee parking is a common benefit, charging employees to park onsite increases the cost of choosing to drive to work	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-13 Implement Employee Parking Cash-Out This measure will require project employers to offer employee parking cash-out. Cash-out is when employers provide employees with a choice of forgoing their current subsidized/free parking for a cash payment equivalent to or greater than the cost of the parking space. This encourages employees to use other modes of travel instead of single occupancy vehicles.	Project/ Site	Urban, Suburban	Reduction is not quantifiable nor enforceable due to a speculative building with an unknown employer.
	T-23 Provide Community-Based Travel Planning This measure will target residences in the plan/community with community-based travel planning (CBTP). CBTP is a residential-based approach to outreach that provides households with customized information, incentives, and support to encourage the use of transportation alternatives in place of single occupancy vehicles.	Plan/ Community	Urban, Suburban	Does not apply at the Project/Site scale.

Notes:

1. Per CAPCOA Handbook, the combined maximum for each subsector or total across subsectors is calculated as:
1 - ((1-A)*(1-B)*(1-C)*(1-D)...); where, A, B, C, and D... represent the percent reduction for individual measures or subsectors.

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Additional Subsurface Investigation Report (Investigation Report) for Prologis, Inc. (Prologis) to present the results from the subsurface investigation conducted in September 2022 at the property at 5355 East Airport Drive in Ontario, California (herein referred to as the Site) (Figure 1). The scope of work for this subsurface investigation was based on the recognized environmental conditions and subsurface investigation findings identified in the *Phase I/Phase II Environmental Site Assessment Report, 5355 East Airport Drive, Ontario, California* dated March 31, 2022 prepared by Farallon (2022a) for Prologis (Phase I/II Report). The potential for constituents of concern (COCs) to be present in Site subsurface media was identified as a recognized environmental condition due to petroleum underground storage tanks (USTs) formerly present in three areas, former and active septic systems, and a vehicle maintenance garage ("Building B" on Figure 2).

The Phase I/II Report summarized the subsurface investigation conducted by Farallon in March 2022 and a sampling event previously conducted at the Site. Tetrachloroethene (PCE) was detected at concentrations exceeding calculated industrial screening levels using a 0.03 attention factor in soil gas in several areas. Additional investigation was recommended to address the potential for vapor intrusion conditions at the warehouse proposed for construction at the Site. This additional subsurface investigation was conducted to provide that additional investigation. The scope of work for the additional subsurface investigation was presented in Work Change Order 1071-080-WCO 003[1] and the general locations, depths, rationale for the borings, and analytes are shown in Table 1.

This Investigation Report has been organized into the following sections:

- **Section 2, Site Background**, provides a description of the Site, and summarizes pertinent background information regarding its history and previous investigations conducted at the Site.
- **Section 3, Physical Setting**, describes the topography, geology, and hydrogeology of the Site.
- **Section 4, Additional Subsurface Investigation**, provides a description of the scope of work conducted as part of the additional subsurface investigation, and a summary of soil gas analytical results and the handling of investigation-derived waste.
- **Section 5, Conclusions and Recommendations**, presents Farallon's conclusions from the additional subsurface investigation, and recommendations based on the results.
- **Section 6, References**, provides a list of the documents cited in this Additional Subsurface Investigation Report.
- **Section 7, Limitations**, presents Farallon's standard limitations applicable to this Additional Subsurface Investigation Report.

[1] *Work Change Order 1071-080-WCO 003, Master Services Agreement, Farallon Consulting, L.L.C. and Prologis, Inc.* dated September 12,2022 between Gavin Polite Fisco of Prologis and Scott Allin of Farallon (2022b).

2.0 SITE BACKGROUND

This section provides a description of the Site, and summarizes pertinent background information regarding its history and previous investigations conducted at the Site.

2.1 SITE DESCRIPTION

The Site consists of two parcels totaling 14.2 acres: San Bernardino County Assessor Parcel Nos. 0238-052-20 (Eastern Parcel), and 0238-052-29 (Western Parcel). The Eastern Parcel is occupied by Verhoeven, a grain-processing company, and is developed with five buildings, grain storage silos, and a grain mill area. An office and warehouse building, referred to as "Building A," is located on the southern portion of the Site. The warehouse portion on the northeastern side of Building A contains a service shop used to repair machinery related to the grain mill. A maintenance shop, referred to as "Building B," is present on the eastern portion of the Site, and is used for light tractor and forklift services. Additional structures on the Eastern Parcel consist of a warehouse referred to as "Building C" on the north-central portion, used for assorted storage, and two grain storage structures on the southeastern and southwestern portions of the parcel, referred to as Buildings D and E, respectively.

The Western Parcel is occupied by The Scoular Company, a corn storage and distribution facility. The Western Parcel contains exterior grain storage areas, and an office trailer that contains a small hazardous substances storage area on secondary containment.

The Site is primarily asphalt-paved, with some gravel-paved areas on the western parcel. Access to the Site is gained from East Airport Drive, south of the Site.

A vehicle wash-down area with a sump is present on the northeastern portion of the Eastern Parcel. Three or four septic systems are associated with the Site: two or three on the Eastern Parcel, and one on the Western Parcel. The location of the septic system on the Western Parcel could not be determined from the records reviewed. A 499-gallon propane aboveground storage tank (AST), two 250-gallon diesel fuel ASTs, and a 220-gallon hydraulic oil AST are present on the Eastern Parcel. Two 12,000-gallon "fuel-storage" USTs formerly were located on the north-central portion of the Site near the grain mill area. A 12,000-gallon diesel fuel UST formerly was located southeast of Building C. The area west of Building B was identified as the location of one or more additional USTs.

2.2 SITE HISTORY

The Site was used as agricultural or grazing land from at least the late 1930s to the early 1970s. By 1973, the Eastern Parcel was developed with small grain storage silos and other features associated with milling operations in the grain mill area. By 1975, grain appeared to be stockpiled in Buildings A through C, located on the southwestern portion of the Site. By 1985 grain storage structures Buildings D and E had been developed. By 2002, grain processing operations at the Site

had expanded to the Western Parcel, which included the development of three large grain storage silos. The Site has appeared in its current configuration since 2002.

Site occupants have consisted of Verhoeven from 1973 to the present; Chino Grain and Milling, Inc. in 1985; Coast Grain Company from 1990 to 2003; The Scoular Company between 2004 and the present; and JD Heistell and Company in 2009.

2.3 PREVIOUS INVESTIGATIONS

Partner Engineering and Science, Inc. (Partner) prepared a Phase II Subsurface Investigation Report dated August 16, 2016 documenting an investigation conducted at the Site, which included an assessment to identify former on-Site USTs or associated features and reported septic systems, and soil and soil gas sampling to assess for indications of a release from historical Site activities. A geophysical survey was conducted to identify USTs remaining in-place, backfilled tank holds, septic tanks, and/or associated features, and to clear boring locations of utilities. One large anomaly indicative of a backfilled excavation was identified under the western canopy of Building B, which generally corresponds to the location of a former UST area. No large metallic features were identified, so Partner concluded that USTs formerly present in this area had been removed. One large anomaly resembling a septic system was identified north of Building A.

As part of the soil and soil gas sampling, 26 borings were advanced at depths of between 1 and 25 feet below ground surface (bgs) for collection of soil and/or soil gas samples. Soil samples were analyzed for total petroleum hydrocarbon carbon chain C6-C40 (TPH-cc) by U.S. Environmental Protection Agency (EPA) Method 8015C and for volatile organic compounds (VOCs) by EPA Method 8260B. Soil gas samples were analyzed for VOCs by either EPA Methods TO-15 or 8260B. No detectable concentrations of VOCs or TPH-cc were present in the soil samples. VOCs, including PCE, trichloroethene, toluene, ethylbenzene, and xylenes, were detected in soil gas samples at concentrations less than residential and commercial/industrial calculated soil gas screening levels in effect at the time the report was completed. Partner concluded that a discernable vapor intrusion condition did not appear to exist at the Site, and that the detections of VOCs in soil gas did not represent a threat to human health or the environment. Partner recommended no further investigation with respect to the on-Site grain-handling facility at the time of the report.

Although the reported concentrations of VOCs in soil gas were less than soil gas screening levels in effect in 2016 at the time the Partner report was prepared, in April 2020, California Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (2020) Human Health Risk Assessment Note Number 3 (HHRA Note 3) was updated with the more-conservative attenuation factor of 0.03 for use in screening level calculations. PCE concentrations in soil gas samples collected from sampling locations B5, B6, and SV-14 through SV-16 in 2016 exceeded the calculated soil gas commercial/industrial screening level of 67 micrograms per cubic meter ($\mu g/m^3$) using the calculated screening level for PCE with the 0.03 attenuation factor. Additionally, the ethylbenzene concentration in one soil gas sample (B4-SG, located west of Building B) exceeded the calculated commercial/industrial screening level of 163 $\mu g/m^3$ using the "low level" screening level for ethylbenzene. These samples were collected west of and beneath Building B at a depth of 4 to 5 feet bgs.

As part of its Phase I/II due diligence investigation, Farallon conducted soil and soil gas sampling at the Site in March 2022, focusing on assessing former UST areas and septic systems, and the proposed new building footprint for the potential for vapor intrusion issues. At the time of the assessment, Farallon was informed that an approximately 250,000-square-foot warehouse would be constructed on the north-central portion of the Site (Figure 2). The scope of work for the Phase II ESA portion of the investigation included advancement of 12 borings, installation of two subslab gas probes, and installation of 10 temporary soil gas probe locations with single- or multi-depth nested gas points for collection of soil and soil gas samples.

Petroleum hydrocarbons and VOCs were not detected at a concentration exceeding laboratory reporting limits in the soil samples. Concentrations of metals either were not detected at a concentration exceeding laboratory reporting limits or were detected at concentrations less than screening levels. Results from the laboratory analyses of the March 2022 sampling event are summarized in Tables 2 through 5. Table 5 also include results from the current round of sampling (September 2022) which is the subject of this report.

Soil gas data indicated that PCE was present at concentrations exceeding calculated industrial screening levels using the 0.03 attenuation factor in soil gas samples collected west of and beneath Building B (samples SS-1, SS-2, SVP-7, and SVP-8), proximate to the former location of the 12,000-gallon diesel fuel UST (sample SVP-5), proximate to the former location of the two 12,000-gallon USTs (sample SVP-1), and proximate to the vehicle washdown area with sump (sample SVP-6). These locations were mapped beneath the planned new building footprint. PCE also was detected at concentrations less than the calculated industrial screening levels in in soil gas in other soil gas samples collected at the Site. The extent of PCE in soil gas was not fully characterized.

In the Phase I/II Report, Farallon recommended that a Media Management Plan be prepared for use during Site redevelopment to address any unexpected impacts to soil associated with historical activities at the Site. Farallon also recommended additional investigation to delineate and design mitigation measures for PCE in soil gas that may impact indoor air in the planned new building at the Site.

3.0 PHYSICAL SETTING

The topography, geology, and hydrogeology of the Site are described in this section.

3.1 TOPOGRAPHY

Farallon reviewed the U.S. Geological Survey topographic map for Guasti, California, dated 2018 provided by Environmental Data Resources, Inc. The map depicts the Site at an elevation of approximately 980 feet above mean sea level. Site topography slopes gently downward to the south. Regional topography generally is sloped downward to the south.

3.2 GEOLOGY AND HYDROGEOLOGY

The Site is situated in the San Bernadino Valley of the Peninsular Ranges Geomorphic Province in Southern California. The Peninsular Ranges Province is bounded by the San Gabriel and San Bernardino mountains to the north, the Colorado Desert to the east, extends into lower California beyond the Mexican border to the south, and is bound by the Pacific Ocean to the west. The San Bernardino Mountains are approximately 7 miles north of the Site.

According to the Partner (2016) Phase II Report, soil beneath the Site generally consists of very fine-grained silty sand from the surface to a depth of approximately 20 feet bgs and transitions to very fine- to coarse-grained poorly graded sand between depths of 20 and 25 feet bgs. Groundwater was not encountered during Partner's investigation.

Soil encountered during the Phase II ESA, described in the Phase I/II Report, and during the September 2022 additional subsurface investigation was described as silty fine to medium sand to the total explored depth of 10 feet bgs, with an apparent coarse sand and gravel layer at a depth of 10 feet bgs (and as shallow as 5 feet bgs on the eastern portion of the Site at boring SB-2), and intermittent clayey sand to clay lenses approximately 1 foot thick at a depth of between 6 and 7 feet bgs (borings SVP-16 and SVP-19) and 10 to 11 feet bgs (borings SVP-12 and SVP-16). Groundwater was not encountered during drilling. Boring logs are provided in Appendix A.

Site-specific groundwater direction and depth information was not available in the records reviewed. Based on information obtained from the previous reports California State Water Resources Control Board (2022) GeoTracker database and topographic interpretation, groundwater beneath the Site is anticipated to be encountered at a depth of approximately 250 feet bgs, and is estimated to flow to the south.

4.0 ADDITIONAL SUBSURFACE INVESTIGATION

This section presents the scope of work for the additional subsurface investigation conducted at the Site in September 2022, and summarizes the results from soil gas sampling and analysis. The handling of waste generated during the additional subsurface investigation also is discussed.

4.1 SCOPE OF WORK

Before field work was initiated, a Site-specific Health and Safety Plan (HASP) was prepared, and underground utilities were cleared. Field work consisted of advancing borings and collecting soil gas samples at the Site to provide a better understanding of soil gas impacts detected during previous subsurface investigations. The following sections detail this scope of work.

4.1.1 Health and Safety Plan Preparation

A Site-specific HASP was required under Section 3202 of Title 8 of the California Code of Regulations (8 CCR 3202) for all field activities due to the potential for exposure to hazardous substances. Prior to commencement of field activities, Farallon prepared a HASP compliant with the requirements of the Occupational Safety and Health Act of 1970 and 8 CCR 3203. Personal protection equipment precautions related to COVID-19 were implemented for Farallon personnel during field activities in accordance with Farallon health and safety policy.

4.1.2 Underground Utility Clearance

Prior to commencement of drilling activities, Farallon marked the proposed boring locations at the Site and contacted Dig Alert for public utility notice. Farallon also engaged a private utility location service to pre-screen the proposed boring locations for utilities that may be encountered during advancement using hand tools.

4.1.3 Boring Advancement

Nine borings, designated SVP-11 through SVP-19, were advanced at the Site on September 16, 2022 to investigate the potential presence of VOCs in soil gas beneath the planned new building footprint. The boring locations are shown on Figure 2 and were generally evenly distributed across the planned new building footprint, with selected borings placed in previously identified impacted areas. The borings were advanced using a hand-auger to a depth of 5 feet bgs, and a direct-push drill rig for the remaining depth. The general locations, depths, rationale for the borings, and analyte are shown in Table 1.

Continuous soil cores were visually inspected and screened by a Farallon geologist using a photoionization detector, and were described and logged using the United Soil Classification System (Modified). Physical evidence of soil impacts, including staining and odors, was not observed; photoionization detector readings ranged from 0.0 to 1.4 parts per million. Boring logs with soil descriptions are provided in Appendix A.

Soil cuttings generated during drilling activities were containerized in a 55-gallon drum pending transport and disposal off the Site.

4.1.4 Soil Gas Probe Installation and Sampling

Following completion of boring advancement, Farallon converted the borings to temporary dual-nested soil gas probes. Borings SVP-11 through SVP-19 were constructed with soil gas probes at depths of 4 and 10 feet bgs.

Soil gas probe installation was performed in accordance with the *Advisory: Active Soil Gas Investigations* dated July 2015 prepared by the California Environmental Protection Agency et al. (2015) (Soil Gas Advisory). The probes consisted of an Airstone microporous gas implant or equivalent connected to 0.25-inch-outside-diameter Nylaflow tubing, finished at the surface with temporary plugs. The annulus around the gas implant was backfilled with approximately 1 foot of screen-washed No. 3 sand, followed by 0.5 foot of dry granular bentonite, and hydrated granular bentonite to create a seal from the top of the dry granular bentonite to near surface. Soil gas probe construction is illustrated in the boring logs provided in Appendix A; their locations are shown on Figure 2.

The temporary dual-nested soil gas probes were allowed to equilibrate for 4 days prior to sample collection on September 20, 2022. Soil gas sampling, including observance of equilibration times, performance of shut-in tests, and purging activities, was conducted in accordance with the Soil Gas Advisory. A total of 19 soil gas samples (18 primary and 1 duplicate) were collected into 1-liter Summa canisters at a rate of 200 milliliters per minute or less. Isopropanol was used as a tracer gas, introduced to ambient air surrounding the sampling train by soaking a cotton swab with liquid isopropanol and placing it at the location where the gas probe tubing exited the ground.

Upon completion of sample collection, soil gas samples were transported under chain-of-custody protocols to a California-certified laboratory, and were analyzed for VOCs by EPA Method 8260B with TO-15 detection limits, where attainable. The soil vapor probes were then abandoned by filling the probe with bentonite grout as practicable and removing.

4.2 SUMMARY OF ANALYTICAL RESULTS FOR SOIL GAS

The soil gas analytical results were compared to DTSC Screening Levels (SLs) for indoor air, EPA Regional Screening Levels (RSLs) for indoor air, and the San Francisco Water Quality Control Board (SFWQCB) Environmental Screening Levels (ESLs) for TPH-g, which were adjusted using suggested attenuation factors provided in the Vapor Intrusion Guidance prepared by DTSC and the California Environmental Protection Agency (2011). The attenuation factor used for this comparison was 0.001 for soil gas in industrial use settings. Farallon also used the more-conservative attenuation factor of 0.03 for “near-source” exterior soil gas published in HHRA Note 3.

A summary of soil gas analytical results from the September 2022 and historical Farallon investigations is provided in Table 5. Soil gas analytical results from the additional subsurface investigation are summarized below:

- The tracer gas isopropanol was not detected at a concentration exceeding laboratory reporting limits in the soil gas samples collected from the soil gas probes.
- PCE was not detected at a concentration exceeding the laboratory reporting limit of 25 $\mu g/m^3$ in the soil gas samples collected from the soil gas probes; the laboratory reporting limit was less than calculated screening levels using the 0.03 attenuation factor published in HHRA Note 3, the most-conservative attenuation factor for "near-source" exterior soil gas samples.
- Ethylbenzene and total xylenes were detected at concentrations exceeding laboratory reporting limits in the two soil gas samples collected from soil gas probe location SVP-16, which was installed in the vicinity of a gravel roadway under the new planned building. The detected concentrations are less than calculated commercial/industrial screening levels using the 0.03 attenuation factor published in HHRA Note 3, the most-conservative attenuation factor for "near-source" exterior soil gas samples.

Because some soil gas samples collected in September 2022 were proximate to areas that showed impacts in March 2022 but no impacts were detected in September 2022, Farallon worked with the original analytical laboratory to conduct a data quality review of both analytical data sets. No anomalies in the data sets were found to render the data from either event unusable. Laboratory analytical reports are provided in Appendix B. Because no COCs were detected in the duplicate sampling pair, laboratory reproducibility could not be evaluated.

4.3 INVESTIGATION-DERIVED WASTE

Soil cuttings were containerized in a 55-gallon drum at the Site. The contents were characterized as nonhazardous, and were transported off the Site for disposal. Copies of the waste disposal documentation are provided in Appendix C.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Farallon conducted an additional subsurface investigation in September 2022 to further investigate impacts of VOCs previously identified in soil gas beneath the planned new building footprint at the Site. Previous soil gas data indicated that PCE was present at concentrations exceeding calculated industrial screening levels using the 0.03 attenuation factor in soil gas samples collected beneath and proximate to the planned new building footprint, specifically west of and beneath Building B, proximate to the former location of the 12,000-gallon diesel fuel UST, proximate to the former location of two 12,000 gallon USTs, and proximate to the vehicle washdown area with sump. PCE also was detected at concentrations less than the calculated industrial screening levels in soil gas in other soil gas samples collected at the Site. It was determined that the extent of PCE impacts to soil gas at the Site had not been fully characterized.

For the September 2022 additional subsurface investigation, nine borings were advanced in the planned new building footprint. Soil gas probes were generally evenly distributed across the planned new building footprint, with selected probes placed in previously identified impacted areas. The borings were converted to temporary dual-nested soil gas probes at depths of 4 and 10 feet bgs. No detectable concentrations of PCE exceeding the laboratory reporting limit of 25 $\mu g/m^3$ were identified during laboratory analysis of soil gas samples collected during this additional subsurface investigation. Concentrations of other, gasoline-related, VOCs, which may be attributable to road current use, did not exceed the calculated screening levels using the most-conservative 0.03 attenuation factor in soil gas samples collected during this additional subsurface investigation.

This additional subsurface investigation did not indicate that the previously identified PCE impacts to soil gas are present in the areas that were resampled, and did not identify additional areas under the proposed building slab. Farallon recommends that the the areas of highest impact previously encountered under the proposed building slab be resampled to aide in the determination of whether mitigation measures are recommended for the proposed building.

7.0 LIMITATIONS

7.1 GENERAL LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- **Accuracy of Information**. Farallon obtained, reviewed, and evaluated certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy or authenticity. Should the information upon which Farallon relied prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.
- **Reconnaissance and/or Characterization**. Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

For the foregoing reasons, Farallon cannot and does not warrant or guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions can be considered valid only as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Prologis, Inc. and currently accepted industry standards. No other warranties, representations, or certifications are made.

7.2 LIMITATION ON RELIANCE BY THIRD PARTIES

Reliance by third parties is prohibited. This report/assessment has been prepared for the exclusive use of Prologis, Inc. to address the unique needs of Prologis, Inc. at the Site at a specific point in time.

This is not a general grant of reliance. No one other than Prologis, Inc. may rely on this report unless Farallon agrees in advance to such reliance in writing. Any unauthorized use, interpretation, or reliance on this report/assessment is at the sole risk of that party, and Farallon will have no liability for such unauthorized use, interpretation, or reliance.

MSSL (> 150 feet Above Groundwater)[3]					**1,000**	**10,000**	**50,000**

NOTES:

< denotes analyte not detected at or exceeding the reporting limit listed.

--- denotes sample not analyzed.

[1]Depth in feet below ground surface.

[2]Analyzed by U.S. Environmental Protection Agency (EPA) Method 8015M (2022 samples) or 8015C (2016 samples).

[3]Los Angeles Regional Water Quality Control Board April 27, 2004 MSSLs for groundwater at depths of less than 20 feet, 20 to 150 feet, and greater than 150 feet below ground surface.

C = carbon range (number of carbons)

Farallon = Farallon Consulting, LLC

MSSL = maximum soil screening level

Partner = Partner Engineering and Science, Inc.

TPH-d = total petroleum hydrocarbons as diesel

TPH-g = total petroleum hydrocarbons as gasoline

TPH-o = total petroleum hydrocarbons as oil

NOTES:

Results in **bold** denote concentrations detected at or above the laboratory reporting limit. Results in **bold** and highlighted yellow denote concentrations exceeding applicable SGSLs for the current property use (industrial/commercial).

< denotes analyte not detected at or exceeding the reporting limit listed.

--- denotes sample not analyzed or not applicable.

[1] Depth in feet below ground surface.

[2] Only detected VOCs shown in table; see lab reports for full list of analytes. Analyzed by EPA Methods 8260B/8260B-Modified (3/11/2022, 7/29/2016 (Modified), and 9/20/2022) or TO-15 (7/21/2016), unless otherwise noted.

[3] Except as noted (see Footnote 4), Calculated soil gas screening levels (SGSLs) were derived by dividing the May 2022 Department of Toxic Substances Control (DTSC) screening levels (shown in black) or November 2022 U.S. Environmental Protection Agency (EPA) Regional Screening Levels (shown in blue) for VOCs, and 2019 SFBWQCB Environmental Screening Levels (ESLs) for TPH-g (shown in green) for indoor air by the noted attenuation factor.

[4] Methane was compared against a Lower Exlosive Limit of 5% as measured by a hand-held GemTech 5000 Flame Ionizaton Detector

C = sample was analyzed via TO-14 due to high concentration of analytes
Farallon = Farallon Consulting, LLC
ND = not detected at or above the laboratory reporting limit
Partner = Partner Engineering and Science, Inc.
PCE = tetrachloroethene
SGSL = soil gas screening level
TCE = trichloroethene
TPH-g = total petroleum hydrocarbons, gasoline range
