QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL
B1= BOD blank is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution
E = Estimated value
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference
J = Analyte concentration detected between RL and MDL

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit
MDL = Method Detection Limit
Qual = Qualifier
Tech = Technician

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Soil Gas Investigation Report (Soil Gas Report) for Prologis, L.P. (Prologis) to present a summary of results from the soil gas investigation conducted in December 2022 at the property at 5355 East Airport Drive in Ontario, California (herein referred to as the Site) (Figure 1). The soil gas investigation was conducted to provide additional assessment of the potential for vapor intrusion related to tetrachloroethene (PCE), which was detected inconsistently in soil gas during subsurface investigations conducted by Partner Engineering and Science, Inc (Partner) in July 2016 and Farallon in February and September 2022. The scope of work for the historical investigations was based on the recognized environmental conditions and subsurface investigation findings identified in the Partner Phase II Subsurface Investigation Report (2016 SI Report),[1] the Farallon Phase I/Phase II Environmental Site Assessment Report (Phase I/II Report),[2] and the Farallon Additional Subsurface Investigation Report.[3] The potential for constituents of concern (COCs) to be present in Site subsurface media was identified as recognized environmental conditions due to petroleum underground storage tanks (USTs) formerly present in three areas, former and active septic systems, and a vehicle maintenance garage ("Building B"). These features are depicted on Figure 2.

According to the 2016 SI Report, the Phase I/II Report, and the Additional Subsurface Investigation Report, tetrachloroethene (PCE) was detected at concentrations exceeding calculated industrial screening levels using a 0.03 attention factor in soil gas in several areas during the July 2016 and March 2022 sampling events, but not during the September 2022 sampling event. Additional investigation was recommended to address the potential for vapor intrusion conditions at the warehouse proposed for construction at the Site. This soil gas investigation was conducted to provide that additional investigation. Additionally, Prologis requested that methane be screened during the soil gas investigation. The scope of work for the soil gas investigation was presented in Work Change Order 1071-080-002-WCO 004[4] and the general locations, depths, rationale for the borings, and analytes are shown in Table 1. Sample locations at the Site are shown on Figure 2.

This Soil Gas Report has been organized into the following sections:

- **Section 2, Site Background**, provides a description of the Site, and summarizes pertinent background information regarding its history and previous investigations conducted at the Site.

---

[1] *Phase II Subsurface Investigation Report, 5355 East Airport Drive, Ontario, California* dated August 16, 2016, prepared for Prologis, Inc. by Partner (2016).

[2] *Phase I/Phase II Environmental Site Assessment Report, 5355 East Airport Drive, Ontario, California* dated March 31, 2022 prepared by Farallon (2022a) for Prologis.

[3] *Additional Subsurface Investigation Report, 5355 East Airport Drive, Ontario, California* dated December 13, 2022 prepared for Prologis, Inc. by Farallon (2022c).

[4] Work Change Order 1071-080-002-WCO 004, Master Services Agreement, Farallon Consulting, L.L.C. and Prologis, Inc. dated December 5, 2022 between Gavin Polite Fisco of Prologis and Scott Allin of Farallon (2022b).

- **Section 3, Physical Setting**, describes the topography, geology, and hydrogeology of the Site.
- **Section 4, Soil Gas Investigation**, provides a description of the scope of work conducted as part of the additional soil gas investigation, and a summary of soil gas analytical results.
- **Section 5, Conclusions and Recommendations**, presents Farallon's conclusions from the additional subsurface investigation, and recommendations based on the results.
- **Section 6, References**, provides a list of the documents cited in this Soil Gas Report.
- **Section 7, Limitations**, presents Farallon's standard limitations applicable to this Soil Gas Report.

2.0 SITE BACKGROUND

This section provides a description of the Site and summarizes pertinent background information regarding its history and previous investigations conducted at the Site.

2.1 SITE DESCRIPTION

The Site consists of two parcels totaling 14.2 acres of land: San Bernardino County Assessor Parcel Nos. 0238-052-20 (Eastern Parcel), and 0238-052-29 (Western Parcel). The Eastern Parcel is occupied by Verhoeven, a grain-processing company, and is developed with five buildings, grain storage silos, and a grain mill area. An office and warehouse building, referred to as "Building A," is located on the southern portion of the Site. The warehouse portion on the northeastern side of Building A contains a service shop used to repair machinery related to the grain mill. A maintenance shop, referred to as "Building B," is present on the eastern portion of the Site, and is used for light tractor and forklift services. Additional structures on the Eastern Parcel consist of a warehouse referred to as "Building C" on the north-central portion, used for assorted storage, and two grain storage structures on the southeastern and southwestern portions of the parcel, referred to as Buildings D and E, respectively.

The Western Parcel is occupied by The Scoular Company, a corn storage and distribution facility. The Western Parcel contains exterior grain storage areas, and an office trailer that contains a small hazardous substances storage area on secondary containment.

The Site is primarily asphalt-paved, with some gravel-paved areas on the western parcel. Access to the Site is gained from East Airport Drive, south of the Site.

A vehicle wash-down area with a sump is present on the northeastern portion of the Eastern Parcel. Three or four septic systems are associated with the Site: two or three on the Eastern Parcel, and one on the Western Parcel. The location of the septic system on the Western Parcel could not be determined from the records reviewed. A 499-gallon propane aboveground storage tank (AST), two 250-gallon diesel fuel ASTs, and a 220-gallon hydraulic oil AST are present on the Eastern Parcel. Two 12,000-gallon "fuel-storage" USTs formerly were located on the north-central portion of the Site near the grain mill area. A 12,000-gallon diesel fuel UST formerly was located southeast of Building C. The area west of Building B was identified as the former location of one or more additional USTs.

2.2 SITE HISTORY

The Site was used as agricultural or grazing land from at least the late 1930s to the early 1970s. By 1973, the Eastern Parcel was developed with small grain storage silos and other features associated with milling operations in the grain mill area. By 1975, grain appeared to be stockpiled in Buildings A through C, located on the southwestern portion of the Site. By 1985 grain storage structures Buildings D and E had been developed. By 2002, grain processing operations at the Site had expanded to the Western Parcel, which included the

development of three large grain storage silos. The Site has appeared in its current configuration since 2002.

Site occupants have consisted of Verhoeven from 1973 to the present; Chino Grain and Milling, Inc. in 1985; Coast Grain Company from 1990 to 2003; The Scoular Company between 2004 and the present; and JD Heistell and Company in 2009.

2.3 PREVIOUS INVESTIGATIONS

Partner's 2016 SI Report documented an investigation conducted at the Site. The scope of work consisted of a geophysical survey to identify former on-Site USTs or associated features and reported septic systems, and soil and soil gas sampling to assess for indications of a release from historical Site activities. The geophysical survey identified one large anomaly indicative of a backfilled UST excavation beneath the western canopy of Building B, which generally corresponds to the location of a former UST area. No large metallic features were identified, so Partner concluded that USTs formerly present in the area had been removed. One large anomaly resembling a septic system was identified north of Building A.

Partner advanced 26 borings with total depths ranging from 1 to 25 feet below ground surface (bgs) for collection of soil and/or soil gas samples. Soil samples were analyzed for total petroleum hydrocarbon carbon chain C6-C40 (TPH-cc) by U.S. Environmental Protection Agency (EPA) Method 8015C and for volatile organic compounds (VOCs) by EPA Method 8260B. Soil gas samples were analyzed for VOCs by either EPA Methods TO-14, TO-15, or 8260B. VOCs and TPH-cc were not detected in soil samples at concentrations exceeding laboratory reporting limits (Tables 2 and 3). VOCs, consisting of PCE, trichloroethene, toluene, ethylbenzene, and xylenes, were detected in soil gas samples at concentrations less than residential and industrial calculated soil gas screening levels in effect at the time the report was completed. Partner concluded that a discernable vapor intrusion condition did not appear to exist at the Site, and that the detections of VOCs in soil gas did not represent a threat to human health or the environment. Partner recommended no further investigation with respect to the on-Site grain-handling facility at the time of the report.

Although the reported concentrations of VOCs in soil gas were less than soil gas screening levels (SGSLs) in effect in 2016 at the time the Partner report was prepared, in April 2020, California Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (2022) Human Health Risk Assessment Note Number 3 (HHRA Note 3) was updated with the recommendation to use a more-conservative attenuation factor of 0.03 in screening level calculations. PCE concentrations ranging from 68 to 230 micrograms per cubic meter (µg/m^3) in soil gas samples collected by Partner in 2016 from sampling locations B5, B6, and SV-14 through SV-16 exceeded the calculated industrial SGSL of 67 µg/m^3 using the 0.03 attenuation factor. Additionally, the ethylbenzene concentration of 280 µg/m^3 in soil gas sample B4-SG, located west of Building B, exceeded the calculated industrial SGSL of 163 µg/m^3 using the 0.03 attenuation factor. These samples were collected west of and beneath Building B at a depth of 4 to 5 feet bgs. Soil gas results from Partner's 2016 SI Report and

calculated SGSLs using the 2020 HHRA Note 3 attenuation faction of 0.03 are presented in Table 5.

As part of its Phase I/II due diligence investigation, Farallon conducted soil and soil gas sampling at the Site in March 2022, focusing on assessing former UST areas and septic systems, and the proposed new building footprint for the potential for vapor intrusion issues. At the time of the assessment, Farallon was informed that an approximately 259,000-square-foot warehouse would be constructed on the north-central portion of the Site (Figure 2). The scope of work for the Phase II Environmental Site Assessment portion of the investigation included advancement of 12 borings, installation of two subslab gas probes, and installation of 10 temporary soil gas probe locations with single- or multi-depth nested gas points for collection of soil and soil gas samples.

VOCs and TPH-cc were not detected at concentrations exceeding laboratory reporting limits (Tables 2 and 3) in soil samples. Metals were either not detected in soil samples at concentrations exceeding laboratory reporting limits, or at concentrations less than screening levels (Table 4). Soil gas data indicated that PCE was present at concentrations exceeding calculated industrial SGSLs using the 0.03 attenuation factor in soil gas samples collected west of and beneath Building B (samples SS-1, SS-2, SVP-7, and SVP-8), proximate to the location of the former 12,000-gallon diesel fuel UST (sample SVP-5), proximate to the location of the two former 12,000-gallon USTs (sample SVP-1), and proximate to the vehicle washdown area with sump (sample SVP-6) as presented in Table 5. These locations were mapped beneath the planned new building footprint. PCE also was detected at concentrations less than the calculated industrial SGSLs in soil gas in other soil gas samples collected at the Site. The extent of PCE in soil gas was not fully characterized.

In September 2022, to further assess soil gas beneath the planned building footprint, Farallon advanced nine borings, designated SVP-11 through SVP-19, at the Site within the planned new building footprint. Dual-nested soil gas probes were constructed in each boring to investigate the potential presence of VOCs in soil gas beneath the planned new building. PCE was not detected at concentrations exceeding the laboratory reporting limit of 25 µg/m^3 in the soil gas samples collected from the soil gas probes. Ethylbenzene and total xylenes were detected at concentrations less than calculated industrial SGSLs. Because some of the soil gas samples collected in September 2022 were proximate to areas that showed impacts in March 2022, but no impacts were detected in September 2022, Farallon worked with the original analytical laboratory to conduct a data quality review of both analytical data sets. No anomalies in the data sets were found to render the data from either event unusable. Farallon recommended that the areas of highest impacts previously encountered under the proposed building slab be resampled to aid in the determination of whether mitigation measures would be recommended for the proposed building.

PCE in soil gas results are shown on Figure 3.

3.0 PHYSICAL SETTING

The topography, geology, and hydrogeology of the Site are described in this section.

3.1 TOPOGRAPHY

Farallon reviewed the U.S. Geological Survey topographic map for Guasti, California dated 2018 provided by Environmental Data Resources, Inc. The map depicts the Site at an elevation of approximately 980 feet above mean sea level. Site topography slopes gently downward to the south. Regional topography generally is sloped downward to the south.

3.2 GEOLOGY AND HYDROGEOLOGY

The Site is situated in the San Bernadino Valley of the Peninsular Ranges Geomorphic Province in Southern California. The Peninsular Ranges Province is bounded by the San Gabriel and San Bernardino mountains to the north and the Colorado Desert to the east, extends into lower California beyond the Mexican border to the south, and is bound by the Pacific Ocean to the west. The San Bernardino Mountains are approximately 7 miles north of the Site.

According to the 2016 SI Report, soil beneath the Site generally consists of very fine-grained silty sand from the surface to a depth of approximately 20 feet bgs and transitions to very fine- to coarse-grained poorly graded sand between depths of 20 and 25 feet bgs. Groundwater was not encountered during Partner's investigation.

Soil encountered during Farallon's previous subsurface investigations was described as silty fine to medium sand to the total explored depth of 4 to 10 feet bgs, with an apparent coarse sand and gravel layer at a depth of 10 feet bgs (and as shallow as 5 feet bgs on the eastern portion of the Site at boring SB-2), and intermittent clayey sand to clay lenses approximately 1 foot thick at a depth of between 6 and 7 feet bgs (borings SVP-16 and SVP-19) and 10 to 11 feet bgs (borings SVP-12 and SVP-16). Groundwater was not encountered during drilling.

Soil observed during the December 2022 sampling round can be generally described as silty fine sand with trace medium sand with some sub-angular gravel to the exploration depth of 4.5 feet bgs. Boring logs are provided in Appendix A.

Site-specific groundwater direction and depth information was not available in the records reviewed. Based on information obtained from the previous reports and California State Water Resources Control Board (2022) GeoTracker database and topographic interpretation, groundwater beneath the Site is anticipated to be encountered at a depth of approximately 250 feet bgs, and is estimated to flow to the south.

4.0 SOIL GAS INVESTIGATION

This section presents the scope of work for the soil gas investigation conducted at the Site in December 2022 and summarizes the results from this and prior soil gas sampling events.

4.1 SCOPE OF WORK

Before field work was initiated, the Site-specific Health and Safety Plan (HASP) was updated, and underground utilities were cleared. Field work consisted of advancing borings and collecting soil gas samples at the Site to provide a better understanding of soil gas impacts detected during previous subsurface investigations. The following sections detail this scope of work.

4.1.1 Health and Safety Plan Preparation

A Site-specific HASP was required under Section 3202 of Title 8 of the California Code of Regulations (8 CCR 3202) for all field activities due to the potential for exposure to hazardous substances. Prior to commencement of field activities, Farallon updated the HASP compliant with the requirements of the Occupational Safety and Health Act of 1970 and 8 CCR 3203. Personal protection equipment precautions related to COVID-19 were implemented for Farallon personnel during field activities in accordance with Farallon health and safety policy.

4.1.2 Underground Utility Clearance

Prior to commencement of drilling activities, Farallon marked the proposed boring locations at the Site and contacted Dig Alert for public utility notice. Farallon also engaged a private utility location service to pre-screen the proposed boring locations for utilities that may be encountered during advancement using hand tools.

4.1.3 Boring Advancement

Seven borings, designated SVP-20 through SVP-26, were advanced at the Site on December 9, 2022 to investigate the potential presence of VOCs in soil gas beneath the planned new building footprint. The boring locations are shown on Figure 2 and were generally evenly distributed across the planned new building footprint, with select borings placed in previously identified impacted areas. Borings SVP-20, SVP-21, SVP-22, SVP-24, SVP-25, and SVP-26 were advanced proximate to previous locations SVP-2, SVP-1, SVP-4, SVP-5, SVP-8, and SVP-7, respectively, to evaluate previous detections of PCE in soil gas. Borings were advanced in exterior locations paved with asphalt or concrete which required coring to access the subsurface. The borings were advanced using a hand-auger to a depth of 4.5 feet bgs to install soil gas probes at 4 feet bgs as described in Section 4.1.4, Soil Gas Probe Installation and Sampling. The general locations, depths, rationale for the borings, and analytes are shown in Table 1.

The displaced soil was visually inspected and screened by a Farallon geologist using a photoionization detector and was described and logged using the United Soil Classification System (Modified). Physical evidence of soil impacts, including staining and odors, was not observed; photoionization detector readings ranged from 0.1 to 1.0 parts per million. Boring logs with soil descriptions are provided in Appendix A.

4.1.4 Soil Gas Probe Installation and Sampling

Following completion of boring advancement, Farallon converted the borings to temporary soil gas probes. Borings SVP-20 through SVP-26 were constructed with soil gas probes at a depth of 4 feet bgs.

Soil gas probe installation was performed in accordance with the *Advisory: Active Soil Gas Investigations* dated July 2015 prepared by the California Environmental Protection Agency et al. (2015) (Soil Gas Advisory). The probes consisted of an Airstone microporous gas implant or equivalent connected to 0.25-inch-outside-diameter Nylaflow tubing, finished at the surface with temporary plugs. The annulus around the gas implant was backfilled with approximately 1 foot of screen-washed No. 3 sand, followed by 1 foot of dry #8 granular bentonite, and completed with hydrated #8 granular bentonite to create a seal from the top of the dry granular bentonite to near surface. Soil gas probe construction is illustrated in the boring logs provided in Appendix A; their locations are shown on Figure 2.

The temporary soil gas probes were allowed to equilibrate for 7 days prior to sample collection on December 16, 2022. Soil gas sampling, including observance of equilibration times, performance of shut-in tests, and purging activities, was conducted in accordance with the Soil Gas Advisory. Seven soil gas samples were collected into 1-liter Summa canisters at a rate of 200 milliliters per minute or less. The tracer gas 1,1-difluoroethane (1,1-DFA) was introduced to ambient air surrounding the sampling train by soaking a cotton swab with liquid 1,1-DFA and placing it at the location where the soil gas probe tubing exited the ground.

Upon completion of sample collection at each location, a 1-liter Tedlar bag was filled with soil gas by a syringe from the probe tubing at each soil gas location. Each Tedlar bag was then connected to a calibrated Landtec Gem5000 landfill gas monitor for on-site methane evaluation.

The Summa canisters were transported under chain-of-custody protocols to a California-certified laboratory, and were analyzed for VOCs by EPA Method TO-15. The soil gas probes were then abandoned by extracting as much tubing as practical, filling the boring with bentonite grout and restoring the surface to match surrounding conditions.

4.2 SUMMARY OF ANALYTICAL RESULTS FOR SOIL GAS

The soil gas analytical results were compared to DTSC Screening Levels for indoor air, EPA Regional Screening Levels for indoor air, and the San Francisco Water Quality Control Board Environmental Screening Levels for TPH-g, which were adjusted using suggested attenuation factors provided in the Vapor Intrusion Guidance prepared by DTSC and the California

Environmental Protection Agency (2011). The attenuation factor used for this comparison was 0.03 published in HHRA Note 3. The methane screening results were obtained in percent, and compared to the DTSC screening level for methane of 0.5 percent by volume[5] (10 percent of the lower explosive limit for methane).

A summary of soil gas analytical results from December 2022 is provided in Table 5 and PCE in soil gas results are shown on Figure 3. In order to provide a comprehensive understanding of analytical results for the Site, PCE in soil gas from previous investigations is also shown on Figure 3, and analytical results from previous investigations are included in the attached data tables.

Soil gas analytical and methane screening results from the December 2022 sampling event are summarized below. A written summary of previous results can be found in each related previous report.

- PCE was not detected at a concentration exceeding the laboratory reporting limit of 0.1 µg/m^3 in soil gas samples collected from locations SVP-20 or SVP-23 on the southwestern and central portions of the planned building, respectively.
- PCE was detected at concentrations of 3.5 ug/m^3 in SVP-21, 2.6 ug/m^3 in SVP-22, 5.7 ug/m^3 in SVP-24, 13.0 ug/m^3 in SVP-25, and 60.2 ug/m^3 in SVP-26, which are less than the calculated industrial SGSL of 67 ug/m^3 using the 0.03 attenuation factor. These samples were collected from beneath the north-central and east-central portions of the planned building. Borings SVP-24, SVP-25, and SVP-26 were located in the immediate vicinity of former borings that contained elevated concentrations of PCE in the soil gas samples collected at a depth of 4 feet bgs in March 2022: 70 ug/m^3 in SVP-5, 232 ug/m^3 in SVP-8, and 247 ug/m^3 in SVP-7, respectively.
- Trace concentrations of cyclohexane, trichlorofluoromethane (Freon 11), dichlorodifluoro-methane (Freon 12), ethylbenzene, toluene, total xylenes, 1,2,4-trimethyl-benzene, and carbon disulfide were detected in soil gas samples collected from various locations at concentrations exceeding their laboratory reporting limit of 1.0 µg/m^3, but well below their respective calculated industrial SGSLs using the 0.03 attenuation factor;
- Methane was not detected at concentrations exceeding the detection level of 0.1 percent in soil gas samples collected from locations SVP-20 through SVP-26 using a Landtec Gem5000 landfill gas monitor for methane evaluation.
- The tracer gas 1,1-DFA was not detected at a concentration exceeding the laboratory reporting limit in the soil gas samples collected from locations SVP-20 through SVP-26.

[5] *Advisory on Methane Assessment and Common Remedies at School Sites* dated June 16, 2005, prepared by Department of Toxic Substances Control (2005).

4.3 INVESTIGATION-DERIVED WASTE

Investigation-derived waste generated during this sampling event consisted of a small amount of excess soil removed from each boring. The excess soil did not display evidence of chemical impact based on visual, olfactory inspection, or photoionization detector screening. Previous soil sample analytical results indicate that Site soil is suitable for on-Site reuse. Excess soil was reused at the Site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Farallon conducted a soil gas investigation in December 2022 to further investigate impacts of VOCs previously identified in soil gas beneath the planned new building footprint at the Site. Previous soil gas data indicated that PCE was present at concentrations exceeding calculated industrial screening levels using the 0.03 attenuation factor in soil gas samples collected beneath and proximate to the planned new building footprint, specifically west of and beneath Building B; proximate to the former location of the 12,000-gallon diesel fuel UST; proximate to the former location of two 12,000 gallon USTs; and proximate to the vehicle washdown area with sump. PCE also was detected at concentrations less than the calculated industrial screening levels in soil gas in other soil gas samples collected at the Site.

For the December 2022 soil gas investigation, seven borings were advanced in the planned new building footprint. Soil gas probes were generally evenly distributed across the planned new building footprint, with selected probes placed proximate to areas previously identified as impacted by PCE. The borings were converted to temporary soil gas probes at a depth of 4 feet bgs and soil gas samples were collected and analyzed for VOCs and methane.

PCE was detected in five of the seven soil gas samples at concentrations exceeding the laboratory reporting limit of 0.1 ug/m^3. PCE detections in four of the soil gas samples ranged from 3.5 ug/m^3 to 13.0 ug/m^3; however, one detection of PCE (60.2 ug/m^3 in SVP-26) approached the calculated industrial SGSL of 67 ug/m^3 using a 0.3 attenuation factor. The detections of PCE in soil gas samples, which were collocated with soil gas samples collected during previous investigations, were less than detections of PCE in soil gas samples collected in 2016 by Partner and March 2022 by Farallon.

Other VOCs were not found during this investigation to be present in soil gas samples at concentrations approaching applicable screening levels. Methane was not detected in the soil gas samples.

Soil gas sampling at the Site has provided evidence of fluctuating concentrations of PCE. PCE concentrations detected in soil gas samples collected by Partner in July 2016 and by Farallon in March 2022 exceeded the calculated SGSL using a 0.03 attenuation factor at select locations. PCE was not detected above the laboratory reporting limit in soil gas samples collected by Farallon in September 2022. PCE was not detected at concentrations above the laboratory reporting limit or was detected at concentrations less than the calculated SGSL using a 0.03 attenuation factor in soil gas samples collected by Farallon in December 2022. The variability of reported concentrations of PCE in soil gas between the four soil gas sampling events suggests that PCE concentrations in soil gas may be influenced by variables such as seasonal changes. Because PCE detections in soil gas from the September and December 2022 investigations either were not detected above laboratory reporting limits or were less than the calculated SGSL using a 0.03 attenuation factor, and sampling locations were chosen in areas of known impacts, sampling data from the last two sampling rounds has not established the potential for an unacceptable vapor intrusion risk in the planned future building footprint. Based on the industrial nature of the use of the Site, Farallon recommends

implementation of a Media Management Plan to address any soil impacts associated with historical activities at the Site that may be encountered during Site redevelopment.

7.0 LIMITATIONS

7.1 GENERAL LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- **Accuracy of Information**. Farallon obtained, reviewed, and evaluated certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy or authenticity. Should the information upon which Farallon relied prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.
- **Reconnaissance and/or Characterization**. Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

For the foregoing reasons, Farallon cannot and does not warrant or guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions can be considered valid only as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Prologis, L.P. and currently accepted industry standards. No other warranties, representations, or certifications are made.

7.2 LIMITATION ON RELIANCE BY THIRD PARTIES

Reliance by third parties is prohibited. This report/assessment has been prepared for the exclusive use of Prologis, L.P. to address the unique needs of Prologis, L.P. at the Site at a specific point in time.

This is not a general grant of reliance. No one other than Prologis, L.P. may rely on this report unless Farallon agrees in advance to such reliance in writing. Any unauthorized use, interpretation, or reliance on this report/assessment is at the sole risk of that party, and Farallon will have no liability for such unauthorized use, interpretation, or reliance.

MSSL (> 150 feet Above Groundwater)[3]					**1,000**	**10,000**	**50,000**

NOTES:

< denotes analyte not detected at or exceeding the reporting limit listed.

--- denotes sample not analyzed.

[1]Depth in feet below ground surface.

[2]Analyzed by U.S. Environmental Protection Agency (EPA) Method 8015M (2022 samples) or 8015C (2016 samples).

[3]Los Angeles Regional Water Quality Control Board April 27, 2004 MSSLs for groundwater at depths of less than 20 feet, 20 to 150 feet, and greater than 150 feet below ground surface.

C = carbon range (number of carbons)

Farallon = Farallon Consulting, LLC

MSSL = maximum soil screening level

Partner = Partner Engineering and Science, Inc.

TPH-d = total petroleum hydrocarbons as diesel

TPH-g = total petroleum hydrocarbons as gasoline

TPH-o = total petroleum hydrocarbons as oil

DRAFT - Issued for Client Review

NOTES:

Results in **bold** denote concentrations detected at or above the laboratory reporting limit. Results in **bold** and highlighted yellow denote concentrations exceeding applicable SGSLs for the current property use (industrial/commercial).

< denotes analyte not detected at or exceeding the reporting limit listed.

--- denotes sample not analyzed or not applicable.

[1] Depth in feet below ground surface.

[2] Only detected VOCs shown in table; see lab reports for full list of analytes. Analyzed by EPA Methods 8260B/8260B-Modified (7/29/2016 (Modified), 3/11/2022, and 9/20/2022) or TO-15 (7/21/2016 and 12/16/2022), unless otherwise noted.

[3] Except as noted (see Footnote 4), Calculated soil gas screening levels (SGSLs) were derived by dividing the May 2022 Department of Toxic Substances Control (DTSC) screening levels (shown in black) or November 2022 U.S. Environmental Protection Agency (EPA) Regional Screening Levels (shown in blue) for VOCs, and 2019 SFBWQCB Environmental Screening Levels (ESLs) for TPH-g (shown in green) for indoor air by the noted attenuation factor.

[4] Methane was compared against a Lower Exlosive Limit of 5% as measured by a hand-held GemTech 5000 Flame Ionizaton Detector

C = sample was analyzed via TO-14 due to high concentration of analytes
Farallon = Farallon Consulting, LLC
ND = not detected at or above the laboratory reporting limit
Partner = Partner Engineering and Science, Inc.
PCE = tetrachloroethene
SGSL = soil gas screening level
TCE = trichloroethene
TPH-g = total petroleum hydrocarbons, gasoline range

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Media Management Plan (MMP) on behalf of Prologis, L.P. (Prologis) for the property at 5355 East Airport Drive in Ontario, California (herein referred to as the Subject Property) (Figure 1). The purpose of this MMP is to provide protocols for managing confirmed and potentially contaminated media that may be encountered during future improvement activities involving subsurface work at the Subject Property. According to the Prologis development team and a November 16, 2021 Preliminary Site Plan – Scheme 01, the Subject Property will be redeveloped with an approximately 250,000-square-foot (footprint) warehouse that will occupy the northern and central portions of the Subject Property.

This document has been organized into the following sections:

- **Section 2, Site Description and Background,** provides a description of the Subject Property and its historical use, the general site setting, regional geology and hydrogeology, and the Subject Property regulatory status.
- **Section 3, Known Environmental Conditions,** summarizes environmental investigations previously conducted at the Subject Property, the defining regulations applicable to the Subject Property, the constituents of concern (COCs), and the areas where COCs have been detected at or are presumed to be present at concentrations exceeding the defining regulations.
- **Section 4, Media Management Plan,** presents the details of this MMP, including the requirements for communication, health and safety, and reporting; and management of soil, groundwater, stormwater, and unanticipated subsurface features/conditions.
- **Section 5, Modifications to the Media Management Plan,** presents the conditions under which modifications to this MMP may be required.
- **Section 6, Scope, Representations, and Limitations,** provides the details of these subjects under this MMP.
- **Section 7**, **References**, lists the documents cited in this MMP.

2.0 SITE DESCRIPTION AND BACKGROUND

This section provides a description of the Subject Property and its historical use, the general site setting, regional geology and hydrogeology, and the Subject Property regulatory status.

2.1 SITE DESCRIPTION AND HISTORICAL USE

The Subject Property consists of San Bernardino County Assessor's Parcel Numbers 0238-052-20-0000 (Eastern Parcel) and 0238-052-29-0000 (Western Parcel), totaling 14.2 acres of land.

According to previous environmental investigations for the Subject Property (described in Section 3.1), a review of historical information for the Subject Property suggested that it was primarily undeveloped through at least the late-1930s until being used for agricultural purposes between the late 1930s through the early 1970s. The Subject Property was developed as a grain processing facility in 1973. The Scoular Company (Scoular) and Verhoeven Grain Company (Verhoeven) have occupied the Subject Property since 2006 and 2008, respectively.

The Eastern Parcel is occupied by Verhoeven, a grain processing company, and contains grain storage silos, a grain mill area, and five buildings. An office and warehouse building, referred to as "Building A," is located on the southern portion of the Subject Property. The warehouse portion on the northeastern side of Building A contains a service shop for the repair of machinery related to the grain mill. Wastes stored in this area include motor oil, hydraulic oil, and gear oil, primarily related to tractor and forklift operation. A maintenance and repair shop, referred to as "Building B," is used for light tractor and forklift service. New and waste vehicle fluids are stored in a hazardous substance storage area on the southwestern interior border of Building B. Additional structures on the Eastern Parcel consist of a warehouse referred to as "Building C" on the north-central portion, used for assorted storage; and two grain storage structures on the southeastern and southwestern portions of the parcel, referred to as Buildings D and E. The property is primarily asphalt-paved, with some gravel-paved areas on the western portion of the parcel. Access to the Subject Property is gained from East Airport Drive, south of the Subject Property.

The Western Parcel is occupied by Scoular, a corn storage and distribution facility. The Scoular portion of the Subject Property contains exterior grain storage, and an office trailer that contains a small hazardous substance storage area on secondary containment used for the storage of lubrication oils and greases for equipment.

A vehicle wash-down area is present on the northeastern portion of the Subject Property, and three to four septic systems are associated with the Subject Property: two or three on the Eastern Parcel, and one on the Western Parcel. The location of the septic system on the Western Parcel could not be determined from the records reviewed. At the time of Farallon's Phase I Environmental Site Assessment activities (in 2022), a 499-gallon propane aboveground storage tank (AST), two 250-gallon diesel fuel ASTs, and a 220-gallon hydraulic oil AST were present on the Eastern Parcel. Two 12,000-gallon "fuel-storage" underground storage tanks (USTs) formerly were located on the north-central portion of the Subject Property near the grain mill area. A 12,000-gallon diesel fuel

UST formerly was located southeast of Building C. The area west of Building B was identified as the former location of one or more additional USTs.

The locations of applicable Subject Property features are shown on Figure 2.

2.2 GENERAL SITE SETTING

The Subject Property is at an elevation of approximately 980 feet above mean sea level. The Subject Property topography slopes gently to the south. Regional topography generally is sloped to the south.

2.3 REGIONAL GEOLOGY AND HYDROGEOLOGY

The Subject Property is situated within the San Bernadino Valley of the Peninsular Ranges Geomorphic Province in Southern California. The Peninsular Range Province extends into lower California and is bounded by the Colorado Desert to the east, the Pacific Ocean to the west and the San Gabriel and San Bernardino mountains to the north. The San Bernardino Mountains are located approximately 7-miles north of the Subject Property.

According to the *Phase II Subsurface Investigation Report, 5355 East Airport Drive, Ontario, California 91761* dated August 16, 2016 prepared by Partner, soil beneath the Site generally consists of very fine-grained silty sand from the surface to a depth of approximately 20 feet bgs (below ground surface) and transitions to very fine- to coarse-grained poorly graded sand between depths of 20 and 25 feet bgs. Groundwater was not encountered during Partner's investigation.

Soil encountered during Farallon's previous subsurface investigations was described as silty fine to medium sand to the total explored depth of 4 to 10 feet bgs, with an apparent coarse sand and gravel layer at a depth of 10 feet bgs (and as shallow as 5 feet bgs on the eastern portion of the Site at boring SB-2), and intermittent clayey sand to clay lenses approximately 1 foot thick at a depth of between 6 and 7 feet bgs (borings SVP-16 and SVP-19) and 10 to 11 feet bgs (borings SVP-12 and SVP-16). Groundwater was not encountered during drilling.

Site-specific groundwater direction and depth information was not available in the records reviewed. Based on information obtained from the previous reports and California State Water Resources Control Board (2022) GeoTracker database and topographic interpretation, groundwater beneath the Site is anticipated to be encountered at a depth of approximately 250 feet bgs, and is estimated to flow to the south.

3.0 KNOWN ENVIRONMENTAL CONDITIONS

This section summarizes environmental investigations previously conducted at the Subject Property, the defining regulations applicable to the Subject Property, the COCs and the areas where COCs have been detected or are presumed to be present at concentrations exceeding the defining regulations.

3.1 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

This section summarizes the most recent and pertinent documents related to environmental assessments previously prepared for the Subject Property, including the following (pertinent portions of the reports attached in Appendix A):

- *Phase I Environmental Site Assessment Report, The Scoular Company, 5355 East Airport Drive, Ontario, California 91761* dated August 18, 2016 prepared by Partner Engineering and Science, Inc. (Partner) (2016 Phase I ESA Report);
- *Phase II Subsurface Investigation Report, 5355 East Airport Drive, Ontario, California 91761* dated August 16, 2016 prepared by Partner (2016 Phase II Report);
- *Phase I Environmental Site Assessment Report, 5355 East Airport Drive Ontario, California 91761* dated January 31, 2022, prepared by Farallon (2022 Phase I ESA Report);
- *Phase I/Phase II Environmental Site Assessment Report, 5355 East Airport Drive, Ontario, California 91761* dated March 30, 2022, prepared by Farallon (2022 Farallon Phase I/II Report);
- *Subsurface Investigation Report, 5355 East Airport Drive, Ontario, California* dated December 13, 2022, prepared by Farallon (2022 Subsurface Investigation Report); and
- *Soil Gas Investigation Report, 5355 East Airport Drive, Ontario, California* dated February 14, 2023, prepared by Farallon (2023 Soil Gas Report).

The 2016 Phase I ESA Report findings identified four recognized environmental conditions (RECs), two historical RECs (HRECs), and four environmental issues. The four RECs relate to the status of a potential unknown UST; surficial degradation and staining of asphalt around two 250-gallon diesel fuel ASTs; staining and historical use of petroleum products and hazardous materials in maintenance areas within Buildings A and B; and potential impacts associated with the vehicle wash-down area and drainage system. The two HRECs are related to the following: the two former 12,000-gallon diesel USTs, which were removed in 1989 and received a No Further Action (NFA) determination; and one former 12,000-gallon diesel UST and associated dispenser, which were removed in 2002 and also received an NFA determination. The four environmental issues identified relate to unknown locations of two septic systems; grain processing equipment and subsurface grain conveyance systems requiring lubrication oil; railroad spurs extending onto the Subject Property that may have impacted the Subject Property with pesticides, herbicides, and oils; and potential asbestos-containing materials associated with the age of the buildings.

According to the Partner 2016 Phase II Report, 26 borings were advanced to depths between 1 and 25 feet bgs for the collection of soil and/or soil gas samples. Analytical results of soil gas samples indicated detections of volatile organic compounds (VOCs), including tetrachloroethene (PCE), trichloroethene (TCE), toluene, ethylbenzene, and xylenes. Based on tabulated data, the concentrations of these detectable results were less than the residential and commercial/industrial calculated soil gas screening levels (SGSLs) at the time of the report beneath and west of Building B; however, the concentrations of PCE and ethylbenzene exceed current commercial/industrial calculated SGSLs, as discussed in Section 3.3.

RECs identified in the Farallon 2022 Phase I ESA Report included the use of hazardous materials and a known release of VOCs at Building B, possible releases to the Building B septic system, and two former petroleum USTs at the grain mill, reported as closed by regulatory authorities with impacts left in-place. HRECs identified during the 2022 Phase I ESA included a former UST area located east of Building B (investigated in 2016 with no petroleum releases detected), and a 12,000-gallon UST and fuel dispenser located southeast of Building C (closed with regulatory oversight in 2002 with minor petroleum impacts noted in backfilled soil). The 2022 Phase I ESA Report also identified the following de minimis conditions: a vehicle wash-down area on the northeastern portion of the Subject Property, reportedly used for washing truck exteriors; two or three septic systems that received only domestic water; petroleum ASTs with secondary containment and/or no evidence of leaking; rail spurs within or along the northern property boundary; transformers with no evidence of leaking; underground grain conveyance systems; and a former brine pond located on or just north of the Subject Property that was reportedly decommissioned in 1998 with no residual pH impacts.

As part of its Phase I/II due diligence investigation, Farallon conducted soil and soil gas sampling at the Subject property in March 2022, focusing on assessing former UST areas, septic systems, and the footprint of a proposed building to evaluate the potential for vapor intrusion. The scope of work for the Phase II Environmental Site Assessment portion of the investigation included advancement of 12 borings, installation of two subslab gas probes, and installation of 10 temporary soil gas probe locations with single- or multi-depth nested gas points for collection of soil and soil gas samples. Petroleum hydrocarbons and VOCs were not detected at a concentration exceeding laboratory reporting limits in the soil samples. According to soil gas data, PCE was present at concentrations exceeding calculated industrial screening levels using the 0.03 attenuation factor in soil gas samples collected in the eastern portion of the Subject Property (proximate to Building B, former diesel UST, and vehicle washdown area with sump), and in the north-central portion of the Subject Property (proximate to two former USTs). Low concentrations of naturally occurring metals, including barium, cadmium, cobalt, chromium, copper, nickel, lead, vanadium, and zinc, were detected in two soil samples submitted for analysis; these concentrations were considerably less than screening levels.

Farallon conducted additional soil gas investigations in September and December 2022 to delineate soil gas in the footprint for the proposed building and assist with design mitigation measures for PCE in soil gas that may impact indoor air. PCE was not detected at a concentration exceeding the laboratory reporting limit in September. Although PCE was detected in December,

the maximum concentration of 60.2 micrograms per cubic meter ($\mu g/m^3$) proximate to Building B did not exceed the calculated industrial screening level of 67 $\mu g/m^3$. The previously detected maximum concentration near this location was 247 $\mu g/m^3$ (SVP-7, March 11, 2022).

Although PCE has been documented in soil gas in the vicinity of Building B at concentrations exceeding calculated screening levels, these concentrations could not be confirmed with additional sampling rounds. Further, it is anticipated that shallow soils at the Subject Property will be reworked during redevelopment activities, potentially mitigating the potential for vapor intrusion conditions to exist.

Farallon recommended preparation of a MMP for use during redevelopment to address any unexpected impacts to soil associated with historical activities, and to address any issues related to the former brine pond, underground grain conveyance systems, septic systems, and former USTs at the Subject Property.

The locations of the features and findings discussed above are depicted on Figure 2. Pertinent portions of previous environmental investigation documents are provided in Appendix A.

3.2 DEFINING REGULATIONS

The published regulatory guidelines considered applicable to the Subject Property for evaluating COCs in soil are the June 2020 California-Modified Regional Screening Levels for soil developed by the California Department of Toxic Substances Control Office of Human and Ecological Risk modified in May 2022 (DTSC-SLs) or the U.S. Environmental Protection Agency (EPA) November 2022 Regional Screening Levels (EPA RSLs) if a DTSC-SL has not been developed for a COC.

The disposition of soil removed from the Subject Property should be performed in accordance with the procedures discussed in Section 4.4, Soil Management.

3.3 AREAS OF CONCERN AND CONSTITUENTS OF CONCERN EXCEEDING DEFINING REGULATIONS

Soil gas and subslab soil gas data indicate that soil gas beneath the slab at Building B, proximate to former UST areas and to the vehicle wash down area with sump, may contain PCE approaching or exceeding the calculated SGSL of 67 $\mu g/m^3$ using the 0.03 attenuation factor for industrial properties. PCE also was detected throughout the central portion of the Subject Property at concentrations less than the calculated industrial SGSL in the shallow zones assessed. One elevated concentration of PCE was detected at a depth of 10 feet bgs, which was collected on March 11, 2022 from the vicinity of the two former 12,000-gallon USTs north of the grain mill area; the shallow soil gas sample collected from this boring at 4 feet bgs did not contain PCE above the SGSL during the March or December 2022 sampling events. Soil gas data are presented on Figure 3.

Additionally, based on Farallon's review of data in the Partner 2016 Phase II Report, ethylbenzene was detected in soil gas at a concentration exceeding the EPA RSL of 160 µg/m^3 in a sample collected in the vicinity of Building B on the eastern portion of the Subject Property at a depth of 5 feet bgs. The presence of ethylbenzene in soil gas is likely related to incidental releases associated with the industrial use and appears to be isolated in nature.

Due to the historical USTs, septic systems, and underground features associated with the Subject Property, and use of petroleum products and hazardous materials, VOCs related to automotive fluids and total petroleum hydrocarbons (TPH) as gasoline range organics (TPHg), diesel-range organics (TPHd), and/or motor oil-range organics (TPHmo) may be present at the Subject Property.

Additionally, due to the current and/or historical presence of railroad tracks, a brine pond and a subsurface grain conveyance system, the potential exists for identification of additional areas of soil impacts and/or unknown subgrade features. Section 4.0 describes best practices for handling media and addressing undocumented conditions during redevelopment at the Subject Property.

4.0 MEDIA MANAGEMENT PLAN

This section presents the details of this MMP. This MMP was developed to provide protocols for managing media that are known to be or potentially are chemically impacted that may be encountered during future improvements or redevelopment activities conducted at the Subject Property. This MMP is applicable to all earthwork activities performed at the Subject Property. Elements of this MMP include:

- Project contacts;
- Communication requirements;
- Health and safety requirements;
- Soil management;
- Groundwater management;
- Stormwater management;
- Unanticipated subsurface conditions; and
- MMP reporting requirements.

The objective of this MMP is to minimize risk to human health, and to ensure protection of the environment during activities associated with improvements or redevelopment of the Subject Property. Before any earthwork activities commence at the Subject Property, this MMP should be made available to workers to address possible environmental risks associated with chemically impacted soil or unanticipated subsurface conditions.

4.1 PROJECT CONTACTS

The personnel associated with the Subject Property investigation and development of this MMP are provided in the table below. When communication pertaining to this MMP is warranted, Prologis will be contacted first.

TITLE NAME	**CONTACT INFORMATION**
Prologis Environmental Contact Gavin Polite Fisco	Office: (415) 733-9410 Email: gfisco@prologis.com
Prologis Development Contact John Carter	Office: (562) 345-9237 Email: jcarter@prologis.com
Farallon Project Manager Kathy Lehnus	Mobile: (657) 247-1304 Email: klehnus@farallonconsulting.com

4.2 COMMUNICATION REQUIREMENTS

Chemical- and petroleum-impacted soil encountered under anticipated conditions during subsurface activities conducted at the Subject Property should be managed in accordance with the procedures described in this MMP. In the event unanticipated conditions are encountered, earthwork should be stopped, and Prologis will be notified within 24 hours of discovery of such conditions; Prologis will subsequently notify the Environmental Professional. Any reuse of potentially contaminated soil to backfill excavations on the Subject Property requires prior laboratory analysis, as outlined in Section 4.4.5, On-Site Reuse of Soil and Off-Site Disposal of Soil, and subsequent written approval by Prologis. Reporting requirements related to earthwork activities are described in Section 4.8, Media Management Plan Reporting Requirements.

4.3 HEALTH AND SAFETY REQUIREMENTS

The Contractor or the Environmental Professional is responsible for preparing a Health and Safety Plan (HASP) for all tasks performed that require subsurface work at the Subject Property, with the exclusion of general maintenance activities (e.g., landscaping). The HASP will provide the following information:

- The health and safety considerations for the specific COCs detected or potentially present at the Subject Property;
- Personal protective equipment and monitoring requirements; and
- The physical hazards associated with the planned tasks.

The HASP will detail all planned construction activities and will describe standard safety precautions (e.g., protective gear for workers, proper soil handling techniques, etc). The HASP will describe the minimum safety measures to be implemented at the Subject Property during all activities. The Contractor or the Environmental Professional is responsible for ensuring that the safety precautions detailed in the HASP are implemented and monitored during all activities at the Subject Property.

The Contractor and the Environmental Professional will abide by all applicable federal, state, and local regulations and codes relating to health and safety and will adhere to all California Occupational Safety and Health Administration regulations contained in Title 8 of the California Code of Regulations (8 CCR), as they apply to the Subject Property activities. Applicable regulations may include but are not limited to the following:

- Injury and Illness Prevention Program (8 CCR 1509 and 3202);
- Hazardous Waste Operations and Emergency Response (8 CCR 5192);
- Hazard Communication (8 CCR 5194);
- Personal Protective Equipment (8 CCR 10);
- Respiratory Protective Equipment (8 CCR 5144);

- Control of Noise Exposure (8 CCR 5095 through 5100);
- Excavations (8 CCR 1503 and 1539 through 1547);
- Fire Prevention and Suppression Procedures (8 CCR 4848);
- Portable Fire Extinguishers (8 CCR 6151);
- Cleaning, Repairing, Servicing, and Adjusting Prime Movers, Machinery, and Equipment Lockout/Tagout (8 CCR 3314); and
- Medical Services and First Aid (8 CCR 3400).

Detected and potential chemicals in soil at the Subject Property have been identified under the California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) and are known to cause cancer and reproductive toxicity. Proposition 65 warnings are required if the estimated exposure to a person exceeds the California Office of Environmental Health Hazard Assessment "safe harbor level." The safe harbor level terms for carcinogens and chemicals with reproductive end points are "no significant risk levels" and "maximum allowable dose levels," respectively. The Contractor or Environmental Professional is responsible for conducting an independent evaluation to determine the need for Proposition 65 notifications for their workers.

If physical indications of potential contamination in soil (e.g., odor, staining) are observed during earthwork, a photoionization detector (PID) should be used to monitor air and soil for VOCs in the area where work is performed. Action levels will be established in the HASP by the Contractor or Environmental Professional. In accordance with South Coast Air Quality Management District Rule 1166, any soils exhibiting VOC concentrations exceeding 50 parts per million, as measured using a PID, will be treated as potentially contaminated soil and managed in accordance with the procedures described in this MMP.

Any equipment that has been in contact with known or potentially contaminated soil or groundwater during work conducted at the Subject Property requires decontamination before being used at another location at the Subject Property or before being removed from the Subject Property. It is recommended that dedicated equipment be used for earthwork activities conducted at the Subject Property to minimize decontamination procedures. The exterior of any vehicle that has been exposed to potentially contaminated soil requires decontamination using brooms or brushes to remove loose soil. If soil remains after brushing, the contaminated surfaces should be washed.

4.4 SOIL MANAGEMENT

This section describes the procedures for handling soil during earthwork activities conducted at the Subject Property. These procedures do not apply to routine maintenance activities such as landscaping.

4.4.1 Site Access

A fence, k-rail, or other appropriate means should be used to surround and limit access to construction areas or soil stockpiles where potentially contaminated soil is exposed.

4.4.2 Soil Excavation

A HASP prepared by the Contractor or the Environmental Professional is required for all earthwork activities conducted at the Subject Property, as specified in Section 4.3, Health and Safety Requirements. If contaminated soil is brought to the surface by grading, excavation, or trenching, provisions stipulated in California State and/or federal law will be followed. Any stockpiling or on-site reuse of excavated soil must be performed in accordance with the procedures described in this section.

4.4.3 Soil Confirmation Sampling

Soil confirmation sampling is defined as collecting soil samples at the limits of an excavation for laboratory analysis. Soil confirmation sampling typically is performed to document removal of chemically impacted soil to a specific cleanup level.

4.4.4 Soil Stockpiling

Stockpiled soil originating at the Subject Property that is suspected to be contaminated based on physical indications (e.g., odor, staining) or elevated PID readings is required to be covered at the end of each workday. Practical considerations (e.g., the size of the stockpile, weather conditions, the length of time the stockpile will remain) will be used in determining the appropriate covering method. Soil in the stockpile exhibiting physical indications (e.g., odor, staining) or elevated PID readings, will be presumed to be chemically impacted, and therefore the stockpile will be placed on an impermeable layer (e.g., Visqueen plastic sheeting), fenced, and otherwise protected and sampled as noted in Section 4.4.5, On-Site Reuse of Soil and Off-Site Disposal of Soil. Stormwater management regarding sediment runoff will be consistent with local, state, and federal rules and regulations, including those set forth by San Bernardino County. Additional measures must be taken to prevent runoff from entering storm drains leading to local creeks, rivers, and other water bodies, as outlined in Section 4.6, Stormwater Management.

4.4.5 On-Site Reuse of Soil and Off-Site Disposal of Soil

Soil stockpiled on the Subject Property that was noted with visual and/or olfactory impacts or elevated PID readings requires laboratory analysis prior to reuse at the Subject Property or off-site disposal. The frequency and specific laboratory analyses to be conducted will be established by the Environmental Professional on a case-by-case basis and approved by Prologis.

The laboratory analyses will likely include, but not be limited to, VOCs by EPA Method 8260 and TPHg, TPHd, and TPHmo by EPA Method 8015. Samples will be additionally analyzed for any additional constituents requested by the receiving facility, if applicable. Following analysis, if COCs are detected at concentrations less than the DTSC-SLs and EPA RSLs, the soil may be reused on the Subject Property at the discretion of the Environmental Professional. Soil containing

COCs at concentrations exceeding DTSC-SLs and EPA RSLs will be disposed of at a facility permitted to receive the soil for disposal.

4.4.6 Off-Site Reuse of Soil

Written approval from Prologis is required for any off-site reuse of soil generated from earthwork activities or excavated at the Subject Property. Soil intended for off-site reuse must be sampled and meet the characterization requirements outlined in Section 4.4.5, On-Site Reuse of Soil and Off-Site Disposal of Soil. The sampling frequency for soil being removed from the Subject Property will be determined by the Environmental Professional on a case-by-case basis, and by the receiving facility.

4.4.7 Imported Fill Material

Written approval from Prologis is required for any importation of fill material to the Subject Property. All imported fill is required to meet the minimum profile requirements outlined in the Department of Toxic Substances Control *Information Advisory, Clean Imported Fill Material* dated October 2001 and provided in Appendix B. The origin of and any analytical data for imported fill material must be provided to Prologis for review and approval prior to importation of fill material.

4.4.8 Dust Control

Implementation of dust-control measures to minimize dust generation is required during earthwork activities conducted at the Subject Property. Basic dust-control measures described in the *Rule 403 Dust Control Information* dated May 7, 1976, amended June 3, 2005, prepared by the South Coast Air Quality Management District, must be followed. It is the responsibility of the Contractor to ensure that the presence of dust is minimized during construction activities, and that all applicable local and state dust-control requirements are met. Should construction activities result in observable dust at the boundary of the Subject Property, enhanced control measures will be performed by the Contractor.

4.5 GROUNDWATER MANAGEMENT

Because the depth to groundwater is approximately 250 feet bgs, it is unlikely that groundwater will be encountered during foreseeable future development at the Subject Property. If groundwater is encountered, it should be presumed to be contaminated and managed accordingly unless analytical testing determines otherwise. Any contact, suspected contact, or proposed contact with the water table, must be reported to Prologis, which will subsequently report it to the Environmental Professional.

4.6 STORMWATER MANAGEMENT

Stormwater management regarding sediment runoff will be consistent with local, state, and federal rules and regulations. As outlined in Section 4.4.4, Soil Stockpiling, applicable stormwater pollution control measures will be implemented to prevent runoff of sediment in stormwater from flowing to nearby storm drains and from entering local creeks, rivers, and other water bodies. The

Contractor is required to obtain all necessary stormwater permits, and to implement best management practices during construction activities conducted at the Subject Property.

4.7 UNANTICIPATED SUBSURFACE CONDITIONS

It is unknown whether the locations of all utilities at the Subject Property have been identified and marked. Unknown historical features or other structures also may be present at the Subject Property and may be encountered during construction activities. Unanticipated subsurface features or conditions that may be present at the Subject Property include:

- USTs;
- Concrete vaults or slabs;
- Septic systems;
- Former oil-water separators;
- Underground piping containing chemicals;
- Buried brine pond;
- Underground equipment related to grain conveyance; and
- Chemically impacted soil.

If the Contractor encounters an unanticipated condition, the Contractor will stop work, secure the work area, and notify Prologis within 24 hours of discovery of the condition. Prologis will identify and contact the appropriate entity to respond to the unanticipated condition. The procedures that will be followed in the event that an unanticipated subsurface structure is discovered are summarized below:

- A licensed Contractor or an Environmental Professional will remove and containerize any observed residual liquid, sludge, or sediment in the subsurface structure, and will characterize the residual material(s) as required by the waste-receiving facility(ies);
- The Contractor will remove the subsurface structure in compliance with applicable laws and regulations, and under permit from and oversight by the applicable regulatory agency, if required;
- Soil removal actions will be performed in accordance with the procedures outlined in this MMP; and
- The area will be cleared after any required regulatory authorization has been obtained from the permitting agency, so work may proceed.

The Contractor will ensure that the health and safety requirements detailed in Section 4.3, Health and Safety Requirements, are met at all times, which will prepare workers for encountering unanticipated conditions during construction activities.

4.8 MEDIA MANAGEMENT PLAN REPORTING REQUIREMENTS

Any earthwork that involves chemically impacted soil, intersects groundwater, or leads to the discovery of any unanticipated condition will be documented and reported to Prologis, which will subsequently report it to the Environmental Professional. After MMP implementation activities are conducted, the Environmental Professional may document activities and prepare a report, if requested by Prologis. Minimum reporting requirements will consist of tabulated analytical results compared to unrestricted land use objectives, scaled site plans depicting sampling locations, disposal manifests, and descriptions of methods used. All activities involving removal of chemically impacted soil will be performed under the management of a California State Professional Geologist or Professional Engineer.

5.0 MODIFICATIONS TO THE MEDIA MANAGEMENT PLAN

This section presents the conditions under which modifications to this MMP may be required.

This MMP has been developed based on currently known environmental conditions at the Subject Property and current applicable regulations. This MMP may require modification for reasons including but not limited to the following:

- A change in site use;
- Receipt of additional information pertaining to environmental conditions;
- Intrusive activity not addressed by this MMP;
- Updated chemical toxicity information for contaminants detected at the Subject Property; and
- New legal or regulatory requirements applicable to the Subject Property.

6.0 SCOPE, REPRESENTATIONS, AND LIMITATIONS

This section discusses the scope, representations, and limitations of this MMP.

This MMP was developed exclusively to address the chemical constituents identified or potentially present during environmental investigations of the Subject Property, as summarized in Section 3.0, Known Environmental Conditions. Other chemicals or media that may be encountered or generated during construction projects (e.g., demolition and construction debris, asphalt, concrete, asbestos-containing materials, lead-based paint) are not addressed in this MMP. If hazardous construction materials are encountered or generated, it is the responsibility of the Contractor to ensure the proper handling and disposal of such materials.

Current site conditions, laws, policies, and regulations were used to develop this MMP. No representation is made to any present or future developer or owner of the Subject Property or portions of the Subject Property with respect to future site conditions, other than those specifically identified in this document.

This MMP was prepared for the sole use of Prologis and its authorized contractors. Unless specifically agreed to in writing, all other such use is unauthorized. Any use or interpretation of or reliance on this MMP is at the sole risk of the unauthorized user, for which Farallon will bear no liability to any party, including any present or future developer, owner, Contractor, agent, occupant, consultant, Environmental Professional, or any other party owning or visiting the Subject Property or portions of the Subject Property based on or arising out of implementation of this MMP. It is expressly understood that although this MMP is intended to provide guidance and establish a framework for management of residual chemicals at the Subject Property to protect human health and the environment, it in no way creates any warranties or obligations by Farallon as to the implementation, adequacy, or success of protective measures under this MMP.

Notes:

^Calculated soil gas screening levels (SGSLs) for soil gas concentrations were derived by dividing the June 2016 Department of Toxic Substances Control (DTSC) or May 2016 United States Environmental Protection Agency (EPA) Regional Screening Level (RSL) with an attenuation factor of 0.05 for sub-slab samples or with an attenuation factor of 0.002 for residential settings and 0.001 for commercial/industrial settings for soil gas samples deeper than sub-slab samples. DTSC RSLs are provided in the June 2016 DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 3. Where DTSC RSLs were not available, EPA Region 9 RSLs were utilized as denoted by *.

Subject: Phase I Environmental Site Assessment
The Scoular Company
5355 East Airport Drive
Ontario, California 91761
Partner Project No. 16-163550.1

Dear Ms. Frentzel:

Partner Engineering and Science, Inc. (Partner) is pleased to provide the results of the *Phase I Environmental Site Assessment* (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in general conformance with the scope and limitations as detailed in the ASTM Practice E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at (818) 337-1203.

Sincerely,

Misty Vazquez Ponce
Principal

EXECUTIVE SUMMARY

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in general accordance with the scope of work and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and as set forth by the Master Services Agreement between Prologis and Partner dated April 18, 2013 for the property located at 5355 East Airport Drive in the City of Ontario, San Bernardino County, California (the "subject property"). The Phase I Environmental Site Assessment is designed to provide Prologis with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

Property Description

The subject property is located on the north side of East Airport Drive, approximately 2,700 feet west of the intersection of Etiwanda Avenue and Airport Drive, and southeast of the Interstates 10 and 15 Interchange. The subject property is located within a mixed commercial and industrial area of the City of Ontario in San Bernardino County. Please refer to the table below for further description of the subject property:

Subject Property Data	
Address:	5355 East Airport Drive, Ontario, California
Historical Address:	Before development Airport Drive was known as "Slover Avenue"
Property Use:	Commercial/Industrial
Land Acreage (Ac):	14.2 Ac
Number of Buildings:	5
Number of Floors:	1
Gross Building Area (SF):	17,000 square foot (SF) (Office/Warehouse); 7,000 SF (Truck Repair Shop); 1,600 SF (Warehouse); 3,600 SF (Grain Storage-East); and 9,000 (Grain Storage-West)*
Net Rentable Area (SF):	See above
Date of Construction:	Between 1965 and 1973
Assessor's Parcel Numbers (APNs):	0238-052-020 (Parcel A); 0238-052-022 (Parcel B); 0238-052-029 (Parcel C)
Type of Construction:	Office/Warehouse- Wood-Framed (Offices & Maintenance Area) Truck Repair Shop - Concrete Block (Maintenance Building) Warehouse - Concrete Block (Warehouse) Grain Storage-East - Wood-Framed Corrugated Metal (Retail Grain Distribution) Grain Storage-West - Wood-Framed Corrugated Metal (Wholesale Grain Distribution)
Current Tenants:	The Scoular Company, with a sub-lease on the subject property to Verhoeven Grain Company
Site Assessment Performed By:	Janet Tentler of Partner
Site Assessment Conducted On:	June 29, 2016

*Square footage was estimated from Google Earth

The subject property is a grain processing facility that has been in operation since at least 1973. Onsite operations consist of loading and unloading of multiple types of grain from trucks or the adjacent railyard and storing, milling, and processing for bulk and retail sale. Grain from the adjacent rail yard is off-loaded from the southern-most adjacent railroad spur and transported in an underground grain screw conveyor system to the centrally-located grain mill for processing, or to the grain silos for storage. The raw materials are steamed, rolled, and flattened into finish products. In addition to the current structures, the subject property is also improved with bulk storage silos, a vehicle wash-down area, and associated sheds. Maintenance areas are located within the Office/Warehouse and Truck Repair Shop buildings. One service pit was observed within the Truck Repair Shop building, in the maintenance area.

According to available historical sources, the subject property was formerly undeveloped as early as 1938; developed as agricultural land between 1938 and circa 1970; and developed with the current structures circa 1973. Previous owners have included Robertson Farm's Company (1946-1956) and Southern Pacific Grain Company (1956-1976), although aerial photographs indicate that no buildings/operations were present/conducted on the site until circa 1973. Since building construction, the following occupants have been located at the subject property: United Dairyman's Association (1976-1978), Chino Grain Company (1978-1985); Coast Grain Company (1985-2003); J.B. Heiskell & Co. (2008); The Scoular Company (2006-Present); and Verhoeven Grain Company (2008-Present).

The immediately surrounding properties consist of commercial warehouses to the north across the railroad tracks (Emser Tile Company at 5300 Shea Center Drive and Dorel Juvenile Group at 5400 Shea Center Drive); Kmart Distribution Center (5600 East Airport Drive) to the south across Airport Drive; Praxair (5735 East Airport Drive) to the east; and a commercial building to the west (5351 East Airport Drive).

According to a nearby investigation report (on GeoTracker), a well located approximately 4 miles to the east of the subject property contained groundwater at approximately 300 feet below ground surface (bgs). Based on topography is anticipated to flow toward the south.

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. The following was identified during the course of this assessment:

- Based on information provided in the Environmental Data Resources, Inc. (EDR) regulatory database report, five former petroleum underground storage tanks (USTs) were located at the subject property since 1988; however, there are inconsistencies on the number and status of the USTs found in other documentation. Partner was able to identify removal/closure records for three of the USTS. Regulatory closure letters address the removal of the three 12,000-gallon diesel USTs (discussed as HRECs below). Separately, at least one UST was suspected to be adjacent to west of the Truck Repair Building. Partner observed evidence of concrete cuts for a possible fuel dispenser in this area. Records for the fifth possible UST were not clear. Based on

the lack of information regarding the status of at least two former suspect USTs at this facility, the former USTs are considered a REC.

- The subject property is currently equipped with two 250-gallon aboveground storage tanks (ASTs) containing diesel fuel. The original installation date is unknown. Diesel fuel is used to maintain the yard equipment, such as the front-end loaders, forklifts, and the bobcats. Minor to moderate staining was observed on the asphalt surface immediately surrounding the ASTs. The asphalt appeared to be in fair to poor condition with cracks observed in the area of the staining. Based on the lack of information regarding the age and installation dates of these ASTs at this facility and site observations, the ASTs are considered a REC.

- Maintenance areas and storage of automotive-related fluids such as motor oil, waste motor oil, and antifreeze was observed in the two central buildings (Office/Warehouse and Truck Repair Shop). Petroleum staining was observed on the concrete floor within these buildings and the condition of the concrete floor was pitted in some areas. In addition, minor staining was observed adjacent to a parts washer. Based on the long-term use of these buildings for maintenance, the usage of petroleum products and hazardous materials and evidence of staining, the historical operations in these areas are considered a REC.

- A former vehicle wash-down area was observed north of the Truck Repair Shop. Partner observed a sump and pump in this area, however, were reportedly no longer in use. According to the site contact, when the vehicle wash-down area was in use, water would collect into the associated sump and "wastewater was pumped into a tank and then stored in 55-gallon drums for off-site disposal." Previous reports indicated a violation was issued by the Regional Water Quality Control Board (RWQCB), which included truck wash water flowing into the parking lot.

  According to an inspection report from the RWQCB based on an inspection conducted on August 16, 2001, it was noted that housekeeping at the subject property was poor and that boiler blow-down water was being used for dust control. In April 2001, the RWQCB received an anonymous compliant stating that employees at the subject property were routinely pouring used oil into a drain located outside of the Truck Repair Shop. The RWQCB re-inspected the subject property and was told that water from the truck wash down area discharges through a filter and is pumped from a sump into a 2,810-gallon AST. Employees at the subject property stated that the tank had never been emptied. The subject property was cited with several violations at the time including: truck wash water flowing into the parking lot; storm water exceedances (December 2001); and condensate from the boiler room at the mill discharging onto the ground. Based on the use of this area as a truck wash and reported violations for past housekeeping practices, the historical operations in this area are considered a REC.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- Partner did not identify controlled recognized environmental conditions during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- Two 12,000 gallon USTs identified as containing diesel were removed from the subject property in July 1989; available file information maps these USTs north of the mill building. In a letter dated September 4, 1998 by the San Bernardino County Fire Department, Hazardous Materials Division (SBCFD), a report prepared by Babcock & Sons, Inc. and dated July 25, 1989 was reviewed by the SBCFD. The letter indicated the "contamination remaining in the excavation is below that which is generally considered a problem and further investigation is not warranted at this time." Based on the reported sampling conducted subsequent issuance of a No Further Action (NFA) letter by SBCFD, the two former 12,000 gallon USTs removed in 1989 are considered an HREC.
- One 12,000 gallon diesel fuel UST and associated dispenser was removed from the area north of the main office/warehouse building in December 2002. Confirmation sampling was conducted beneath the UST and the stockpiled soil which was re-used for backfill of the excavation. Residual petroleum impacts were identified in the stockpiled soil. The SBCFD issued an NFA letter on January 8, 2003 for the removal of the UST and associated dispenser. Based on the removal and subsequent issue of the NFA, the former 12,000 gallon diesel UST located north of the main office building (east of the "former vegetable oil processing center") is considered an HREC.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following was identified during the course of this assessment:

- The site contact indicated sanitary discharges from the restrooms in the office/warehouse and truck repair shop buildings are directed to on-site septic systems. The site contact was not aware of where the septic systems were located and Partner did not observe any evidence of the septic system during the site visit. Previous reports identified two potential areas of the septic systems on a site figure; however, the prior reports also indicated the location of the septic systems were unknown. No service sinks or floor drains, other than those located in the restrooms, were observed on the subject property. Septic systems are typically of environmental concern due to the potential discharge of petroleum products or hazardous substances; however, since there were no floor drains or evidence of discharges to the septic systems other than for domestic use, the septic system(s) do not appear to be a significant environmental concern.
- The grain processing mill has been in operation since circa 1973. The processing equipment within the mill and underground conveyor systems require lubrication oil; however, no leaking or

other indications of a release were observed during the site reconnaissance. Based on site observations, the equipment use does not appear to be a significant environmental concern.

- The area north of the subject property includes several railroad lines, including rail road spurs which extend onto the subject property. Railroad lines may be of environmental concern due to the use of pesticides, herbicides and oils used for the maintenance of the rail lines, regulated railroad bedding material (slag, gravel, etc.) or chemicals leaching from treated railroad crossties. Based on the commercial nature of the subject property, the presence of the rail lines do not appear to be a significant environmental concern.
- Due to the age of the subject property buildings, there is a potential that asbestos-containing material (ACM) is present. Overall, suspect ACMs were observed in good condition and do not pose a health and safety concern to the occupants of the subject property at this time.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of 5355 East Airport Drive in the City of Ontario, San Bernardino County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed evidence of recognized environmental conditions and/or environmental issues in connection with the subject property. Based on the conclusions of this assessment, Partner recommends the following:

- A limited subsurface investigation should be conducted in order to determine the presence or absence of soil and/or groundwater contamination due to the historical use of the subject property.
- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs located at the subject property.

ENVIRONMENTAL PROFESSIONALS' STATEMENT

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as established in Part 312.10 of Title 40 of the Code of Federal Regulations (40 CFR 312.10) and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR 312.

Name Brant Rotnem
Title Staff Geologist

Name Kathy Lehnus, L.E.P., P.G.
Title Senior Geologist

Name Scott Allin, R.E.P.A.
Title Principal Environmental Scientist

EXECUTIVE SUMMARY

Farallon Consulting, L.L.C. (Farallon) has prepared this Phase I/Phase II Environmental Site Assessment (Phase I/II ESA) Report for the property at 5355 East Airport Drive in Ontario, California (herein referred to as the Site). The Phase I/II ESA was conducted by Brant Rotnem and was reviewed and approved by Kathy Lehnus and Scott Allin. All are experienced Environmental Professionals in the field of Phase I/II ESAs and related environmental investigations.

This Phase I/II ESA Report was prepared for Prologis, L.P., and its subsidiaries, affiliates, related parties (specifically including any 1031 exchange entities), successors, and assigns (Prologis) in accordance the letter regarding Proposal for Phase I Environmental Site Assessment and Media Management Plan dated December 10, 2021, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis; and the letter regarding Proposal for Subsurface Investigation, 5355 East Airport Drive, Ontario, California dated February 14, 2022, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis. The scope of work for this Phase I/II ESA is consistent with ASTM International Standard E1527-13 and E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-13 and -21). ASTM E1527-13 is intended to assist the user in satisfying one of the requirements to qualify for protection from potential liability under the Comprehensive Environmental Response, Compensation, and Liability Act as the innocent landowner, contiguous property owner, or bona fide prospective purchaser. ASTM E1527-13 constitutes "all appropriate inquiry" into the previous ownership, uses, and environmental conditions of a property consistent with good commercial or customary practice, as defined in Section 9601(35)(B) of Title 42 of the U.S. Code.

There were no deviations from ASTM E1527-13 or -21 during this Phase I/II ESA, with the exception of additional environmental services requested by Prologis. Limiting conditions encountered during the Phase I/II ESA were the presence of vehicles parked on exterior portions of the Site that prevented Farallon from observing the entire ground surface of the Site, and the presence of equipment in the Site buildings that prevented Farallon from observing the entire interior floor surfaces. Based on information obtained from the Site representative, historical records, previous reports, and data obtained during the subsurface investigation conducted in March 2022, these limiting conditions are not expected to alter the conclusions of this report.

The purpose of the Phase I/II ESA was to identify, as practicable, recognized environmental conditions on the Site or proximate to the Site that have caused and/or may cause an adverse environmental condition. This Phase I/II ESA Report provides the results of investigation into past and present ownership and uses of the Site, consistent with good commercial and/or customary practice.

The Site consists of two parcels totaling 14.2 acres: Assessor Parcel No. 0238-052-20 (Eastern Parcel), and Assessor Parcel No. 0238-052-29 (Western Parcel). The Site is occupied by George Verhoeven Grain Inc. (dba Verhoeven Grain Inc.) and The Scoular Company, grain processing companies. Operations consist of the processing of raw grain, which is received by truck or by rail from the rail line north of the Site. The exact location of the rail line and associated spurs with

respect to the northern Site boundary could not be confirmed in available files. The raw materials are off-loaded, weighed, and transported to grain storage silos or other storage areas either by an underground auger conveyance or by dedicated on-Site vehicles. Raw grain processing operations occur at the grain mill Area, located in the north-central portion of the Site. After production, the processed grain is weighed, packaged, and loaded onto trucks for distribution.

The Site includes five buildings on the Eastern Parcel, consisting of Building A, used for office and warehouse space; Building B, used for facility maintenance with a vehicle repair shop; Building C, used as a warehouse; and Buildings D and E, used for grain storage. In addition, an office trailer with a small hazardous materials storage area is present on the southern portion of the Western Parcel. On-Site buildings are reportedly connected to septic systems; septic tanks are reportedly located southeast of Building E and potentially east of Building B, and one septic system is reportedly located on the western portion of the Site (location unknown). In 2016, a suspected septic system appears to have been located with ground-penetrating radar north of Building A, which could be in addition to or instead of previously reported septic systems. A vehicle wash-down area with sump leading to an empty 10,000-gallon wash water aboveground storage tank (AST) is located north of Building B; this system is no longer used. Historical features associated with previous operations on the Site include two former "fuel storage" 12,000-gallon underground storage tanks (USTs) at the grain mill area, one former 12,000-gallon diesel UST east of Building C, and a former UST area containing an unspecified number of former USTs west of Building B. These USTs are discussed further below. Access to the Site is gained from East Airport Drive, south of the Site. According to the San Bernardino County Assessor's Office, the Site owner is Prologis Exchange 5355.

Historically, the Site was used as agricultural or grazing land from at least the late 1930s to the early 1970s. By 1973, the Eastern Parcel was developed with small grain storage silos and other features associated with milling operations in the grain mill area. In the 1975 aerial photograph, grain appeared to be stockpiled in the southwestern portion of the Site in Buildings A through C. By 1985, the grain storage structures, Buildings D and E, were developed. By 2002, the Site appeared in its existing configuration. The 2002 aerial photograph shows grain processing operations had expanded at the Site to the Western Parcel, which included the development of three large grain storage silos. The Site has been occupied by Verhoeven Grain Inc. from 1973 to the present; Chino Grain and Milling, Inc. in 1985; Coast Grain Company between 1990 and 2003; The Scoular Company between 2004 and the present; and JD Heistell and Company in 2009.

Adjacent properties at the time of Farallon's site reconnaissance included a rail line to the north followed by industrial buildings occupied by home furnishing businesses Emser Tile at 5300 Shea Center Drive and Dorel Home Furnishings at 5400 Shea Center Drive; Praxair, Inc. to the east at 5735 East Airport Drive; East Airport Drive to the south followed by industrial buildings occupied by distribution businesses K-Mart Distributions at 5600 East Airport Drive and XPO Logistics, Inc. at 5200 East Airport Drive; and a Verizon facility to the west at 5351 East Airport Drive.

Historically, adjacent properties consisted primarily of undeveloped and/or agricultural land. Railroad tracks were present on the north-adjacent property from at least the early 1900s through the 1960s, when the east-adjacent property was developed with the existing industrial facility. By

the early 1990s, the south-adjacent property was developed with an industrial building. By the early 2000s, the west- and north-adjacent properties were developed with industrial buildings and have remained relatively unchanged through the present.

A brine disposal pond owned by the Union Pacific Railroad Company and used by the Coast Grain Company for boiler blow-down water was installed in 1969 and removed in 1998 to allow for the addition of a rail line north of the grain mill area. According to the letter regarding Approval of Closure Report for the Brine Disposal Pond, Coast Grain Company, Ontario, California dated September 24, 1999, from the Santa Ana Regional Water Quality Control Board (Water Board), the closure of the pond included the removal of approximately 7,500 cubic yards of salt-contaminated soil and placement of a 40-mil high-density polyethylene liner. Miscellaneous analytical data available in the Water Board file indicated that soil was analyzed for pH, with no elevated readings noted. Based on mapping provided in the Water Board file, the pond was located south of the Southern Pacific Railroad Main Line between two sets of rail spurs; it appears to be just north of the current property line. However, a survey would be required to understand the northern property line in relation to the former brine disposal pond; this is considered a data gap for this report.

The EDR Radius Map Report with GeoCheck prepared for the Site by Environmental Data Resources, Inc. (EDR) dated December 9, 2021 (EDR Report) identified the Site address in several databases. The Site listings generally relate to hazardous material management, air quality permit requirements associated with grain processing equipment and operations, and historical USTs. Database listings did not indicate records of a release at the Site. Farallon searched the California State Water Resources Control Board online GeoTracker database and the California Department of Toxic Substances Control online EnviroStor database for records related to the Site, but found no listings.

Farallon reviewed a Phase I ESA report dated August 18, 2016, and a Phase II Subsurface Investigation report dated August 16, 2016, prepared by Partner Engineering and Science, Inc. (Partner) for the Site (Partner 2016 Phase I Report and Partner 2016 Phase II Report, respectively). According to the Partner 2016 Phase I Report, as many as five petroleum USTs were formerly in use at the Site, which was considered a recognized environmental condition, along with truck maintenance operations, ASTs, a vehicle wash-down area, conveyor belts, and at least one septic system. According to the Partner 2016 Phase II Report, 26 borings were advanced at depths between 1 and 25 feet below ground surface for the collection of soil and/or soil gas samples. Soil samples were analyzed for total petroleum hydrocarbons (TPH) carbon chain C6-C40 by U.S. Environmental Protection Agency (EPA) Method 8015C and volatile organic compounds (VOCs) by EPA Method 8260B; and soil gas samples were analyzed for VOCs by EPA Methods TO-15 and 8260B. No detectable concentrations of VOCs or TPH carbon chain C6-C40 were present in soil samples. Analytical results of soil gas samples indicated detections of VOCs including tetrachloroethene, trichloroethene, toluene, ethylbenzene, and xylenes. The concentrations of these detectable results were less than the residential and commercial/industrial calculated soil gas screening levels (SGSL) at the time of the report beneath and west of Building B; however, concentrations of tetrachloroethene (PCE) detected in soil vapor samples collected from beneath

and west of Building B exceed current commercial/industrial calculated SGSLs. Additionally, in comparison with the "low level" ethylbenzene SGSL, the ethylbenzene concentration in one soil vapor sample from this area exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.

The EDR Report identified several facilities adjacent or proximate to the Site in the regulatory databases. Several of these facilities have known or suspected releases of hazardous substances to soil and/or groundwater. Based on their current regulatory status, depth to groundwater, topographic location relative to the Site, and/or relative distance from the Site, these facilities do not represent recognized environmental conditions in connection with the Site.

Prologis provided Farallon with a *Preliminary Site Plan – Scheme 01, 5355 E. Airport Drive, City of Ontario* by RGA Office of Architectural Design dated November 16, 2021, which depicted a proposed building on the northern and central portions of the Site. In March 2022, Farallon conducted soil and soil vapor sampling at the Site to assess former UST areas and septic systems, and the new building footprint for the potential for vapor intrusion issues. The scope of work for the Phase II ESA portion of this assessment included the advancement of 12 borings and installation of 10 temporary soil vapor probe locations with single- or multi-depth nested vapor points for the collection of soil and soil vapor samples. The Phase II ESA portion of this assessment was conducted on March 4 and 11, 2022.

No TPH or VOCs were detected exceeding laboratory detection limits in the soil samples collected from the Site. Low concentrations of naturally occurring metals including barium, cadmium, cobalt, chromium, copper, nickel, lead, vanadium, and zinc were detected in two soil samples submitted for analysis; these concentrations were considerably less than screening levels.

Based on subslab soil vapor data, soil vapor beneath the slab at Building B contains PCE exceeding calculated screening levels. PCE is present west of Building B at concentrations exceeding current calculated industrial screening levels using the 0.03 attenuation factor, but less than screening levels using the less conservative attenuation factors. PCE was also detected in soil vapor in central and eastern portions of the Site at concentrations less than the calculated screening levels in the shallow zones that were assessed. One concentration of PCE was detected exceeding calculated screening levels in a deeper soil vapor sample collected from the vicinity of two former 12,000-gallon USTs north of the grail mill area; the shallow soil vapor sample collected from this boring did not contain PCE exceeding calculated screening levels. The extent of PCE in soil vapor was not fully characterized.

Based on review of the Site history, including subsurface investigation reports, interviews with persons knowledgeable about the Site, reconnaissance of the Site, review of regulatory agency lists, and the completion of subsurface investigation at the Site, this Phase I/II ESA identified the following recognized environmental condition in connection with the Site:

- PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Site.

In addition, Farallon identified the following historical recognized environmental conditions in association with the Site:

- Previous environmental reports note that one or more USTs were historically located west of Building B. Farallon was not able to find information regarding the UST in regulatory files, but did find some information regarding three to four diesel and unleaded gasoline USTs ranging in capacity from 4,000 to 10,000 gallons at unspecified locations at the Site preceding the presence of the three known 12,000-gallon USTs (noted in the grain mill area and southeast of Building C). In 2016, Partner conducted a subsurface investigation in this area and did not identify evidence of a petroleum release.
- In 2002, Tank Specialists of California removed a 12,000-gallon diesel steel UST and fuel dispenser mapped southeast of Building C. According to the letter regarding Soil Sampling Following the Removal of an Underground Storage Tank – Coast Grain Co., 5355 E. Airport Drive, Ontario, California dated December 18, 2002, from Advanced GeoEnvironmental, Inc., three confirmatory soil samples were collected beneath the bottom of the UST after removal, and soil samples were collected from stockpiles. The soil samples were analyzed for TPH as diesel; benzene, toluene, ethylbenzene, and xylenes; and methyl tertiary-butyl ether. Minor petroleum impacts were noted in stockpiled soil (800 milligrams per kilogram of TPH as diesel), which was reportedly used as backfill for the excavation. No constituents of concern were detected in the confirmatory soil samples collected from beneath the UST. Advanced GeoEnvironmental, Inc. recommended that San Bernardino County Fire Department (SBCFD) Hazardous Materials Division issue closure of the UST; and the letter regarding Removal of One Underground Storage Tank at Coast Grain Inc., Located at 5355 E. Airport Drive, Ontario, California dated January 8, 2002, from SBCFD was issued indicating that further investigation was not warranted.
- Based on sampling conducted as part of this Phase I/II ESA, no release was found in connection with the two 12,000-gallon "fuel storage" USTs historically located at the grain mill, which were removed from the Site in 1998. A No Further Action determination issued by SBCFD indicated that residual impacts were present, although "below that which is generally considered a problem."

The vehicle wash-down area located north of Building B was used for washing trucks (including molasses transportation trucks) and is no longer used. According to Site personnel, only truck exteriors were washed (not engines). Given the nature of use and that wash water was routed to an AST, with no discharge, the vehicle wash-down area is considered a de minimis condition for the Site. No release was found in the vicinity of the septic tanks located east of Building B, which provides a disposal pathway for a building that is known to have used chlorinated solvents and vehicular fluids.

Because two or three potential on-Site septic systems on the Western Parcel, located north of Building A and southeast of Building E, appear to be used for domestic sewer, with limited hazardous material use in the proximity that could be introduced to the septic systems as a release pathway, the presence of those septic systems is considered a de minimis condition for the Site. Additionally, the presence of petroleum ASTs with secondary containment and/or no evidence of

leaking, rail spurs within or along the northern property boundary, transformers with no evidence of leaking, and underground grain conveyance systems are considered de minimis conditions for the Site. Further, based on the location and nature of use (boiler blow-down), the former brine pond located in the vicinity of the northern property line is also considered a de minimis condition for the Site.

At the request of Prologis, Farallon has included additional opinions and recommendations for the Site beyond those specified in ASTM E1527-13 and -21 for de minimis and recognized environmental conditions.

Based on the findings from this Phase I/II ESA, Farallon recommends preparation of a Media Management Plan for use during Site redevelopment to address any unexpected impacts to soil associated with historical activities at the Site, and to address any issues related to the former brine pond, underground grain conveyance systems, septic systems, and former USTs at the Site. Additionally, because PCE has been documented in soil vapor in the vicinity of Building B at concentrations exceeding calculated screening levels, and PCE was detected in shallow soil vapor at concentrations less than the calculated RSLs in other soil gas samples collected at the Site, the potential for vapor intrusion into the planned new Site building should be addressed. Additional investigation and characterization are recommended to delineate and design mitigation measures for PCE in soil vapor that may impact indoor air in the future building.

1.0 INTRODUCTION

This Phase I/II Environmental Site Assessment (Phase I/II ESA) Report was prepared by Farallon Consulting, L.L.C. (Farallon) for the property at 5355 East Airport Drive in Ontario, California (herein referred to as the Site) (Figure 1). This section discusses the project authorization, and the qualifications of the Environmental Professionals conducting and reviewing the Phase I/II ESA work. Also included in this section are the project purpose, objective, scope of services, deviations, limiting conditions, and data gaps.

1.1 PROJECT AUTHORIZATION

This Phase I/II ESA Report was prepared for Prologis, L.P., and its subsidiaries, affiliates, related parties (specifically including any 1031 exchange entities), successors, and assigns (Prologis) in accordance with the letter regarding Proposal for Phase I Environmental Site Assessment and Media Management Plan dated December 10, 2021, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis; and the letter regarding Proposal for Subsurface Investigation, 5355 East Airport Drive, Ontario, California dated February 14, 2022, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis. The scope of work for this Phase I/II ESA is consistent with ASTM International Standard E1527-13 and E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-13 and -21).

1.2 PROFESSIONAL QUALIFICATIONS

The Phase I/II ESA was conducted by Brant Rotnem and was reviewed and approved by Kathy Lehnus and Scott Allin. All have an understanding of surface and subsurface environmental conditions and the processes used to evaluate these conditions, and the ability to develop opinions regarding conditions indicative of a release or threatened release of hazardous substances and petroleum products. These Environmental Professionals have developed and performed all appropriate inquiry, in conformance with the standards and practices set forth in Part 312 of Title 40 of the Code of Federal Regulations. The professional qualifications of Brant Rotnem, Kathy Lehnus, and Scott Allin are provided in Appendix A.

1.3 PROJECT PURPOSE AND OBJECTIVE

The purpose of the Phase I/II ESA was to identify, as practicable, recognized environmental conditions on the Site and within the appropriate study area that have caused and/or may cause an adverse environmental impact. ASTM E1527-13 is intended to permit a user to satisfy one of the requirements to qualify for protection from potential liability under the Comprehensive Environmental Response, Compensation, and Liability Act as the innocent landowner, contiguous property owner, or bona fide prospective purchaser. ASTM E1527-13 constitutes "all appropriate inquiry" into the previous ownership, uses, and environmental conditions of a property consistent with good commercial or customary practice, as defined in Section 9601(35)(B) of Title 42 of the U.S. Code.

The objective of the Phase I/II ESA was to perform an appropriate inquiry into past and present ownership and uses of the Site, consistent with good commercial and/or customary practice. This Phase I/II ESA Report is to be used as a risk management tool to meet all appropriate inquiry requirements and the Comprehensive Environmental Response, Compensation, and Liability Act liability defense. The Phase I/II ESA does not guarantee that there are no impacts to the Site.

For the purpose of this Phase I/II ESA Report, the term "recognized environmental condition" is defined as the presence or likely presence of any hazardous substance or petroleum product in, on, or at the Site due to releases to the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment. The term is not intended to include "de minimis conditions" that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of the applicable governmental agencies.

The term "controlled recognized environmental condition" is defined as a recognized environmental condition resulting from a past release of a hazardous substance or petroleum product that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in-place subject to implementation of required controls.

The term "historical recognized environmental condition" is defined as a past release of any hazardous substance or petroleum product that has occurred in connection with the Site and has been addressed to the satisfaction of the applicable regulatory authority, without subjecting the Site to any required controls.

1.4 PROJECT SCOPE OF SERVICES

This Phase I/II ESA Report was prepared for Prologis, L.P., and its subsidiaries, affiliates, related parties (specifically including any 1031 exchange entities), successors, and assigns (Prologis) in accordance with the letter regarding Proposal for Phase I Environmental Site Assessment and Media Management Plan dated December 10, 2021, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis; and the letter regarding Proposal for Subsurface Investigation, 5355 East Airport Drive, Ontario, California dated February 14, 2022, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis. In addition, this work was conducted in accordance with the *Master Services Agreement* between Prologis and Farallon dated August 4, 2011.

The scope of work for this Phase I/II ESA included a records review, literature research and review, site reconnaissance, interviews with individuals familiar with the Site, interviews with local governmental officials, an investigation of soil and soil vapor, and preparation of this report.

At the request of Prologis, Farallon provided additional environmental services and recommendations for further action based on the findings of the Phase I/II ESA. These services are considered non-scope items and are not required to satisfy ASTM E1527-13 and -21.

1.5 DEVIATIONS

There were no deviations from ASTM E1527-13 or -21 during this Phase I/II ESA, with the exception of additional environmental services requested by Prologis.

1.6 LIMITING CONDITIONS

Limiting conditions encountered during this Phase I/II ESA were the presence of vehicles parked on exterior portions of the Site that prevented Farallon from observing the entire ground surface of the Site, and the presence of equipment in the Site buildings that prevented Farallon from observing the entire interior floor surfaces. Based on information obtained from the Site representative, historical records, previous reports, and data obtained during the subsurface investigation conducted in March 2022, these limiting conditions are not expected to alter the conclusions of this report.

1.7 DATA GAPS

Data gaps may affect the ability to identify recognized environmental conditions and Farallon's ability to render opinions and conclusions for presentation in the Phase I/II ESA Report. The following data gap was identified during this Phase I/II ESA:

- George Verhoeven Grain Inc., dba Verhoeven Grain Inc. (Verhoeven), receives raw grain via a rail line north of the Site. The exact location of the rail line in relation to the northern property line has not been established in available records; part of the rail line could be located on portions of the Site. This constitutes a data gap for the Site. A land survey would be required to determine whether the rail spurs and/or a former brine pond in the area are present on the Site. If found to be located on the Site, further evaluation regarding the possible environmental issues related to rail lines, transportation of materials, and brine water disposal should be assessed.

Farallon did not identify other data gaps during this Phase I/II ESA.

2.0 SITE OVERVIEW

This section includes an overview of the Site location, improvements, and operations. A description of adjacent and surrounding land use also is provided.

2.1 SITE LOCATION

The Site is approximately 0.5 mile west of the intersection of Etiwanda Avenue and East Airport Drive, located at 5355 East Airport Drive in Ontario, San Bernardino County, California (Figure 1). The location is in an industrial area approximately 40 miles east of downtown Los Angeles and approximately 7 miles south of the San Bernardino Mountains. The nearest residential community is 1.8 mile southeast of the Site.

2.2 SITE DESCRIPTION

The Site consists of two parcels totaling 14.2 acres: Assessor Parcel No. 0238-052-20 (Eastern Parcel), and Assessor Parcel No. 0238-052-29 (Western Parcel).

The Eastern Parcel is occupied by Verhoeven, a grain processing company, and contains grain storage silos, a grain mill area, and five buildings. An office and warehouse building, referred to as "Building A," is located on the southern portion of the Site. The warehouse portion on the northeastern side of Building A contains a service shop for the repair of machinery related to the grain mill. Wastes stored in this area include motor oil, hydraulic oil, and gear oil, primarily related to tractor and forklift operation. A maintenance and repair shop, referred to as "Building B," is present on the eastern portion of the Site, and is used for light tractor and forklift service. New and waste vehicle fluids are stored in a hazardous substance storage area on the southwestern interior border of Building B. Additional structures on the Eastern Parcel consist of a warehouse referred to as "Building C" on the north-central portion, used for assorted storage; and two grain storage structures on the southeastern and southwestern portions of the parcel, referred to as Buildings D and E. The property is primarily asphalt-paved, with some gravel-paved areas on the western portion of the parcel. Access to the Site is gained from East Airport Drive, south of the Site.

The Western Parcel is occupied by The Scoular Company (Scoular), a corn storage and distribution facility. The Scoular portion of the Site contains exterior grain storage, with an office trailer that contains a small hazardous substance storage area on secondary containment used for the storage of lubrication oils and greases for equipment.

A vehicle wash-down area is present on the northeastern portion of the Site, and three to four septic systems are associated with the Site: two or three on the Eastern Parcel, and one on the Western Parcel. The location of the septic system on the Western Parcel could not be determined from the records reviewed. Additionally, aboveground storage tanks (ASTs) and three areas with former underground storage tank (USTs) are associated with the Site (detailed in Section 4.5).

Figure 2 presents a general plan map of the Site; additional details pertaining to the Site are provided in Section 8.2, Site Reconnaissance Observations. Site photographs are presented in Appendix B.

2.3 SITE OPERATIONS

According to the San Bernardino County Assessor's Office, the Site owner is Prologis Exchange 5355. Verhoeven has operated the Eastern Parcel as a grain processing facility since development in 1973. Raw grain, including corn and barley, is received at the facility via a rail line north of the Site (Assessor Parcel No. 0238-052-22) and distributed via conveyor belt from grain silos to Scoular on the Western Parcel; the exact location of the rail line in relation to the northern property line has not been established in the records reviewed. Raw grain product is transferred via conveyor from the Western Parcel or transloaded from rail cars via underground piping to four large storage silos in the grain mill on the Eastern Parcel.

In the grain mill, the raw grain is fed through a cleaner silo, which removes chaff, cobb pieces, and other excess matter with a water wash. The cleaned grain is gravity-fed through steam jackets, which use natural-gas-fired, boiler-generated steam to soften the product before fan-drying. After processing, the product is stored in silos for off-Site transfer via truck.

In addition to product processing at the grain mill, operations at Verhoeven consist of light tractor and forklift service in Building B. A 4- to 5-foot-deep repair pit is located in Building B that is not in use by Verhoeven. Service on tractors and forklifts includes minor repairs with use of a petroleum-based parts cleaner, and tire changes. The fleet of grain distribution trucks is not serviced on the Site, with the exception of oil changes performed by an external service technician, who reportedly collects and removes the waste oil from the Site.

A bermed truck-washing area equipped with an underground sump leading to an empty 10,000-gallon wash water AST is located north of Building B. Personnel reported that it is no longer in use, only truck exteriors were washed in this area, and no undercarriage/chassis or engine washing was conducted on the Site.

Scoular operates the Western Parcel as a grain storage and distribution facility. Raw grain product is brought onto the Site via rail to the north, and either off-loaded into trucks for direct distribution, or transloaded via underground piping to one of three grain storage silos. The storage silos use hydraulic augers to transfer the grain onto a conveyor system for processing at the Verhoeven grain mill. In addition to the storage silos, the Scoular parcel is developed with a mobile office trailer and a gravel-paved yard.

At the time of the site reconnaissance, Farallon observed hazardous materials in the warehouse in the northeastern portion of Building A, an aboveground fueling area northeast of Building A (consisting of two 250-gallon diesel ASTs and one 220-gallon hydraulic oil AST), and in Building B. Materials stored in these areas consisted of diesel, motor oil, waste oil, gasoline, grease, lubricant, gear oil, transmission oil, and parts cleaning solution. Hazardous materials consisting of

lubricating oils and greases for equipment were also stored in the office trailer on the Western Parcel.

Historical features associated with previous operations on the Site include two former petroleum 12,000-gallon USTs at the grain mill area, one former 12,000-gallon diesel UST east of Building C, and a former UST Area west of Building B. Historical operations, features, and reported septic systems are discussed further in Section 4.5. Figure 2 presents the locations of on-Site buildings and historical features.

2.4 ADJACENT AND SURROUNDING LAND USE

Adjacent properties at the time of Farallon's site reconnaissance included a rail line to the north followed by industrial buildings occupied by home furnishing businesses Emser Tile at 5300 Shea Center Drive and Dorel Home Furnishings at 5400 Shea Center Drive; Praxair, Inc. to the east at 5735 East Airport Drive; East Airport Drive to the south followed by industrial buildings occupied by distribution businesses K-Mart Distributions at 5600 East Airport Drive and XPO Logistics, Inc. at 5200 East Airport Drive; and a Verizon facility to the west at 5351 East Airport Drive.

No visual evidence of recognized environmental conditions was observed on abutting or nearby properties during the site reconnaissance. Observations were restricted to areas readily observable from the Site.

3.0 PHYSICAL SETTING

The physical setting of the Site, including topography, geology, and hydrogeology, is described in this section. Farallon's assessment of sensitive receptors in the area also is discussed.

3.1 TOPOGRAPHY

Farallon reviewed the U.S. Geological Survey (USGS) topographic maps for Guasti, California, dated 2018 and provided by Environmental Data Resources, Inc. (EDR). The maps depict the Site at an elevation of approximately 980 feet above mean sea level. Site topography slopes gently to the south. Regional topography generally is sloped to the south.

3.2 GEOLOGY AND HYDROGEOLOGY

The Site is situated within the San Bernadino Valley of the Peninsular Ranges Geomorphic Province in Southern California. The Peninsular Range Province extends into lower California, and is bounded by the Colorado Desert to the east, the Pacific Ocean to the west and the San Gabriel and San Bernardino mountains to the north. The San Bernardino Mountains are located approximately 7 miles north of the Site. According to *The EDR Radius Map Report with GeoCheck* prepared for the Site by EDR dated December 9, 2021 (EDR Report), surface soil at the Site consists primarily of Delhi fine sand, which is somewhat excessively well drained.

According to the *Phase II Subsurface Investigation Report* dated August 16, 2016 by Partner Engineering and Science, Inc. (Partner) for the Site (Partner 2016 Phase II Report), soil beneath the Site generally consists of very fine grained, silty sand from the surface to depths of approximately 20 feet below ground surface (bgs) and transitions to very fine to coarse grained, poorly graded sand between depths of 20 and 25 feet bgs. Groundwater was not encountered during Partner's investigation.

Soil encountered during the Phase II ESA investigation portion of this scope of work was described as silty fine to medium sand to a total explored depth of 10 feet bgs, with an apparent coarse sand and gravel layer at 10 feet bgs (and as shallow as 5 feet bgs on the eastern portion of the Site at boring SB-2). Boring logs are attached in Appendix F. Groundwater was not encountered during drilling.

Site-specific groundwater direction and depth information was not available in the records reviewed. Based on information obtained from the California State Water Resources Control Board GeoTracker database (GeoTracker database) and topographic interpretation, groundwater beneath the Site is anticipated at a depth of approximately 250 bgs and is estimated to flow to the south.

3.3 OIL AND GAS RECORDS

According to the California Department of Conservation, Geologic Energy Management Division Well Finder online database, there are no permitted oil or gas wells on the Site or at adjacent properties.

3.4 SENSITIVE RECEPTORS

Farallon conducted a limited assessment of sensitive receptors on or in the vicinity of the Site that was confined to visually apparent features such as surface water bodies (e.g., low-lying wet areas, streams, ponds) and residential and recreational areas. Farallon's assessment of sensitive receptors included a review of readily ascertainable information relating to the presence of private, semiprivate, public, and industrial water-supply wells.

According to the EDR Report, a groundwater monitoring well maintained by the San Bernardino County Water Resources Division is located between 0.125 and 0.25 mile of the Site, and groundwater monitoring wells maintained by the San Bernardino County Water Resources Division and Department of Public Health are located within 0.25 and 0.5 mile of the Site. In addition, a public drinking water well is located within 0.25 and 0.5 mile of the Site. No wetlands are mapped on the Site, and the Site is not mapped in a floodplain. The major water body nearest the Site was identified as the Santa Ana River, located approximately 6 miles south of the Site.

4.0 USER-PROVIDED INFORMATION

Farallon understands that the user of this report, Prologis, is seeking to follow the standards set forth in ASTM E1527-13 and -21 to complete an environmental assessment of the Site. The user has specific responsibilities for fulfilling ASTM E1527-13 and -21 requirements to help identify the possibility of recognized environmental conditions in connection with the Site. These responsibilities do not require the technical expertise of an Environmental Professional, and were not performed by the Environmental Professional who conducted the Phase I ESA at the Site.

To facilitate fulfillment of the ASTM E1527-13 and -21 requirements identified below, Farallon provided Prologis with a copy of the *Phase I ESA User Questionnaire* (User Questionnaire) to complete. The User Questionnaire is provided in Appendix C of this Phase I ESA Report.

4.1 TITLE AND LIEN RECORDS

Prologis indicated that it was not aware of environmental liens against the Site.

4.2 EXPERIENCE AND SPECIALIZED KNOWLEDGE

Prologis indicated that it has no experience or specialized knowledge regarding the Site.

4.3 COMMONLY KNOWN INFORMATION

Prologis indicated that it is not aware of commonly known information that would lead to identification of recognized environmental conditions in connection with the Site.

4.4 PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT USERS

Prologis will rely on this Phase I ESA Report.

4.5 PREVIOUS ENVIRONMENTAL STUDIES

Farallon was provided with the following environmental documents prepared for the Site:

- *Phase I Environmental Site Assessment Report, The Scoular Company, 5355 East Airport Drive, Ontario, California 91761* dated August 18, 2016, prepared by Partner Engineering and Science, Inc. (Partner 2016 Phase I Report); and
- *Phase II Subsurface Investigation Report, 5355 East Airport Drive, Ontario, California 91761* dated August 16, 2016, prepared by Partner (Partner 2016 Phase II Report).

At the time of the Partner 2016 Phase I Report, the Site was developed as it is today and occupied by grain processing companies. Facility features and operations included the same buildings and grain processing equipment and procedures discussed in Section 2.3. Other features observed at the Site included bulk storage silos, a vehicle wash-down area with associated sheds in the northeastern portion of the Site, two subsurface grain conveyance systems in the northern portion

of the Site, and two maintenance areas within the office and warehouse building (Building A) and truck repair shop building (Building B). The maintenance area inside the truck repair shop (Building B) included a subsurface service pit for vehicle repairs; this pit was not observed during the Site visit due to the presence of stored equipment, but reported by the Site contact to be 4 feet wide by 25 to 30 feet long and between 4 and 5 feet deep. Domestic wastewater was reportedly disposed of by one or two septic systems. Information regarding the construction and locations of the septic systems was not provided from Site contacts. However, locations of the septic systems were speculated, based on previous reports, as being southeast of Building E and east of Building B. In 2016, a suspected septic system appears to have been located with ground-penetrating radar north of Building A, which could be in addition to or instead of previously reported septic system locations. Partner observed hazardous substances and petroleum products at the Site in hazardous material storage areas within Buildings A or B, which included antifreeze, motor oil, waste motor oil, grease, and waste grease. Three ASTs were located outside the northeastern corner of Building A, including one 85-gallon AST containing hydraulic oil, and two 250-gallon ASTs containing diesel fuel.

Previous investigations discussed in the Partner 2016 Phase I Report included four previous Phase I ESAs, three of which were prepared by Terracon Consultants, Inc. (Terracon), dated May 3, 2016, January 19, 2010, and May 5, 2009; and one of which was prepared by SECOR International Incorporated (SECOR), dated October 8, 2003 (SECOR 2003 Phase I Report). Only one of these reports was attached for Farallon's review: the 2016 Phase I Report by Terracon. Terracon did not identify recognized environmental conditions or controlled recognized environmental conditions in connection with the Site; however, a historical recognized environmental condition associated with total petroleum hydrocarbon (TPH) concentrations remaining in-place from a former UST was identified, based on a review of SECOR's 2003 Phase I Report. The SECOR 2003 Phase I Report was not included as an attachment in Terracon's report. The following information regarding SECOR's observations and findings was summarized in the Terracon 2016 Phase I Report. According to Terracon, SECOR did not identify recognized environmental conditions or historical recognized environmental conditions but noted several environmental concerns, including former USTs, the use of petroleum-impacted material as backfill following the removal of a UST, septic systems, and various wastewater and stormwater violations.

SECOR reported that four USTs were removed from the Site, including two 12,000-gallon USTs located north of the mill area, one 12,000-gallon UST located east of the former vegetable oil processing area, and one UST of unknown size located west of the former truck shop building (assumed as present-day Building B). This area was screened with ground-penetrating radar by Partner in 2016, and an assumed UST grave was identified beneath the overhang west of Building B.

Based on SECOR's review of records maintained by the San Bernardino County Fire Department (SBCFD), two 12,000-gallon USTs located north of the mill area were removed in 1989, and a letter issued by SBCFD on September 4, 1998 indicated "contamination remaining in the excavation is below that which is generally considered a problem and further investigation is not warranted." SECOR reported previous investigations were completed by Grisanti and Associates.

Soil samples were collected in the vicinity of a 12,000-gallon diesel UST located east of the "former vegetable oil processing" center, which was speculated by Partner to be located in the northern-central portion of the Site. Analytical results of soil samples indicated concentrations of TPH as diesel (TPH-d) up to 4,500 parts per million at a depth of 16 feet bgs. The 12,000-gallon diesel UST was removed in December 2002 and was granted regulatory closure from SBCFD on January 8, 2003.

During SECOR's site reconnaissance, a former fueling island was reportedly observed west of the truck repair shop (Building B). According to SECOR, no records were available regarding this former UST. However, an undated permit application for two 4,000-gallon diesel USTs was found on file with SBCFD. Additionally, a permit to operate five USTs, dated February 25, 1988, included a handwritten note indicating that the "number of tanks was amended from five to four per signed-off job card." In 2002, this area was investigated by Grisanti and Associates, who found concentrations of TPH-d at 11 parts per million at a depth of 15 feet bgs, and no detectable concentrations at a depth of 20 feet bgs. Farallon assumes that these tank graves were the anomalies identified by Partner under the Building B awning in 2016.

Based on a review of Santa Ana Regional Water Quality Control Board, SECOR found that stormwater discharge from the Site exceeded discharge permit limits in 2001 for pH, total suspended solids, oil and grease, total organic carbon, total Kjeldahl nitrogen, biological oxygen demand, copper, and/or zinc. A violation was issued by the Santa Ana Regional Water Quality Control Board in 2001 for the absence of a Storm Water Pollution Prevention Plan and a Storm Water Management Plan.

The Partner 2016 Phase I findings identified four recognized environmental conditions, two historical recognized environmental conditions, and four environmental issues. The four recognized environmental conditions relate to the statuses of a fourth or fifth UST located on the Site, based on conflicting database information and a lack of historical records available regarding the status and location of the USTs; surficial degradation and staining of asphalt around two 250-gallon diesel fuel ASTs; staining and historical use of petroleum products and hazardous materials in maintenance areas within Buildings A and B; and potential impacts associated with the vehicle wash-down area and drainage system, based on reported violations relating to wastewater runoff, poor housekeeping, and an anonymous complaint regarding the routine pouring of used oil into a drain in the vicinity of the vehicle wash-down area. The two historical recognized environmental conditions identified related to the following: the two former 12,000-gallon diesel USTs, which were removed in 1989 and received a No Further Action (NFA) determination issued by SBCFD; and one former 12,000-gallon diesel UST and associated dispenser, which were removed in 2002 and received an NFA determination issued by SBCFD. The four environmental issues identified relate to unknown locations of two on-Site septic systems; grain processing equipment and subsurface grain conveyance systems requiring lubrication oil; railroad spurs extending onto the Site that may have impacted the Site with pesticides, herbicides, and oils from rail line maintenance and/or construction; and potential asbestos-containing materials associated with the age of the buildings. Recommendations regarding these findings included a limited subsurface investigation to determine the presence or absence of soil and/or groundwater contamination due to the historical

use of the Site, and an operation and maintenance program to be implemented to safely manage the suspect asbestos-containing materials at the Site.

The Partner 2016 Phase II Report investigation completed at the Site included an assessment to identify former on-Site USTs or associated features, reported septic systems, and soil and soil gas sampling to assess for indications of a release from historical Site activities. A geophysical survey was completed to identify USTs remaining in-place, backfilled tankholds, septic tanks, and/or associated features, and to clear boring locations of utilities. One large anomaly, indicative of a backfilled excavation, was located under the western canopy of Building B, which generally corresponded to the location of the former USTs. There were no large metallic features identified, so Partner concluded that the USTs in this area had been removed. One large anomaly resembling a septic system was located north of Building A.

As part of the soil and soil gas investigation, 26 borings were advanced between depths of 1 and 25 feet bgs for the collection of soil and/or soil gas samples. Soil samples were analyzed for TPH carbon chain C6-C40 (TPH-cc) by U.S. Environmental Protection Agency (EPA) Method 8015C and volatile organic compounds (VOCs) by EPA Method 8260B; and soil gas samples were analyzed for VOCs by EPA Methods TO-15 and 8260B. No detectable concentrations of VOCs or TPH-cc were present in soil samples. Analytical results of soil gas samples indicated detections of VOCs including tetrachloroethene (PCE), trichloroethene, toluene, ethylbenzene, and xylenes. The concentrations of these detectable results were less than the residential and commercial/industrial calculated soil gas screening levels (SGSLs) at the time of the report. Partner concluded that there did not appear to be a discernable vapor intrusion condition to the Site, and the detections of VOCs in soil gas did not represent a threat to human health or the environment. Partner recommended no further investigation with respect to the on-Site grain handling facility at the time of the report.

Although the reported concentrations were less than regulatory criteria at the time of the report, the California Department of Toxic Substances Control *Human Health Risk Assessment Note Number 3* was updated in April 2020 to include the use of a more conservative attenuation factor of 0.03 in SGSL calculations. The 0.03 attenuation factor can be used to develop "low" level screening levels and can be used in conjunction with previously approved attenuation factors published in 2011 (known as "high" level screening levels). In comparison with the "low level" PCE SGSL, the PCE concentrations in soil vapor samples collected from five locations in 2016 exceeded the calculated soil gas commercial/industrial screening level of 67 micrograms per cubic meter ($\mu g/m^3$). Additionally, in comparison with the "low level" ethylbenzene SGSL, the ethylbenzene concentration in one soil vapor sample exceeded the calculated soil gas commercial/industrial screening level of 163 $\mu g/m^3$. These samples were located within and adjacent to Building B at a depth of 5 feet bgs.

No other reports were provided to Farallon for review.

5.0 SITE BACKGROUND AND HISTORY

Farallon reviewed the following historical sources as part of this Phase I/II ESA:

- Aerial photographs of the Ontario, California area dated 1938, 1948, 1953, 1959, 1966, 1975, 1985, 1990, 1994, 2002, 2005, 2009, 2012, and 2016 obtained from EDR;
- Cole Information Services, GTE, and Haines and Digital Business Directories of Ontario, California dated 1985, 1990, 1995, 1999, 2003, 2004, 2008, 2009, 2014, and 2017 obtained from EDR; and
- USGS topographic maps of Guasti, California dated 1897, 1900, 1903, 1941, 1944, 1953, 1954, 1966, 1973, 1976, 1981, 2012, 2015, and 2018 obtained from EDR.

A search for fire insurance maps resulted in notification that there was no coverage for the Site.

Farallon is not responsible for the accuracy or completeness of the historical sources reviewed. The historical sources documented were reasonably ascertainable and practically reviewable during this Phase I ESA. Historical sources are provided in Appendix D.

5.1 SITE

Topographic maps between 1897 and 1903 did not include significant detail regarding the Site. The Site was used as agricultural or grazing land from at least the late 1930s to the early 1970s. By 1973, the Eastern Parcel was developed with small grain storage silos and other features associated with milling operations in the grain mill area. In the 1975 aerial photograph, grain appeared to be stockpiled in the southwestern portion of the Site in Buildings A through C. Based on 1953, 1966, and 1981 topographic maps, Airport Drive was previously known as "Slover Avenue." By 1985, the grain storage structures, Buildings D and E, were developed. By 2002, the Site appeared in its existing configuration. The 2002 aerial photograph shows grain processing operations had expanded at the Site to the Western Parcel, which included the development of three large grain storage silos. The Site has been occupied by Verhoeven from 1973 to the present; Chino Grain and Milling, Inc. in 1985; Coast Grain Company between 1990 and 2003; Scoular between 2004 and the present; and JD Heistell and Company in 2009.

Additional information regarding the Site history is provided in Section 6.1, On-Site Listings, and Section 7.0, Interviews.

5.2 ADJACENT PROPERTIES

The Site is bound by industrial properties to the north beyond the railroad tracks, industrial properties to the east and west, and industrial properties to the south across East Airport Drive.

Adjacent properties consisted primarily of undeveloped and/or agricultural land. Railroad tracks were present on the north-adjacent property from at least the early 1900s through the 1960s, when the east-adjacent property was developed with the existing industrial facility. By the early 1990s,

the south-adjacent property was developed with an industrial building. By the early 2000s, the west- and north-adjacent properties were developed with industrial buildings and have remained relatively unchanged through the present.

Additional information regarding adjacent properties is provided in Section 6.2, Adjacent and Other Facility Listings.

6.0 REGULATORY REVIEW

EDR conducted a review of environmental regulatory agency database listings to identify reported environmental issues related to the Site and facilities in the Site vicinity. Farallon used the greater of each approximate minimum search distance from the Site for each of the referenced federal and state environmental databases, as specified in ASTM E1527-13 and -21.

Farallon reviewed the results from the EDR Report prepared for the Site to note reported facilities in the vicinity of the Site that were considered to have a potential to adversely impact the Site (i.e., are known to have resulted in or are expected to result in a recognized environmental condition). Reported facilities identified in the EDR Report were evaluated with respect to the nature and extent of a given release, the distance of the reported facility from the Site, the stratigraphy of soil, the expected soil permeability, and the location of a reported facility with respect to known or expected local and/or regional groundwater flow direction.

The descriptions of the databases searched, the complete database names for the abbreviations used in this Phase I/II ESA Report, and the associated search distances from the Site are provided in the EDR Report presented in Appendix E.

6.1 ON-SITE LISTINGS

JD Heiskell Holdings LLC, former occupant of the Site, was identified on HAZNET, HWTS, CA FID UST, EMI, CIWQS, CERS, and WDS databases. The listings relate to hazardous material management, air quality permits, records of USTs, and industrial stormwater permits associated with livestock feed manufacturing operations. Hazardous wastes listed as being disposed of between 2003 and 2010 consisted of waste oil and mixed oil, aqueous solution with total organic residues less than 10 percent, other organic solvents, and asbestos-containing waste. No violations were identified in the listings. The listings for the USTs did not provide new information regarding contents, locations, and removal dates of the first-generation USTs.

George Verhoeven Grain Inc., located on the Site, was identified on FINDS, ECHO, RCRA NonGen/NLR, EMI, and CIWQS databases. George Verhoeven Grain Inc. was identified in the CERS, AST, CERS HAZ WASTE, CERS TANKS, NPDES, and San Bern. Co. Permit databases (listed in the EDR Report under "Coast Grain Inc.)." The listings relate to hazardous material management, air quality permits, ASTs, and industrial stormwater permits associated with grain processing operations. The CERS TANKS listings indicated records of aboveground petroleum storage. No other information regarding ASTs was provided in the EDR database listings. The CERS listing indicated some administrative violations during inspections; however, there were no violations indicating a spill or a release occurred at the Site.

The Scoular Company, located on the Site, was identified as "John Powell," a manager of Scoular, based on information obtained online, in the HAZNET and HWTS databases. The listings related to hazardous material management between 2006 and 2010. Hazardous wastes in the listing included other organic solids, waste oil and mixed oil, unspecified aqueous solution, and unspecified organic liquid mixture. No violations were identified in the listings.

Coast Grain Inc./Coast Grain Company, former occupant of the Site, was identified on UST, CERS HAZ WASTE, SWEEPS UST, WDS, EMI, HAZNET, and HWTS databases. The listings related to records of USTs, industrial stormwater permits, air quality permits, and hazardous waste management associated with grain processing operations. The SWEEPS UST listing indicated the Site had five registered USTs. No specific information regarding the ASTs or USTs, including tank capacity, contents, or status, was provided in the listings. See Sections 4.5 and 7.3 for further discussion regarding USTs at the Site. Hazardous wastes in the listing between 2002 and 2003 included tank bottom waste with halogenated organics.

G&R Transportation, a freight shipping and trucking company, according to online resources, was listed as being associated with the Site address and identified in the HAULERS database. No pertinent information or violations were identified in the listing. No current or historical information regarding tenants at the Site has indicated G&R Transportation occupied the Site, and this listing may be incorrectly associated with the Site.

Farallon searched the GeoTracker database and the California Department of Toxic Substances Control online EnviroStor database (EnviroStor database) for records related to the Site, but found no listings. Additional information regarding the Site is provided in Section 7.5, Interview with Regional Water Quality Control Board.

6.2 ADJACENT AND OTHER FACILITY LISTINGS

Reported facilities within 0.25 mile up-gradient, 0.125 mile cross-gradient, or adjacent down-gradient of the Site with respect to the assumed groundwater flow direction are considered to have a potential to have impacted the Site. Facilities that were listed in the EDR Report but not identified as a reported facility (e.g., a facility listed as a hazardous waste generator but not as having had a release), and facilities that were listed as "Closed" were not considered to have a potential to have impacted the Site.

Praxair, Inc./Union Carbide Corp./Linde Inc./Kenan Advantage Group/Old Dominion Freight Line, at 5735 and 5705 East Airport Drive, east-adjacent to and cross-gradient of the Site with respect to assumed groundwater flow direction, were identified in the San Bern. Co. Permit**,** HIST UST, EMI, RCRA NonGen/NLR, UST, RCRA-SQG, LUST, CERS HAZ WASTE, CERS TANKS, TRIS, Cortese, NPDES, CIWQS, CERS, HWTS, AST, SWEEPS UST, CA FID UST, HIST CORTESE, NPDES, WDS, and/or CPS-SLIC databases. The listings relate to records of ASTs, USTs, industrial stormwater permits and discharge, air quality permits, hazardous materials management, and a leaking UST case that was granted case closure status in 1988. The LUST listing under Union Carbide Corp indicated solvents from a leaking UST had impacted soil. The listing indicated a case closure status as of September 7, 1988. HIST UST listings associated with

Union Carbide Corporation indicate the facility has or had between two and 18 registered USTs on the property. One HIST UST listing indicated two 1,000-gallon USTs used for waste were installed in 1975. The other HIST UST listing indicated 18 USTs or subsurface features were registered at the property, including four 10,000-gallon USTs and one 12,000-gallon UST used for diesel fuel; eight unlined concrete or carbon steel sumps used for sulfuric acid, chlorpyrifos (chromate), silica, sodium hydroxide, sodium bichromate, and/or waste oil; one 1,000-gallon UST used for waste oil; one 8,000-gallon UST used for unleaded fuel; one 6,000-gallon UST used for motor oil; and two 500-gallon USTs used for waste oil. No information regarding the status of the USTs or subsurface features was provided in the listings. Hazardous wastes in listings included ignitable waste, corrosive waste, reactive waste, chromium, lead, and spent nonhalogenated solvents. No other listing except for the one associated with the leaking UST case indicated a release had occurred at the property. A number of administrative violations associated with inspections were indicated in the San Bern. Co. Permit database listings. No information was provided in the violation listings that indicated a release had occurred at the property. Based on the status, depth to groundwater, and location of the property at a cross-gradient direction from the Site, no evidence was found to indicate that this property represents a recognized environmental condition in connection with the Site.

K-Mart Distribution Center/Ontario Distribution Center/Costco Wholesale/Costco Logistics, at 5600 East Airport Drive, located beyond Airport Drive, south-adjacent to and down-gradient of the Site with respect to assumed groundwater flow direction, was identified in the LUST, SWEEPS UST, HIST UST, Cortese, HIST CORTESE, CERS, CA FID UST, EMI, NPDES, WDS, CIWQS, RCRA NonGen/NLR, AST, HAZNET, San Bern. Co. Permit, HWTS, RCRA-SQG, and RCRA-LQG databases. The listings relate to records of USTs, ASTs, industrial stormwater permits, hazardous materials management, and a leaking UST case. According to the SWEEPS UST and HIST UST listings, three USTs were installed on the property, including two 15,000-gallon diesel USTs and one 2,000-gallon unleaded fuel UST. Information obtained from the GeoTracker database indicated a leaking UST containing diesel fuel impacted soil at the property in 1992. The case was granted case closure status in 1993. Based on the status, depth to groundwater, and location of the property at a down-gradient direction from the Site, this property does not represent a recognized environmental condition in connection with the Site.

6.3 UNMAPPABLE LISTINGS

EDR identified six facilities as “unplottable” that EDR was unable to map due to inaccurate or inadequate address information. Farallon did not identify any of the unplottable facilities in the immediate vicinity of the Site. Therefore, the unplottable facilities located do not represent a recognized environmental condition in connection with the Site.

7.0 INTERVIEWS

Farallon conducted interviews with individuals familiar with the Site and contacted relevant local governmental agencies to obtain additional Site information. The responses from the parties contacted are provided below.

7.1 INTERVIEW WITH SITE REPRESENTATIVE

During the site reconnaissance, Farallon interviewed Randy Verhoeven of Verhoeven, and Steve Schennum of Scoular on January 13, 2022. The following information was obtained from this interview:

- No known USTs are present at the Site;
- Hazardous materials on the Site generally consist of diesel fuel, hydraulic fluid, gear oil, transmission oil, waste oil, and cleaning solvent;
- Utilities and natural gas are provided by the local municipality and gas company; and
- The maintenance area inside the truck repair shop (Building B) included a subsurface service pit for vehicle repairs; this pit was not observed during the Site visit due to the presence of stored equipment, but reported by the Site contact to be 4 feet wide by 25 to 30 feet long and between 4 and 5 feet deep.

Randy Verhoeven and Steve Schennum stated that they had not been made aware of any pending, threatened, or past:

- Litigation relevant to hazardous substances or petroleum products in, on, or from the Site;
- Administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the Site; or
- Notices from a governmental entity regarding violations of environmental laws or liability relating to hazardous substances or petroleum products.

7.2 INTERVIEW WITH CITY

Farallon submitted a written information request to the City of Ontario on December 23, 2021 to inquire whether records of inspections, notices of violations and/or reported hazardous spills, building files, permits, wastewater discharge permits, and/or USTs for the Site were on file. On January 26, 2022, the City of Ontario provided Farallon with over 150 pages of files for the Site address related to building permits, City fire department inspections (for signage/fire safety violations), stormwater, and tenant improvement information. No information related to processing or storage locations, septic systems, or hazardous material use for the Site was found in the file.

7.3 INTERVIEW WITH THE COUNTY

Farallon submitted a written information request for records from SBCFD on December 16, 2021. SBCFD is the Certified Unified Program Agency for San Bernardino County, and maintains most records pertaining to hazardous substance use, storage, and waste generation; USTs and ASTs; hazardous substance inspections, and unauthorized releases. SBCFD allowed Farallon to copy files for Cast Grain Milling, Verhoeven, and Scoular at the Site addresses. In general, files were related to generator/handler information, USTs, and permit information. Pertinent files are summarized below.

Cast Grain Milling

In the letter regarding Removal of Two Underground Storage Tanks at 5355 Airport, Ontario dated September 4, 1998, from SBCFD, it was noted that a July 25, 1989 Babcock & Sons, Inc. report was reviewed by SBCFD and that contamination remaining after excavation is "below that which is generally considered a problem and further investigation is not warranted." No further information was in the file regarding the USTs and locations; however, Farallon has determined that SBCFD is likely referring to the two 12,000-gallon fueling USTs noted in previous reports as formerly located north of the grain mill.

A 2001 SBCFD inspection indicated similar quantities of automotive fluids and oils generated as wastes at the Site. It was also noted that a "parts washer" was present in the "Vehicle Maintenance Division," but the solvent used was not noted. It was also noted that molasses silos were in use at the Site, and a molasses storage tank was noted in the vicinity of the truck-washing area (containing molasses truck rinse water used as pig feed). A hazardous waste inventory dated 2001 noted perchloroethylene and trichloroethylene related to the parts washer, but volumes and locations were not noted.

In 2002, Tank Specialists of California removed a 12,000-gallon diesel steel UST and fuel dispenser mapped southeast of Building C. According to the letter regarding Soil Sampling Following the Removal of an Underground Storage Tank – Coast Grain Co., 5355 E. Airport Drive, Ontario, California dated December 18, 2002, from Advanced GeoEnvironmental, Inc., three confirmatory soil samples were collected beneath the bottom of the UST after removal, and soil samples were collected from stockpiles. The soil samples were analyzed for TPH-d; benzene, toluene, ethylbenzene, and xylenes; and methyl tertiary-butyl ether. Minor petroleum impacts were noted in stockpiled soil (800 milligrams per kilogram of TPH-d), which was reportedly used as backfill for the excavation. No constituents of concern were detected in the confirmatory soil samples collected from beneath the UST. Advanced GeoEnvironmental, Inc. recommended that SBCFD Hazardous Materials Division issue closure of the UST, and the letter regarding Removal of One Underground Storage Tank at Coast Grain Inc., Located at 5355 E. Airport Drive, Ontario, California dated January 8, 2002, from SBCFD was issued indicating that further investigation was not warranted. Farallon considers this UST a historical recognized environmental condition for the Site.

George Verhoeven Grain Inc.

Generator files dated 2016 through 2019 were maintained with SBCFD that noted the use and generation of automotive fluids and wastes on the Site. Violations were noted as requiring the completion of a Spill Prevention, Control, and Countermeasure plan and a business plan. Hazardous waste inventories noted oils and welding gases; no solvents were noted.

The Scoular Company

Generator files dated 2010 were maintained with SBCFD that noted the use and generation of automotive fluids and wastes on the Site. No violations were noted. Operations were noted as discontinued in 2011 (although Farallon noted Scoular active at the Site during the 2022 site reconnaissance).

7.4 INTERVIEW WITH SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

Farallon accessed online records available from South Coast Air Quality Management District on January 26, 2022. South Coast Air Quality Management District maintains records for five facilities associated with the Site address: Chino Grain & Milling Inc. (ID 3037); Coast Grain Company (ID 52930); Unicorn, LLC (ID 131542); George Verhoeven Grain Inc. (ID 163123); and The Scoular Company (ID 17251). A summary of the files is provided below.

Chino Grain & Milling Inc. (ID 3037)

The online file indicates that the Chino Grain & Milling Inc. facility is out of business, and contained equipment for storage and dispensing of gasoline and milling operations including amine regeneration, livestock feed rolling, cyclone, bulk loading of trucks, and livestock feed pelletizing. No violations were noted, and no documents could be found related to the storage or dispensing of gasoline in the online files.

Coast Grain Company (ID 52930)

The online file indicates that the Chino Grain Company facility was sold, and contained equipment for livestock feed rolling, cyclone, bulk loading of trucks, livestock feed pelletizing, storage tank livestock feed, service station storage and dispensing of gasoline, afterburner, boiler, baghouse, and emission reduction. No violations were noted, and no documents could be found related to the storage or dispensing of gasoline in the online files.

Unicorn, LLC (ID 131542)

The online file indicates that the Unicorn LLC facility was sold, and contained equipment for railroad car unloading grains. No violations were noted.

George Verhoeven Grain Inc. (ID 163123)

The online file indicates that the Verhoeven facility was active, and contained equipment for livestock feed rolling, cyclone, bulk loading of trucks, and a boiler. One violation was noted on September 4, 2012 that was in compliance by September 19, 2012; the nature of the violation was not captured in the record.

The Scoular Company (ID 17251)

The online file indicates that the Scoular facility was active, and contained equipment for rail car unloading. No violations were noted.

7.5 INTERVIEW WITH REGIONAL WATER QUALITY CONTROL BOARD

Farallon received files available from the Santa Ana Regional Water Quality Control Board (Water Board) on December 27, 2021. Water Board records included information regarding a former brine disposal pond associated with the boilers at the grain mill area. A summary of files is provided below.

A brine disposal pond owned by the Union Pacific Railroad Company and used by the Coast Grain Company for boiler blow-down water was installed in 1969 and removed in 1998 to allow for the addition of a rail line north of the grain mill area. According to the letter regarding Approval of Closure Report for the Brine Disposal Pond, Coast Grain Company, Ontario, California dated September 24, 1999, from the Water Board, the closure of the pond included the removal of approximately 7,500 cubic yards of salt-contaminated soil and placement of a 40-mil high-density polyethylene liner. Miscellaneous analytical data available in the Water Board file indicated that soil was analyzed for pH, with no elevated readings noted. Based on mapping provided in the Water Board file, the pond was located south of the Southern Pacific Railroad Main Line between two sets of rail spurs; it appears to be just north of the current property line. However, a survey would be required to understand the northern property line in relation to the former brine disposal pond. Based on the location and nature of use (boiler blow-down), and the location of the former brine pond in the vicinity of the northern property line, this is considered a data gap for this report. In the event that the former brine pond is located off-Site, it would be considered a de minimis condition for the Site.

8.0 SITE RECONNAISSANCE

Farallon conducted a site reconnaissance on January 13, 2022 to observe the Site for physical evidence of recognized environmental conditions. The methodology used for the site reconnaissance and the observations made during the reconnaissance are discussed below. A description of the Site is provided in Section 2.2, Site Description. Photographs taken during the site reconnaissance are presented in Appendix B.

8.1 SITE RECONNAISSANCE METHODOLOGY

Farallon completed a walk around the entire perimeter of the Site and viewed interior operations.

There were no deviations from ASTM E1527-13 or -21 during the Phase I ESA, with the exception of additional environmental services requested by Prologis.

Limiting conditions encountered during this Phase I ESA were the presence of active and decommissioned equipment and vehicles on exterior portions of the Site that prevented Farallon from observing the entire ground surface of the Site, and the presence of equipment in the Site buildings that prevented Farallon from observing entire interior floor surfaces. Based on information obtained from the Site representative, historical records, previous reports, and data obtained during the subsurface investigation conducted in March 2022, these limiting conditions are not expected to alter the conclusions of this report.

8.2 SITE RECONNAISSANCE OBSERVATIONS

Weather conditions at the time of the reconnaissance were overcast, with a temperature of approximately 70 degrees Fahrenheit. No weather-related Site-access restrictions were encountered during the reconnaissance. Operations at the Site at the time of the reconnaissance were observed to be consistent with operations as described in Section 2.3, Site Operations.

8.2.1 Interior Observations

Farallon's observations of the interior of the Site buildings during the site reconnaissance are documented in the table below. Comments pertaining to notable interior observations follow in Section 8.2.2. Photographs taken during the site reconnaissance are provided in Appendix B.

INTERIOR OBSERVATIONS	YES	NO
Odor		X
Heating/Cooling System	X	
Drain(s) and/or Sump(s)		X
Staining and/or Corrosion		X
Storage Tank(s), Vent Pipe(s), Fuel Port(s), and/or Fill Pipe(s)		X

INTERIOR OBSERVATIONS	YES	NO
Clarifier(s)		X
Discharge Area		X
Drum(s) and/or Other Container(s)		X
Pool(s) of Liquid		X
Automobile Lift(s)		X
Monitoring Well(s)		X
Hazardous Material(s) and/or Petroleum Product(s)	X	
Hazardous Waste	X	
Other	X	

8.2.2 Interior Observation Comments

Heating/Cooling System

The Site buildings are primarily unconditioned. Electrical window air-conditioning units were observed in select office/administrative areas.

A natural-gas-powered boiler unit is present within the grain mill, and provides steam for the steam jackets. The grain mill is also equipped with a fan-cooled cooling area. No other heating systems were observed in the buildings.

Hazardous Material(s) and/or Petroleum Product(s)

Hazardous substances stored within the Building A warehouse on the Eastern Parcel included small quantities of oils and automotive fluids. The materials were observed to be stored on pallets, with no staining or other evidence of a significant release.

Hazardous substances stored within Building B on the Eastern Parcel included two 55-gallon used oil drums; two 25-gallon grease carts; and a parts washer attached to a 55-gallon drum of Shellsol D43, a petroleum hydrocarbon-based mineral spirit. The materials were observed to be stored on pallets, with no staining or other evidence of a significant release.

Hazardous substances within a fire cabinet in the Western Parcel office trailer included two 5-gallon gasoline canisters. Additional materials stored outside of the fire cabinet included ten 5-gallon pails containing truck lubricants, gear oil, and hydraulic oil; one 25-gallon grease cart; and one 5-gallon pail containing grease. The materials were observed to be stored on pallets, with no staining or other evidence of a significant release.

Hazardous Waste

Hazardous wastes stored within the Building A warehouse on the Eastern Parcel included four 55-gallon drums of waste oil, five 25-gallon drums of waste oil, and approximately 20 five-gallon waste oil pails. The materials were observed to be stored on pallets, with no staining or other evidence of a significant release.

Other

The maintenance area inside the truck repair shop (Building B) included a subsurface service pit for vehicle repairs; this pit was not observed during the Site visit due to the presence of stored equipment, but reported by the Site contact to be 4 feet wide by 25 to 30 feet long and between 4 and 5 feet deep.

8.2.3 Exterior Observations

Farallon's observations of the exterior of the Site during the site reconnaissance are documented in the table below. Comments pertaining to notable exterior observations follow in Section 8.2.4. Photographs taken during the site reconnaissance are provided in Appendix B.

EXTERIOR OBSERVATIONS	YES	NO
Odor		X
Staining and/or Corrosion	X	
Storage Tank(s), Vent Pipe(s), and/or Fuel Port(s)	X	
Drum(s) and/or Other Container(s)		X
Pool(s) of Liquid		X
Hazardous Material(s) and/or Petroleum Product(s)		X
Hazardous Waste		X
Pit(s), Pond(s), and/or Lagoon(s)		X
Stressed Vegetation		X
Solid (Nonhazardous) Waste—Evidence of Dumping		X
Wastewater		X
Domestic Water	X	
Water Well(s)		X
Septic/Sewer System	X	
Stormwater	X	
Transformer(s)	X	

EXTERIOR OBSERVATIONS	YES	NO
Significant Amount of Fill Material		X
Other	X	

8.2.4 Exterior Observation Comments

Staining and/or Corrosion

Farallon observed incidental petroleum staining on several areas of the Site, generally near petroleum product storage areas. No drains, sumps, clarifiers, or other potential subsurface conduits were observed in these areas. The staining is considered de minimis and does not constitute a recognized environmental condition.

Storage Tank(s), Vent Pipe(s), and/or Fuel Port(s)

Four ASTs were present on the Site:

- Two 250-gallon, reportedly double-walled diesel ASTs within secondary containment. These ASTs are located on the northeastern exterior border of Building A and are used for fueling tractors and forklift equipment. One of the ASTs is used by Verhoeven, and the other by Scoular.
- One 220-gallon, reportedly double-walled hydraulic oil AST located on the northeastern exterior border of Building A. This AST is used to provide new hydraulic oil for equipment operation and maintenance.
- One 499-gallon, single-walled propane AST located east of Building C.

The ASTs were observed to be in good condition with de minimis staining to nearby concrete pads, and no evidence of a significant release.

Domestic Water

Domestic water is supplied to the Site buildings by the City of Ontario.

Septic/Sewer System

Sanitary sewage generated at the Site discharges to three or four on-Site septic systems, two or three of which are located on the Eastern Parcel and one of which is located on the Western Parcel. The estimated locations of the septic tanks and leach fields on the Eastern Parcel are identified on Figure 2. Property personnel on the Western Parcel were unaware of the location of the septic systems.

Because on-Site septic systems appear to be used for domestic sewer, with limited hazardous material use in the proximity that could be introduced to the septic systems as a release pathway, the presence of the septic systems at Building E, Building A, and on the Western Parcel is considered a de minimis condition for the Site. Because the septic system east of Building B is

connected to a building that has been subject to the use and release of chlorinated solvents, this septic system is considered a recognized environmental condition in connection with the Site.

Stormwater

Stormwater is removed from the Site via direct permeation through gravel-paved surfaces, and via concrete swale and paved surfaces to Airport Boulevard.

Transformer(s)

Three pad-mounted transformers were observed on the Site on the Western Parcel. No staining or leakage was observed in the vicinity of the transformers. Based on the good condition of the equipment, the transformers are not expected to represent a significant environmental concern.

An underground grain conveyance system is located within the grain mill area. Details of the underground system, including how grain is moved or whether hydraulic systems are present, was not provided to Farallon.

The presence of transformers, with no evidence or report of leaking, and underground grain conveyance systems are considered de minimis conditions for the Site. In the event that the conveyance systems are hydraulic and determined to have leaked, this conclusion should be reevaluated.

Other

The Eastern Parcel is equipped with a vehicle wash-down area with sump north of Building B, which is asphalt-paved and bermed, and was previously used for truck washing. Property personnel report that truck exteriors were washed in this area on an infrequent basis, and no undercarriage/chassis or engine washing was conducted on the Site. The wash area is equipped with a lined sump connected to an approximately 10,000-gallon AST via underground piping. The AST was empty at the time of the Site visit. Personnel report that the water tank has not been used in at least 11 years. Given the nature of use and that wash water was routed to an AST with no discharge, the vehicle wash-down area is considered a de minimis condition for the Site.

Rail spurs are present along the northern property boundary. Based on available mapping, it cannot be confirmed whether the rail spurs are located on the Site or to the north, which is a data gap for this report. Because of the nature of the conveyance of the rail spurs (for moving grain), the presence of rail spurs within or along the northern property boundary is considered a de minimis condition for the Site. If the spurs are determined to be on the Site, this conclusion should be reevaluated, as creosote and oils in rail spurs can lead to surficial releases to soil.

9.0 ADDITIONAL ENVIRONMENTAL SERVICES

At the request of Prologis, Farallon conducted environmental services in addition to those specified in ASTM E1527-13 and -21. These services are considered non-scope items, and are not required to satisfy ASTM E1527-13 and -21.

9.1 WETLANDS

Wetlands are defined jointly by EPA and the U.S. Army Corps of Engineers as "those areas that are inundated or saturated by surface or groundwater for a duration and frequency sufficient to support and under normal circumstances do support a prevalence of vegetation adapted for life in saturated soil conditions." According to the EDR Report, wetlands are not present on the Site.

9.2 ASBESTOS

In June 1978, EPA initiated a ban on the use of asbestos-containing material in spray application products such as structural fireproofing and acoustic ceilings, pipe lagging, joint compounds, and spackles. Based on the construction date of the Site buildings of approximately 1973, asbestos-containing materials may be present at the Site.

9.3 LEAD-BASED PAINT

In 1978, EPA initiated a ban on the manufacture and use of lead-based paints. Based on the construction date of the Site buildings of approximately 1973, lead-based paint may be present at the Site.

9.4 WATER SUPPLY/LEAD IN DRINKING WATER

Based on the Site buildings' construction date of approximately 1973, it is possible that lead solder was used during construction of plumbing fixtures.

9.5 RADON

Radon is a colorless, tasteless, radioactive gas with an EPA-specified action level of 4.0 picocuries per liter of air. Radon gas has a short half-life of 3.8 days. The health risk potential of radon is associated with its rate of accumulation within confined areas, particularly those near or in the ground such as basements, where vapors can readily transfer from the ground to indoor air through foundation cracks or other pathways.

According to the EDR Report, the Site is in EPA Radon Zone 2, with predicted average indoor screening levels of between 2.0 and 4.0 picocuries per liter. The EPA zone designation reflects the average short-term radon measurement that can be expected to be measured in a building without implementation of radon-control methods. Based on the EPA designation, radon is unlikely to pose an environmental concern to Site occupants.

9.6 WATER INTRUSION

Farallon inspected visually accessible building materials for evidence of water damage during the site reconnaissance. No visible evidence of water-damaged building materials was observed. Farallon did not detect high-humidity areas in the buildings that would suggest moisture concerns.

10.0 PHASE II ESA

In March 2022, Farallon conducted soil and soil vapor sampling at the Site to assess former UST areas and septic systems, and the new building footprint for the potential for vapor intrusion issues. The scope of work for the Phase II ESA portion of this assessment included the advancement of 12 borings and installation of 10 temporary soil vapor probe locations with single- or multi-depth nested vapor points for the collection of soil and soil vapor samples.

The general scope of work was proposed and authorized in the letter regarding Proposal for Subsurface Investigation, 5355 East Airport Drive, Ontario, California dated February 14, 2022, from Kathy Lehnus and Scott Allin of Farallon to Julia Smith of Prologis.

Sample locations are provided on Figures 2 and 3, with limited analytical data presented on Figure 3. Sampling rationale and analytical data from the sampling are included in Tables 1 through 5.

10.1 PERMITTING

No permitting was required for this work.

10.2 HEALTH AND SAFETY

Prior to conducting field investigation activities, a health and safety plan compliant with the requirements of the Occupational Safety and Health Act of 1970 and 8 CCR 3203 was prepared. Additionally, in accordance with Farallon health and safety policy, personal protection equipment precautions related to COVID-19 were implemented for field personnel during field activities.

Prior to commencement of drilling activities, Farallon marked the proposed boring locations at the Site and contacted Dig Alert for public utility notice. Farallon also engaged a private utility location service to screen the proposed boring locations for utilities that may be encountered during advancement with hand tools and direct-push drilling.

10.3 GEOPHYSICAL SURVEY

Farallon oversaw the completion of a geophysical survey at several areas at the Site to attempt to locate former UST areas and reported septic tank areas. No underground structures were found in the survey areas, with the exception of two connected septic tanks northeast of Building B: one north of the building and one east of the building. A vapor point was advanced at the northern septic tank (SVP-10). The septic system east of the building was not accessible (in fenced area). It could not be determined whether the two septic tanks were connected.

10.4 BORING LOCATIONS AND SAMPLING RATIONALE

Borings SB-1 and SVP-1 were advanced in the vicinity of the two former 12,000-gallon petroleum USTs on the northern portion of the Site to confirm conditions at the former USTs and assess soil vapor beneath the proposed building footprint. Borings SVP-2, SVP-3, and SVP-4 were advanced

on the central portion of the Site to assess soil vapor beneath the proposed building footprint. Borings SB-2 and SVP-5 were advanced in the vicinity of the former 12,000-gallon petroleum USTs on the central-eastern portion of the Site to confirm conditions at the former UST and assess soil vapor beneath the proposed building footprint. Boring SVP-6 was advanced at the vehicle wash-down area with sump to assess this area and the soil vapor beneath the proposed building footprint. Borings SVP-7, SVP-8, and SVP-9 were advanced west of Building B, and sub-slab points SS-1 and SS-2 were advanced beneath Building B to assess former PCE impacts encountered in soil vapor in these areas. Boring SVP-10 was advanced to the northwest of Building B to assess the likely location of the septic system associated with the building. Boring locations and rationale are presented in Table 1.

10.5 BORING ADVANCEMENT AND SOIL SAMPLING

For health and safety reasons, the borings were advanced using a hand auger to a depth of 5 feet bgs and subsequently completed to target (or attainable) depths with a direct-push drill rig. Concrete and asphalt coverings were cored prior to advancing the borings. Soil encountered during the investigation was described as silty fine to medium sand to a total explored depth of 10 feet bgs, with an apparent coarse sand and gravel layer at 10 feet bgs (and as shallow as 5 feet bgs on the eastern portion of the Site at boring SB-2). Groundwater was not encountered during drilling.

The soils were visually inspected and screened by a Farallon Scientist using a photoionization detector and were described and logged using the United Soil Classification System (Modified). No elevated photoionization detector readings or visual or olfactory evidence of a release were documented during the sampling activities.

Select soil samples were submitted under standard chain-of-custody protocols to Jones Environmental, Inc. of Santa Fe Springs, California for analysis of VOCs by EPA Method 8260 and TPH as gasoline (TPH-g) by EPA Method 8015M using EPA Method 5035 for preservation. In addition, select soil samples were analyzed for the presence of TPH as diesel (TPH-d) and TPH as oil (TPH-o) by EPA Method 8015M, and for California Administration Manual metals by EPA Method 6010B. The full soil sampling schedule is provided in Table 1.

10.6 SOIL VAPOR PROBE CONSTRUCTION AND SAMPLING

A total of 14 soil temporary soil vapor probes were installed in 10 soil vapor borings at locations SVP-1 through SVP-10. In general, soil vapor probes were installed at a depth of 4 feet bgs throughout the proposed building footprint, with some deeper probes installed at depths of 8 and 10 feet bgs to assess targeted deeper potential source areas. Soil vapor probe final installation depths are provided in Table 1.

On March 11, 2022, soil gas probe installation was performed in accordance with the *Advisory: Active Soil Gas Investigations* dated July 2015, prepared by the California Environmental Protection Agency (Soil Gas Advisory). The probes consisted of an Airstone microporous vapor implant (or equivalent) connected to 0.25-inch-outside-diameter Nylaflow tubing, finished at the surface with temporary plugs. The annulus around the vapor implant was backfilled with

approximately 0.5 foot of screen-washed No. 3 sand, followed by 6 inches of hydrated granular bentonite to create a seal from the top of the sand to near surface.

The soil gas probes were allowed to equilibrate for 1 week prior to sample collection. Farallon contracted with Jones Environmental Inc. of Santa Fe Springs, California to perform soil gas sampling and analyze samples with its on-Site mobile laboratory. Prior to sample collection, a shut-in test was conducted in accordance with Section 4.2.1 of the Soil Gas Advisory; purging was conducted in accordance with Section 4.2.3 of the Soil Gas Advisory.

The soil vapor samples were collected into glass syringes at a rate of no more than 200 milliliters per minute. A mixture of n-pentane, n-hexane, and n-heptane was used as tracer compounds, which was applied to rags and set at each sample fitting during sample collection; the tracer compounds were not detected in the sub-slab soil vapor samples.

10.7 SUMMARY OF SOIL SAMPLING RESULTS

Soil analytical results are summarized below with a comparison with the Los Angeles Regional Water Quality Control Board Maximum Soil Screening Levels for properties with groundwater at a depth greater than 150 feet bgs (for TPH in soil), and with the California Department of Toxic Substances Control (DTSC) CA-Modified Regional Screening Levels (RSLs) and EPA RSLs (in the event that DTSC CA-Modified RSLs are not available) for industrial soil (for metals in soil). Soil sampling results are summarized as follows:

- No TPH or VOCs were detected exceeding laboratory detection limits in the soil samples collected from the Site.
- Low concentrations of naturally occurring metals including barium, cadmium, cobalt, chromium, copper, nickel, lead, vanadium, and zinc were detected in two soil samples submitted for analysis (location SVP-6 from depths of 4 and 8 feet bgs). These concentrations were considerably less than screening levels.

Soil analytical results are tabulated in Tables 2 through 4. Soil analytical reports are attached in Appendix G.

10.8 SUMMARY OF SOIL VAPOR SAMPLING RESULTS

Soil vapor analytical results from the Phase II ESA are summarized below. These results were compared with DTSC calculated SGSLs using CA-Modified RSLs or EPA RSLs for indoor air with an attenuation factor of 0.03 or 0.001 for commercial/industrial settings, with an attenuation factor of 0.05 used for sub-slab soil vapor samples.

- PCE was detected in several of the soil vapor samples collected from the Site, as indicated below:
    - PCE was detected in sub-slab soil vapor at concentrations of 220 and 170 µg/m^3, exceeding calculated screening levels.

- PCE was detected at concentrations ranging between 24 and 247 µg/m^3 in soil gas samples collected from the soil vapor borings west and northwest of Building B (SVP-5, SVP-7, SVP-8, and SVP-9). The concentrations of PCE in soil vapor samples exceeded the calculated screening level using the 0.03 attenuation factor (but were less than the less conservative attenuation factor) in three of the four samples at the targeted 4-foot investigation zone.
- PCE was detected in shallow soil vapor in central and eastern portions of the planned building slab area at concentrations less than calculated screening levels.
- The soil vapor sample collected from a depth of 10 feet bgs at SVP-1 at the two former 12,000-gallon diesel USTs at the grain mill area contained PCE at a concentration of 157 µg/m^3, exceeding the calculated screening level using the 0.03 attenuation factor (but less than the less conservative attenuation factor). Shallow soil vapor from this area contained PCE at considerably less concentrations than the calculated screening level using the 0.03 attenuation factor.

- A trace concentration of dichlorodifluromethane was detected exceeding laboratory reporting limits in soil vapor sample SVP-10-8; however, this concentration (60 µg/m^3) did not exceed the Industrial SGSL and was not found in other samples.
- Low concentrations of toluene were detected at concentrations exceeding laboratory reporting limits in the soil vapor samples collected at the Site; however, none of these concentrations exceeded the Industrial SGSL for toluene (as high as 1,300,000 µg/m^3). The maximum toluene concentration was reported as 106 µg/m^3.
- No other VOCs were detected at concentrations exceeding laboratory reporting limits.

The results for the soil gas samples are considered valid because the tracer compounds were not detected in the samples.

Based on the sampling results, PCE has been documented in soil vapor in the vicinity of Building B at concentrations exceeding screening levels, and PCE is also present in central and eastern portions of the Site in shallow zones at concentrations less than calculated screening levels.

Soil vapor analytical results are summarized in Table 5. Soil vapor analytical reports are attached in Appendix G.

10.9 WASTE HANDLING DISPOSAL

Soil cuttings and decontamination water were accumulated into one 55-gallon drum. The drum was sampled and is currently being profiled for disposal. Waste disposal information can be forwarded when available.

11.0 SUMMARY AND CONCLUSIONS

Farallon conducted a Phase I/II ESA for 5355 East Airport Drive in Ontario, California in conformance with the scope and limitations of ASTM E1527-13 and -21. Any exceptions to or deletions from this practice are described in Section 1.5, Deviations.

The Phase I ESA indicated that the Site consists of two parcels totaling 14.2 acres: Assessor Parcel No. 0238-052-20 (Eastern Parcel), and Assessor Parcel No. 0238-052-29 (Western Parcel). The Site is occupied by George Verhoeven Grain Inc. (dba Verhoeven Grain Inc.) and The Scoular Company, grain processing companies. Operations consist of the processing of raw grain, which is received by truck or by rail from the rail line north of the Site. The exact location of the rail line and associated spurs with respect to the northern Site boundary could not be confirmed in available files. Former petroleum USTs in two areas, former and active septic systems, and a vehicle maintenance garage (Building B) were found in association with the Site during the Phase I ESA portion of this assessment.

According to the Partner 2016 Phase II Report, 26 borings were advanced at depths between 1 and 25 feet bgs for the collection of soil and/or soil gas samples. Analytical results of soil gas samples indicated detections of VOCs including tetrachloroethene, trichloroethene, toluene, ethylbenzene, and xylenes. The concentrations of these detectable results were less than the residential and commercial/industrial calculated SGSLs at the time of the report beneath and west of Building B. However, the concentrations of PCE detected in five of the six soil gas samples contained PCE exceeding current commercial/industrial calculated SGSLs; these samples were collected from beneath and west of building B. Additionally, in comparison with the "low level" ethylbenzene SGSL, the ethylbenzene concentration in one soil vapor sample from this area exceeded the calculated soil gas commercial/industrial screening level of 163 $\mu g/m^3$.

In March 2022, Farallon conducted soil and soil vapor sampling at the Site to assess former UST areas and septic systems, and the new building footprint for the potential for vapor intrusion issues. No underground structures were found in the survey, with the exception of the two septic tanks northeast of Building B. The scope of work for the Phase II ESA portion of this assessment included the advancement of 12 soil borings and installation of 10 temporary soil vapor probe locations with single- or multi-depth nested vapor points and two sub-slab soil vapor sampling points for the collection of soil and/or soil vapor samples. The Phase II ESA portion of this assessment was conducted on March 4 and 11, 2022.

No TPH or VOCs were detected exceeding laboratory detection limits in the soil samples collected from the Site. Low concentrations of naturally occurring metals including barium, cadmium, cobalt, chromium, copper, nickel, lead, vanadium, and zinc were detected in two soil samples submitted for analysis; these concentrations were considerably less than screening levels.

Based on sub-slab soil vapor data, soil vapor beneath the slab at Building B contains PCE exceeding calculated screening levels. PCE is present west of Building B at concentrations exceeding current calculated industrial screening levels using the 0.03 attenuation factor, but less than screening levels using the less conservative attenuation factors. PCE was also detected in

shallow soil vapor in the central and eastern portions of the Site at concentrations less than calculated screening levels in the shallow zones assessed. One concentration of PCE was detected exceeding calculated screening levels in the deeper sample collected from the vicinity of the two former 12,000-gallon USTs north of the grail mill area; the shallow soil vapor collected from this boring did not contain PCE exceeding calculated screening levels. The extent of PCE in soil vapor was not fully characterized.

Based on review of the Site history, including subsurface investigation reports, interviews with persons knowledgeable about the Site, reconnaissance of the Site, review of regulatory agency lists, and the completion of subsurface investigation at the Site, this Phase I/II ESA identified the following recognized environmental condition in connection with the Site:

- PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Site.

In addition, Farallon identified the following historical recognized environmental conditions in association with the Site:

- Previous environmental reports note that one or more USTs were historically located west of Building B. Farallon was not able to find information regarding the UST in regulatory files, but did find some information regarding three to four diesel and unleaded gasoline USTs ranging in capacity from 4,000 to 10,000 gallons at unspecified locations at the Site preceding the presence of the three known 12,000-gallon USTs (noted in the grain mill area and southeast of Building C). In 2016, Partner conducted a subsurface investigation in this area and did not identify evidence of a petroleum release.
- In 2002, Tank Specialists of California removed a 12,000-gallon diesel steel UST and fuel dispenser mapped southeast of Building C. According to the letter regarding Soil Sampling Following the Removal of an Underground Storage Tank – Coast Grain Co., 5355 E. Airport Drive, Ontario, California dated December 18, 2002, from Advanced GeoEnvironmental, Inc., three confirmatory soil samples were collected beneath the bottom of the UST after removal, and soil samples were collected from stockpiles. The soil samples were analyzed for TPH as diesel; benzene, toluene, ethylbenzene, and xylenes; and methyl tertiary-butyl ether. Minor petroleum impacts were noted in stockpiled soil (800 milligrams per kilogram of TPH as diesel), which was reportedly used as backfill for the excavation. No constituents of concern were detected in the confirmatory soil samples collected from beneath the UST. Advanced GeoEnvironmental, Inc. recommended that SBCFD Hazardous Materials Division issue closure of the UST; and the letter regarding Removal of One Underground Storage Tank at Coast Grain Inc., Located at 5355 E. Airport Drive, Ontario, California dated January 8, 2002, from SBCFD was issued indicating that further investigation was not warranted.
- Based on sampling conducted as part of this Phase I/II ESA, no release was found in connection with the two 12,000-gallon "fuel storage" USTs historically located at the grain mill, which were removed from the Site in 1998. A No Further Action determination issued by SBCFD indicated that residual impacts were present, although "below that which is

generally considered a problem." PCE was detected in a shallow soil vapor sample collected from this area at a concentration less than calculated screening levels.

The vehicle wash-down area located north of Building B was used for washing trucks (including molasses transportation trucks) and is no longer used. According to Site personnel, only truck exteriors were washed (not engines). Given the nature of use and that wash water was routed to an AST, with no discharge, the vehicle wash-down area is considered a de minimis condition for the Site. No release was found in the vicinity of the septic tanks located east of Building B, which provides a disposal pathway for a building that is known to have used chlorinated solvents and vehicular fluids.

Because two or three potential on-Site septic systems on the Western Parcel, located north of Building A and southeast of Building E, appear to be used for domestic sewer, with limited hazardous material use in the proximity that could be introduced to the septic systems as a release pathway, the presence of those septic systems is considered a de minimis condition for the Site. Additionally, the presence of petroleum ASTs with secondary containment and/or no evidence of leaking, rail spurs within or along the northern property boundary, transformers with no evidence of leaking, and underground grain conveyance systems are considered de minimis conditions for the Site. Further, based on the location and nature of use (boiler blow-down), the former brine pond located in the vicinity of the northern property line is also considered a de minimis condition for the Site.

At the request of Prologis, Farallon has included additional opinions and recommendations for the Site beyond those specified in ASTM E1527-13 and -21 for de minimis and recognized environmental conditions.

Based on the findings from this Phase I/II ESA, Farallon recommends preparation of a Media Management Plan for use during Site redevelopment to address any unexpected impacts to soil associated with historical activities at the Site, and to address any issues related to the former brine pond, underground grain conveyance systems, septic systems, and former USTs at the Site. Additionally, because PCE has been documented in soil vapor in the vicinity of Building B at concentrations exceeding calculated screening levels, and PCE was detected at concentrations in shallow soil vapor less than the calculated RSLs in other soil gas samples collected at the Site, the potential for vapor intrusion issues into the planned new Site building should be addressed. Additional investigation and characterization are recommended to delineate and design mitigation measures for PCE in soil vapor that may impact indoor air in the future building.

13.0 LIMITATIONS

13.1 GENERAL LIMITATIONS

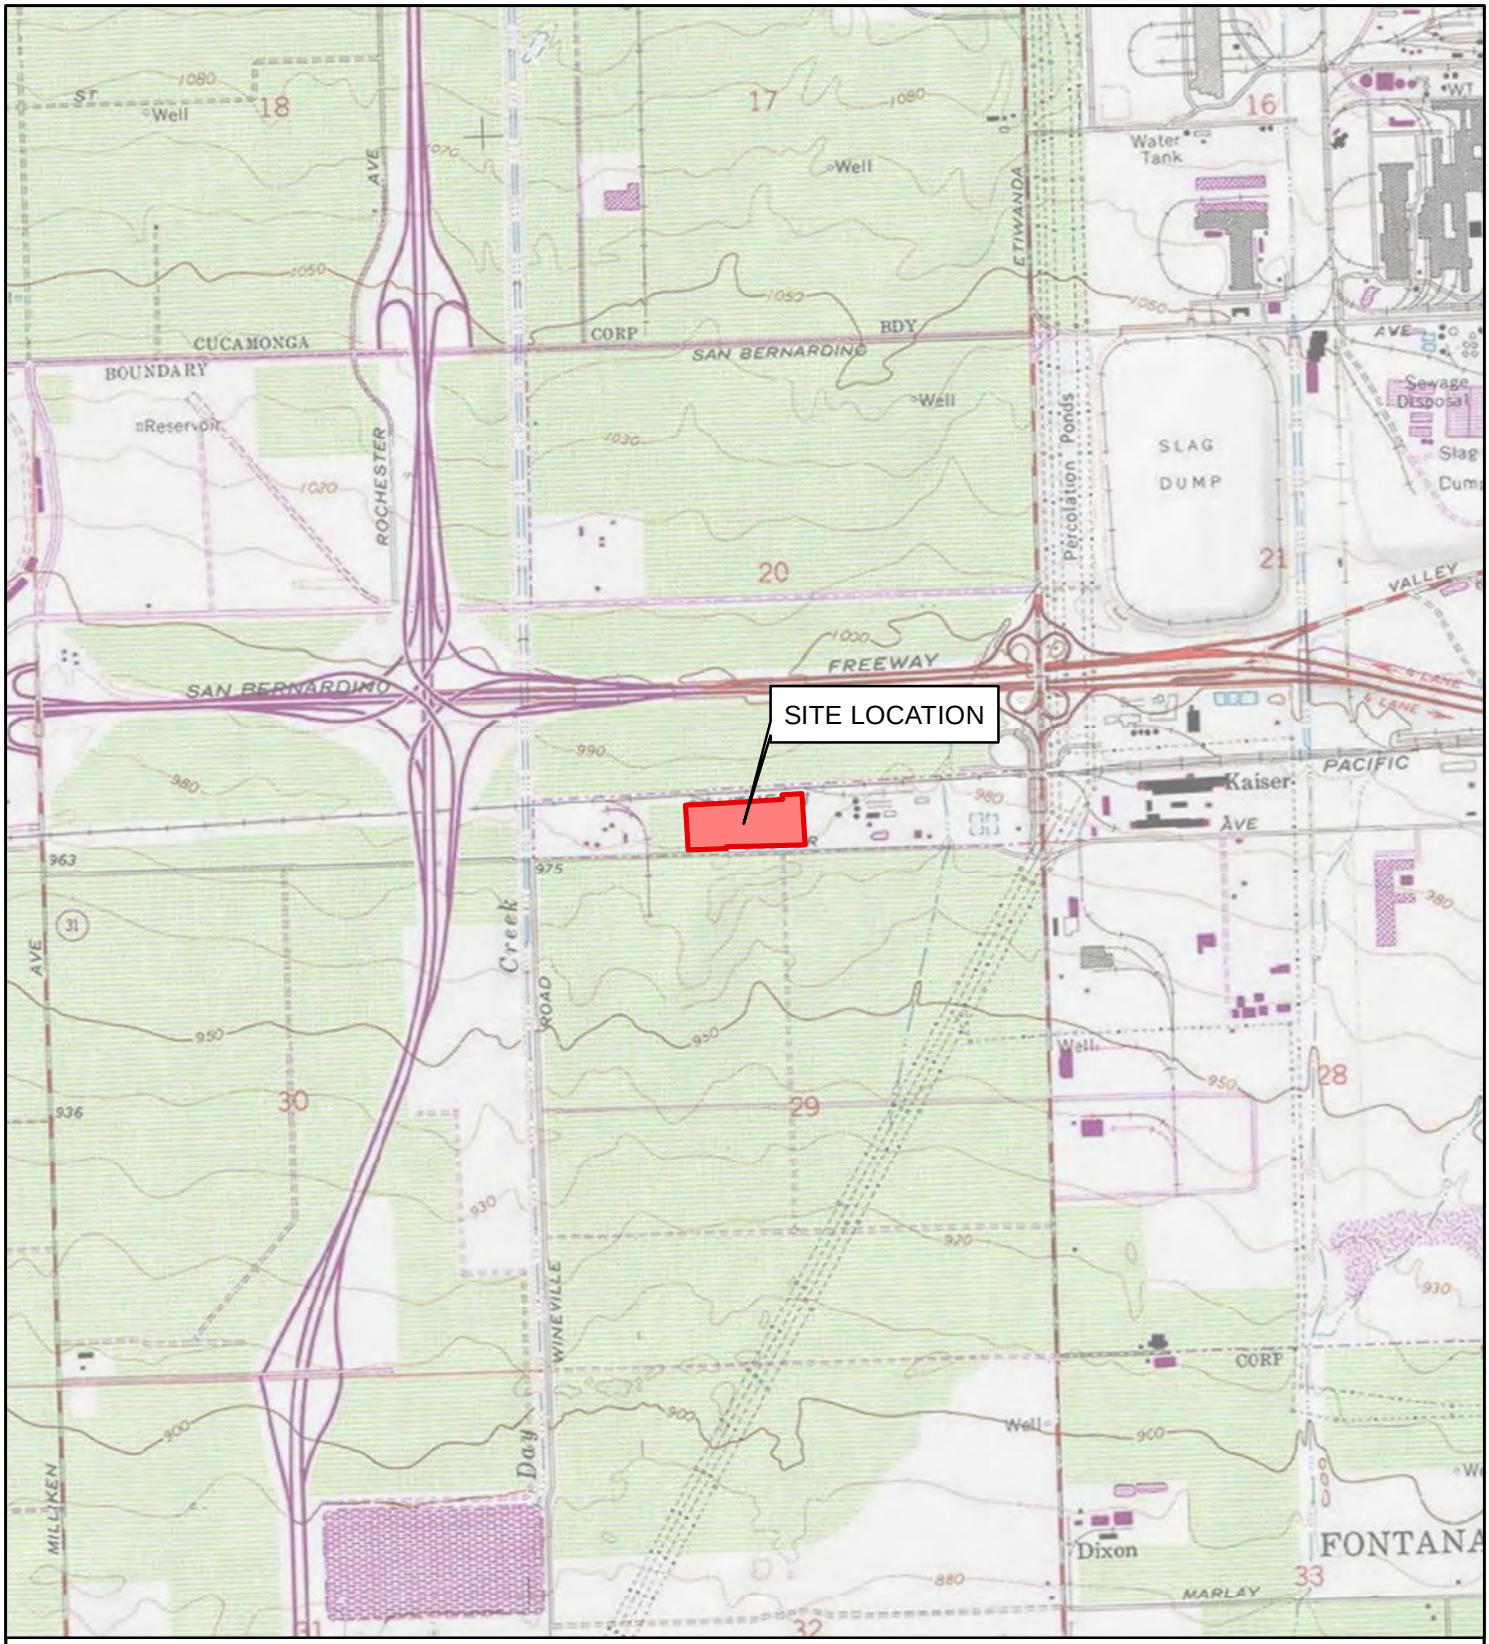
The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- **Accuracy of Information.** Farallon obtained, reviewed, and evaluated certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy or authenticity. Should the information upon which Farallon relied prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.
- **Reconnaissance and/or Characterization.** Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

For the foregoing reasons, Farallon cannot and does not warrant or guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions can be considered valid only as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Prologis, Inc. and currently accepted industry standards. No other warranties, representations, or certifications are made.

13.2 LIMITATION ON RELIANCE BY THIRD PARTIES



Reliance by third parties is prohibited. This report/assessment has been prepared for the exclusive use of Prologis, Inc. to address the unique needs of Prologis, Inc. at the Site at a specific point in time.

This is not a general grant of reliance. No one other than Prologis, Inc. may rely on this report unless Farallon agrees in advance to such reliance in writing. Any unauthorized use, interpretation, or reliance on this report/assessment is at the sole risk of that party, and Farallon will have no liability for such unauthorized use, interpretation, or reliance.

BA Environmental Policy
13 years' experience

Brant Rotnem is an Environmental Professional with over 13 years of experience in the environmental consulting industry. Professional experience includes project management, site inspection in support of environmental due diligence, and preparation of over 1,000 Phase I Environmental Site Assessment Reports. Brant also has prepared Transaction Screen Analyses, Limited Environmental Site Assessments, database reviews, peer reviews, and additional due diligence scopes.

KATHY LEHNUS, L.E.P., P.G.
Senior Geologist

BSc Environmental Science
MSc Applied Geology
24 years' experience

Kathy Lehnus has 24 years of experience in the environmental consulting industry. Her professional experience includes conducting Phase I and Phase II Environmental Site Assessments, managing investigation and remediation projects led by the California Department of Toxic Substances Control and California Regional Water Quality Control Boards, investigating environmental impacts on investment portfolios, and providing oversight for soil and groundwater assessments. Kathy's key skills include preparation of investigation and remediation work plans, regulatory navigation, and project quality and process improvement, including developing new policies and updating standard operating procedures.

SCOTT ALLIN, R.E.P.A.
Principal Environmental Scientist

BS Physical Science (Hydrology)
30 years' experience

Scott Allin has 30 years of project and program management experience in the evaluation and reporting of environmental liability associated with the sale or Brownfield redevelopment of impaired properties. He has supported the needs of developers and others in the acquisition of Cost Cap and Finite Risk environmental insurance to manage long-term environmental risks. He has provided clients with value-added due diligence services for single properties and large multimillion-dollar mixed-use portfolios, both nationally and internationally. Scott has provided guidance for evaluating environmental risks during complex mergers and acquisitions; and management services for implementation of remedial actions, asbestos abatement, environmental audit programs, and environmentally sensitive property improvements.

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Soil Gas Investigation Report (Soil Gas Report) for Prologis, L.P. (Prologis) to present a summary of results from the soil gas investigation conducted in December 2022 at the property at 5355 East Airport Drive in Ontario, California (herein referred to as the Site) (Figure 1). The soil gas investigation was conducted to provide additional assessment of the potential for vapor intrusion related to tetrachloroethene (PCE), which was detected inconsistently in soil gas during subsurface investigations conducted by Partner Engineering and Science, Inc (Partner) in July 2016 and Farallon in February and September 2022. The scope of work for the historical investigations was based on the recognized environmental conditions and subsurface investigation findings identified in the Partner Phase II Subsurface Investigation Report (2016 SI Report),[1] the Farallon Phase I/Phase II Environmental Site Assessment Report (Phase I/II Report),[2] and the Farallon Additional Subsurface Investigation Report.[3] The potential for constituents of concern (COCs) to be present in Site subsurface media was identified as recognized environmental conditions due to petroleum underground storage tanks (USTs) formerly present in three areas, former and active septic systems, and a vehicle maintenance garage ("Building B"). These features are depicted on Figure 2.

According to the 2016 SI Report, the Phase I/II Report, and the Additional Subsurface Investigation Report, tetrachloroethene (PCE) was detected at concentrations exceeding calculated industrial screening levels using a 0.03 attention factor in soil gas in several areas during the July 2016 and March 2022 sampling events, but not during the September 2022 sampling event. Additional investigation was recommended to address the potential for vapor intrusion conditions at the warehouse proposed for construction at the Site. This soil gas investigation was conducted to provide that additional investigation. Additionally, Prologis requested that methane be screened during the soil gas investigation. The scope of work for the soil gas investigation was presented in Work Change Order 1071-080-002-WCO 004[4] and the general locations, depths, rationale for the borings, and analytes are shown in Table 1. Sample locations at the Site are shown on Figure 2.

This Soil Gas Report has been organized into the following sections:

- **Section 2, Site Background**, provides a description of the Site, and summarizes pertinent background information regarding its history and previous investigations conducted at the Site.

- **Section 3, Physical Setting**, describes the topography, geology, and hydrogeology of the Site.
- **Section 4, Soil Gas Investigation**, provides a description of the scope of work conducted as part of the additional soil gas investigation, and a summary of soil gas analytical results.
- **Section 5, Conclusions and Recommendations**, presents Farallon's conclusions from the additional subsurface investigation, and recommendations based on the results.
- **Section 6, References**, provides a list of the documents cited in this Soil Gas Report.
- **Section 7, Limitations**, presents Farallon's standard limitations applicable to this Soil Gas Report.

2.0 SITE BACKGROUND

This section provides a description of the Site and summarizes pertinent background information regarding its history and previous investigations conducted at the Site.

2.1 SITE DESCRIPTION

The Site consists of two parcels totaling 14.2 acres of land: San Bernardino County Assessor Parcel Nos. 0238-052-20 (Eastern Parcel), and 0238-052-29 (Western Parcel). The Eastern Parcel is occupied by Verhoeven, a grain-processing company, and is developed with five buildings, grain storage silos, and a grain mill area. An office and warehouse building, referred to as "Building A," is located on the southern portion of the Site. The warehouse portion on the northeastern side of Building A contains a service shop used to repair machinery related to the grain mill. A maintenance shop, referred to as "Building B," is present on the eastern portion of the Site, and is used for light tractor and forklift services. Additional structures on the Eastern Parcel consist of a warehouse referred to as "Building C" on the north-central portion, used for assorted storage, and two grain storage structures on the southeastern and southwestern portions of the parcel, referred to as Buildings D and E, respectively.

The Western Parcel is occupied by The Scoular Company, a corn storage and distribution facility. The Western Parcel contains exterior grain storage areas, and an office trailer that contains a small hazardous substances storage area on secondary containment.

The Site is primarily asphalt-paved, with some gravel-paved areas on the western parcel. Access to the Site is gained from East Airport Drive, south of the Site.

A vehicle wash-down area with a sump is present on the northeastern portion of the Eastern Parcel. Three or four septic systems are associated with the Site: two or three on the Eastern Parcel, and one on the Western Parcel. The location of the septic system on the Western Parcel could not be determined from the records reviewed. A 499-gallon propane aboveground storage tank (AST), two 250-gallon diesel fuel ASTs, and a 220-gallon hydraulic oil AST are present on the Eastern Parcel. Two 12,000-gallon "fuel-storage" USTs formerly were located on the north-central portion of the Site near the grain mill area. A 12,000-gallon diesel fuel UST formerly was located southeast of Building C. The area west of Building B was identified as the former location of one or more additional USTs.

2.2 SITE HISTORY

The Site was used as agricultural or grazing land from at least the late 1930s to the early 1970s. By 1973, the Eastern Parcel was developed with small grain storage silos and other features associated with milling operations in the grain mill area. By 1975, grain appeared to be stockpiled in Buildings A through C, located on the southwestern portion of the Site. By 1985 grain storage structures Buildings D and E had been developed. By 2002, grain processing operations at the Site had expanded to the Western Parcel, which included the

development of three large grain storage silos. The Site has appeared in its current configuration since 2002.

Site occupants have consisted of Verhoeven from 1973 to the present; Chino Grain and Milling, Inc. in 1985; Coast Grain Company from 1990 to 2003; The Scoular Company between 2004 and the present; and JD Heistell and Company in 2009.

2.3 PREVIOUS INVESTIGATIONS

Partner's 2016 SI Report documented an investigation conducted at the Site. The scope of work consisted of a geophysical survey to identify former on-Site USTs or associated features and reported septic systems, and soil and soil gas sampling to assess for indications of a release from historical Site activities. The geophysical survey identified one large anomaly indicative of a backfilled UST excavation beneath the western canopy of Building B, which generally corresponds to the location of a former UST area. No large metallic features were identified, so Partner concluded that USTs formerly present in the area had been removed. One large anomaly resembling a septic system was identified north of Building A.

Partner advanced 26 borings with total depths ranging from 1 to 25 feet below ground surface (bgs) for collection of soil and/or soil gas samples. Soil samples were analyzed for total petroleum hydrocarbon carbon chain C6-C40 (TPH-cc) by U.S. Environmental Protection Agency (EPA) Method 8015C and for volatile organic compounds (VOCs) by EPA Method 8260B. Soil gas samples were analyzed for VOCs by either EPA Methods TO-14, TO-15, or 8260B. VOCs and TPH-cc were not detected in soil samples at concentrations exceeding laboratory reporting limits (Tables 2 and 3). VOCs, consisting of PCE, trichloroethene, toluene, ethylbenzene, and xylenes, were detected in soil gas samples at concentrations less than residential and industrial calculated soil gas screening levels in effect at the time the report was completed. Partner concluded that a discernable vapor intrusion condition did not appear to exist at the Site, and that the detections of VOCs in soil gas did not represent a threat to human health or the environment. Partner recommended no further investigation with respect to the on-Site grain-handling facility at the time of the report.

Although the reported concentrations of VOCs in soil gas were less than soil gas screening levels (SGSLs) in effect in 2016 at the time the Partner report was prepared, in April 2020, California Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (2022) Human Health Risk Assessment Note Number 3 (HHRA Note 3) was updated with the recommendation to use a more-conservative attenuation factor of 0.03 in screening level calculations. PCE concentrations ranging from 68 to 230 micrograms per cubic meter (µg/m^3) in soil gas samples collected by Partner in 2016 from sampling locations B5, B6, and SV-14 through SV-16 exceeded the calculated industrial SGSL of 67 µg/m^3 using the 0.03 attenuation factor. Additionally, the ethylbenzene concentration of 280 µg/m^3 in soil gas sample B4-SG, located west of Building B, exceeded the calculated industrial SGSL of 163 µg/m^3 using the 0.03 attenuation factor. These samples were collected west of and beneath Building B at a depth of 4 to 5 feet bgs. Soil gas results from Partner's 2016 SI Report and

calculated SGSLs using the 2020 HHRA Note 3 attenuation faction of 0.03 are presented in Table 5.

As part of its Phase I/II due diligence investigation, Farallon conducted soil and soil gas sampling at the Site in March 2022, focusing on assessing former UST areas and septic systems, and the proposed new building footprint for the potential for vapor intrusion issues. At the time of the assessment, Farallon was informed that an approximately 259,000-square-foot warehouse would be constructed on the north-central portion of the Site (Figure 2). The scope of work for the Phase II Environmental Site Assessment portion of the investigation included advancement of 12 borings, installation of two subslab gas probes, and installation of 10 temporary soil gas probe locations with single- or multi-depth nested gas points for collection of soil and soil gas samples.

VOCs and TPH-cc were not detected at concentrations exceeding laboratory reporting limits (Tables 2 and 3) in soil samples. Metals were either not detected in soil samples at concentrations exceeding laboratory reporting limits, or at concentrations less than screening levels (Table 4). Soil gas data indicated that PCE was present at concentrations exceeding calculated industrial SGSLs using the 0.03 attenuation factor in soil gas samples collected west of and beneath Building B (samples SS-1, SS-2, SVP-7, and SVP-8), proximate to the location of the former 12,000-gallon diesel fuel UST (sample SVP-5), proximate to the location of the two former 12,000-gallon USTs (sample SVP-1), and proximate to the vehicle washdown area with sump (sample SVP-6) as presented in Table 5. These locations were mapped beneath the planned new building footprint. PCE also was detected at concentrations less than the calculated industrial SGSLs in soil gas in other soil gas samples collected at the Site. The extent of PCE in soil gas was not fully characterized.

In September 2022, to further assess soil gas beneath the planned building footprint, Farallon advanced nine borings, designated SVP-11 through SVP-19, at the Site within the planned new building footprint. Dual-nested soil gas probes were constructed in each boring to investigate the potential presence of VOCs in soil gas beneath the planned new building. PCE was not detected at concentrations exceeding the laboratory reporting limit of 25 µg/m^3 in the soil gas samples collected from the soil gas probes. Ethylbenzene and total xylenes were detected at concentrations less than calculated industrial SGSLs. Because some of the soil gas samples collected in September 2022 were proximate to areas that showed impacts in March 2022, but no impacts were detected in September 2022, Farallon worked with the original analytical laboratory to conduct a data quality review of both analytical data sets. No anomalies in the data sets were found to render the data from either event unusable. Farallon recommended that the areas of highest impacts previously encountered under the proposed building slab be resampled to aid in the determination of whether mitigation measures would be recommended for the proposed building.

PCE in soil gas results are shown on Figure 3.

3.0 PHYSICAL SETTING

The topography, geology, and hydrogeology of the Site are described in this section.

3.1 TOPOGRAPHY

Farallon reviewed the U.S. Geological Survey topographic map for Guasti, California dated 2018 provided by Environmental Data Resources, Inc. The map depicts the Site at an elevation of approximately 980 feet above mean sea level. Site topography slopes gently downward to the south. Regional topography generally is sloped downward to the south.

3.2 GEOLOGY AND HYDROGEOLOGY

The Site is situated in the San Bernadino Valley of the Peninsular Ranges Geomorphic Province in Southern California. The Peninsular Ranges Province is bounded by the San Gabriel and San Bernardino mountains to the north and the Colorado Desert to the east, extends into lower California beyond the Mexican border to the south, and is bound by the Pacific Ocean to the west. The San Bernardino Mountains are approximately 7 miles north of the Site.

According to the 2016 SI Report, soil beneath the Site generally consists of very fine-grained silty sand from the surface to a depth of approximately 20 feet bgs and transitions to very fine- to coarse-grained poorly graded sand between depths of 20 and 25 feet bgs. Groundwater was not encountered during Partner's investigation.

Soil encountered during Farallon's previous subsurface investigations was described as silty fine to medium sand to the total explored depth of 4 to 10 feet bgs, with an apparent coarse sand and gravel layer at a depth of 10 feet bgs (and as shallow as 5 feet bgs on the eastern portion of the Site at boring SB-2), and intermittent clayey sand to clay lenses approximately 1 foot thick at a depth of between 6 and 7 feet bgs (borings SVP-16 and SVP-19) and 10 to 11 feet bgs (borings SVP-12 and SVP-16). Groundwater was not encountered during drilling.

Soil observed during the December 2022 sampling round can be generally described as silty fine sand with trace medium sand with some sub-angular gravel to the exploration depth of 4.5 feet bgs. Boring logs are provided in Appendix A.

Site-specific groundwater direction and depth information was not available in the records reviewed. Based on information obtained from the previous reports and California State Water Resources Control Board (2022) GeoTracker database and topographic interpretation, groundwater beneath the Site is anticipated to be encountered at a depth of approximately 250 feet bgs, and is estimated to flow to the south.

4.0 SOIL GAS INVESTIGATION

This section presents the scope of work for the soil gas investigation conducted at the Site in December 2022 and summarizes the results from this and prior soil gas sampling events.

4.1 SCOPE OF WORK

Before field work was initiated, the Site-specific Health and Safety Plan (HASP) was updated, and underground utilities were cleared. Field work consisted of advancing borings and collecting soil gas samples at the Site to provide a better understanding of soil gas impacts detected during previous subsurface investigations. The following sections detail this scope of work.

4.1.1 Health and Safety Plan Preparation

A Site-specific HASP was required under Section 3202 of Title 8 of the California Code of Regulations (8 CCR 3202) for all field activities due to the potential for exposure to hazardous substances. Prior to commencement of field activities, Farallon updated the HASP compliant with the requirements of the Occupational Safety and Health Act of 1970 and 8 CCR 3203. Personal protection equipment precautions related to COVID-19 were implemented for Farallon personnel during field activities in accordance with Farallon health and safety policy.

4.1.2 Underground Utility Clearance

Prior to commencement of drilling activities, Farallon marked the proposed boring locations at the Site and contacted Dig Alert for public utility notice. Farallon also engaged a private utility location service to pre-screen the proposed boring locations for utilities that may be encountered during advancement using hand tools.

4.1.3 Boring Advancement

Seven borings, designated SVP-20 through SVP-26, were advanced at the Site on December 9, 2022 to investigate the potential presence of VOCs in soil gas beneath the planned new building footprint. The boring locations are shown on Figure 2 and were generally evenly distributed across the planned new building footprint, with select borings placed in previously identified impacted areas. Borings SVP-20, SVP-21, SVP-22, SVP-24, SVP-25, and SVP-26 were advanced proximate to previous locations SVP-2, SVP-1, SVP-4, SVP-5, SVP-8, and SVP-7, respectively, to evaluate previous detections of PCE in soil gas. Borings were advanced in exterior locations paved with asphalt or concrete which required coring to access the subsurface. The borings were advanced using a hand-auger to a depth of 4.5 feet bgs to install soil gas probes at 4 feet bgs as described in Section 4.1.4, Soil Gas Probe Installation and Sampling. The general locations, depths, rationale for the borings, and analytes are shown in Table 1.

The displaced soil was visually inspected and screened by a Farallon geologist using a photoionization detector and was described and logged using the United Soil Classification System (Modified). Physical evidence of soil impacts, including staining and odors, was not observed; photoionization detector readings ranged from 0.1 to 1.0 parts per million. Boring logs with soil descriptions are provided in Appendix A.

4.1.4 Soil Gas Probe Installation and Sampling

Following completion of boring advancement, Farallon converted the borings to temporary soil gas probes. Borings SVP-20 through SVP-26 were constructed with soil gas probes at a depth of 4 feet bgs.

Soil gas probe installation was performed in accordance with the *Advisory: Active Soil Gas Investigations* dated July 2015 prepared by the California Environmental Protection Agency et al. (2015) (Soil Gas Advisory). The probes consisted of an Airstone microporous gas implant or equivalent connected to 0.25-inch-outside-diameter Nylaflow tubing, finished at the surface with temporary plugs. The annulus around the gas implant was backfilled with approximately 1 foot of screen-washed No. 3 sand, followed by 1 foot of dry #8 granular bentonite, and completed with hydrated #8 granular bentonite to create a seal from the top of the dry granular bentonite to near surface. Soil gas probe construction is illustrated in the boring logs provided in Appendix A; their locations are shown on Figure 2.

The temporary soil gas probes were allowed to equilibrate for 7 days prior to sample collection on December 16, 2022. Soil gas sampling, including observance of equilibration times, performance of shut-in tests, and purging activities, was conducted in accordance with the Soil Gas Advisory. Seven soil gas samples were collected into 1-liter Summa canisters at a rate of 200 milliliters per minute or less. The tracer gas 1,1-difluoroethane (1,1-DFA) was introduced to ambient air surrounding the sampling train by soaking a cotton swab with liquid 1,1-DFA and placing it at the location where the soil gas probe tubing exited the ground.

Upon completion of sample collection at each location, a 1-liter Tedlar bag was filled with soil gas by a syringe from the probe tubing at each soil gas location. Each Tedlar bag was then connected to a calibrated Landtec Gem5000 landfill gas monitor for on-site methane evaluation.

The Summa canisters were transported under chain-of-custody protocols to a California-certified laboratory, and were analyzed for VOCs by EPA Method TO-15. The soil gas probes were then abandoned by extracting as much tubing as practical, filling the boring with bentonite grout and restoring the surface to match surrounding conditions.

4.2 SUMMARY OF ANALYTICAL RESULTS FOR SOIL GAS

The soil gas analytical results were compared to DTSC Screening Levels for indoor air, EPA Regional Screening Levels for indoor air, and the San Francisco Water Quality Control Board Environmental Screening Levels for TPH-g, which were adjusted using suggested attenuation factors provided in the Vapor Intrusion Guidance prepared by DTSC and the California

Environmental Protection Agency (2011). The attenuation factor used for this comparison was 0.03 published in HHRA Note 3. The methane screening results were obtained in percent, and compared to the DTSC screening level for methane of 0.5 percent by volume[5] (10 percent of the lower explosive limit for methane).

A summary of soil gas analytical results from December 2022 is provided in Table 5 and PCE in soil gas results are shown on Figure 3. In order to provide a comprehensive understanding of analytical results for the Site, PCE in soil gas from previous investigations is also shown on Figure 3, and analytical results from previous investigations are included in the attached data tables.

Soil gas analytical and methane screening results from the December 2022 sampling event are summarized below. A written summary of previous results can be found in each related previous report.

- PCE was not detected at a concentration exceeding the laboratory reporting limit of 0.1 µg/m^3 in soil gas samples collected from locations SVP-20 or SVP-23 on the southwestern and central portions of the planned building, respectively.
- PCE was detected at concentrations of 3.5 ug/m^3 in SVP-21, 2.6 ug/m^3 in SVP-22, 5.7 ug/m^3 in SVP-24, 13.0 ug/m^3 in SVP-25, and 60.2 ug/m^3 in SVP-26, which are less than the calculated industrial SGSL of 67 ug/m^3 using the 0.03 attenuation factor. These samples were collected from beneath the north-central and east-central portions of the planned building. Borings SVP-24, SVP-25, and SVP-26 were located in the immediate vicinity of former borings that contained elevated concentrations of PCE in the soil gas samples collected at a depth of 4 feet bgs in March 2022: 70 ug/m^3 in SVP-5, 232 ug/m^3 in SVP-8, and 247 ug/m^3 in SVP-7, respectively.
- Trace concentrations of cyclohexane, trichlorofluoromethane (Freon 11), dichlorodifluoro-methane (Freon 12), ethylbenzene, toluene, total xylenes, 1,2,4-trimethyl-benzene, and carbon disulfide were detected in soil gas samples collected from various locations at concentrations exceeding their laboratory reporting limit of 1.0 µg/m^3, but well below their respective calculated industrial SGSLs using the 0.03 attenuation factor;
- Methane was not detected at concentrations exceeding the detection level of 0.1 percent in soil gas samples collected from locations SVP-20 through SVP-26 using a Landtec Gem5000 landfill gas monitor for methane evaluation.
- The tracer gas 1,1-DFA was not detected at a concentration exceeding the laboratory reporting limit in the soil gas samples collected from locations SVP-20 through SVP-26.

[5] *Advisory on Methane Assessment and Common Remedies at School Sites* dated June 16, 2005, prepared by Department of Toxic Substances Control (2005).

4.3 INVESTIGATION-DERIVED WASTE

Investigation-derived waste generated during this sampling event consisted of a small amount of excess soil removed from each boring. The excess soil did not display evidence of chemical impact based on visual, olfactory inspection, or photoionization detector screening. Previous soil sample analytical results indicate that Site soil is suitable for on-Site reuse. Excess soil was reused at the Site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Farallon conducted a soil gas investigation in December 2022 to further investigate impacts of VOCs previously identified in soil gas beneath the planned new building footprint at the Site. Previous soil gas data indicated that PCE was present at concentrations exceeding calculated industrial screening levels using the 0.03 attenuation factor in soil gas samples collected beneath and proximate to the planned new building footprint, specifically west of and beneath Building B; proximate to the former location of the 12,000-gallon diesel fuel UST; proximate to the former location of two 12,000 gallon USTs; and proximate to the vehicle washdown area with sump. PCE also was detected at concentrations less than the calculated industrial screening levels in soil gas in other soil gas samples collected at the Site.

For the December 2022 soil gas investigation, seven borings were advanced in the planned new building footprint. Soil gas probes were generally evenly distributed across the planned new building footprint, with selected probes placed proximate to areas previously identified as impacted by PCE. The borings were converted to temporary soil gas probes at a depth of 4 feet bgs and soil gas samples were collected and analyzed for VOCs and methane.

PCE was detected in five of the seven soil gas samples at concentrations exceeding the laboratory reporting limit of 0.1 ug/m^3. PCE detections in four of the soil gas samples ranged from 3.5 ug/m^3 to 13.0 ug/m^3; however, one detection of PCE (60.2 ug/m^3 in SVP-26) approached the calculated industrial SGSL of 67 ug/m^3 using a 0.3 attenuation factor. The detections of PCE in soil gas samples, which were collocated with soil gas samples collected during previous investigations, were less than detections of PCE in soil gas samples collected in 2016 by Partner and March 2022 by Farallon.

Other VOCs were not found during this investigation to be present in soil gas samples at concentrations approaching applicable screening levels. Methane was not detected in the soil gas samples.

Soil gas sampling at the Site has provided evidence of fluctuating concentrations of PCE. PCE concentrations detected in soil gas samples collected by Partner in July 2016 and by Farallon in March 2022 exceeded the calculated SGSL using a 0.03 attenuation factor at select locations. PCE was not detected above the laboratory reporting limit in soil gas samples collected by Farallon in September 2022. PCE was not detected at concentrations above the laboratory reporting limit or was detected at concentrations less than the calculated SGSL using a 0.03 attenuation factor in soil gas samples collected by Farallon in December 2022. The variability of reported concentrations of PCE in soil gas between the four soil gas sampling events suggests that PCE concentrations in soil gas may be influenced by variables such as seasonal changes. Because PCE detections in soil gas from the September and December 2022 investigations either were not detected above laboratory reporting limits or were less than the calculated SGSL using a 0.03 attenuation factor, and sampling locations were chosen in areas of known impacts, sampling data from the last two sampling rounds has not established the potential for an unacceptable vapor intrusion risk in the planned future building footprint. Based on the industrial nature of the use of the Site, Farallon recommends

implementation of a Media Management Plan to address any soil impacts associated with historical activities at the Site that may be encountered during Site redevelopment.

7.0 LIMITATIONS

7.1 GENERAL LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- **Accuracy of Information**. Farallon obtained, reviewed, and evaluated certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy or authenticity. Should the information upon which Farallon relied prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.
- **Reconnaissance and/or Characterization**. Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

For the foregoing reasons, Farallon cannot and does not warrant or guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions can be considered valid only as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Prologis, L.P. and currently accepted industry standards. No other warranties, representations, or certifications are made.

7.2 LIMITATION ON RELIANCE BY THIRD PARTIES

Reliance by third parties is prohibited. This report/assessment has been prepared for the exclusive use of Prologis, L.P. to address the unique needs of Prologis, L.P. at the Site at a specific point in time.

This is not a general grant of reliance. No one other than Prologis, L.P. may rely on this report unless Farallon agrees in advance to such reliance in writing. Any unauthorized use, interpretation, or reliance on this report/assessment is at the sole risk of that party, and Farallon will have no liability for such unauthorized use, interpretation, or reliance.

MSSL (> 150 feet Above Groundwater)[3]					**1,000**	**10,000**	**50,000**

NOTES:

< denotes analyte not detected at or exceeding the reporting limit listed.

--- denotes sample not analyzed.

[1]Depth in feet below ground surface.

[2]Analyzed by U.S. Environmental Protection Agency (EPA) Method 8015M (2022 samples) or 8015C (2016 samples).

[3]Los Angeles Regional Water Quality Control Board April 27, 2004 MSSLs for groundwater at depths of less than 20 feet, 20 to 150 feet, and greater than 150 feet below ground surface.

C = carbon range (number of carbons)

Farallon = Farallon Consulting, LLC

MSSL = maximum soil screening level

Partner = Partner Engineering and Science, Inc.

TPH-d = total petroleum hydrocarbons as diesel

TPH-g = total petroleum hydrocarbons as gasoline

TPH-o = total petroleum hydrocarbons as oil

DRAFT - Issued for Client Review

APPENDIX B
DTSC INFORMATION ADVISORY, CLEAN IMPORTED FILL MATERIAL

MEDIA MANAGEMENT PLAN
5355 East Airplane Drive
Ontario, California

Farallon PN: 1071-080 (Task 2)

Information Advisory
Clean Imported Fill Material

October 2001

DEPARTMENT OF TOXIC SUBSTANCES CONTROL

It is DTSC's mission to restore, protect and enhance the environment, to ensure public health, environmental quality and economic vitality, by regulating hazardous waste, conducting and overseeing cleanups, and developing and promoting pollution prevention.

State of California

California Environmental Protection Agency

Executive Summary

This fact sheet has been prepared to ensure that inappropriate fill material is not introduced onto sensitive land use properties under the oversight of the DTSC or applicable regulatory authorities. Sensitive land use properties include those that contain facilities such as hospitals, homes, day care centers, and schools. This document only focuses on human health concerns and ecological issues are not addressed. It identifies those types of land use activities that may be appropriate when determining whether a site may be used as a fill material source area. It also provides guidelines for the appropriate types of analyses that should be performed relative to the former land use, and for the number of samples that should be collected and analyzed based on the estimated volume of fill material that will need to be used. The information provided in this fact sheet is not regulatory in nature, rather is to be used as a guide, and in most situations the final decision as to the acceptability of fill material for a sensitive land use property is made on a case-by-case basis by the appropriate regulatory agency.

Introduction

The use of imported fill material has recently come under scrutiny because of the instances where contaminated soil has been brought onto an otherwise clean site. However, there are currently no established standards in the statutes or regulations that address environmental requirements for imported fill material. Therefore, the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) has prepared this fact sheet to identify procedures that can be used to minimize the possibility of introducing contaminated soil onto a site that requires imported fill material. Such sites include those that are undergoing site remediation, corrective action, and closure activities overseen by DTSC or the appropriate regulatory agency. These procedures may also apply to construction projects that will result in sensitive land uses. The intent of this fact sheet is to protect people who live on or otherwise use a sensitive land use property. By using this fact sheet as a guide, the reader will minimize the chance of introducing fill material that may result in potential risk to human health or the environment at some future time.

Overview

Both natural and manmade fill materials are used for a variety of purposes. Fill material properties are commonly controlled to meet the necessary site specific engineering specifications. Because most sites requiring fill material are located in or near urban areas, the fill materials are often obtained from construction projects that generate an excess of soil, and from demolition debris (asphalt, broken concrete, etc.). However, materials from those types of sites may or may not be appropriate, depending on the proposed use of the fill, and the quality of the assessment and/or mitigation measures, if necessary. Therefore, unless material from construction projects can be demonstrated to be free of contamination and/or appropriate for the proposed use, the use of that material as fill should be avoided.

Selecting Fill Material

In general, the fill source area should be located in nonindustrial areas, and not from sites undergoing an environmental cleanup. Nonindustrial sites include those that were previously undeveloped, or used solely for residential or agricultural purposes. If the source is from an agricultural area, care should be taken to insure that the fill does not include former agricultural waste process byproducts such as manure or other decomposed organic material. Undesirable sources of fill material include industrial and/or commercial sites where hazardous ma-

Potential Contaminants Based on the Fill Source Area

Fill Source:	Target Compounds
Land near to an existing freeway	Lead (EPA methods 6010B or 7471A), PAHs (EPA method 8310)
Land near a mining area or rock quarry	Heavy Metals (EPA methods 6010B and 7471A), asbestos (polarized light microscopy), pH
Agricultural land	Pesticides (Organochlorine Pesticides: EPA method 8081A or 8080A; Organophosphorus Pesticides: EPA method 8141A; Chlorinated Herbicides: EPA method 8151A), heavy metals (EPA methods 6010B and 7471A)
Residential/acceptable commercial land	VOCs (EPA method 8021 or 8260B, as appropriate and combined with collection by EPA Method 5035), semi-VOCs (EPA method 8270C), TPH (modified EPA method 8015), PCBs (EPA method 8082 or 8080A), heavy metals including lead (EPA methods 6010B and 7471A), asbestos (OSHA Method ID-191)

**The recommended analyses should be performed in accordance with USEPA SW-846 methods (1996). Other possible analyses include Hexavalent Chromium: EPA method 7199*

Recommended Fill Material Sampling Schedule

Area of Individual Borrow Area	Sampling Requirements
2 acres or less	Minimum of 4 samples
2 to 4 acres	Minimum of 1 sample every 1/2 acre
4 to 10 acres	Minimum of 8 samples
Greater than 10 acres	Minimum of 8 locations with 4 subsamples per location
Volume of Borrow Area Stockpile	**Samples per Volume**
Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

terials were used, handled or stored as part of the business operations, or unpaved parking areas where petroleum hydrocarbons could have been spilled or leaked into the soil. Undesirable commercial sites include former gasoline service stations, retail strip malls that contained dry cleaners or photographic processing facilities, paint stores, auto repair and/or painting facilities. Undesirable industrial facilities include metal processing shops, manufacturing facilities, aerospace facilities, oil refineries, waste treatment plants, etc. Alternatives to using fill from construction sites include the use of fill material obtained from a commercial supplier of fill material or from soil pits in rural or suburban areas. However, care should be taken to ensure that those materials are also uncontaminated.

Documentation and Analysis

In order to minimize the potential of introducing contaminated fill material onto a site, it is necessary to verify through documentation that the fill source is appropriate and/or to have the fill material analyzed for potential contaminants based on the location and history of the source area. Fill documentation should include detailed information on the previous use of the land from where the fill is taken, whether an environmental site assessment was performed and its findings, and the results of any testing performed. It is recommended that any such documentation should be signed by an appropriately licensed (CA-registered) individual. If such documentation is not available or is inadequate, samples of the fill material should be chemically analyzed. Analysis of the fill material should be based on the source of the fill and knowledge of the prior land use.

Detectable amounts of compounds of concern within the fill material should be evaluated for risk in accordance with the DTSC Preliminary Endangerment Assessment (PEA) Guidance Manual. If

metal analyses are performed, only those metals (CAM 17 / Title 22) to which risk levels have been assigned need to be evaluated. At present, the DTSC is working to establish California Screening Levels (CSL) to determine whether some compounds of concern pose a risk. Until such time as these CSL values are established, DTSC recommends that the DTSC PEA Guidance Manual or an equivalent process be referenced. This guidance may include the Regional Water Quality Control Board's (RWQCB) guidelines for reuse of non-hazardous petroleum hydrocarbon contaminated soil as applied to Total Petroleum Hydrocarbons (TPH) only. The RWQCB guidelines should not be used for volatile organic compounds (VOCs) or semi-volatile organic compounds (SVOCS). In addition, a standard laboratory data package, including a summary of the QA/QC (Quality Assurance/Quality Control) sample results should also accompany all analytical reports.

When possible, representative samples should be collected at the borrow area while the potential fill material is still in place, and analyzed prior to removal from the borrow area. In addition to performing the appropriate analyses of the fill material, an appropriate number of samples should also be determined based on the approximate volume or area of soil to be used as fill material. The table above can be used as a guide to determine the number of samples needed to adequately characterize the fill material when sampled at the borrow site.

Alternative Sampling

A Phase I or PEA may be conducted prior to sampling to determine whether the borrow area may have been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with DTSC or appropriate regulatory agency. However, if it is not possible to analyze the fill material at the borrow area or determine that it is appropriate for use via a Phase I or PEA, it is recommended that one (1) sample per truckload be collected and analyzed for all compounds of concern to ensure that the imported soil is uncontaminated and acceptable. (See chart on Potential Contaminants Based on the Fill Source Area for appropriate analyses). This sampling frequency may be modified upon consultation with the DTSC or appropriate regulatory agency if all of the fill material is derived from a common borrow area. However, fill material that is not characterized at the borrow area will need to be stockpiled either on or off-site until the analyses have been completed. In addition, should contaminants exceeding acceptance criteria be identified in the stockpiled fill material, that material will be deemed unacceptable and new fill material will need to be obtained, sampled and analyzed. Therefore, the DTSC recommends that all sampling and analyses should be completed prior to delivery to the site to ensure the soil is free of contamination, and to eliminate unnecessary transportation charges for unacceptable fill material.

Composite sampling for fill material characterization may or may not be appropriate, depending on quality and homogeneity of source/borrow area, and compounds of concern. Compositing samples for volatile and semivolatile constituents is not acceptable. Composite sampling for heavy metals, pesticides, herbicides or PAH's from unanalyzed stockpiled soil is also unacceptable, unless it is stockpiled at the borrow area and originates from the same source area. In addition, if samples are composited, they should be from the same soil layer, and not from different soil layers.

When very large volumes of fill material are anticipated, or when larger areas are being considered as borrow areas, the DTSC recommends that a Phase I or PEA be conducted on the area to ensure that the borrow area has not been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with the DTSC.

For further information, call Shahir Haddad, P.E. at (714) 484-5368.

APPENDIX C
SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
SOUTH COAST AQMD RULE BOOK, RULE 403, FUGITIVE DUST

MEDIA MANAGEMENT PLAN
5355 East Airplane Drive
Ontario, California

Farallon PN: 1071-080 (Task 2)

(Adopted May 7, 1976) (Amended November 6, 1992)
(Amended July 9, 1993) (Amended February 14, 1997)
(Amended December 11, 1998)(Amended April 2, 2004)
(Amended June 3, 2005)

RULE 403. FUGITIVE DUST

(a) Purpose

The purpose of this Rule is to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (man-made) fugitive dust sources by requiring actions to prevent, reduce or mitigate fugitive dust emissions.

(b) Applicability

The provisions of this Rule shall apply to any activity or man-made condition capable of generating fugitive dust.

(c) Definitions

(1) ACTIVE OPERATIONS means any source capable of generating fugitive dust, including, but not limited to, earth-moving activities, construction/demolition activities, disturbed surface area, or heavy- and light-duty vehicular movement.

(2) AGGREGATE-RELATED PLANTS are defined as facilities that produce and / or mix sand and gravel and crushed stone.

(3) AGRICULTURAL HANDBOOK means the region-specific guidance document that has been approved by the Governing Board or hereafter approved by the Executive Officer and the U.S. EPA. For the South Coast Air Basin, the Board-approved region-specific guidance document is the Rule 403 Agricultural Handbook dated December 1998. For the Coachella Valley, the Board-approved region-specific guidance document is the Rule 403 Coachella Valley Agricultural Handbook dated April 2, 2004.

(4) ANEMOMETERS are devices used to measure wind speed and direction in accordance with the performance standards, and maintenance and calibration criteria as contained in the most recent Rule 403 Implementation Handbook.

(5) BEST AVAILABLE CONTROL MEASURES means fugitive dust control actions that are set forth in Table 1 of this Rule.

(6) BULK MATERIAL is sand, gravel, soil, aggregate material less than two inches in length or diameter, and other organic or inorganic particulate matter.

(7) CEMENT MANUFACTURING FACILITY is any facility that has a cement kiln at the facility.

(8) CHEMICAL STABILIZERS are any non-toxic chemical dust suppressant which must not be used if prohibited for use by the Regional Water Quality Control Boards, the California Air Resources Board, the U.S. Environmental Protection Agency (U.S. EPA), or any applicable law, rule or regulation. The chemical stabilizers shall meet any specifications, criteria, or tests required by any federal, state, or local water agency. Unless otherwise indicated, the use of a non-toxic chemical stabilizer shall be of sufficient concentration and application frequency to maintain a stabilized surface.

(9) COMMERCIAL POULTRY RANCH means any building, structure, enclosure, or premises where more than 100 fowl are kept or maintained for the primary purpose of producing eggs or meat for sale or other distribution.

(10) CONFINED ANIMAL FACILITY means a source or group of sources of air pollution at an agricultural source for the raising of 3,360 or more fowl or 50 or more animals, including but not limited to, any structure, building, installation, farm, corral, coop, feed storage area, milking parlor, or system for the collection, storage, or distribution of solid and liquid manure; if domesticated animals, including horses, sheep, goats, swine, beef cattle, rabbits, chickens, turkeys, or ducks are corralled, penned, or otherwise caused to remain in restricted areas for commercial agricultural purposes and feeding is by means other than grazing.

(11) CONSTRUCTION/DEMOLITION ACTIVITIES means any on-site mechanical activities conducted in preparation of, or related to, the building, alteration, rehabilitation, demolition or improvement of property, including, but not limited to the following activities: grading, excavation, loading, crushing, cutting, planing, shaping or ground breaking.

(12) CONTRACTOR means any person who has a contractual arrangement to conduct an active operation for another person.

(13) DAIRY FARM is an operation on a property, or set of properties that are contiguous or separated only by a public right-of-way, that raises cows or

produces milk from cows for the purpose of making a profit or for a livelihood. Heifer and calf farms are dairy farms.

(14) DISTURBED SURFACE AREA means a portion of the earth's surface which has been physically moved, uncovered, destabilized, or otherwise modified from its undisturbed natural soil condition, thereby increasing the potential for emission of fugitive dust. This definition excludes those areas which have:

(A) been restored to a natural state, such that the vegetative ground cover and soil characteristics are similar to adjacent or nearby natural conditions;

(B) been paved or otherwise covered by a permanent structure; or

(C) sustained a vegetative ground cover of at least 70 percent of the native cover for a particular area for at least 30 days.

(15) DUST SUPPRESSANTS are water, hygroscopic materials, or non-toxic chemical stabilizers used as a treatment material to reduce fugitive dust emissions.

(16) EARTH-MOVING ACTIVITIES means the use of any equipment for any activity where soil is being moved or uncovered, and shall include, but not be limited to the following: grading, earth cutting and filling operations, loading or unloading of dirt or bulk materials, adding to or removing from open storage piles of bulk materials, landfill operations, weed abatement through disking, and soil mulching.

(17) DUST CONTROL SUPERVISOR means a person with the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule 403 requirements at an active operation.

(18) FUGITIVE DUST means any solid particulate matter that becomes airborne, other than that emitted from an exhaust stack, directly or indirectly as a result of the activities of any person.

(19) HIGH WIND CONDITIONS means that instantaneous wind speeds exceed 25 miles per hour.

(20) INACTIVE DISTURBED SURFACE AREA means any disturbed surface area upon which active operations have not occurred or are not expected to occur for a period of 20 consecutive days.

(21) LARGE OPERATIONS means any active operations on property which contains 50 or more acres of disturbed surface area; or any earth-moving operation with a daily earth-moving or throughput volume of 3,850 cubic

meters (5,000 cubic yards) or more three times during the most recent 365-day period.

(22) OPEN STORAGE PILE is any accumulation of bulk material, which is not fully enclosed, covered or chemically stabilized, and which attains a height of three feet or more and a total surface area of 150 or more square feet.

(23) PARTICULATE MATTER means any material, except uncombined water, which exists in a finely divided form as a liquid or solid at standard conditions.

(24) PAVED ROAD means a public or private improved street, highway, alley, public way, or easement that is covered by typical roadway materials, but excluding access roadways that connect a facility with a public paved roadway and are not open to through traffic. Public paved roads are those open to public access and that are owned by any federal, state, county, municipal or any other governmental or quasi-governmental agencies. Private paved roads are any paved roads not defined as public.

(25) PM_{10} means particulate matter with an aerodynamic diameter smaller than or equal to 10 microns as measured by the applicable State and Federal reference test methods.

(26) PROPERTY LINE means the boundaries of an area in which either a person causing the emission or a person allowing the emission has the legal use or possession of the property. Where such property is divided into one or more sub-tenancies, the property line(s) shall refer to the boundaries dividing the areas of all sub-tenancies.

(27) RULE 403 IMPLEMENTATION HANDBOOK means a guidance document that has been approved by the Governing Board on April 2, 2004 or hereafter approved by the Executive Officer and the U.S. EPA.

(28) SERVICE ROADS are paved or unpaved roads that are used by one or more public agencies for inspection or maintenance of infrastructure and which are not typically used for construction-related activity.

(29) SIMULTANEOUS SAMPLING means the operation of two PM_{10} samplers in such a manner that one sampler is started within five minutes of the other, and each sampler is operated for a consecutive period which must be not less than 290 minutes and not more than 310 minutes.

(30) SOUTH COAST AIR BASIN means the non-desert portions of Los Angeles, Riverside, and San Bernardino counties and all of Orange

County as defined in California Code of Regulations, Title 17, Section 60104. The area is bounded on the west by the Pacific Ocean, on the north and east by the San Gabriel, San Bernardino, and San Jacinto Mountains, and on the south by the San Diego county line.

(31) STABILIZED SURFACE means any previously disturbed surface area or open storage pile which, through the application of dust suppressants, shows visual or other evidence of surface crusting and is resistant to wind-driven fugitive dust and is demonstrated to be stabilized. Stabilization can be demonstrated by one or more of the applicable test methods contained in the Rule 403 Implementation Handbook.

(32) TRACK-OUT means any bulk material that adheres to and agglomerates on the exterior surface of motor vehicles, haul trucks, and equipment (including tires) that have been released onto a paved road and can be removed by a vacuum sweeper or a broom sweeper under normal operating conditions.

(33) TYPICAL ROADWAY MATERIALS means concrete, asphaltic concrete, recycled asphalt, asphalt, or any other material of equivalent performance as determined by the Executive Officer, and the U.S. EPA.

(34) UNPAVED ROADS means any unsealed or unpaved roads, equipment paths, or travel ways that are not covered by typical roadway materials. Public unpaved roads are any unpaved roadway owned by federal, state, county, municipal or other governmental or quasi-governmental agencies. Private unpaved roads are all other unpaved roadways not defined as public.

(35) VISIBLE ROADWAY DUST means any sand, soil, dirt, or other solid particulate matter which is visible upon paved road surfaces and which can be removed by a vacuum sweeper or a broom sweeper under normal operating conditions.

(36) WIND-DRIVEN FUGITIVE DUST means visible emissions from any disturbed surface area which is generated by wind action alone.

(37) WIND GUST is the maximum instantaneous wind speed as measured by an anemometer.

(d) Requirements

(1) No person shall cause or allow the emissions of fugitive dust from any active operation, open storage pile, or disturbed surface area such that:

(A) the dust remains visible in the atmosphere beyond the property line of the emission source; or

(B) the dust emission exceeds 20 percent opacity (as determined by the appropriate test method included in the Rule 403 Implementation Handbook), if the dust emission is the result of movement of a motorized vehicle.

(2) No person shall conduct active operations without utilizing the applicable best available control measures included in Table 1 of this Rule to minimize fugitive dust emissions from each fugitive dust source type within the active operation.

(3) No person shall cause or allow PM_{10} levels to exceed 50 micrograms per cubic meter when determined, by simultaneous sampling, as the difference between upwind and downwind samples collected on high-volume particulate matter samplers or other U.S. EPA-approved equivalent method for PM_{10} monitoring. If sampling is conducted, samplers shall be:

(A) Operated, maintained, and calibrated in accordance with 40 Code of Federal Regulations (CFR), Part 50, Appendix J, or appropriate U.S. EPA-published documents for U.S. EPA-approved equivalent method(s) for PM_{10}.

(B) Reasonably placed upwind and downwind of key activity areas and as close to the property line as feasible, such that other sources of fugitive dust between the sampler and the property line are minimized.

(4) No person shall allow track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. Notwithstanding the preceding, all track-out from an active operation shall be removed at the conclusion of each workday or evening shift.

(5) No person shall conduct an active operation with a disturbed surface area of five or more acres, or with a daily import or export of 100 cubic yards or more of bulk material without utilizing at least one of the measures listed in subparagraphs (d)(5)(A) through (d)(5)(E) at each vehicle egress from the site to a paved public road.

(A) Install a pad consisting of washed gravel (minimum-size: one inch) maintained in a clean condition to a depth of at least six inches and extending at least 30 feet wide and at least 50 feet long.

(B) Pave the surface extending at least 100 feet and at least 20 feet wide.

(C) Utilize a wheel shaker/wheel spreading device consisting of raised dividers (rails, pipe, or grates) at least 24 feet long and 10 feet wide to remove bulk material from tires and vehicle undercarriages before vehicles exit the site.

(D) Install and utilize a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the site.

(E) Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the actions specified in subparagraphs (d)(5)(A) through (d)(5)(D).

(6) Beginning January 1, 2006, any person who operates or authorizes the operation of a confined animal facility subject to this Rule shall implement the applicable conservation management practices specified in Table 4 of this Rule.

(e) Additional Requirements for Large Operations

(1) Any person who conducts or authorizes the conducting of a large operation subject to this Rule shall implement the applicable actions specified in Table 2 of this Rule at all times and shall implement the applicable actions specified in Table 3 of this Rule when the applicable performance standards can not be met through use of Table 2 actions; and shall:

(A) submit a fully executed Large Operation Notification (Form 403 N) to the Executive Officer within 7 days of qualifying as a large operation;

(B) include, as part of the notification, the name(s), address(es), and phone number(s) of the person(s) responsible for the submittal, and a description of the operation(s), including a map depicting the location of the site;

(C) maintain daily records to document the specific dust control actions taken, maintain such records for a period of not less than three years; and make such records available to the Executive Officer upon request;

(D) install and maintain project signage with project contact signage that meets the minimum standards of the Rule 403 Implementation Handbook, prior to initiating any earthmoving activities;

(E) identify a dust control supervisor that:

(i) is employed by or contracted with the property owner or developer;

(ii) is on the site or available on-site within 30 minutes during working hours;

(iii) has the authority to expeditiously employ sufficient dust mitigation measures to ensure compliance with all Rule requirements;

(iv) has completed the AQMD Fugitive Dust Control Class and has been issued a valid Certificate of Completion for the class; and

(F) notify the Executive Officer in writing within 30 days after the site no longer qualifies as a large operation as defined by paragraph (c)(18).

(2) Any Large Operation Notification submitted to the Executive Officer or AQMD-approved dust control plan shall be valid for a period of one year from the date of written acceptance by the Executive Officer. Any Large Operation Notification accepted pursuant to paragraph (e)(1), excluding those submitted by aggregate-related plants and cement manufacturing facilities must be resubmitted annually by the person who conducts or authorizes the conducting of a large operation, at least 30 days prior to the expiration date, or the submittal shall no longer be valid as of the expiration date. If all fugitive dust sources and corresponding control measures or special circumstances remain identical to those identified in the previously accepted submittal or in an AQMD-approved dust control plan, the resubmittal may be a simple statement of no-change (Form 403NC).

(f) Compliance Schedule

The newly amended provisions of this Rule shall become effective upon adoption. Pursuant to subdivision (e), any existing site that qualifies as a large operation will have 60 days from the date of Rule adoption to comply with the notification and recordkeeping requirements for large operations. Any Large Operation

Notification or AQMD-approved dust control plan which has been accepted prior to the date of adoption of these amendments shall remain in effect and the Large Operation Notification or AQMD-approved dust control plan annual resubmittal date shall be one year from adoption of this Rule amendment.

(g) Exemptions

(1) The provisions of this Rule shall not apply to:

(A) Dairy farms.

(B) Confined animal facilities provided that the combined disturbed surface area within one continuous property line is one acre or less.

(C) Agricultural vegetative crop operations provided that the combined disturbed surface area within one continuous property line and not separated by a paved public road is 10 acres or less.

(D) Agricultural vegetative crop operations within the South Coast Air Basin, whose combined disturbed surface area includes more than 10 acres provided that the person responsible for such operations:

(i) voluntarily implements the conservation management practices contained in the Rule 403 Agricultural Handbook;

(ii) completes and maintains the self-monitoring form documenting sufficient conservation management practices, as described in the Rule 403 Agricultural Handbook; and

(iii) makes the completed self-monitoring form available to the Executive Officer upon request.

(E) Agricultural vegetative crop operations outside the South Coast Air Basin whose combined disturbed surface area includes more than 10 acres provided that the person responsible for such operations:

(i) voluntarily implements the conservation management practices contained in the Rule 403 Coachella Valley Agricultural Handbook; and

(ii) completes and maintains the self-monitoring form documenting sufficient conservation management practices, as described in the Rule 403 Coachella Valley Agricultural Handbook; and

(iii) makes the completed self-monitoring form available to the Executive Officer upon request.

(F) Active operations conducted during emergency life-threatening situations, or in conjunction with any officially declared disaster or state of emergency.

(G) Active operations conducted by essential service utilities to provide electricity, natural gas, telephone, water and sewer during periods of service outages and emergency disruptions.

(H) Any contractor subsequent to the time the contract ends, provided that such contractor implemented the required control measures during the contractual period.

(I) Any grading contractor, for a phase of active operations, subsequent to the contractual completion of that phase of earth-moving activities, provided that the required control measures have been implemented during the entire phase of earth-moving activities, through and including five days after the final grading inspection.

(J) Weed abatement operations ordered by a county agricultural commissioner or any state, county, or municipal fire department, provided that:

(i) mowing, cutting or other similar process is used which maintains weed stubble at least three inches above the soil; and

(ii) any discing or similar operation which cuts into and disturbs the soil, where watering is used prior to initiation of these activities, and a determination is made by the agency issuing the weed abatement order that, due to fire hazard conditions, rocks, or other physical obstructions, it is not practical to meet the conditions specified in clause (g)(1)(H)(i). The provisions this clause shall not exempt the owner of any property from stabilizing, in accordance with paragraph (d)(2), disturbed surface areas which have been created as a result of the weed abatement actions.

(K) sandblasting operations.

(2) The provisions of paragraphs (d)(1) and (d)(3) shall not apply:

(A) When wind gusts exceed 25 miles per hour, provided that:

(i) The required Table 3 contingency measures in this Rule are implemented for each applicable fugitive dust source type, and;

(ii) records are maintained in accordance with subparagraph (e)(1)(C).

(B) To unpaved roads, provided such roads:

(i) are used solely for the maintenance of wind-generating equipment; or

(ii) are unpaved public alleys as defined in Rule 1186; or

(iii) are service roads that meet all of the following criteria:

(a) are less than 50 feet in width at all points along the road;

(b) are within 25 feet of the property line; and

(c) have a traffic volume less than 20 vehicle-trips per day.

(C) To any active operation, open storage pile, or disturbed surface area for which necessary fugitive dust preventive or mitigative actions are in conflict with the federal Endangered Species Act, as determined in writing by the State or federal agency responsible for making such determinations.

(3) The provisions of (d)(2) shall not apply to any aggregate-related plant or cement manufacturing facility that implements the applicable actions specified in Table 2 of this Rule at all times and shall implement the applicable actions specified in Table 3 of this Rule when the applicable performance standards of paragraphs (d)(1) and (d)(3) can not be met through use of Table 2 actions.

(4) The provisions of paragraphs (d)(1), (d)(2), and (d)(3) shall not apply to:

(A) Blasting operations which have been permitted by the California Division of Industrial Safety; and

(B) Motion picture, television, and video production activities when dust emissions are required for visual effects. In order to obtain this exemption, the Executive Officer must receive notification in writing at least 72 hours in advance of any such activity and no nuisance results from such activity.

(5) The provisions of paragraph (d)(3) shall not apply if the dust control actions, as specified in Table 2, are implemented on a routine basis for

each applicable fugitive dust source type. To qualify for this exemption, a person must maintain records in accordance with subparagraph (e)(1)(C).

(6) The provisions of paragraph (d)(4) shall not apply to earth coverings of public paved roadways where such coverings are approved by a local government agency for the protection of the roadway, and where such coverings are used as roadway crossings for haul vehicles provided that such roadway is closed to through traffic and visible roadway dust is removed within one day following the cessation of activities.

(7) The provisions of subdivision (e) shall not apply to:

(A) officially-designated public parks and recreational areas, including national parks, national monuments, national forests, state parks, state recreational areas, and county regional parks.

(B) any large operation which is required to submit a dust control plan to any city or county government which has adopted a District-approved dust control ordinance.

(C) any large operation subject to Rule 1158, which has an approved dust control plan pursuant to Rule 1158, provided that all sources of fugitive dust are included in the Rule 1158 plan.

(8) The provisions of subparagraph (e)(1)(A) through (e)(1)(C) shall not apply to any large operation with an AQMD-approved fugitive dust control plan provided that there is no change to the sources and controls as identified in the AQMD-approved fugitive dust control plan.

(h) Fees

Any person conducting active operations for which the Executive Officer conducts upwind/downwind monitoring for PM_{10} pursuant to paragraph (d)(3) shall be assessed applicable Ambient Air Analysis Fees pursuant to Rule 304.1. Applicable fees shall be waived for any facility which is exempted from paragraph (d)(3) or meets the requirements of paragraph (d)(3).

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Backfilling	01-1 Stabilize backfill material when not actively handling; and 01-2 Stabilize backfill material during handling; and 01-3 Stabilize soil at completion of activity.	✓ Mix backfill soil with water prior to moving ✓ Dedicate water truck or high capacity hose to backfilling equipment ✓ Empty loader bucket slowly so that no dust plumes are generated ✓ Minimize drop height from loader bucket
Clearing and grubbing	02-1 Maintain stability of soil through pre-watering of site prior to clearing and grubbing; and 02-2 Stabilize soil during clearing and grubbing activities; and 02-3 Stabilize soil immediately after clearing and grubbing activities.	✓ Maintain live perennial vegetation where possible ✓ Apply water in sufficient quantity to prevent generation of dust plumes
Clearing forms	03-1 Use water spray to clear forms; or 03-2 Use sweeping and water spray to clear forms; or 03-3 Use vacuum system to clear forms.	✓ Use of high pressure air to clear forms may cause exceedance of Rule requirements
Crushing	04-1 Stabilize surface soils prior to operation of support equipment; and 04-2 Stabilize material after crushing.	✓ Follow permit conditions for crushing equipment ✓ Pre-water material prior to loading into crusher ✓ Monitor crusher emissions opacity ✓ Apply water to crushed material to prevent dust plumes

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Cut and fill	05-1 Pre-water soils prior to cut and fill activities; and 05-2 Stabilize soil during and after cut and fill activities.	✓ For large sites, pre-water with sprinklers or water trucks and allow time for penetration ✓ Use water trucks/pulls to water soils to depth of cut prior to subsequent cuts
Demolition – mechanical/manual	06-1 Stabilize wind erodible surfaces to reduce dust; and 06-2 Stabilize surface soil where support equipment and vehicles will operate; and 06-3 Stabilize loose soil and demolition debris; and 06-4 Comply with AQMD Rule 1403.	✓ Apply water in sufficient quantities to prevent the generation of visible dust plumes
Disturbed soil	07-1 Stabilize disturbed soil throughout the construction site; and 07-2 Stabilize disturbed soil between structures	✓ Limit vehicular traffic and disturbances on soils where possible ✓ If interior block walls are planned, install as early as possible ✓ Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes
Earth-moving activities	08-1 Pre-apply water to depth of proposed cuts; and 08-2 Re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed 100 feet in any direction; and 08-3 Stabilize soils once earth-moving activities are complete.	✓ Grade each project phase separately, timed to coincide with construction phase ✓ Upwind fencing can prevent material movement on site ✓ Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Importing/exporting of bulk materials	09-1 Stabilize material while loading to reduce fugitive dust emissions; and 09-2 Maintain at least six inches of freeboard on haul vehicles; and 09-3 Stabilize material while transporting to reduce fugitive dust emissions; and 09-4 Stabilize material while unloading to reduce fugitive dust emissions; and 09-5 Comply with Vehicle Code Section 23114.	✓ Use tarps or other suitable enclosures on haul trucks ✓ Check belly-dump truck seals regularly and remove any trapped rocks to prevent spillage ✓ Comply with track-out prevention/mitigation requirements ✓ Provide water while loading and unloading to reduce visible dust plumes
Landscaping	10-1 Stabilize soils, materials, slopes	✓ Apply water to materials to stabilize ✓ Maintain materials in a crusted condition ✓ Maintain effective cover over materials ✓ Stabilize sloping surfaces using soil binders until vegetation or ground cover can effectively stabilize the slopes ✓ Hydroseed prior to rain season
Road shoulder maintenance	11-1 Apply water to unpaved shoulders prior to clearing; and 11-2 Apply chemical dust suppressants and/or washed gravel to maintain a stabilized surface after completing road shoulder maintenance.	✓ Installation of curbing and/or paving of road shoulders can reduce recurring maintenance costs ✓ Use of chemical dust suppressants can inhibit vegetation growth and reduce future road shoulder maintenance costs

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Screening	12-1 Pre-water material prior to screening; and 12-2 Limit fugitive dust emissions to opacity and plume length standards; and 12-3 Stabilize material immediately after screening.	✓ Dedicate water truck or high capacity hose to screening operation ✓ Drop material through the screen slowly and minimize drop height ✓ Install wind barrier with a porosity of no more than 50% upwind of screen to the height of the drop point
Staging areas	13-1 Stabilize staging areas during use; and 13-2 Stabilize staging area soils at project completion.	✓ Limit size of staging area ✓ Limit vehicle speeds to 15 miles per hour ✓ Limit number and size of staging area entrances/exists
Stockpiles/ Bulk Material Handling	14-1 Stabilize stockpiled materials. 14-2 Stockpiles within 100 yards of off-site occupied buildings must not be greater than eight feet in height; or must have a road bladed to the top to allow water truck access or must have an operational water irrigation system that is capable of complete stockpile coverage.	✓ Add or remove material from the downwind portion of the storage pile ✓ Maintain storage piles to avoid steep sides or faces

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure	Guidance
Traffic areas for construction activities	15-1 Stabilize all off-road traffic and parking areas; and 15-2 Stabilize all haul routes; and 15-3 Direct construction traffic over established haul routes.	✓ Apply gravel/paving to all haul routes as soon as possible to all future roadway areas ✓ Barriers can be used to ensure vehicles are only used on established parking areas/haul routes
Trenching	16-1 Stabilize surface soils where trencher or excavator and support equipment will operate; and 16-2 Stabilize soils at the completion of trenching activities.	✓ Pre-watering of soils prior to trenching is an effective preventive measure. For deep trenching activities, pre-trench to 18 inches soak soils via the pre-trench and resuming trenching ✓ Washing mud and soils from equipment at the conclusion of trenching activities can prevent crusting and drying of soil on equipment
Truck loading	17-1 Pre-water material prior to loading; and 17-2 Ensure that freeboard exceeds six inches (CVC 23114)	✓ Empty loader bucket such that no visible dust plumes are created ✓ Ensure that the loader bucket is close to the truck to minimize drop height while loading
Turf Overseeding	18-1 Apply sufficient water immediately prior to conducting turf vacuuming activities to meet opacity and plume length standards; and 18-2 Cover haul vehicles prior to exiting the site.	✓ Haul waste material immediately off-site

TABLE 1
BEST AVAILABLE CONTROL MEASURES
(Applicable to All Construction Activity Sources)

Source Category	Control Measure		Guidance
Unpaved roads/parking lots	19-1	Stabilize soils to meet the applicable performance standards; and	✓ Restricting vehicular access to established unpaved travel paths and parking lots can reduce stabilization requirements
	19-2	Limit vehicular travel to established unpaved roads (haul routes) and unpaved parking lots.	
Vacant land	20-1	In instances where vacant lots are 0.10 acre or larger and have a cumulative area of 500 square feet or more that are driven over and/or used by motor vehicles and/or off-road vehicles, prevent motor vehicle and/or off-road vehicle trespassing, parking and/or access by installing barriers, curbs, fences, gates, posts, signs, shrubs, trees or other effective control measures.	

Table 2
DUST CONTROL MEASURES FOR LARGE OPERATIONS

FUGITIVE DUST SOURCE CATEGORY		CONTROL ACTIONS
Earth-moving (except construction cutting and filling areas, and mining operations)	(1a)	Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Executive Officer, the California Air Resources Board, and the U.S. EPA. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations each subsequent four-hour period of active operations; OR
	(1a-1)	For any earth-moving which is more than 100 feet from all property lines, conduct watering as necessary to prevent visible dust emissions from exceeding 100 feet in length in any direction.
Earth-moving: Construction fill areas:	(1b)	Maintain soil moisture content at a minimum of 12 percent, as determined by ASTM method D-2216, or other equivalent method approved by the Executive Officer, the California Air Resources Board, and the U.S. EPA. For areas which have an optimum moisture content for compaction of less than 12 percent, as determined by ASTM Method 1557 or other equivalent method approved by the Executive Officer and the California Air Resources Board and the U.S. EPA, complete the compaction process as expeditiously as possible after achieving at least 70 percent of the optimum soil moisture content. Two soil moisture evaluations must be conducted during the first three hours of active operations during a calendar day, and two such evaluations during each subsequent four-hour period of active operations.

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS	
Earth-moving: Construction cut areas and mining operations:	(1c)	Conduct watering as necessary to prevent visible emissions from extending more than 100 feet beyond the active cut or mining area unless the area is inaccessible to watering vehicles due to slope conditions or other safety factors.
Disturbed surface areas (except completed grading areas)	(2a/b)	Apply dust suppression in sufficient quantity and frequency to maintain a stabilized surface. Any areas which cannot be stabilized, as evidenced by wind driven fugitive dust must have an application of water at least twice per day to at least 80 percent of the unstabilized area.
Disturbed surface areas: Completed grading areas	(2c)	Apply chemical stabilizers within five working days of grading completion; OR
	(2d)	Take actions (3a) or (3c) specified for inactive disturbed surface areas.
Inactive disturbed surface areas	(3a)	Apply water to at least 80 percent of all inactive disturbed surface areas on a daily basis when there is evidence of wind driven fugitive dust, excluding any areas which are inaccessible to watering vehicles due to excessive slope or other safety conditions; OR
	(3b)	Apply dust suppressants in sufficient quantity and frequency to maintain a stabilized surface; OR
	(3c)	Establish a vegetative ground cover within 21 days after active operations have ceased. Ground cover must be of sufficient density to expose less than 30 percent of unstabilized ground within 90 days of planting, and at all times thereafter; OR
	(3d)	Utilize any combination of control actions (3a), (3b), and (3c) such that, in total, these actions apply to all inactive disturbed surface areas.

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS	
Unpaved Roads	(4a)	Water all roads used for any vehicular traffic at least once per every two hours of active operations [3 times per normal 8 hour work day]; OR
	(4b)	Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; OR
	(4c)	Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.
Open storage piles	(5a)	Apply chemical stabilizers; OR
	(5b)	Apply water to at least 80 percent of the surface area of all open storage piles on a daily basis when there is evidence of wind driven fugitive dust; OR
	(5c)	Install temporary coverings; OR
	(5d)	Install a three-sided enclosure with walls with no more than 50 percent porosity which extend, at a minimum, to the top of the pile. This option may only be used at aggregate-related plants or at cement manufacturing facilities.
All Categories	(6a)	Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the methods specified in Table 2 may be used.

TABLE 3
CONTINGENCY CONTROL MEASURES FOR LARGE OPERATIONS

FUGITIVE DUST SOURCE CATEGORY	CONTROL MEASURES
Earth-moving	(1A) Cease all active operations; OR (2A) Apply water to soil not more than 15 minutes prior to moving such soil.
Disturbed surface areas	(0B) On the last day of active operations prior to a weekend, holiday, or any other period when active operations will not occur for not more than four consecutive days: apply water with a mixture of chemical stabilizer diluted to not less than 1/20 of the concentration required to maintain a stabilized surface for a period of six months; OR (1B) Apply chemical stabilizers prior to wind event; OR (2B) Apply water to all unstabilized disturbed areas 3 times per day. If there is any evidence of wind driven fugitive dust, watering frequency is increased to a minimum of four times per day; OR (3B) Take the actions specified in Table 2, Item (3c); OR (4B) Utilize any combination of control actions (1B), (2B), and (3B) such that, in total, these actions apply to all disturbed surface areas.
Unpaved roads	(1C) Apply chemical stabilizers prior to wind event; OR (2C) Apply water twice per hour during active operation; OR (3C) Stop all vehicular traffic.
Open storage piles	(1D) Apply water twice per hour; OR (2D) Install temporary coverings.
Paved road track-out	(1E) Cover all haul vehicles; OR (2E) Comply with the vehicle freeboard requirements of Section 23114 of the California Vehicle Code for both public and private roads.
All Categories	(1F) Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the methods specified in Table 3 may be used.

Table 4
(Conservation Management Practices for Confined Animal Facilities)

SOURCE CATEGORY	CONSERVATION MANAGEMENT PRACTICES
Manure Handling **(Only applicable to Commercial Poultry Ranches)**	(1a) Cover manure prior to removing material off-site; AND (1b) Spread the manure before 11:00 AM and when wind conditions are less than 25 miles per hour; AND (1c) Utilize coning and drying manure management by removing manure at laying hen houses at least twice per year and maintain a base of no less than 6 inches of dry manure after clean out; or in lieu of complying with conservation management practice (1c), comply with conservation management practice (1d). (1d) Utilize frequent manure removal by removing the manure from laying hen houses at least every seven days and immediately thin bed dry the material.
Feedstock Handling	(2a) Utilize a sock or boot on the feed truck auger when filling feed storage bins.
Disturbed Surfaces	(3a) Maintain at least 70 percent vegetative cover on vacant portions of the facility; OR (3b) Utilize conservation tillage practices to manage the amount, orientation and distribution of crop and other plant residues on the soil surface year-round, while growing crops (if applicable) in narrow slots or tilled strips; OR (3c) Apply dust suppressants in sufficient concentrations and frequencies to maintain a stabilized surface.
Unpaved Roads	(4a) Restrict access to private unpaved roads either through signage or physical access restrictions and control vehicular speeds to no more than 15 miles per hour through worker notifications, signage, or any other necessary means; OR (4b) Cover frequently traveled unpaved roads with low silt content material (i.e., asphalt, concrete, recycled road base, or gravel to a minimum depth of four inches); OR (4c) Treat unpaved roads with water, mulch, chemical dust suppressants or other cover to maintain a stabilized surface.
Equipment Parking Areas	(5a) Apply dust suppressants in sufficient quantity and frequency to maintain a stabilized surface; OR (5b) Apply material with low silt content (i.e., asphalt, concrete, recycled road base, or gravel to a depth of four inches).

"EXHIBIT X"

1.0 INTRODUCTION AND PURPOSE

The Planning Commission of the City of Ontario (the "Planning Commission") in approving the 5355 East Airport Drive Project (the "Project") makes the Findings described below. The Findings are based upon the entire record before the Planning Commission, as described in Subsection 1.3 below, including the Environmental Impact Report ("EIR") prepared for the Project with the City of Ontario (the "City") acting as lead agency under the California Environmental Quality Act ("CEQA").

Hereafter, the Notice of Preparation, Notice of Availability, Draft EIR ("DEIR"), Technical Studies, and Final EIR (containing responses to public comments on the DEIR and textual revisions to the Final EIR), will be referred to collectively herein as the "EIR" unless otherwise specified.

1.1 FINDINGS REQUIRED UNDER CEQA

Public Resources Code Section 21002 provides that "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects[.]" The statute also provides that the procedures required by CEQA are "intended to assist public agencies in systematically identifying both the significant effects of projects and the feasible alternatives or feasible mitigation measures which will avoid or lessen such significant effects." Finally, Section 21002 indicates that "in the event [that] specific economic, social, or other conditions make infeasible such project alternatives or such mitigation measures, individual projects may be approved in spite of one or more significant effects thereof."

The mandate described in Public Resources Code Section 21002 is implemented, in part, through the requirement that agencies must adopt findings before approving projects for which EIRs are required. For each significant environmental effect identified in an EIR for a project, the approving agency must issue a written finding reaching one or more of three permissible conclusions. The first such finding is that changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR. The second finding is that such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. The third finding is that specific economic, legal, social, technological, or other considerations make infeasible the mitigation measures or project alternatives identified in the EIR. (CEQA Guidelines, §15091.) Public Resources Code Section 21061.1 defines "feasible" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, legal, and technological factors."

1.2 PROJECT SUMMARY

1.2.1 SITE LOCATION

The 13.08-acre Project Site is located in southwestern San Bernardino County, within the City of Ontario. The Project Site is located at 5355 East Airport Drive (APN: 0238-052-29 and 0238- 052-20). The Project Site is bordered by East Airport Drive to the south, industrial uses to the east and west, and railroad tracks to the north.

1.2.2 PROJECT OVERVIEW

The Project Applicant seeks to demolish all existing on-site structures and redevelop the site as a warehouse distribution facility with approximately 270,337 square feet (s.f.) of building area and 54 south-facing loading dock doors. Of the total building square footage, the Project design allocates 255,337 s.f. for ground floor space and 15,000 s.f. for mezzanine space. Development of the Project site would require demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The proposed building would be a one-story, 49-foot-tall speculative warehouse/ distribution facility with ancillary office space. The Project design includes surface parking with 251 parking spaces including 126 standard automobile parking stalls, 7 accessible parking stalls, 25 electric vehicle parking stalls, 93 additional standard stalls within the truck court, and 48 truck trailer parking spaces. The truck court/loading area would be enclosed and screened from public viewing areas by landscaping and minimum 14-foot-tall concrete tilt screening walls, with an 8-foot-tall black tube steel gate used at the access points. Vehicular access would be provided via 2 driveways connecting with East Airport Drive. A new sidewalk would be constructed along East Airport Drive to provide pedestrian access from the public street to the primary building entrances. Bike racks also would be provided near the building entrance and electrical room. Ornamental landscaping, lighting, walls, and utility infrastructure improvements/connections would be installed in compliance with the City's Municipal Code. Although the future building user is not presently known, the proposed building is assumed to operate 24 hours a day, 7 days a week.

1.2.3 PROJECT OBJECTIVES

The fundamental purpose and goal of the 5355 East Airport Drive Project is to accomplish the orderly redevelopment of the Project Site with a modern warehouse distribution facility. The Project would achieve this goal through the following objectives.

A. To expand economic development and facilitate job creation in the City of Ontario by redeveloping the property with a new, in-demand industrial use adjacent to an already established industrial area.

B. To attract employment-generating businesses to the City of Ontario to reduce the need for members of the local workforce to commute outside the area for employment.

C. To develop industrial buildings with loading bays in close proximity to designated truck routes and the State highway system to avoid or shorten heavy truck-trip lengths on City and regional roads.

D. To attract businesses that can expedite the delivery of goods to consumers and businesses in the City of Ontario and beyond.

E. To develop a project that has architectural design and operational characteristics that complement other existing and planned buildings in the immediate vicinity of the Project Site and minimize conflicts with other nearby land uses.

F. To develop a property that has access to available infrastructure, including roads and utilities.

1.2.4 CITY OF ONTARIO ACTIONS COVERED BY THE EIR

The following discretionary and administrative actions are required of the City to implement the Project. The EIR prepared for the Project covers all discretionary and administrative approvals which may be needed to construct or implement the Project, whether or not they are explicitly listed below.

- Development Plan (PDEV22-017)

1.2.5 APPROVALS FROM OTHER AGENCIES

The California Public Resource Code (§ 21104) requires that all EIRs be reviewed by responsible and trustee agencies (see also CEQA Guidelines Section 15082 and Section 15086(a)). As defined by CEQA Guidelines Section 15381, "the term 'Responsible Agency' includes all public agencies other than the Lead Agency that have discretionary approval power over the project." A "Trustee Agency" is defined in CEQA Guidelines Section 15386 as "a state agency having jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California."

The anticipated agencies expected to use the EIR are described below. However, the EIR can be used by any Trustee Agency or Responsible Agency, whether explicitly noted in the table below or not, as part of their decision-making processes in relation to the proposed Project.

Agency	Action
Responsible and Trustee Agencies	
Santa Ana Regional Water Quality Control Board ("RWQCB")	Santa Ana RWQCB is responsible for the protection of California's water resources and water quality. The Santa Ana RWQCB is responsible for issuance of a National Pollutant Discharge Elimination System ("NPDES") Permit to ensure that during and after Project construction, on-site water flows do not result in siltation, other erosional actions, or degradation of surface or subsurface water quality.
San Bernardino County Flood Control District ("SBCFCD")	Responsible for the proposed drainage infrastructure that would be utilized by the Project.
Ontario Fire Department ("OFD")	Approvals required for the installation of new fire hydrant locations and fire protection features for the proposed building.
South Coast Air Quality Management District ("South Coast AQMD")	Responsible for the issuance of permits that allow for the construction and operation of the Project to ensure that during and post-Project construction and during Project operation, Project emissions do not result in significant impacts to air quality
Ontario Municipal Utilities Company ("OMUC")	Approvals for the installation of proposed water improvements and connections.
Inland Empire Utilities Agency ("IEUA")	Approval of proposed sewer improvements and connections.
Southern California Edison ("SCE")	Approvals required for the installation of new SCE facilities/connections to service the Project
Southern California Gas Company ("SoCal Gas")	Approvals required for the installation of new SoCal Gas facilities/connections to service the Project

1.3 ENVIRONMENTAL REVIEW AND PUBLIC PARTICIPATION

The City conducted an extensive environmental review of the Project to ensure that the City's decision makers and the public are fully informed about the potential significant environmental effects of the Project; to identify ways that environmental damage can be avoided or significantly reduced; and to prevent significant, avoidable damage to the environment by requiring changes in the Project using mitigation measures which have been found to be feasible. To do this, the City, acting as Lead Agency under CEQA, undertook the following:

- Circulated a Notice of Preparation (NOP) to the California Office of Planning and Research (the "State Clearinghouse"), Responsible Agencies, Trustee Agencies, other interested parties, and all property owners and occupants within a 600-foot radius of the Project site on September 1, 2022 for a 30-day review period beginning on September 1;

- Held a publicly noticed virtual EIR Scoping Meeting on September 13, 2022 to solicit comments from the public on the environmental issue areas that should be analyzed in the EIR;

- Sent a Notice of Completion (NOC) and copies of the Draft EIR to the California Office of Planning and Research, State Clearinghouse, on August 22, 2023, for a 45-day public review period from August 22, 2023 to October 5, 2023;

- Mailed a Notice of Availability (NOA) to all Responsible Agencies, Trustee Agencies, the Riverside County Clerk, other interested parties, and organizations, individuals who had previously requested the Notice, and all property owners and occupants within a 600-foot radius of the Project site to inform recipients that the Draft EIR was available for a 45-day review period beginning on August 22, 2023, and ending on October 5, 2023;

- Made an electronic copy of the Draft EIR available on the City's website;

- Prepared responses to comments on the Draft EIR received during the 45-day comment period on the Draft EIR, which have been included in the Final EIR;

- Mailed notice of the Planning Commission hearing to all property owners and occupants within a 600-foot radius of the Project site.

- Sent individual responses to all public agencies, organizations, and individuals who submitted comments the Draft EIR on April 10, 2023; and

- Held a Planning Commission hearing on April 23, 2023.

All the documents identified above and all the documents which are required to be part of the record pursuant to Public Resources Code §21167.6(e) are on file with the City of Ontario Planning Department located at 303 East B Street in Ontario, CA 91764. Questions should be directed to Thomas Grahn, Senior Planner.

2.0 ENVIRONMENTAL IMPACTS AND FINDINGS

The EIR was prepared by T&B Planning, Inc., an independent, professional consulting firm. The professional qualifications and reputation of the EIR Consultant, the supervision and direction of the EIR Consultant by City staff, the thorough and independent review of the DEIR and Final EIR, including comments and responses by City staff, and the review and careful consideration of the Final EIR by the Planning Commission, including comments and responses, all conclusively show that the Final EIR is the product of and reflects the independent judgment and analysis of the City as the Lead Agency.

Based on the NOP, Technical Appendix A to the Draft EIR, and the responses to the NOP, the EIR analyzed 12 potential areas where significant environmental impacts could result from the development of the Project. The 12 potential areas where significant environmental impacts could result from the development of the Project include: aesthetics, air quality, cultural resources, energy, geology and soils, greenhouse gas emissions, hazards and hazardous materials, hydrology and water quality, noise, transportation, tribal cultural resources, and utilities and service systems.

3.0 ENVIRONMENTAL IMPACTS NOT REQUIRING MITIGATION

The Planning Commission hereby finds that the following potential environmental impacts associated with the implementation of the 5355 East Airport Drive Project are less-than-significant and therefore do not require the imposition of mitigation measures, or there are no impacts at all.

3.1 AESTHETICS

3.1.1 THRESHOLD A

Impact Statement: The Project would not have a substantial effect on a scenic vista.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.1.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

A significant impact would occur if a project were to introduce incompatible scenic elements within a field of view containing a scenic vista or substantially block views of a scenic vista. Viewsheds refer to the visual qualities of the geographical area that is defined by the horizon, topography, and other natural features that give an area its visual boundary and context, or by artificial developments that have become prominent visual components of an area. The City of Ontario's General Plan (Policy Plan) does not identify scenic vistas within the City; however, The Policy Plan (Policy CD1-5) requires all major require north-south streets be designed and redeveloped to feature views of the San Gabriel Mountain. The Project Site is located at East Airport Drive, a minor east-west minor arterial street, as identified in the Functional Roadway Classification Plan (Figure M-2) of the Mobility Element within the Policy Plan. Additionally, the Project Site is bordered by industrial uses to the east and west. The San Gabriel Mountains are partially visible from the East Airport Drive segment that abuts the Project Site (while looking north); however, views of the Mountains are largely obstructed by existing onsite structures and improvements. The proposed warehouse building would not obscure views of the San Gabriel Mountains substantially more than views of the Mountains are already obscured under existing conditions, and views of the San Bernardino Mountains would continue to be available above the proposed building. Therefore, the visibility – or lack thereof – of the San Gabriel Mountains from public viewing areas along the Project Site frontage would not change substantially with implementation of the Project. Accordingly, given that the Project Site is not a scenic vista, is not located near a designated scenic resource, and unique, prominent, and scenic views would not be obscured by the Project, implementation of the Project would not have a substantial adverse effect on a scenic vista and less-than-significant impacts would occur. (DEIR, p. 4.1-8)

3.1.2 THRESHOLD B

Impact Statement: The Project would not damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.1.5 of the DEIR. This Planning Commission finds that the development of the proposed Project would result in no impacts with respect to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The City of Ontario is served by three freeways: I-10, I-15, and SR-60. I-10 and SR-60 traverse the northern and central portion of the City, respectively, in an east–west direction. I-15 traverses the northeastern portion of the City in a north–south direction. These segments of I-10, I-15, and SR-60 have not been officially designated as scenic highways by the California Department of Transportation. The nearest eligible State scenic highway is SR-142, approximately 12.7 miles to the southwest of the Project Site. In addition, there are no historic buildings or any scenic resources identified on or in the vicinity of the Project Site. Therefore, the Project would not substantially damage scenic resources, including, but not limited to, tress, rock outcroppings and historic buildings within a state scenic highway. No impacts are anticipated. (DEIR, pp. 4.1-8)

3.1.3 THRESHOLD C

Impact Statement: The Project would not, in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.1.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

According to CEQA Guidelines Section 15387, urban areas mean a central city or group of contiguous cities with a population of 50,000 or more, together with adjacent densely populated areas having a population density of at least 1,000 persons per square mile. According to the 2010 Census Urbanized Area Reference Map, the Project is located within an urbanized area. As such, the potential impacts of the Project under this threshold are assessed based on whether the Project would conflict with applicable zoning and other regulations governing scenic quality.

The Project Site is zoned Heavy Industrial (IH) and the Project is required to comply with the development standards established in Section 6.01.025, Industrial Zoning Districts, of the City's Development Code. The intent and purpose of Section 6.01.025 are to ensure that development within the industrial zoning districts of the City will contribute toward an urban environment of stable, desirable character, which is harmonious with existing and future development, and is consistent with the goals and policies of the Policy Plan component of The Ontario Plan (TOP). Furthermore, these regulations are to ensure that the appearance of industrial buildings and uses are compatible with the visual character of the area in which they are located. Table 4.1-1, *Zoning District Development Standards Consistency Analysis*, addresses the Project's consistency with applicable development

standards outlined in the City's Development Code. As shown below, the Project would not conflict with the applicable development standards in the City's Development Code established for the IH zone. Therefore, no adverse impacts are anticipated. (DEIR, pp. 4.1-9 – 4.1-12)

3.1.4 THRESHOLD D

Impact Statement: The Project would not create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 4.1.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

The analysis of light and glare describes the existing light and glare environments in the Project area, identifies the light- and glare-sensitive land uses in the area, describes the light and glare sources under the Project, and qualitatively evaluates whether the Project would result in a substantial increase in nighttime lighting and daytime glare as seen from the area's sensitive uses. The analysis of lighting impacts focuses on whether the Project would cause or substantially increase adverse night time lighting effects on light sensitive uses. Included in this analysis is consideration of the affected street frontages, the direction in which Project lighting would be directed, the potential for sunlight to reflect off the exterior surfaces of the proposed buildings, and the extent to which glare would interfere with the operation of motor vehicles or other activities.

Under existing conditions, the Project Site is surrounded by industrial uses and railroad tracks and street lights are located along East Airport Drive. New lighting would be introduced to the Site with the development of the Project. Pursuant to the requirements of the City's Development Code, on-site lighting is required to be shielded, diffused or indirect, to avoid glare to pedestrians or motorists. In addition, lighting fixtures are required to be selected and located to confine the area of illumination to within the Project Site and minimize light spillage. Furthermore, Site lighting plans are subject to review by the City's Planning Department and Police Department prior to issuance of building permits (pursuant to the City's Building Security Ordinance).

With respect to glare, a majority of Project building materials would consist of tilt-up concrete panels which are low reflective. Although the building would incorporate some glass elements, the glass would result in minimal glare effects because proposed window glazing would be low reflective, would be set back from East Airport Drive at a distance and would be buffered from East Airport Drive by landscaping. Therefore, implementation of the Project would not result in a significant source of light or glare that would adversely affect daytime or nighttime views and impacts would be less than significant. (DEIR, p. 4.1-12.)

3.2 AGRICULTURAL AND FORESTRY RESOURCES

3.2.1 THRESHOLD A

Impact Statement: The Project would not the Project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 5.4.1 of the DEIR. This Planning Commission finds that the development of the proposed Project would not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantive Evidence**

The Project Site is presently industrial and does not contain any agricultural uses. Further, the Site is identified as Urban and Built-up Land on the map prepared by the California Resources Agency, pursuant to the Farmland Mapping and Monitoring Program (DOC, 2018). The Project does not have the potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to non-agricultural use. As a result, no adverse environmental impacts are anticipated. (DEIR, p. 5-5-4)

3.2.2 THRESHOLD B

Impact Statement: The Project would not conflict with existing zoning for agricultural use, or a Williamson Act contract.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 5.4.1 of the DEIR. This Planning Commission finds that the development of the proposed Project would not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantive Evidence**

The Project Site is not zoned for agricultural use. The Project Site is zoned Heavy Industrial. The Project's implementation would not require a zone change and would not result in a loss of land zoned for agriculture. The Project is consistent with the development standards and allowed land uses of the proposed zone. Furthermore, there is no Williamson Act contract in effect on the subject Site. Therefore, no impacts to agricultural uses are anticipated, nor will there be any conflict with existing or Williamson Act contracts. (DEIR, p. 5-5-4)

3.2.3 THRESHOLD C

Impact Statement: The Project would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public

Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g).

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 5.4.1 of the DEIR. This Planning Commission finds that the development of the proposed Project would not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantive Evidence**

The Project is zoned Heavy Industrial and does not contain forest land. The Project is consistent with the development standards and allowed land uses of the Heavy Industrial zone. The City's Zoning Map does not designate any parcels of land in the Project area for forest land, timberland, or timberland zoned Timberland Production. Therefore, no adverse impacts are anticipated. (DEIR, p. 5-5-4)

3.2.4 THRESHOLD D

Impact Statement: The Project would not result in the loss of forest land or conversion of forest land to non-forest use.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 5.4.1 of the DEIR. This Planning Commission finds that the development of the proposed Project would not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantive Evidence**

There is currently no land in the City of Ontario that qualifies as forest land as defined in Public Resources Code Section 12220(g). Neither the Policy Plan nor the City's Zoning Code provide designations for forest land. Consequently, the Project would not result in the loss or conversion of forest land. (DEIR, p. 5-5-5)

3.2.5 THRESHOLD E

Impact Statement: The Project would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

❑ **Findings**

Potential impacts of the Project related to Threshold e are discussed in detail in Section 5.4.1 of the DEIR. This Planning Commission finds that the development of the proposed Project would not result in significant impacts related to Threshold e; therefore, no mitigation is required.

❑ **Substantive Evidence**

The Project Site is currently zoned Heavy Industrial and is not designated as Farmland. The Project Site is currently developed with industrial uses and there are no agricultural uses occurring onsite. As a result, to the extent that the Project would result in changes to the existing environment those changes would not result in the loss of Farmland to non-agricultural use.

Additionally, there is currently no land in the City of Ontario that qualifies as forest land as defined in Public Resources Code Section 12220(g). Neither the Policy Plan nor the City's Development Code provide designations for forest land. Consequently, to the extent that the Project would result in changes to the existing environment, those changes would not impact forest land. (DEIR, p. 5-5)

3.3 AIR QUALITY

3.3.1 THRESHOLD A

Impact Statement: The Project would conflict with and/or obstruct implementation of the applicable air quality plan.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.2.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

Consistency Criterion No. 1 refers to violations of the California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS). CAAQS and NAAQS violations would occur if LSTs or regional significance thresholds were exceeded. As disclosed under the analysis for Thresholds "b" and "c" below, Project localized and regional construction and operational-source emissions would not exceed applicable South Coast Air Quality Management District (SCAQMD) regional significance thresholds and Localized significance thresholds (LST) thresholds. As such, the Project is determined to be consistent with the first criterion.

With regard to Consistency Criterion No. 2, the 2016 Air Quality Management Plan (AQMP) demonstrates that the applicable ambient air quality standards can be achieved within the timeframes required under federal law. Growth projections from local general plans adopted by cities in the Air District are provided to the Southern California Association of Governments (SCAG), which develops regional growth forecasts, which are then used to develop future air quality forecasts for the AQMP. Development consistent with the growth projections in City of Ontario Policy Plan is considered to be consistent with the AQMP.

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. Irrespective of the site's land use designation, development of the site to its maximum potential would

likely occur, with disturbance of the entire site occurring during construction activities. As such, when considering that no emissions thresholds will be exceeded, a less than significant impact would result.

The Project is designated for Industrial uses within the Policy Plan. The Industrial designation allows for a variety of light industrial uses, including warehousing/distribution, assembly, light manufacturing, research and development, storage, repair facilities, and supporting retail and professional office uses. This designation also accommodates activities that could potentially generate impacts, such as noise, dust, and other nuisances. The Project is proposed to consist of a single 270,337 s.f. warehouse building. As previously stated, this analysis assumes up to 27,034 s.f. of high-cube cold storage use (10% of the total building s.f.) and 243,303 s.f. of warehouse use (90% of total building) which is consistent with the proposed Industrial designation and therefore, the Project does not propose or require amendment of the Site's underlying land use designation.

Furthermore, as discussed below, the Project would not result in or cause exceedances of regional or localized air quality significance thresholds. Emissions generated by the Project are accurately represented in the AQMP emissions modeling, air pollution control strategies, and associated assumptions for emissions affecting the South Coast Air Basin (SCAB). On the basis of the preceding discussion, the Project would not exceed the assumptions in the AQMP based on the years of Project build-out phase. The Project is therefore determined to be consistent with the second criterion.

The Project would not result in or cause NAAQS or CAAQS violations and the Project is consistent with the land use and growth intensities reflected in the adopted City of Ontario Policy Plan. Furthermore, the Project would not exceed any applicable regional or local thresholds. As such, the Project is considered to be consistent with the AQMP and impacts would be less than significant. (DEIR, pp. 4.2-29 – 4.2-30)

3.3.2 THRESHOLD B

Impact Statement: The Project would result in a cumulatively considerable net increase of criteria pollutants for which the Project region is non-attainment under an applicable federal or state ambient air quality standard.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.2.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

Construction Emissions Impact Analysis: The Project's peak construction-related emissions are summarized in Table 4.2-8, *Peak Construction Emissions Summary*, of the DEIR. Detailed air model outputs are presented in Appendix 4.1 of the Project's Air Quality Impact Analysis (AQIA). As shown in Table 4.2-8, peak construction-related emissions of VOC, NO_X, CO, SO_X, and particulate matter (PM_{10} and $PM_{2.5}$) would not exceed the applicable South Coast Air Quality Management District (SCAQMD) regional thresholds. Accordingly, the Project's construction activities would not emit

substantial concentrations for all pollutants and would not contribute to an existing or projected air quality violation on a cumulatively-considerable basis, and Project construction impacts would be less than significant.

Operational Emissions Impact Analysis: Peak emissions from Project operations are presented in Table 4.2-9, *Peak Operational Emissions Summary*, of the DEIR. Detailed air model outputs for the operational analysis are provided in Appendices 4.2 and 4.3 of the Project's AQIA contained as *Technical Appendix B1* of the DEIR. As shown, Project operational emissions of VOCs, NO_X, CO, SO_X, PM_{10} and $PM_{2.5}$ would not exceed SCAQMD regional criteria thresholds. Moreover, existing emissions from operation of the existing uses on the Project Site summarized in Table 4.2-4, *Existing Project Site Operation-Source Emissions,* were subtracted from the Project operational emissions to determine the new emissions from the proposed Project. As summarized in Table 4.2-9, Project operational emissions of VOCs, NOX, CO, SO_X, PM_{10} and $PM_{2.5}$ would not exceed SCAQMD regional criteria thresholds. Accordingly, the Project would not emit substantial concentrations of these pollutants during long-term operation and would not contribute to an existing or projected air quality violation. The Project's long-term emissions of VOCs, NO_X, CO, SO_X, PM_{10} and $PM_{2.5}$ would be less than significant. (DEIR, pp. 4.2-31 – 4.2-32)

3.3.3 THRESHOLD C

Impact Statement: The Project would not expose sensitive receptors to substantial pollutant concentrations.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.2.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

During both construction and operation, the Project has the potential to expose nearby sensitive receptors to substantial pollutant concentrations. The following provides an analysis based on the applicable LSTs established by the State of California and SCAQMD, an analysis of the Project's potential to result in or contribute to CO "hot spots," and an analysis of the Project's potential to result in cancer risks and non-cancer health hazards.

1. Localized Criteria Pollutant Analysis

Construction Analysis: Table 4.2-10, *Localized Construction-Source Emissions Summary*, of the DEIR shows that localized emissions of NO_X, CO, and particulate matter (PM_{10} and $PM_{2.5}$) during Project construction would not exceed applicable SCAQMD thresholds. Accordingly, Project construction would not expose any sensitive receptors in the vicinity of the Project Site to substantial criteria pollutant concentrations. Impacts would be less than significant.

Operational Analysis: As shown in Table 4.2-11, *Localized Operational-Source Emissions Summary*, Project operations would not exceed the applicable SCAQMD thresholds for localized NO_X, CO, and particulate matter (PM_{10} and $PM_{2.5}$) emissions. Accordingly, the Project would not expose any sensitive receptors in the vicinity of the Project Site to substantial pollutant concentrations. Impacts would be less than significant.

2. CO Hot Spot Impact Analysis

An adverse CO concentration, known as a "hot spot", would occur if an exceedance of the State one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur. It has long been recognized that CO hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last twenty years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment.

A CO "hot spot" analysis was not performed for the Project because CO attainment in the SCAB was thoroughly analyzed as part of SCAQMD's 2003 AQMP and the 1992 Federal Attainment for Carbon Monoxide Plan (1992 CO Plan). For context, the CO "hot spot" analysis performed for the 2003 AQMP recorded a CO concentration of 8.4 parts per million (8-hour) at the Long Beach Boulevard/Imperial Highway intersection in Los Angeles County; however, only a small portion of the recorded CO concentrations (0.7 parts per million) were attributable to traffic congestion at the intersection. The vast majority of the recorded CO concentrations at the Long Beach Boulevard/Imperial Highway intersection (7.7 parts per million) were attributable to ambient air concentrations. In comparison, the ambient 1-hr and 8-hr CO concentration within the Project study area is estimated to be 1.6 ppm and 1.3 ppm, respectively (data from I-10 Near Road monitoring station for 2020). Therefore, even if the traffic volumes for the Project were double or even triple of the traffic volumes generated at the Long Beach Blvd. and Imperial Hwy. intersection, coupled with the on-going improvements in ambient air quality, the Project would not be capable of resulting in a CO "hot spot" at any study area intersections. Furthermore, data from several air studies indicate that under existing and future vehicle emission rates, a given project would have to increase traffic volumes at a single intersection by between 24,000 and 44,000 vehicles per hour in order to generate a significant CO impact; the Project would generate nowhere near this volume of traffic. Based on the relatively low traffic congestion levels, low existing ambient CO concentrations, and the lack of any unusual meteorological and/or topographical conditions in the Project Site vicinity, the Project is not expected to cause or contribute to a CO "hot spot". (Urban Crossroads, 2022a, pp. 47-49) Impacts would be less than significant.

3. Toxic Air Contaminant Impact Analysis

Construction Analysis: Construction activity would occur over the entire Project Site. Therefore, the sensitive receptor land use with the greatest potential exposure to Project construction-source DPM emissions is Location R6 which is located approximately 8,840 feet northwest of the Project Site at an existing residence located at 11210 Fourth Street on the opposite side of I-10 and SR-60 from the

Project Site. Since there are no private outdoor living areas (backyards) facing the Project Site, receptor R6 is placed at the building façade facing the Project Site. At the Maximally Exposed Individual Resident (MEIR), the maximum incremental cancer risk attributable to Project construction-source DPM emissions is estimated at <0.01 in one million, which is far less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable threshold of 1.0. There are no sensitive receptors located in immediate, close proximity to the Project Site. As such, the Project will not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction activity. All other receptors during construction activity would experience less risk than what is identified for Location R6.

Operational Analysis: The Project Site primarily surrounded by industrial uses. Therefore, the residential land use with the greatest potential exposure to Project operational-source DPM emissions is Location R6 which is located approximately 8,840 feet northwest of the Project Site at an existing residence located at 11210 Fourth Street on the opposite side of I-15 and I-10 from the Project Site. Since there are no private outdoor living areas (backyards) facing the Project Site, receptor R6 is placed at the building façade facing the Project Site. At the MEIR, the maximum incremental cancer risk attributable to Project operational-source DPM emissions is estimated at 0.01 in one million, which is far less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be residential receptors located in immediate, close proximity to the Project Site. As such, the Project will not cause a significant human health or cancer risk to nearby residences.

The worker receptor land use with the greatest potential exposure to Project operational-source DPM emissions is Location R5, which represents the adjacent potential worker receptor approximately 58 feet east of the Project Site. At the Maximally Exposed Individual Worker (MEIW), the maximum incremental cancer risk impact is 0.25 in one million which is far less than the SCAQMD's threshold of 10 in one million. Maximum non-cancer risks at this same location were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. Because all other modeled worker receptors are located at a greater distance than the MEIW analyzed herein, and DPM dissipates with distance from the source, all other worker receptors in the vicinity of the Project would be exposed to less emissions and therefore less risk than the MEIW identified herein. As such, the Project will not cause a significant human health or cancer risk to adjacent workers.

Proximity to sources of toxics is critical to determining the impact. In traffic-related studies, the additional non-cancer health risk attributable to proximity was seen within 1,000 feet and was strongest within 300 feet. California freeway studies show about a 70-percent drop-off in particulate pollution levels at 500 feet. Based on California Air Resources Board (CARB) and SCAQMD emissions and modeling analyses, an 80-percent drop-off in pollutant concentrations is expected at approximately 1,000 feet from a distribution center. The 1,000-foot evaluation distance is supported by research-based findings concerning TAC emission dispersion rates from roadways and large sources showing that emissions diminish substantially between 500 and 1,000 feet from emission sources. A one-quarter mile radius, or 1,320 feet, is commonly utilized for identifying sensitive receptors, such as schools, that may be impacted by a proposed project. This radius is more robust than, and therefore provides a more health protective scenario for evaluation than the 1,000-foot impact radius identified above.

There are no schools within one-quarter mile of the Project Site. The nearest school is Chaparral Elementary School, which is located approximately 11,200 feet southeast of the Project Site. Because there is no reasonable potential that TAC emissions would cause significant health impacts at distances of more than one-quarter mile from the air pollution source, the Project would result in less-than-significant impacts to any schools in the vicinity of the Project. (DEIR, pp. 4.2-33 – 4.2-36)

3.3.4 THRESHOLD D

Impact Statement: The Project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 4.2.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

During construction activities on the Project Site, odors could be produced by construction equipment exhaust or from the application of asphalt and/or architectural coatings; however, standard construction practices would minimize the odor emissions and their associated impacts. Furthermore, any odors emitted during construction would be temporary, short-term, and intermittent in nature, and would cease upon the completion of the respective phase of construction. In addition, construction activities on the Project Site would be required to comply with SCAQMD Rule 402, which prohibits the discharge of odorous emissions that would create a public nuisance. Accordingly, the Project's construction would not create objectionable odors affecting a substantial number of people and all impacts would be less than significant.

During long-term operation, the Project would operate as a warehouse distribution facility, which is not typically associated with the emission of objectionable odors. Temporary outdoor refuse storage could be a potential source of odor; however, Project-generated refuse is required to be stored in covered containers and removed at regular intervals in compliance with the City's solid waste regulations, thereby precluding any significant odor impact. Furthermore, the occupant(s) of the proposed warehouse building would be required to comply with SCAQMD Rule 402, which prohibits the discharge of odorous emissions that would create a public nuisance, during long-term operation. As such, long-term operation of the Project would not create objectionable odors affecting a substantial number of people and all impacts would be less than significant. (DEIR, pp. 4.2-36 – 4.2-37)

3.4 BIOLOGICAL RESOURCES

3.4.1 THRESHOLD A

Impact Statement: The Project would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in

local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed Section 5.4.2 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Thresholds a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is currently developed with a grain processing company and a corn storage and distribution facility. The Project Site is in an urbanized and industrialized area in the City of Ontario and vegetation onsite is limited to ornamental species. The Project Site is located within an area that has not been identified as containing species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations or by the California Department of Fish and Wildlife (CDFW) or the United States Fish and Wildlife Service (USFWS). As a part of the Project, existing vegetation within the developed portion of the Project Site would be removed and replaced with a variety of trees and ornamental vegetation. The relocation and/or replacement of on-site vegetation and trees would not have a substantial adverse effect on candidate, sensitive or special status species, as defined by the CDFW or the USFWS. Therefore, no adverse impacts are anticipated. (DEIR, p. 5-5-5)

3.4.2 THRESHOLD B

Impact Statement: The Project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed Section 5.4.2 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is currently developed with industrial uses and is in a highly urbanized and industrialized area in the City. The Project Site does not contain any riparian habitat or other sensitive natural community identified by the CDFW or the USFWS (USFWS, 2020). Therefore, no adverse environmental impacts are anticipated. (DEIR, p. 5-5-6)

3.4.3 THRESHOLD C

Impact Statement: The Project would not have a substantial adverse effect on federally protected wetlands [as defined by Section 404 of the Clean Water Act] (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed Section 5.4.2 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

There are no wetlands habitat present on site (USFWS, 2020). Therefore, Project implementation would have no impact on these resources. (DEIR, p. 5-5-6)

3.4.4 THRESHOLD D

Impact Statement: The Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed Section 5.4.2 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

No surface water bodies, streams or waterways occur on the Project Site. The Project Site does not provide nursery sites for wildlife, nor is it conducive to function as a corridor for migratory wildlife. There are a limited number of ornamental trees on site that would be removed and replaced with new trees and landscaping. The Migratory Bird Treaty Act of 1918 (MBTA) implements the United States' commitment to four treaties with Canada, Japan, Mexico, and Russia for the protection of shared migratory bird resources. Nesting migratory birds are protected under the MBTA (United States Code, Title 16, Sections 703–712) and California Fish and Game Code Sections 3503 et seq. Compliance with federal MBTA and California Fish and Game Code would eliminate any potential impacts. The Project would not interfere with the movement of any native resident or migratory species or impede the use of native wildlife nursery sites. Therefore, no adverse environmental impacts are anticipated. (DEIR, p. 5-5-6)

3.4.5 THRESHOLD E

Impact Statement: The Project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

❑ **Findings**

Potential impacts of the Project related to Threshold e are discussed Section 5.4.2 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold e; therefore, no mitigation is required.

❑ **Substantial Evidence**

The City of Ontario does not have any ordinances protecting biological resources. Further, the Site does not contain any mature trees necessitating the need for preservation. As a result, no adverse environmental impacts are anticipated. (DEIR, p. 5-5-6)

3.4.6 THRESHOLD F

Impact Statement: The Project would not conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan.

❑ **Findings**

Potential impacts of the Project related to Thresholds f are discussed Section 5.4.2 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold f; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is not part of an adopted HCP, NCCP or other approved habitat conservation plan (CDFW, 2019). As a result, no adverse environmental impacts are anticipated. (DEIR, p. 5-5-7)

3.5 CULTURAL RESOURCES

3.5.1 THRESHOLD A

Impact Statement: The Project would not cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.3.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

Under existing conditions, the Project Site is currently developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed silo grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site, and three known septic systems are located beneath the Site. Implementation of the Project would require the demolition of all structures that are located on the Project Site under existing conditions.

Brian F. Smith & Associates, Inc. (BFSA) conducted a cultural resources record search of the Project Site and concluded that no recorded historical resources pursuant to CEQA Guidelines Section 15064.5

are located within the Project boundaries or a one-half mile radius of the Project Site. The structures on the Project Site have a construction date of 1975 and after; and, the buildings and features within the Project Site were assessed and found not to be historically or architecturally significant under CEQA. Accordingly, implementation of the Project would not result in a substantial adverse change to any historical resource as defined by CEQA Guidelines Section 15064.5. No impact to a historical resource would occur. (DEIR, pp. 4.3-7 – 4.3-8)

3.5.2 THRESHOLD C

Impact Statement: The Project would not disturb any human remains, including those interred outside of formal cemeteries.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.3.4 of the DEIR. This Planning Commission finds that the development of the proposed Project would not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site does not contain a cemetery and no known formal cemeteries are located within the immediate Site vicinity. Nevertheless, the remote potential exists that human remains may be unearthed during grading and excavation activities associated with Project construction.

If human remains are unearthed during Project construction, the construction contractor would be required by law to comply with California Health and Safety Code Section 7050.5 "Disturbance of Human Remains." According to Section 7050.5(b) and (c), if human remains are discovered, the County Coroner must be contacted and if the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner is required to contact the Native American Heritage Commission (NAHC) by telephone within 24 hours. Pursuant to California Public Resources Code Section 5097.98, whenever the NAHC receives notification of a discovery of Native American human remains from a county coroner, the NAHC is required to immediately notify those persons it believes to be most likely descended from the deceased Native American. The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American human remains and may recommend to the owner or the person responsible for the excavation work means for treatment or disposition, with appropriate dignity, of the human remains and any associated grave goods. The descendants shall complete their inspection and make recommendations or preferences for treatment within 48 hours of being granted access to the Project Site. According to Public Resources Code Section 5097.94(k), the NAHC is authorized to mediate disputes arising between landowners and known descendants relating to the treatment and disposition of Native American human burials, skeletal remains, and items associated with Native American burials. With mandatory compliance to California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98, any potential impacts to human remains, including human remains of Native American ancestry, that may result from development of the Project would be less than significant. (DEIR, pp. 4.3-8 – 4.3-9)

3.6 ENERGY

3.6.1 THRESHOLD A

Impact Statement: The Project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.4.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

1. Construction

The Project's construction process would consume electrical energy and diesel fuel. Project-related construction would represent a "single-event" energy demand and would not require on-going or permanent commitment of diesel fuel resources. Project construction activities are estimated to consume approximately 113,853 kWh of electricity, 67,491 gallons of diesel fuel from operation of construction equipment, 15,066 gallons of fuel from construction worker trips, and 11,965 gallons of fuel related to construction vendor trips (Urban Crossroads, 2022c, p. 30-38). Detailed calculations for all components of the Project's construction energy use are provided in subsection 5.3 of the Project's energy analysis (refer to *Technical Appendix D* of Draft EIR). Construction equipment use of fuel would not be atypical for the type of construction proposed because there are no aspects of the Project's proposed construction process that are unusual or energy-intensive, and Project construction equipment would conform to the applicable CARB emissions standards, acting to promote equipment fuel efficiencies. (Urban Crossroads, 2022c, p. 41) CCR Title 13, Title 13, Motor Vehicles, Section 2449(d)(3) Idling, limits idling times of construction vehicles to no more than 5 minutes, thereby precluding unnecessary and wasteful consumption of fuel due to unproductive idling of construction equipment. Best Available Control Measures (BACMs) inform construction equipment operators of this requirement. Enforcement of idling limitations is realized through periodic site inspections conducted by City building officials, and/or in response to citizen complaints. (Urban Crossroads, 2022c, p. 41) As supported by the preceding discussion, the Project's construction energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary.

2. Operation

Energy consumption in support of or related to Project operations would include transportation fuel demands (fuel consumed by passenger car and truck vehicles accessing the Project Site), fuel demands from operational equipment, and facilities energy demands (energy consumed by building operations, site maintenance activities, and on-site cargo handling equipment). The Project energy demand is calculated to be 179,406 gallons of fuel, 5,337,545 kBTU of natural gas per year, and 1,774,048 kWh of electricity per year The energy consumption of existing uses on the Project Site (refer to Subsection 4.4.1) were subtracted from the Project's gross energy totals to determine the new, net energy demands

from the proposed Project. The net Project energy demand is calculated to be 45,152 gallons of fuel, 4,543,279 kBTU of natural gas per year, and 746,675 kWh of electricity per year. Project on-site cargo handling equipment would consume an estimated 4,642 gallons of natural gas per year (Urban Crossroads, 2022c, pp. 38-40). Refer to subsection 5.4 of the Project's energy analysis (see *Technical Appendix D* of the Draft EIR) for detailed calculations of all components of the Project's operational energy use.

Enhanced fuel economies realized pursuant to federal and state regulatory actions, and related transition of vehicles to alternative energy sources (e.g., electricity, natural gas, biofuels, hydrogen cells) would likely decrease future gasoline fuel demands per VMT. Location of the Project proximate to regional and local roadway systems tends to reduce VMT within the region, acting to reduce regional vehicle energy demands. The Project would implement sidewalks, facilitating and encouraging pedestrian access. Facilitating pedestrian and bicycle access would reduce VMT and associated energy consumption. In compliance with the California Green Building Standards Code and City requirements, the Project would promote the use of bicycles as an alternative mean of transportation by providing short-term and/or long-term bicycle parking accommodations. (Urban Crossroads, 2022c, p. 42)

Project on-site equipment would conform to the applicable CARB emissions standards, acting to promote equipment fuel efficiencies. The Project proposes a conventional warehouse use reflecting contemporary energy efficient/energy conserving designs and operational programs. The Project does not propose uses that are inherently energy intensive and the energy demands in total would be comparable to other industrial uses of similar scale and configuration. Lastly, the Project will comply with the applicable California Green Building Standard Code Title 24 standards. (Urban Crossroads, 2022c, p. 43) As supported by the preceding discussion, the Project's operational energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary. (DEIR, pp. 4.4-5 – 4.4-6)

3.6.2 THRESHOLD B

Impact Statement: The Project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.4.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project was analyzed for consistency with the Intermodal Surface Transportation Efficiency Act of 1991, the Transportation Equity Act for the 21st Century, Integrated Energy Policy Report, the State of California Energy Plan, California Code Title 24, Part 6, Energy Efficiency Standards, California Code Title 24, Part 11, CALGreen, Pavley Fuel Efficiency Standards, Renewable Portfolio Standard, Senate Bill 350, and the City of Ontario Community Climate Action Plan. The Project would not

conflict with any of the preceding state and local plans. As such impacts would be less than significant. (DEIR, pp. 4.4-6 – 4.4-8)

3.7 GEOLOGY AND SOILS

3.7.1 THRESHOLD A

Impact Statement: The Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: strong seismic ground shaking; seismic-related ground failure, including liquefaction; or landslides.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed Section 4.5.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

1. Rupture of a Known Earthquake Fault

There are no known active or potentially active faults on or trending toward the Project Site. Research of available maps indicates that the Project Site is not located within an Alquist-Priolo Earthquake Fault Zone. No evidence of faulting was identified during the geotechnical investigation. (SoCal Geotechnical, 2022a, p. 10) Because there are no known faults located on or trending towards the Project Site, there is no potential for the Project to directly or indirectly expose people or structures to substantial adverse effects related to ground rupture. Impacts would be less than significant.

2. Strong Seismic Ground Shaking

The Project Site is located in a seismically active area of southern California and is expected to experience moderate to severe ground shaking during the lifetime of the Project. The risk is not substantially different than the risk to other properties throughout the southern California area. As a mandatory condition of Project approval, the Project Applicant would be required to construct the proposed building in accordance with the California Building Standards Commission (CBSC) and the Ontario Development Code. The CBSC and Ontario Development Code, which have been specifically tailored for California earthquake conditions, provide building standards that must be met to safeguard life or limb, health, property, and public welfare by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all buildings and structures. In addition, the CBSC (Chapter 18) require development project sites to be evaluated in preliminary soil reports to identify site-specific geologic and seismic conditions and provide site-specific recommendations to preclude adverse effects involving unstable soils and strong seismic ground-shaking, including, but not limited to, recommendations related to ground stabilization, selection of appropriate foundation type and depths, and selection of appropriate structural systems. The Project Applicant retained a professional geotechnical firm, Southern California Geotechnical, to prepare a geotechnical investigation for the Project Site, which is included as *Technical Appendix E1* to the DEIR. The geotechnical investigation included recommendations for design, construction, and grading

considerations based on the site-specific geological conditions and the Project's specific design. The recommendations included seismic design considerations, geotechnical design considerations, site grading, construction, foundation design and construction, floor slab design and construction, retaining wall design and construction, and pavement design parameters. This geotechnical investigation complies with the requirements of Chapter 18 of the CBSC. With mandatory compliance with these standards and site-specific design and construction measures, implementation of the Project would not directly or indirectly expose people or structures to substantial adverse effects, including loss, injury or death, involving seismic ground shaking. Impacts would be less than significant.

3. Seismic-Related Ground Failure

The Project would be required to be designed and constructed in accordance with applicable seismic safety guidelines, including the standard requirements of the CBSC, as noted above. Furthermore, the Project would be required (via conditions of approval) to comply with the grading and construction recommendations contained within the geotechnical investigation for the Project Site to further reduce the risk of seismic-related ground failure due to liquefaction. Therefore, implementation of the Project would not directly or indirectly expose people or structures to substantial hazards associated with seismic-related ground failure and/or liquefaction hazards. Impacts would be less than significant.

4. Landslides

The Project Site is relatively flat, as is the immediately surrounding area. The Project Site slopes gently to the south-southeast at a gradient of less than 1 percent. There is no evidence of historical landslides or rockfalls on the Project Site (CGS, 2021). The Project includes retaining walls, which would be constructed in accordance with the site-specific recommendations contained within the geotechnical report to ensure their structural soundness. The City would condition the Project to comply with the site-specific design and engineering recommendations contained within the geotechnical investigation to ensure these measures are implemented. Mandatory compliance with the recommendations contained within the Project Site's geotechnical report would ensure that the Project is engineered and constructed to maximize stability and preclude safety hazards to on-site and abutting off-site areas. Accordingly, the Project would not be exposed to substantial landslide risks, and implementation of the Project would not pose a substantial direct or indirect landslide risk to surrounding properties. Impacts would be less than significant. (DEIR, pp. 4.5-8 – 4.5-9)

3.7.2 THRESHOLD B

Impact Statement: The Project would not result in substantial soil erosion or the loss of topsoil.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed Section 4.5.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

- **Substantial Evidence**

1. Construction

Development of the Project would result in the demolition of all structures on-site, and grading and construction activities would occur that would expose and disturb soils that are currently covered by impervious surfaces. Disturbed soils would be subject to potential erosion during rainfall events or high winds due to the removal of stabilizing vegetation and building materials (e.g., existing concrete foundations) and exposure of these erodible materials to wind and water.

Pursuant to the requirements of the State Water Resources Control Board, the Project Applicant would be required to obtain coverage under the State's General Construction Storm Water Permit for construction activities (National Pollutant Discharge Elimination System [NPDES] permit). The NPDES permit is required for all development projects that include construction activities, such as clearing, grading, and/or excavation, that disturb at least 1 acre of total land area. In addition, the Project would be required to comply with the Santa Ana Regional Water Quality Control Board's (RWQCB's) Santa Ana River Basin Water Quality Control Program. Compliance with the NPDES permit and the Santa Ana River Basin Water Quality Control Program involves the preparation and implementation of a Stormwater Pollution Prevention Plan (SWPPP) for construction-related activities. The SWPPP will specify the Best Management Practices (BMPs) that the Project Applicant will be required to implement during construction activities to ensure that waterborne pollution – including erosion/sedimentation – is prevented, minimized, and/or otherwise appropriately treated prior to surface runoff being discharged from the subject property. Examples of Best Management Practices (BMPs) that may be utilized during construction include, but are not limited to, sandbag barriers, geotextiles, storm drain inlet protection, sediment traps, rip rap soil stabilizers, and hydro-seeding. Mandatory compliance with the SWPPP would ensure that the Project's implementation does not violate any water quality standards or waste discharge requirements during construction activities. Therefore, water quality impacts associated with construction activities would be less than significant and no mitigation measures would be required..

2. Operation

Upon Project build-out, the Project Site would be covered by buildings, landscaping, and impervious surfaces. Stormwater runoff from the Project Site would be captured, treated to reduce waterborne pollutants (including sediment), and conveyed off-site via an on-site storm drain system. The Project would be required to implement erosion control measures pursuant to Ontario Municipal Code Title 6, Chapter 12. During operation of the Project, the Project Applicant would be required to prepare and implement a Water Quality Management Plan (WQMP) to demonstrate compliance with the City's NPDES municipal stormwater permit, and to minimize the release of potential waterborne pollutants, including pollutants of concern for downstream receiving waters. The WQMP is a site specific post-construction water quality management program designed to address the potential release of pollutants of concern for downstream receiving waters and other water pollutants through the use of BMPs. Implementation of the WQMP ensures on-going, long-term protection of the watershed basin. The Preliminary WQMP for the Project was prepared by Westland and is included as *Technical Appendix H2* to the DEIR. Because the Project Applicant would be required to utilize erosion and sediment control measures to preclude substantial, long-term soil erosion and loss of topsoil, Project operation

would result in less-than-significant impacts related to soil erosion and sedimentation. (DEIR, pp. 4.5-10 – 4.5-11)

3.7.3 THRESHOLD C

Impact Statement: The Project would not be located on a geologic unit or soil that is unstable, or that would become unstable because of the Project, and potentially result in on-site or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed Section 4.5.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is relatively flat, as is the immediately surrounding area. The Project Site slopes gently to the south-southeast at a gradient of less than 1 percent. There is no evidence of historical landslides or rockfalls on the Project Site (CGS, 2021). As noted in the response to Threshold "a", the Project includes retaining walls and manufactured slopes that would be engineered for structural soundness and constructed in accordance with the site-specific recommendations contained within the geotechnical investigation for the Project. Accordingly, the Project would result in less than significant impacts associated with landslide hazards.

Southern California Geotechnical indicated that there is a low potential for subsidence to affect the Project Site. Removal and recompaction of the near-surface existing soils is estimated to result in an average shrinkage of 5 to 15 percent. Minor ground subsidence is expected to occur in the soils below the zone of removal, due to settlement and machinery working. The subsidence is estimated to be 0.15 feet. The City will condition the Project to comply with the Site-specific ground preparation and construction recommendations contained in the Project's geotechnical report. Based on the foregoing, potential impacts related to soil shrinkage/subsidence and collapse would be less than significant.

Southern California Geotechnical indicated that there is a low potential for lateral spreading to affect the Project Site. Lateral spreading is primarily associated with liquefaction hazards. As noted above under the discussion of Threshold "a," the Project Site is not susceptible to liquefaction. Accordingly, impacts associated with lateral spreading would be less than significant. (DEIR, p. 4.5-11)

3.7.4 THRESHOLD D

Impact Statement: The Project would not be located on expansive soil, as defined in the Uniform Building Code, creating substantial risks to life or property.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed Section 4.5.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

The near-surface soils consist of sands and silty sands with no appreciable clay content. These materials have been visually classified as non-expansive. Therefore, no design considerations related to expansive soils are considered warranted for this Site. (SoCal Geotechnical, 2022a, p. 13) Accordingly, the Project Site does not contain expansive soils and as such, would not create substantial direct or indirect risks to life or property associated with the presence of expansive soils. No impacts would occur. (DEIR, p. 4.5-11)

3.7.5 THRESHOLD E

Impact Statement: The Project would not propose the use of septic tanks.

❑ **Findings**

Potential impacts of the Project related to Threshold e are discussed Section 4.5.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold e; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project would connect to an existing sewer line installed beneath Airport Drive. The existing onsite septic systems would be removed and there would be no continued use of Project-site related septic systems upon implementation of the proposed Project. The Project would not utilize septic tanks or alternative wastewater systems. No impact related to the use of alternative waste water systems would thus occur. (DEIR, p. 4.5-12)

3.8 GREENHOUSE GAS EMISSIONS

3.8.1 THRESHOLD A

Impact Statement: The Project would generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.6.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

As previously stated, Supplemental Environmental Impact Report (SEIR) prepared for The Ontario Plan 2050 identifies that the measures included in the 2022 update to the Community Climate Action Plan (CCAP) are not substantially different than that of the 2014 CCAP and therefore there is no change in the environmental impacts associated with the CCAP. As such, and consistent with the 2014 CCAP, this analysis relies on the annual screening threshold of 3,000 $MTCO_2e$/yr to define small projects that are considered less than significant and do not require further GHG emissions calculations or analysis. Projects that do not exceed an annual 3,000 $MTCO_2e$/yr are therefore considered less than significant and would not require further analysis or mitigation. (Urban Crossroads, 2022d, p. 51)

The annual GHG emissions associated with the operation of the proposed Project are summarized in Table 4.6-3, *Project GHG Emissions*, of the DEIR. As shown, construction and operation of the Project would generate a total of approximately 4,236.54 $MTCO_2e$/yr. GHG emissions from existing land uses on the Project Site were subtracted from the Project's gross emissions to determine the net (or new) emissions attributed to the Project. Construction and operation of the Project less emissions from the existing onsite uses would result a net total of new GHG emissions of approximately 2,590.77 $MTCO_2e$/yr, which would fall below the significance threshold of 3,000 $MTCO_2e$/yr; therefore, Project-related GHG emissions are considered less than significant. (DEIR, pp. 4.6-22 – 4.5-23)

3.8.2 THRESHOLD B

Impact Statement: The Project would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.6.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project's consistency with the City's CCAP, Assembly Bill (AB) 32 and Senate Bill (SB) 32 are discussed below. It should be noted that the Project's consistency with the SB 32 (2017 Scoping Plan) also satisfies consistency with AB 32 since the 2017 Scoping Plan is based on the overall targets established by AB 32. Consistency with the 2008 Scoping Plan is not necessary, since the target year for the 2008 Scoping Plan was 2020, and the Project's buildout year is 2024. As such the 2008 Scoping Plan does not apply and consistency with the 2017 Scoping Plan is relevant. (Urban Crossroads, 2022d, p. 59)

Since the Project does not exceed the established annual screening threshold of 3,000 $MTCO_2e$/yr, the Project is considered less than significant, does not require further GHG emissions calculations or analysis, and is presumed to be consistent with the City's CCAP. (Urban Crossroads, 2022d, p. 59)

In April 2015, Governor Brown signed EO B-30-15, which advocated for a statewide GHG-reduction target of 40 percent below year 1990 levels by 2030 and 80 percent below 1990 levels by 2050. In September 2016, Governor Brown signed the SB 32. SB 32 formally established a statewide goal to reduce GHG emissions to 40 percent below year 1990 levels by 2030. To date, no statues or regulations have been adopted to translate the year 2050 GHG reduction goal into comparable, scientifically-based statewide emission reduction targets.

CARB prepared the 2017 Scoping Plan Update to identify the measures that would achieve the emissions reduction goals of SB 32 (and, thus, also would achieve the emissions reductions goals of AB 32). Research conducted by the Lawrence Berkeley National Laboratory confirmed that California, under its existing GHG reduction policy framework (i.e., Scoping Plan Update), is on track to meet the year 2030 reduction targets established by the SB 32 (Urban Crossroads, 2022d, p. 37). As explained in point-by-point detail in Table 4-7 of the Project's GHG Analysis (Refer to *Technical Appendix F* of the DEIR), the Project would not conflict with applicable measures of the 2017 Scoping Plan Update and, therefore, would not interfere with the State's ability to achieve the year GHG-reduction targets established by AB 32 and SB32. Further, recent studies show that the State's existing and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40% below 1990 levels by 2030 (Urban Crossroads, 2022d, p. 59-64)

In relation to CARB's 2022 Scoping Plan, the Project would not impede the State's progress towards carbon neutrality by 2045 under the 2022 Scoping Plan. The Project would be required to comply with applicable current and future regulatory requirements promulgated through the 2022 Scoping Plan. Some of the current transportation sector policies that the Project would comply with (through vehicle manufacturer compliance) include: Advanced Clean Cars II, Advanced Clean Trucks, Advanced Clean Fleets, Zero Emission Forklifts, the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation, Off-Road Zero Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation, carbon pricing through the Cap-and-Trade Program, and the Low Carbon Fuel Standard. Further, the Project would be required to comply with applicable elements outlined in the City's CAP. As such, the Project would not be inconsistent with the 2022 Scoping Plan.

As described on the preceding pages, implementation of the Project would not conflict with the State's ability to achieve the State-wide GHG reduction mandates and would be consistent with applicable policies and plans related to GHG emissions reductions. Implementation of the Project would not actively interfere with any future federally-, State-, or locally-mandated retrofit obligations (such as requirements to use new technologies such as diesel particulate filters, emissions upgrades to a higher tier equipment, etc.) enacted or promulgated to legally require development projects to assist in meeting State-adopted GHG emissions reduction targets, including those established under Executive Order (EO) S-3- 05, EO B-30-15, or SB 32. Therefore, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs and would result in a less-than significant impact. (DEIR, pp. 4.6-23 – 4.5-24)

3.9 HAZARDS AND HAZARDOUS MATERIALS

3.9.1 THRESHOLD C

Impact Statement: The Project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.7.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is not within one-quarter mile of an existing or proposed school. The nearest school to the Project Site is the Chaparral Elementary School, which is located approximately 2.23 miles southeast of the Project Site. Accordingly, the Project has no potential to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, and/or wastes within one-quarter mile of an existing or proposed school. No impact would occur. (DEIR, p. 4.7-16)

3.9.2 THRESHOLD D

Impact Statement: The Project site would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would not create a significant hazard to the public or the environment.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 4.7.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

Government Code Section 65962.5 requires State Department of Health Services (DTSC), State Water Resources Control Board, and the State Department of Resources Recycling and Recovery to maintain a list of hazardous materials sites that fall within specific, defined categories. As discussed in Subsection 4.7.1A.2, current and previous uses of the Project Site are included in several listings. No violations indicating a spill or a release were identified in the listings. Therefore, theses listings are not considered to represent a significant environmental concern. Additionally, Farallon searched the GeoTracker database and the California Department of Toxic Substances Control online EnviroStor database (EnviroStor database) for records related to the Site, but found no listings.

Two facilities (Costco Distribution Center to the south and Praxair, Inc. to the east) in the Project's vicinity were also recorded in several listings. However, based on the status, depth to groundwater, and location of the property at a cross-gradient direction from the Project Site, no evidence was found

to indicate that these properties represent a recognized environmental condition in connection with the Project Site. (Farallon, 2022, pp. 6-2 to 6-3) Therefore, impacts would be less than significant. (DEIR, p. 4.7-16)

3.9.3 THRESHOLD E

Impact Statement: The Project site is not within two miles of an airport and the Project site is not identified as within an airport influence area.

❑ **Findings**

Potential impacts of the Project related to Threshold e are discussed in detail in Section 4.7.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold e; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is located approximately 2.7 miles east of the Ontario International Airport (ONT). According to the Ontario International Airport (ONT) Land Use Compatibility Plan (ALUCP), the Project Site is located within the ONT Airport Influence Area (Ontario, 2011). Moreover, the Project Site is located outside the 65 community noise equivalent level (CNEL) noise impact zone and is subject to the Noise Criteria established on Table 2-3 in the ONT ALUCP. According to Table 2-3 of the ONT ALUCP, industrial land uses located outside the 65 dBA CNEL noise level contours of ONT, such as the Project, are considered normally compatible land use. For normally compatible land use, either the activities associated with the land use are inherently noisy or standard construction methods will sufficiently attenuate exterior noise to an acceptable indoor CNEL. Therefore, the Project would not result in excessive noise for people residing or working in the Project area.

Furthermore, the Project Site is not located in an ONT safety hazard zone (Ontario, 2011). Accordingly, implementation of the Project would not result in a safety hazard for people living or working on the Project area and impacts would be less than significant. (DEIR, p. 4.7-16 – 4.7-17)

3.9.4 THRESHOLD F

Impact Statement: The Project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

❑ **Findings**

Potential impacts of the Project related to Threshold f are discussed in detail in Section 4.7.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold f; therefore, no mitigation is required.

❑ **Substantial Evidence**

The City's Safety Element includes policies and procedures to be administered in the event of a disaster. The Ontario Plan seeks interdepartmental and interjurisdictional coordination and collaboration to be

prepared for, respond to and recover from everyday and disaster emergencies. The City manages disaster preparedness through the Technical Services Bureau of the Ontario Fire Department. This bureau is responsible for the preparation of the community for disasters and the organization of recovery efforts. The City updated a Local Hazard Mitigation Plan prepared by the Office of Emergency Services of the Ontario Fire Department in 2018. Because the Project Site has been historically used for industrial uses, it is not identified in any of these plans as being an evacuation area.

Furthermore, construction of the Project would be generally confined to the Project Site and would not physically impair access to the Site or the Project area. During both construction and long-term operation, the Project would be required to maintain adequate emergency access for emergency vehicles as required by the City and the Ontario Fire Department. In addition, the Project will comply with the requirements of the Ontario Fire Department and all City requirements for fire and other emergency access. Because the Project is required to comply with all applicable City codes, impacts would be less than significant level. (DEIR, p. 4.7-17)

3.9.5 THRESHOLD G

Impact Statement: The Project would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

❑ **Findings**

Potential impacts of the Project related to Threshold g are discussed in detail in Section 4.7.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold g; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is not located adjacent to wildlands nor is the Project Site located within or adjacent to a very high fire hazard severity zone (CAL FIRE, 2008). Accordingly, the Project would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires. No impact would occur. (DEIR, p. 4.7-17)

3.10 HYDROLOGY AND WATER QUALITY

3.10.1 THRESHOLD A

Impact Statement: The Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.8.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Applicant would be required to comply with Section 402 of the Clean Water Act, which authorizes the NPDES permit program that covers point sources of pollution discharging to a water body. The NPDES program would require the Project Applicant and/or construction contractor to prepare a Stormwater Pollution Prevention Plan (SWPPP) and obtain authorization to discharge stormwater under a NPDES construction stormwater permit because the Project would result in construction on a site that is larger than 1 acre. The Project Applicant also would be required to comply with the California Porter-Cologne Water Quality Control Act (Section 13000 et seq., of the California Water Code), which requires that comprehensive water quality control plans be developed for all waters within the State of California. The Project Site is located within the jurisdiction of the Santa Ana RWQCB.

1. Construction-Related Water Quality Impacts

Construction of the Project would include demolition, site preparation and grading, building construction, paving, utility installation, and architectural coating and landscaping, which have the potential to generate silt, debris, organic waste, chemicals, paints, and other solvents; should these materials come into contact with water that reaches the groundwater table or flows off-site, the potential exists for the Project's construction activities to adversely affect water quality. As such, short term water quality impacts have the potential to occur during Project construction in the absence of any protective or avoidance measures.

Pursuant to the requirements of the Santa Ana RWQCB and Ontario Municipal Code Title 6, Chapter 6, Article IV and V, the Project Applicant would be required to obtain coverage under the State's General Construction Storm Water Permit for construction activities (NPDES permit). The NPDES permit is required for all development projects that include construction activities, such as clearing, grading, and/or excavation, that disturb at least one (1) acre of total land area. In addition, the Project Applicant would be required to comply with the Sana Ana RWQCB's *Santa Ana River Basin Water Quality Control Program*. Compliance with the NPDES permit and the *Santa Ana River Basin Water Quality Control Program* involves the preparation and implementation of a SWPPP for construction related activities. The SWPPP will specify the Best Management Practices (BMPs) that the Project's construction contractors would be required to implement during construction activities to ensure that potential pollutants of concern are prevented, minimized, and/or otherwise appropriately treated prior to being discharged from the subject property. Examples of BMPs that may be utilized during construction include, but are not limited to, sandbag barriers, geotextiles, storm drain inlet protection, sediment traps, rip rap soil stabilizers, and hydroseeding. Pursuant to Ontario Municipal Code Title 6, Chapter 12, the Project Applicant also would be required to implement erosion control measures to prevent soil erosion by wind. Mandatory compliance with the SWPPP and erosion control measures would ensure that the Project construction does not violate any water quality standards or waste discharge requirements. Therefore, water quality impacts associated with construction activities would be less than significant.

2. Post-Development Water Quality Impact

The Project Applicant would be required to prepare and implement a Water Quality Management Plan (WQMP) to demonstrate compliance with the City's NPDES municipal stormwater permit, and to minimize the release of potential waterborne pollutants, including pollutants of concern for downstream receiving waters. The WQMP is a site-specific post-construction water quality management program designed to address the potential release of pollutants of concern for downstream receiving waters and other water pollutants through the use of BMPs. Implementation of the WQMP ensures on-going, long-term protection of the watershed basin. The preliminary WQMP for the Project was prepared by Westland and is included as *Technical Appendix H2* to the DEIR. As identified in the WQMP, the Project is designed to include underground stormwater retention chambers, source control BMPs, and treatment control BMPs to minimize, prevent, and/or otherwise appropriately treat stormwater runoff flows for pollutants of concern before they are discharged into the municipal storm drain system (Westland, 2022b, pp. 4 to 6). Compliance with the preliminary WQMP would be required as a condition or Project approval pursuant to Ontario Municipal Code Title 6, Chapter 6, Article V, and long-term maintenance of on-site BMPs would be required to ensure their long-term effectiveness. Therefore, water quality impacts associated with long-term operational activities would be less than significant.

Additionally, pursuant to Ontario Municipal Code Title 6, Chapter 6, Article IV, all businesses that own or operate facilities described in 40 CFR 122.26(b)(14)(i)-(xi) are required to obtain coverage under the State's General Permit for Discharges of Stormwater Associated with Industrial Activities, at least 14 days prior to the startup of business activities. All listed businesses are required to submit a completed Notice of Intent (NOI) form, site map and application fee to the SWRCB. The SWRCB also requires the listed businesses to prepare a SWPPP, retain a copy of the SWPPP on site and comply with all the requirements of the general permit. The Project would be required to prepare a SWPPP for operational activities and implement a long-term water quality sampling and monitoring program or receive an exemption. Because the permit is dependent upon a detailed accounting of all operational activities and procedures, and the Project's building users and their operational characteristics are not known at this time, details of the operational SWPPP (including BMPs) or potential exemption to the SWPPP operational activities requirement cannot be determined with certainty at this time. However, based on the performance requirements of the NPDES Industrial General Permit, the Project's mandatory compliance with all applicable water quality regulations would further reduce potential water quality impacts during long-term operation. Additionally, the Project would comply with the State Trash Amendments and the MS4 Permit by installing the appropriate Full Capture System or equivalent.

Based on the foregoing analysis, the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality during long term operation. Impacts would be less than significant. (DEIR, pp. 4.8-10 – 4.8-11)

3.10.2 THRESHOLD B

Impact Statement: The Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that the Project would impede sustainable groundwater management of the basin.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.8.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

Water service to the Project Site would be provided by the Ontario Municipal Utilities Company (OMUC). As depicted in Figure 3-7, *Proposed Utility Plan*, water would be accommodated via proposed water lines that would extend from the southeastern and southwestern corners of the building to an existing 12-inch water main at East Airport Drive. The Project Applicant does not propose the use of any wells or other groundwater extraction activities. Therefore, the Project would not directly draw water from the groundwater table. Implementation of the Project has no potential to substantially deplete or decrease groundwater supplies and the Project's impact to groundwater supplies would be less than significant. Development of the Project would slightly increase impervious surface coverage on the Project Site, which would, in turn, slightly reduce the amount of water percolating down into the underground aquifer that underlies the Project Site and a majority of the City and surrounding areas (i.e., Chino Groundwater Basin). Percolation is just one of several sources of groundwater recharge for the Subbasin. A majority of the groundwater recharge in the Chino Groundwater Basin occurs within percolation basins ("recharge basins") that are located in the northern and western portions of the Basin (CBWM, 2021, Exhibit 3-5). The Project Site is located in the central portion of the Chino Groundwater Basin and would not physically impact any of the major groundwater recharge facilities in the Basin. Therefore, the Project would not result in substantial, adverse effects to local groundwater levels. Additionally, the Project includes design features that would maximize the percolation of onsite stormwater runoff into the groundwater basin, such as underground infiltration chambers and permeable landscape areas. Accordingly, buildout of the Project with these design features would not interfere substantially with groundwater recharge or impede sustainable groundwater management of the Chino Groundwater Basin. Based on the foregoing information, the Project would not interfere substantially with groundwater recharge. For the reasons stated above, the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project would impede sustainable groundwater management of the basin. Impacts would be less than significant. (DEIR, pp. 4.8-11 – 4.8-12)

3.10.3 THRESHOLD C

Impact Statement: The Project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: result in substantial erosion or siltation on- or off-site; substantially increase the rate or amount of surface runoff in a manner which would result in flooding

on- or offsite; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.8.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The proposed Project entails redevelopment of the Project Site with one warehouse building supported by drive aisles and parking areas for passenger vehicles and trailers. Docking areas are located south facing façade of the proposed building. Landscape areas are proposed around the perimeter of the Site. The proposed development would consist of approximately 89% of impervious areas.

The proposed development would maintain the same drainage pattern as the existing condition. Stormwater is designed to sheet flow from north to south and be captured by proposed onsite catch basins. The proposed on-site storm drain system is designed to convey the flow into a proposed underground infiltration chamber. This system is designed to meet project's water quality requirements and provide sufficient storage to meet the 100-year storm hydrology requirement. In a large storm event, stormwater would exit the underground chamber system via pipes and be pumped out through a proposed parkway drain on Airport Drive. Runoff would sheet flow east along Airport Drive and discharge into the existing catch basin to maintain the same point of discharge as the existing condition. (Westland, 2022a, p. 2) See Figure 4.8-1, *Proposed Post-Development Hydrology Map*, for the post development drainage map.

The following analysis evaluates the potential for Project-related development activities to adversely affect water quality or cause or exacerbate local flooding.

A. Erosion and Siltation

The Project would not alter the existing drainage pattern. Pursuant to the requirements of the State Water Resources Control Board, the Project Applicant would be required to obtain coverage under the State's General Construction Storm Water Permit for construction activities (NPDES permit). The NPDES permit is required for all development projects, including the Project, that include construction activities, such as clearing, grading, and/or excavation, that disturb at least 1 acre of total land area. In addition, the Project would be required to comply with the Santa Ana RWQCB's Santa Ana River Basin Water Quality Control Program. Compliance with the NPDES permit and the Santa Ana River Basin Water Quality Control Program involves the preparation and implementation of a SWPPP for construction-related activities. The SWPPP will specify the BMPs that would be required to be implemented during construction activities to ensure that waterborne pollution – including erosion/siltation – is prevented, minimized, and/or otherwise appropriately treated prior to surface runoff being discharged from the subject property. Examples of BMPs that may be utilized during construction include, but are not limited to, sandbag barriers, geotextiles, storm drain inlet protection,

sediment traps, rip rap soil stabilizers, and hydro-seeding. Lastly, the Project would be required to implement erosion control measures pursuant to Ontario Municipal Code Title 6, Chapter 12, and to ensure compliance with SCAQMD Rule 403. Mandatory compliance with the SWPPP and the Cityrequired erosion control measures would ensure that the Project's implementation does not violate any water quality standards or waste discharge requirements during construction activities. Based on the foregoing information, erosion and sedimentation impacts associated with Project construction activities would be less than significant.

During operation of the Project, the Project Applicant would be required to prepare and implement a WQMP to demonstrate compliance with the City's NPDES municipal stormwater permit, and to minimize the release of potential waterborne pollutants, including pollutants of concern for downstream receiving waters. The WQMP is a site-specific post-construction water quality management program designed to address the potential release of pollutants of concern for downstream receiving waters and other water pollutants through the use of BMPs. Implementation of the WQMP ensures on-going, long-term protection of the watershed basin. The PWQMP for the Project was prepared by Westland and is included as *Technical Appendix H2* to the DEIR. Because the Project Applicant would be required to utilize erosion and sediment control measures to preclude substantial, long-term soil erosion and loss of topsoil, Project operation would result in less-than-significant impacts related to soil erosion and sedimentation.

B. Stormwater Runoff Discharge

Based on the 100-year rational method analysis presented in Table 4.8-1, *Pre-Development Hydrology Summary Table*, and Table 4.8-2, *Post-Development Hydrology Summary Table*, the post-development flow rate within the disturbed area decreased compared to the pre-development flow rate. Furthermore, the post- development runoff volume decreased compared to the pre-development runoff volume. The decrease in flow rate and runoff volume was a result from a decrease in impervious areas.

The proposed Project would not create or contribute runoff that would exceed the capacity of the existing downstream storm drain system. At buildout, the Project would discharge approximately 35.24 cubic feet per second (cfs) to the existing storm drain system, which is an approximately 7 percent decrease relative to existing conditions. Furthermore, the underground infiltration system is designed to accommodate the 100-year storm event and would not exceed the flow rates and runoff volumes generated by the existing condition. Once construction is complete, there would not be any substantial increase in flood boundaries, levels, or frequencies in any areas outside the development. (Westland, 2022a, p. 4)

Based on the foregoing information, the Project would not substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site. Impacts would be less than significant.

C. Stormwater Drainage System Capacity & Polluted Runoff

As described above, buildout of the Project would reduce the cfs of runoff discharged into the existing municipal storm drain system during peak storm events relative to existing conditions. Accordingly,

the Project would not create or contribute runoff that would exceed the capacity of any existing storm water drainage system, and impacts would be less than significant.

As discussed in the response to Threshold "a" and this Threshold (refer to sub-item "A"), the Project's construction contractors would be required to comply with a SWPPP and the Project's owner or operator would be required to comply with the WQMP to ensure that Project-related construction activities and operational activities do not result in substantial amounts of polluted runoff. Additionally, the Project would comply with the State Trash Amendments and the MS4 Permit by installing the appropriate Full Capture System or equivalent. The Project would not result in substantial additional sources of polluted runoff and impacts would be less than significant.

D. Flood Flows

The Project Site is not located within a special flood hazard area (FEMA, 2016). Accordingly, the Project Site is not expected to be inundated by flood flows during the lifetime of the Project and the Project would not impede flood flows. No impact would occur. (DEIR, pp. 4.8-12 – 4.8-16)

3.10.4 THRESHOLD D

Impact Statement: The Project would not result in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 4.8.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is located approximately 38 miles northeast of the Pacific Ocean; consequently, there is no potential for the Project Site to be impacted by a tsunamis as tsunamis typically only reach up to a few miles inland. The Project Site also is not subject to flooding hazards associated with a seiche because the nearest body of water is the San Antonio Dam, approximately 10 miles to the north of the Project Site, which is too far away from the subject property to impact the property with a seiche (Google Earth, 2021). According to The Ontario Plan 2050 EIR, the Project Site is not located within the potential inundation from San Antonio Dam; however, the Project Site is adjacent to an area with potential inundation from debris basins (Ontario, 2022a, Figure 5.10-3). The probability of dam failure is very low, and Ontario has never been impacted by a major dam failure. In addition, dam owners are required to maintain emergency action plans that include procedures for damage assessment and emergency warnings. (Ontario, 2022a, p. 5.10-26) Accordingly, impacts would be less than significant. (DEIR, p. 4.8-16)

3.10.5 THRESHOLD E

Impact Statement: The Project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

❑ **Findings**

Potential impacts of the Project related to Threshold e are discussed in detail in Section 4.8.6 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold e; therefore, no mitigation is required.

❑ **Substantial Evidence**

As discussed under Threshold "a" above, the Project Site is located within the Santa Ana River Basin and Project-related construction and operational activities would be required to comply with the Santa Ana RWQCB's Santa Ana River Basin Water Quality Control Plan by preparing and adhering to a SWPPP and WQMP. As also discussed in Threshold "a" above, implementation of the Project would not conflict with or obstruct the Santa Ana River Basin Water Quality Control Plan and impacts would be less than significant.

The Project Site is located within the Chino Groundwater Basin, which is an adjudicated groundwater basin. Adjudicated basins, like the Chino Groundwater Basin, are exempt from the 2014 Sustainable Groundwater Management Act (SGMA) because such basins already operate under a court-ordered management plan to ensure the long-term sustainability of the basin. No component of the Project would obstruct with or prevent implementation of the management plan for the Chino Groundwater Basin. As such, the Project's construction and operation would not conflict with any sustainable groundwater management plan. Impacts would be less than significant. (DEIR, p. 4.8-17)

3.11 LAND USE AND PLANNING

3.11.1 THRESHOLD A

Impact Statement: The Project would not physically divide an established community.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 5.4.3 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is located in an area that is currently developed with urban land uses. Existing industrial development borders the Site to the south, west, and east; the BNSF railroad track borders the Site to the north. The Project Applicant would redevelop the Site with another industrial use with associated parking and landscaping improvements. The Project will be of similar design and size to surrounding development. The Project would not have the potential to physically divide an established community. No adverse impacts are anticipated.. (DEIR, p. 5-5-7)

3.11.2 THRESHOLD B

Impact Statement: The Project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 5.4.3 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is designated for Industrial by the City's Policy Plan and the Heavy Industrial zoning district. The Project Applicant would redevelop the Project Site in accordance with the underlying land use designation and applicable zoning ordinance development standards. No change to the existing land use designation or zoning is required or proposed by the Project. The Project is consistent with the Policy Plan and does not interfere with any policies for environmental protection. As such, no impacts are anticipated. (DEIR, p. 5-5-7)

3.12 MINERAL RESOURCES

3.12.1 THRESHOLD A

Impact Statement: The Project would not result in the loss of availability of a known mineral resource of value to the region and residents of the state.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed Section 5.4.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is located within a mostly developed area surrounded by urban land uses. As shown in Figure 5.12-1 of The Ontario Plan 2050 Final Supplemental EIR, the Project Site is designated as Mineral Resource Zone MRZ-3 (Ontario, 2022b). Areas designated by the State of California Geologist as MRZ-3 include land that the significance of mineral deposits cannot be determined from the available data. According to the Policy Plan, there are no permitted mining operations in the City. Significant mineral resources within Ontario are limited to construction aggregate. These areas have been developed with urban uses and are not suitable for mineral resource extraction (Ontario, 2022a). There are no known mineral resources in the area. Therefore, no impacts are anticipated. (DEIR, p. 5-5-7)

3.12.2 THRESHOLD B

Impact Statement: The Project would not result in the loss of availability of a locally important mineral resource recovery site delineated on any land use plan.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed Section 5.4.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

As discussed in threshold a above, there are no known mineral resources in the area. The Project would not result in the loss of availability of locally-important mineral resources. No impacts are anticipated. (DEIR, p. 5-5-8)

3.13 NOISE

3.13.1 THRESHOLD A

Impact Statement: The Project will not generate substantial increase in ambient noise levels in the vicinity of the Project site in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.9.6 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The analysis presented on the following pages summarizes the Project's potential construction noise levels and operational noise levels, including operational noise that would be generated on-site as well as off-site noise that would be generated by Project-related traffic. The detailed noise calculations for the analysis presented here are provided in Appendices 7.1 and 8.1 of the Project's noise impact analysis (see *Technical Appendix I*).

A. Construction Noise Impact Analysis

Construction activities on the Project Site would proceed in 6 stages: 1) demolition; 2) site preparation; 3) grading; 4) building construction; 5) paving, and 6) application of architectural coatings. These activities would create temporary periods of noise when heavy construction equipment (i.e. trucks, concrete mixer, portable generators, power tools) is in operation and would cause a short-term increase in ambient noise levels. The Project construction noise levels at nearby receiver locations are summarized in Table 4.9-5, *Construction Equipment Noise Level Summary*.

To evaluate whether the Project will generate potentially significant short-term noise levels at nearest receiver locations, a construction-related daytime noise level threshold of 80 dBA Leq is used as a reasonable threshold to assess the daytime construction noise level impacts. The construction noise analysis shows that the nearest receiver locations will satisfy the reasonable daytime 80 dBA Leq significance threshold during Project construction activities as shown in Table 4.9-5. Additionally, Project-related construction activities are expected to occur on weekdays (and, potentially, on Saturdays) during the hours when the City's Municipal Code does not restrict construction noise (i.e., between the hours 7:00 a.m. and 6:00 p.m. on any weekday or between the hours of 9:00 a.m. and 6:00 p.m on Saturday or Sunday). Accordingly, construction noise impacts would be less than significant. If the Project's construction requires concrete pouring during nighttime hours, the resulting noise levels are summarized in Table 4.9-6, *Nighttime Concrete Pouring Noise Level Summary*. At all receiver locations, the Project's nighttime concrete pouring noise levels would not exceed the standards established by the City and impacts would be less than significant

B. Operational Noise Impact Analysis – Stationary Noise

Stationary (on-site) noise sources associated with long-term Project operation are expected to include idling trucks, delivery truck and automobile parking, delivery truck backup alarms, roof-top air conditioning units, loading and unloading of dry goods, and parking lot vehicle movements. The Project also is expected to generate noise during the loading and unloading of delivery trailers on-site. The daytime and nighttime Project stationary noise levels at nearby sensitive receptor locations are summarized Table 4.9-7, *Daytime Project Operational Noise Levels*, and Table 4.9-8, *Nighttime Project Operational Noise Levels*. Table 4.9-7, *Daytime Project Operational Noise Levels*, shows the Project operational noise levels during the daytime hours of 7:00 a.m. to 10:00 p.m. The daytime hourly noise levels at the off-site receiver locations are expected to range from 22.2 to 27.4 dBA Leq.

Table 4.9-8, *Nighttime Project Operational Noise Levels*, shows the Project operational noise levels during the nighttime hours of 10:00 p.m. to 7:00 a.m. The nighttime hourly noise levels at the off-site receiver locations are expected to range from 22.1 to 27.4 dBA Leq. The daytime and nighttime Project stationary noise levels at nearby receiver locations are summarized in Table 4.9-9, Project Operational Noise Summary – Stationary Noise. As shown, Project stationary noise would not expose nearby receivers to unacceptable daytime or nighttime noise levels during Project operations following Project buildout. Accordingly, Project operation would not result in the exposure of receivers near the Project Site to stationary noise levels that exceed the exterior noise level standards established in the City. Impacts would be less than significant.

Noise levels that would be experienced at receiver locations when unmitigated Project-source noise is added to the ambient daytime, evening, and nighttime conditions are presented on Table 4.9-10, *Project Operational Noise Level Contributions – Daytime* and Table 4.9-11, *Project Operational Noise Level Contributions – Nighttime*. As shown, the Project-related operational noise level increases will satisfy the operational noise level increase criteria at the nearest sensitive receiver locations. On this basis, although the Project would increase noise level in the Project vicinity, Project operational stationary source noise would not result in a substantial temporary/periodic, or permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project. Noise impacts associated with long-term on-site operations would be less than significant.

C. Off-Site Transportation Noise Impact Analysis

Traffic generated by the operation of the proposed Project will influence the traffic noise levels in surrounding off-site areas and at the Project Site. The off-site Project-related traffic represents an incremental increase to the existing roadway volumes, which is not expected to generate a barely perceptible noise level increase of 3 dBA CNEL at nearby sensitive land uses adjacent to study area roadways, since a doubling of the existing traffic volumes would be required to generate a 3 dBA CNEL increase. Due to the low traffic volumes generated by the Project, the off-site traffic noise levels generated by the Project are considered less than significant and no further analysis is required. (DEIR, pp. 4.9-16 – 4.9-21)

3.13.2 THRESHOLD B

Impact Statement: The Project will not generate excessive groundborne vibration or groundborne noise levels.

❑ Findings

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.9.6 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold b; therefore, no mitigation is required.

❑ Substantial Evidence

Construction Analysis: Construction activities on the Project Site would utilize equipment that has the potential to generate vibration. Vibration levels at sensitive receptors near the Project Site during Project construction are summarized on Table 4.9-12, *Construction Equipment Vibration Levels*. As shown, none of the receiver locations in the vicinity of the Project Site would be exposed to vibration levels that exceed the applicable significance threshold. Accordingly, Project construction would not generate excessive or substantial temporary groundborne vibration or noise levels and a less-than-significant impact would occur.

Operational Analysis: Under long-term conditions, the Project would not include or require equipment or activities that would result in perceptible groundborne vibration beyond the Project Site. Trucks would travel to and from the Project Site along local roadways; however, vibration levels for heavy trucks operating at the posted speed limits on paved surfaces are not perceptible beyond the roadway. The Project would not result in the exposure of persons to excessive groundborne vibration or noise levels during long-term operation. (DEIR, pp. 4.10-21 – 4.10-22)

3.13.3 THRESHOLD C

Impact Statement: The Project is not located within vicinity of a private airstrip or airport land use plan, or within two miles of a public airport or public use airport.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.10.6 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site is located approximately 2.7 miles east of ONT. The Project Site is located within the ONT Airport Influence Area but is located outside the 65 dBA CNEL airport noise impact zone. According to Table 2-3 of the ONT ALUCP, industrial land uses located outside the 65 dBA CNEL noise level contours of ONT, such as the Project, are considered normally compatible land use. For normally compatible land use, either the activities associated with the land use are inherently noisy or standard construction methods will sufficiently attenuate exterior noise to an acceptable indoor CNEL. Accordingly, the Project would be a compatible use within the ONT Noise Impact Zone and operation of the Project would not expose people working on the Project Site to excessive noise levels. The Project's impact would be less than significant. (DEIR, p. 4.9-22)

3.14 POPULATION AND HOUSING

3.14.1 THRESHOLD A

Impact Statement: The Project would not induce substantial unplanned population growth in the area.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed Section 5.4.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project would result in the development of approximately 270,337 s.f. warehouse facility, replacing an existing grain processing and corn storage and distribution facility. According to Southern California Association of Governments' (SCAG) Employment Density Study, the Project would generate approximately 226 employees (Urban Crossroads, 2022f). According to the California Employment Development Department (EDD), as of June 2022, the City of Ontario has a labor force of 92,300 persons and of that labor force, 3,200 are unemployed (unemployment rate of 3.5 percent) (EDD, 2022). According to SCAG's 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy, the City of Ontario is anticipated to employ approximately 169,300 persons by 2045 (SCAG, 2020b). As discussed above, TOP 2050 projected a total of 296,002 jobs in 2050. Therefore, the Project is consistent with the SCAG's 2045 and the TOP 2050 employment projections for the City. Project-generated jobs are well within the employment projections for the City of Ontario. Operation of the Project would not induce substantial unplanned population growth in the Project area, either directly or indirectly and would not exceed regional or local growth projections. Therefore, no impacts are anticipated. (DEIR, p. 5-5-8)

3.14.2 THRESHOLD B

Impact Statement: The Project would not displace substantial numbers of existing people or housing.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed Section 5.4.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project Site does not contain any housing and there are no people living at the Project Site that would be displaced by the Project. Therefore, no impacts are anticipated. (DEIR, p. 5-5-8)

3.15 PUBLIC SERVICES

3.15.1 THRESHOLD A

Impact Statement: The Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of public services.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed Section 5.4.6 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

A. Fire Protection

Fire protection services are provided by the Ontario Fire Department (OFD). OFD serves these residents from 10 strategically located fire stations, including the Ontario International Airport fire station, with a daily staffing level of 59 sworn firefighters. These fire stations house nine 4-person paramedic engine companies, three 4-person truck companies, an 8-person Aircraft Rescue and Fire Fighting (ARFF) station, 1 fire investigation supervisor, and 2 battalion chiefs (Ontario, 2022c). The closest fire station to the Project Site is Station 7, located at 4901 Vanderbilt Street, approximately 1.3 miles to the southwest of the Project Site. The proposed building would be in accordance with the applicable provisions of the adopted California Fire Code (CFC) and the City's Municipal Code Section 4-4.01, ordinances, and standard conditions regarding fire prevention and suppression measures related to water improvement plans, fire hydrants, fire access, and water availability. The Project Site is in a developed area currently served by OFD. The Project will not require the construction of any new fire protection facilities or alteration of any existing fire protection facilities or cause a decline in the levels of service, which could cause the need to construct new fire protection

facilities. Development impact fees (DIF) would also be collected in order to build and supply necessary infrastructure for fire protection services, as necessary. No impacts are anticipated.

B. Police Protection

Police protection services are provided by the Ontario Police Department (OPD). OPD's headquarters is located at 2500 S. Archibald Avenue, approximately 4.16 miles to the southwest of the Project Site. The Project Site is in a developed area, currently served by OPD. The Project will not require the construction of any new police protection facilities or alteration of any existing police protection facilities or cause a decline in the levels of service, which could cause the need to construct new police protection facilities. DIF would also be collected in order to build and supply necessary infrastructure for police protection services, as necessary. No impacts are anticipated.

C. Schools

The Project is located within the attendance boundaries of the Cucamonga Elementary School District and Chaffey Joint Union High School District. The Project Applicant proposes to demolish the existing grain processing and corn storage and distribution facility and redevelop the Site with a single industrial building. Implementation of the Project does not have the potential to result in substantial direct growth in the population, nor an increase in student population. The Project would be required to pay school fees as prescribed by state law prior to the issuance of building permits. No impacts are anticipated.

D. Parks

The City of Ontario Recreation & Community Services Department operates and manages parks and park programs for the City. The Project would not introduce new residents to the City necessitating the need for additional parks. The Project will not require the construction of any new parks or alteration of any existing parks or cause a decline in the levels of service, which could cause the need to construct new park facilities. No impacts are anticipated.

E. Other Public Facilities

The Project would not introduce new residents to the City necessitating the need for additional public facilities. The Project will not require the construction of any new public facilities or alteration of any existing public facilities or cause a decline in the levels of service, which could cause the need to construct new public facilities. No impacts are anticipated. (DEIR, pp. 5-5-9 – 5-5-10)

3.16 RECREATION

3.16.1 THRESHOLD A

Impact Statement: The Project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed Section 5.4.7 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project is not proposing any significant new housing or large employment generator that would cause an increase in the use of neighborhood parks or other recreational facilities. No impacts are anticipated. (DEIR, p. 5-5-10)

3.16.2 THRESHOLD B

Impact Statement: The Project would not require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed Section 5.4.7 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project does not include recreational facilities or require the construction or expansion of recreational facilities. Implementation of the Project would not result in any adverse physical effects on the environment due to the construction of recreational facilities. No impacts are anticipated. (DEIR, p. 5-5-10)

3.17 TRANSPORTATION

3.17.1 THRESHOLD A

Impact Statement: The Project would not conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.10.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

This response provides an analysis of a project's potential to conflict with plans, programs, ordinances, or policies that address the circulation system, including transit, roadway, bicycle, and pedestrian facilities. A project that generally conforms with, and does not obstruct, applicable development plans, programs, ordinances, and policies is considered to be consistent. The transportation plans, policies,

programs, ordinances, and standards that are relevant to the Project are identified in the analysis below. For context, the Project is expected to generate approximately 160 more vehicle trips than are being generated by the uses at the Project Site under existing conditions. (Urban Crossroads, 2023a.) In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the Institute of Transportation Engineers (ITE) Trip Generation Manual (11th Edition, 2021) for the proposed Project's land uses was utilized. As shown in Table 4.10-2, *Project Trip Generation*, the proposed Project is anticipated to generate 476 vehicle trip-ends per day with 42 AM peak hour trips and 46 PM peak hour trips. Taking into consideration that the existing structures proposed for demolition generate 316 daily trips (see Table 4.10-1), the net number of new trips that would be generated by the Project is 160 trips with 12 AM peak hour trips and 44 PM peak hour trips above the trips generated by existing uses. The comparison is shown below in Table 4.10-3, *Project Net New Daily Trips*.

Connect SoCal: The fundamental goals of SCAG's Connect SoCal are to make the SCAG region a better place to live, work, and play for all residents regardless of race, ethnicity, or income class. As shown in Table 4.10- 4, *SCAG's Connect SoCal Goal Consistency Analysis*, the Project would not conflict with any applicable goals and policies of SCAG's regional planning program. As such, Project impacts would be less than significant.

City of Ontario Policy Plan: As demonstrated in Table 4.10-5, *Mobility Element Policy Consistency Analysis*, the Project would not conflict with the City's Mobility Element, and impacts associated with conflict of an applicable program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities would be less than significant. (DEIR, pp. 4.10-5 – 4.10.11)

3.17.2 THRESHOLD C

Impact Statement: The Project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.10.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project's potential to increase hazards as a result of a geometric design feature has been assessed to provide adequate truck access/circulation. The Project's circulation plan is designed to be compatible with all foreseeable vehicles. Vehicular access would be provided via two driveways that would connect with East Airport Drive. Both driveways would include enhanced decorative paving and would provide inbound/outbound access for passenger vehicles and trucks. The driveways are designed as 40 feet wide to accommodate the wide turning radius of the heavy trucks. The types of traffic generated during operation of the Project (i.e., passenger cars and trucks) would be compatible with the type of traffic generated by surrounding development. All proposed improvements within the

public right-of-way would be installed in conformance with City design standards. If any component of Project construction would occur in the public right-of-way and require the partial or full closure of a sidewalk and/or travel lane, all work would be required to adhere to the applicable construction control practices that are specified in the *State of California Department of Transportation Construction Manual and the California Manual on Uniform Traffic Control Devices*, to minimize potential safety hazards. The City of Ontario Engineering Department reviewed the Project's application materials and determined that no hazardous transportation design features would be introduced within the City public right-of-way through implementation of the Project. At the time of final grading, landscape, and street improvement plans, the City will review project access points to ensure adequate sight distance. Based on the foregoing information, the Project's construction and operation would not create or substantially increase safety hazards due to a design feature or incompatible use and impacts would be less than significant. (DEIR, p. 4.10-14)

3.17.3 THRESHOLD D

Impact Statement: The Project would not result in inadequate emergency access.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 4.11.6 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project is designed to provide access for all emergency vehicles and meet all applicable City of Ontario Fire and Police Department access requirements to ensure that adequate access would be provided for emergency vehicles at Project build out. During construction activities that include road and sidewalk improvements, the Project would provide adequate emergency access along abutting roadways during temporary construction activities within the public right-of-way. Any Project construction activities that would occur within the East Airport Drive public right-of-way and requires a partial or full closure of a sidewalk or vehicle travel lane would require a traffic control plan that complies with the *California Manual on Uniform Traffic Control Devices* and that must be approved by the City of Ontario to ensure that emergency response is not adversely affected. As a result, the Project would not a less than significant impact to emergency access. (DEIR, pp. 4.10-14 – 4.10-15)

3.18 UTILITIES AND SERVICE SYSTEMS

3.18.1 THRESHOLD A

Impact Statement: The Project would not require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.

- ❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.12.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

- ❑ **Substantial Evidence**

A. Water and Wastewater

The Project would include the installation of water lines within the Project Site. Water would be accommodated via proposed water lines that would extend from the southeastern and southwestern corners of the building to an existing 12-inch water main at East Airport Drive. Additionally, recycled water to the Project Site would be provided via a proposed 8-inch recycled water main along East Airport Drive. The proposed 8-inch recycled water main would extend from the west of South Wineville Avenue to the eastern boundary of the Project Site and connect to the existing 24-inch recycled water main. Sanitary sewer service to the Project Site would be provided by OMUC's sanitary sewer wastewater collection system and conveyed to the Inland Empire Utilities Agency (IEUA) for wastewater treatment. Sewer would be accommodated via proposed 6-inch sewer line that would extend from the southwestern corners of the building to a proposed 8-inch OMUC sewer main on East Airport Drive. There is an existing 8-inch OMUC sewer main on East Airport Drive that ends approximately at the western boundary of the Project Site where the proposed 8-inch sewer main would connect to. Although the Project would result in new water and wastewater line connections, these connections would be part of the Project's construction phase, which is evaluated throughout the DEIR. The construction of the Project's water and wastewater lines necessary to serve the Project would not result in any significant physical effects on the environment that are not already identified and disclosed as part of the DEIR. Impacts would be less than significant.

B. Stormwater Drainage

Stormwater will sheet flow from north to south and will be captured by proposed on-site catch basins. The proposed on-site storm drain system will convey the flow into a proposed underground infiltration chamber. In a large storm event, stormwater will exit the underground chamber system via pipes and will be pumped out through a proposed parkway drain on Airport Drive. Runoff will sheet flow east along Airport Drive and discharge into the existing catch basin, located approximately 1,500 feet east of the Project Site, to maintain the same point of discharge as the existing condition.

Refer to the analysis under Section 4.8, *Hydrology and Water Quality*, Threshold c.ii. As discussed, stormwater runoff would be treated on-site and would not require relocation or construction of new or expanded storm water drainage infrastructure which could cause significant environmental effects. Therefore, impacts would be less than significant.

C. Dry Utilities

Electricity will be provided by SCE. All new dry utility infrastructure would be installed underground and within the Project Site. Connections to the existing utility networks are available in the Project area and any offsite improvements would occur within improved rights-of-way, which are inherent to

the Project's construction phase and have been evaluated throughout the DEIR. Because the Project Site has been previously developed with industrial uses that requires electric power and telecommunication services, implementation of the Project is not anticipated to limit the ability of service providers to provide service to Project. Therefore, the Project would not require or result in the construction or expansion of new facilities, and impacts would be less than significant. (DEIR, pp. 4.12-9 – 4.12-10)

3.18.2 THRESHOLD B

Impact Statement: The Project would have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.12.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

OMUC is responsible for supplying potable water to the Project Site. The OMUC's 2020 UWMP includes an analysis of water supply reliability projected through 2045 under normal years, single dry year, and multiple dry years. OMUC's total water demand for 2020 was approximately 32,109 AF (OMUC, 2021). OMUC's forecasts for projected water demand based on the population projections of the Southern California Associations of Governments (SCAG), which rely on the adopted land use designations contained within the general plans that cover the geographic area within OMUC's service. Because the Project Applicant would redevelop the Site with a use permitted under the Heavy Industrial land use designation, the Project would be consistent with the City's Policy Plan and, therefore, the water demand associated with the Project was considered in the demand anticipated by the 2020 UWMP and analyzed therein. As stated above, the City is anticipated to have adequate water supplies to meet all its demands until the year 2045 under a normal year, single dry year, and multiple dry years. Therefore, the City has sufficient water supplies available to serve the Project from existing entitlements/resources and no new or expanded entitlements are needed. Impacts would be less than significant. (DEIR, p. 4.12-10)

3.18.3 THRESHOLD C

Impact Statement: The Project would not result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

❑ **Findings**

Potential impacts of the Project related to Threshold c are discussed in detail in Section 4.12.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

IEUA is responsible for supplying wastewater treatment services to the Project Site. There are four recycling plants (RPs) within the IEUA's service area. Regional Water Recycling Plant No. 1 (RP-1) is located in the City of Ontario and has been in operation since 1948. According to IEUA's 2020 UWMP, the current wastewater treatment capacity of RP-1 is 44 MGD, although it currently treats approximately 21 MGD. (IEUA, 2021) The Project Site is currently developed and served by septic tank systems. The Project Applicant would demolish the existing structures and redevelop the Site with an approximately 270,337 s.f. building. The Project is calculated to generate 28,776 gallons per day (gpd) of wastewater (2,200 gpd/acre × 13.08 acres = 28,776 gpd). The wastewater generated by the Project would only represent approximately 0.13 percent of the excess treatment capacity of RP-1 ([28,776 gpd ÷ 23 million gpd] × 100 = 0.13 %); therefore, it is anticipated that RP-1 have sufficient treatment capacity to provide service to the Project. The associated increase in wastewater generation would have a negligible effect on the wastewater treatment provider. As such, the IEUA's existing wastewater treatment facilities are anticipated to have adequate capacity to serve the Project's project demand in addition to its existing commitments. Impacts would be less than significant. (DEIR, p. 4.12-11)

3.18.4 THRESHOLD D

Impact Statement: The Project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

❑ **Findings**

Potential impacts of the Project related to Threshold d are discussed in detail in Section 4.12.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

Solid waste generated during the operation of the Project is anticipated to be collected by the City of Ontario and is anticipated to be hauled to either Badlands Sanitary Landfill or El Sobrante Landfill. As previously discussed, the Badlands Sanitary Landfill has a permitted disposal capacity of 4,800 tons per day with a remaining capacity of 15,748,799 cubic yards. The Badlands Sanitary Landfill is estimated to reach capacity, at the earliest time, in the year 2022 (CalRecycle, 2022a). The El Sobrante Landfill is permitted to received 16,054 tons of solid waste per day with a remaining capacity of 143,977,170 ton. The El Sobrante Landfill is estimated to reach capacity, at the earliest time, in the year 2051. (CalRecycle, 2022b; CalRecycle, 2022c) Based on the generation rate of 1.42 pounds per 100 s.f. per day, the proposed 270,337 s.f. building would result in approximately 3,838 pounds per day (1.91 tons per day). As previously stated, the Badlands Sanitary Landfill has a permitted disposal capacity of 4,800 tons per day and the El Sobrante Landfill has a permitted disposal capacity of 16,054 tons per day. The Project generated solid waste represents a nominal portion of the landfill's capacity and would not contribute significantly to the daily landfill capacity, and the landfill facilities are sufficient. Accordingly, impacts would be less than significant. (DEIR, p. 4.12-11)

3.18.5 THRESHOLD E

Impact Statement: The Project would comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

❑ **Findings**

Potential impacts of the Project related to Threshold e are discussed in detail in Section 4.12.4 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold e; therefore, no mitigation is required.

❑ **Substantial Evidence**

The following federal and state laws and regulations govern solid waste disposal:

- AB 939 (Chapter 1095, Statutes of 1989), the California Integrated Waste Management Act of 1989 required each city, county, and regional agency to develop a source reduction and recycling element of an integrated waste management plan that contained specified components, including a source reduction component, a recycling component, and a composting component. With certain exceptions, the source reduction and recycling components were required to divert 50 percent of all solid waste from landfill disposal or transformation by January 1, 2000, through source reduction, recycling, and composting activities.

- AB 32 (Chapter 488, Statutes of 2006), the California Global Warming Solutions Act, established mandatory recycling as one of the measures to reduce GHG emissions adopted in the Scoping Plan by the California Air Resources Board.

- AB 341 (Chapter 476, Statutes of 2011) requires that all "commercial" generators of solid waste (businesses, institutions, and multifamily dwellings) establish recycling and/or composting programs. AB 341 goes beyond AB 939 and establishes the new recycling goal of 75 percent by 2020.

The Project would implement the requirements of the City's Integrated Waste Department's Refuse & Recycling Planning Manual on refuse and recycling storage and access for service, as well as addressing the City's recycling goals. The requirements of Chapter 3, Integrated Waste Management, of the Municipal Code will also be implemented to ensure that the Project complies with all applicable state and federal laws. Therefore, no impacts would occur. (DEIR, p. 4.12-12)

3.19 WILDFIRE

3.19.1 THRESHOLD A

Impact Statement: The Project would not substantially impair an adopted emergency response plan or emergency evacuation plan.

❑ **Findings**

Potential impacts of the Project related to Threshold a is discussed Section 5.4.8 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold a; therefore, no mitigation is required.

❑ **Substantial Evidence**

The State Responsibility Area (SRA) is the land where the State of California is financially responsible for the preservation and suppression of wildfires. The SRA does not include lands within City boundaries or in federal ownership; therefore, the Project Site does not have the potential to be in an SRA. According to the California Department of Forestry and Fire Protection's fire hazard map for the Local Responsibility Area (LRA), the Project Site is not within a Very High Fire Hazard Severity Zone (CAL FIRE, 2008). The City updated the Local Hazard Mitigation Plan prepared by the Office of Emergency Management in 2018. The purpose of the Hazard Mitigation Plan (HMP) is to demonstrate the plan for reducing and/or eliminating risk in the City. The HMP process encourages communities to develop goals and projects that will reduce risk and build a more disaster resilient community by analyzing potential hazards. Construction of the Project would be generally confined to the Project Site and would not physically impair access to the Site or Project area. During both construction and long-term operation, the Project would be required to maintain adequate emergency access for emergency vehicles as required by the City and OFD. Because the Project is required to comply with all applicable City codes and is not located within a Very High Fire Hazard Severity Zone (VHFHSZ), any emergency evacuation or emergency response plan impacts would be reduced to a less than significant level. Therefore, impacts are less than significant. (DEIR, p. 5-5-11)

3.19.2 THRESHOLD B

Impact Statement: Due to slope, prevailing winds, and other factors, the Project would not exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

❑ **Findings**

Potential impacts of the Project related to Threshold b is discussed Section 5.4.8 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold b; therefore, no mitigation is required.

❑ **Substantial Evidence**

As demonstrated above, the Project Site is not in or near an SRA or LRA or lands classified as VHFHSZ. Implementation of the Project would not add wildland vegetation to the Project Site or change site topography (such as adding large slopes) so as to exacerbate wildfire spread. Adjacent areas to the Project Site are also urbanized; therefore, there are no wildlands adjacent to the Site that may expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope and prevailing winds. Therefore, no impacts are anticipated. (DEIR, p. 5-5-11)

3.19.3 THRESHOLD C

Impact Statement: The Project would not require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.

❑ **Findings**

Potential impacts of the Project related to Threshold c is discussed Section 5.4.8 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold c; therefore, no mitigation is required.

❑ **Substantial Evidence**

The Project would not require the installation of infrastructure that would exacerbate fire risk. The Project would connect to the existing Ontario Municipal Utilities Company (OMUC) 12-inch water main on East Airport Drive. Sanitary sewer service to the Project Site would be provided by Inland Empire Utilities Agency (IEUA). Sewer would be accommodated via proposed 6-inch sewer line that would extend from the southwestern corners of the building to a proposed 8-inch sewer main on East Airport Drive. The proposed 8-inch sewer main would connect to an existing 8-inch sewer main on East Airport Drive that ends approximately at the western boundary of the Project Site. Although the Project would require the installation of utility infrastructure connection, the construction of these improvements is inherent to the Project's construction phase and impacts associated with the Project construction phase are evaluated throughout the DEIR. In addition to the Project's utility infrastructure, the Project would result in the installation of on-site fire hydrants, that are designed in accordance with the OFD standards. The internal waterlines are anticipated to supply sufficient fire flows and pressure to meet the demands required for on-site fire hydrants. Therefore, the proposed connections to existing infrastructure would not be anticipated to exacerbate fire risk on or off-site or result in temporary or ongoing impacts to the environment. Impacts would be less than significant. (DEIR, p. 5-5-12)

3.19.4 THRESHOLD D

Impact Statement: The Project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

❑ **Findings**

Potential impacts of the Project related to Threshold d is discussed Section 5.4.8 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Threshold d; therefore, no mitigation is required.

❑ **Substantial Evidence**

As discussed above, the Project Site is not located within a landslide zone (DOC, 2021) or in a FEMA flood zone (FEMA, 2016). Regardless of the landslide susceptibility, the Project would be required by the California Building Code (CBC) and City's Building Code to comply with the recommendations

identified in the Project's Preliminary Geotechnical Investigation, which would ensure that the Project is engineered and constructed to maximize stability and preclude safety hazards to on-site areas. The implementation of the Project would not increase the risk of landslides after a wildfire compared to existing conditions. Impacts would be less than significant. Moreover, the Project would result in minor changes to the existing drainage patterns of the Project Site. However, such changes would not increase the rate or amount of surface runoff in a manner which would result in flooding or result in substantial erosion or siltation on- or off-site. The Project would replace the existing developed Site with a single industrial building and would not add wildland vegetation that would not readily transmit wildfire. Therefore, the Project would reduce the risk of wildfire spread. In the event that wildfire occurs in the Project vicinity, the Project would not result in an increased risk of downslope or downstream flooding because it is within an area of minimal flooding and Project runoff would be adequately conveyed by the existing storm drain infrastructure. Therefore, the implementation of the Project would not increase the risk of downslope or downstream flooding. Impacts would be less than significant. (DEIR, p. 5-5-12)

4.0 ENVIRONMENTAL IMPACTS MITIGATED TO A LEVEL OF LESS-THAN-SIGNIFICANT

4.1 CULTURAL RESOURCES

4.1.1 THRESHOLD B

Impact Statement: The Project has the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5.

❑ **Findings**

Potential impacts of the Project related to Threshold b are discussed in detail in Section 4.3.4 of the DEIR. A potential exists for ground disturbing activities to unearth previously unknown archaeological resources and result in a potentially significant impact. The Project is required to comply with Mitigation Measures MM 4.3-1 through MM 4.3-3, which would reduce impacts to less than significant. The Planning Commission has determined that changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the EIR.

❑ **Substantial Evidence**

BFSA conducted a cultural resources record search of the Project Site and one-half mile radius around the Project Site. The results of this records search indicate that no pre/protohistoric cultural resources are located on or within a one-half mile of the Project Site. Additionally, no pre/protohistoric resources were observed on the Project Site. Therefore, implementation of the Project would not cause a substantial adverse change in the significance of a known prehistoric archaeological resource pursuant to CEQA Guidelines Section 15064.5. Given the lack of any previously identified pre/protohistoric sites within or near the property and the magnitude of ground disturbances on the Project Site over the previous 47 years including the presence of subsurface septic systems, there is little potential for any pre/protohistoric resources to be present or disturbed by the proposed development. Notwithstanding, excavations on portions of the Project Site would occur within previously undisturbed soils that have the potential to contain pre/protohistoric archaeological resources. If any pre/protohistoric cultural resources are unearthed during Project construction that meet the definition of a significant archaeological resource pursuant to CEQA Guidelines Section 15064.5 and are disturbed/damaged by Project construction activities, impacts to those pre/protohistoric cultural resources would be significant. Based on the tribal consultation process conducted under AB 52, mitigation is presented in Subsection 4.3.7 consisting of monitoring and treatment procedures for any discovered resources that would lessen potential impacts to below a level of significance. Refer to Section 4.11, *Tribal Cultural Resources*, for details on the tribal consultation process. (DEIR, p. 4.3-8)

MM 4.3-1 Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities:

a. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The

monitor shall be retained prior to the commencement of any "ground disturbing activity" for the subject project at all project locations (i.e., both onsite and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching[1]

b. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the earlier of the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground disturbing activity.

c. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs will be provided to the project applicant/lead agency upon written request to the Tribe.

d. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh to the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs.

e. Upon discovery of any TCRs, all construction activities in the immediate vicinity of the discovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh monitor and/or Kizh archaeologist. The Kizh will recover and retain all discovered TCRs in the form and/or manner the Tribe deems appropriate, in the Tribe's sole discretion, and for any purpose the Tribe deems appropriate, including for educational, cultural and/or historic purposes.

MM 4.3-2 Unanticipated Discovery of Human Remains and Associated Funerary Objects:

[1] Tribal monitoring shall cease once all ground disturbance activities have been completed with respect to the property or portion thereof. Example: Once excavation, grading, trenching, etc. have occurred tribal monitoring shall cease.

a. Native American human remains are defined in PRC 5097.98 (d)(1) as an inhumation or cremation, and in any state of decomposition or skeletal completeness. Funerary objects, called associated grave goods in Public Resources Code Section 5097.98, are also to be treated according to this statute.

b. If Native American human remains and/or grave goods discovered or recognized on the project site, then all construction activities shall immediately cease. Health and Safety Code Section 7050.5 dictates that any discoveries of human skeletal material shall be immediately reported to the County Coroner and all ground disturbing activities shall immediately halt and shall remain halted until the coroner has determined the nature of the remains. If the coroner recognizes the human remains to be those of a Native American or has reason to believe they are Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission, and Public Resources Code Section 5097.98 shall be followed.

c. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2).

d. Construction activities may resume in other parts of the project site at a minimum of 200 feet away from discovered human remains and/or burial goods, if the Kizh determines in its sole discretion that resuming construction activities at that distance is acceptable and provides the project manager express consent of that determination (along with any other mitigation measures the Kizh monitor and/or archaeologist deems necessary). (CEQA Guidelines Section 15064.5(f))

e. Preservation in place (i.e., avoidance) is the preferred manner of treatment for discovered human remains and/or burial goods. Any historic archaeological material that is not Native American in origin (non-TCR) shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

f. Any discovery of human remains/burial goods shall be kept confidential to prevent further disturbance.

MM 4.3-3 Procedures for Burials and Funerary Remains:

a. As the Most Likely Descendant ("MLD"), the Koo-nas-gna Burial Policy shall be implemented. To the Tribe, the term "human remains" encompasses more

than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains.

b. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created.

c. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials.

d. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard should be posted outside of working hours. The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed.

e. In the event preservation in place is not possible despite good faith efforts by the project applicant/developer and/or landowner, before ground-disturbing activities may resume on the project site, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects.

f. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if possible. These items should be retained and reburied within six months of recovery. The site of reburial/repatriation shall be on the project site but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

g. The Tribe will work closely with the project's qualified archaeologist to ensure that the excavation is treated carefully, ethically and respectfully. If data

recovery is approved by the Tribe, documentation shall be prepared and shall include (at a minimum) detailed descriptive notes and sketches. All data recovery data recovery-related forms of documentation shall be approved in advance by the Tribe. If any data recovery is performed, once complete, a final report shall be submitted to the Tribe and the NAHC. The Tribe does NOT authorize any scientific study or the utilization of any invasive and/or destructive diagnostics on human remains.

Implementation of MM 4.3-1 through MM 4.3-3 would ensure the proper identification and subsequent treatment of any significant archaeological resources that may be encountered during ground-disturbing activities associated with Project construction. With implementation of the required mitigation, the Project's potential impacts to important archaeological resources would be reduced to less-than-significant. Cumulatively considerable impacts would likewise be reduced to less-than-significant.

4.2 GEOLOGY AND SOILS

4.2.1 THRESHOLD F

Impact Statement: The Project has the potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

❑ **Findings**

Potential impacts of the Project related to Threshold f are discussed in detail in Section 4.5.4. of the DEIR The Project site contains sediment with a high paleontological sensitivity. Ground disturbing activities have the potential to unearth previously unknown paleontological and/or unique geologic features. The Project is required to comply with Mitigation Measures MMs 4.5-1 through 4.5-4, which would reduce impacts to less than significant. The Planning Commission has determined that changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the DEIR.

❑ **Substantial Evidence**

The Project Site is underlain by Young Eolian Deposits (Qye) and Very Young Alluvial Fan Deposits (Qf). Qye are wind-deposited Holocene sediments consisting of silt and fine- to medium-grained sand which are generally about 10 feet thick and are underlain by alluvial fan deposits. Qf are Late Holocene and consist predominantly of sand, gravel, cobbles, and boulders that form the active and recently active portions of the fan. These deposits are generally unconsolidated to slightly consolidated, and where they have not been graded, they have a network of braided channels on the surface (Ontario, 2022b, p. 5.7-5 through 5.7-7). The possibility of finding additional paleontological resources within City boundaries is moderate to high. However, geologic maps indicate that the Project Site is situated on surface exposures of recent alluvium. These sediments have low potential to yield fossil resources or to contain significant nonrenewable paleontological resources. However, these recent sediments overlie older Pleistocene sediments with high potential to contain paleontological resources. (Ontario, 2022b, p. 5.7-17) In the event that the Project's construction activities encroach into previously

undisturbed older alluvium deposits, the Project could result in impacts to important paleontological resources if such resources are unearthed and not properly treated. Therefore, the Project's potential to directly or indirectly destroy a unique paleontological resource buried beneath the ground surface is determined to be a potentially significant impact and mitigation is required. (DEIR, p. 4.5-12)

MM 4.5-1 Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Ontario that a qualified paleontologist ("paleontologist") has been retained by the Project Applicant or contractor to conduct monitoring of excavation activities in olde alluvium soils and has the authority to halt and redirect earthmoving activities in the event that suspected paleontological resources are unearthed.

MM 4.5-2 The paleontologist shall conduct full-time monitoring during grading and excavation operations in undisturbed Holocene and late Pleistocene old alluvial fan deposits starting at a depth of five (5) feet below the existing ground surface. The paleontologist shall be equipped to salvage fossils if they are unearthed to avoid construction delays and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontologist shall be empowered to temporarily halt or divert equipment to allow for the removal of abundant and large specimens in a timely manner. Monitoring may be reduced if the potentially fossiliferous units are not present in the subsurface, or if present, are determined upon exposure and examination by the paleontologist to have a low potential to contain or yield fossil resources.

MM 4.5-3 Recovered specimens shall be properly prepared to a point of identification and permanent preservation, including screen washing sediments to recover small invertebrates and vertebrates, if necessary. Identification and curation of specimens into the collections of the Division of Geological Sciences, San Bernardino County Museum, shall be required for discoveries of significance as determined by the paleontological monitor.

MM 4.5-4 A final monitoring and mitigation report of findings and significance shall be prepared, including lists of all fossils recovered, if any, and necessary maps and graphics to accurately record the original location of the specimens. The report shall be submitted to the City of Ontario prior to issuance of the first occupancy permit.

MMs 4.5-1 through 4.5-4 would ensure the proper identification and subsequent treatment of any paleontological resources that may be encountered during ground-disturbing activities associated with implementation of the proposed Project. Therefore, with implementation of MMs 4.5-1 through 4.5-4, the Project's potential impact to paleontological resources would be reduced to less-than-significant.

4.3 HAZARDS AND HAZARDOUS MATERIALS

4.3.1 THRESHOLDS A AND B

Impact Statement: The Project would not create a significant hazard to the public or the environment through the routine transport, use, disposal of hazardous materials or reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

❑ **Findings**

Potential impacts of the Project related to Thresholds a and b are discussed in detail in Section 4.7.5 of the DEIR. This Planning Commission finds that the development of the proposed Project will not result in significant impacts related to Thresholds a and b; therefore, no mitigation is required.

❑ **Substantial Evidence**

Implementation of the Project would require demolition and removal of all existing structures and improvements on the Project Site, as well as the removal of all materials stored on the Site, and would result in the construction and long-term operation of one warehouse distribution building on the Site. In the event any hazards or hazardous materials were to be present on the Project Site or any hazardous materials were to be used or stored on the Project Site during construction or long-term operation, the Project would have the potential to expose workers on-site, the public, and/or the environment to a substantial hazard. The analysis below evaluates the potential for the Project to result in a substantial hazard to people or the environment during any stage of the Project.

A. Impact Analysis for Existing Site Conditions

1. Soil Vapor

In March 2022, Farallon conducted soil and soil vapor sampling at the Site to assess former UST areas and septic systems, and the new building footprint for the potential for vapor intrusion issues. Results showed that no total petroleum hydrocarbons (TPH) or volatile organic compounds (VOCs) were detected exceeding laboratory detection limits in the soil samples collected from the Project Site. Low concentrations of naturally occurring metals including barium, cadmium, cobalt, chromium, copper, nickel, lead, vanadium, and zinc were detected in two soil samples submitted for analysis; and these concentrations were considerably less than screening levels. (Farallon, 2022, pp. 10-3)

Based on the sampling results, tetrachloroethylene (PCE) has been documented in soil vapor in the vicinity of Building B at concentrations exceeding screening levels, and PCE is also present in central and eastern portions of the Site in shallow zones at concentrations less than calculated screening levels. (Farallon, 2022, pp. 10-4) Therefore, PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Project Site and impacts would be potentially significant.

2. Building Materials

The use of ACMs (a known carcinogen) and lead paint (a known toxin) was common in building construction prior to 1978. Because the Project Site contains structures known to be constructed before

1978, there is potential for ACMs and surfaces covered with lead paint to be present on the Project Site.

Asbestos is a carcinogen and is categorized as a hazardous air pollutant by the federal EPA. Federal asbestos requirements are found in National Emission Standards for Hazardous Air Pollutants (NESHAP) within the CFR Title 40, Part 61, Subpart M, and are enforced in the Project area by the SCAQMD via Rule 1403. Rule 1403 establishes survey requirements, notification, and work practice requirements to prevent asbestos emissions from emanating during building renovation and demolition activities. Because ACMs are present in the existing construction debris and/or structures located on the property, then Rule 1403 requires notification of the SCAQMD prior to commencing any demolition or renovation activities. Rule 1403 also sets forth specific procedures for the removal of asbestos, and requires that an on-site representative trained in the requirements of Rule 1403 be present during the stripping, removing, handling, or disturbing of ACM. Mandatory compliance with the provisions of Rule 1403 would ensure that construction-related grading, clearing and demolition activities do not expose construction workers or nearby sensitive receptors to significant health risks associated with ACMs. Because the Project's demolition and construction contractors would be required to comply with AQMD Rule 1403 during demolition activities, impacts due to asbestos would be less than significant.

During demolition of the existing buildings on-site, there also is a potential to expose construction workers to health hazards associated with lead-based paint (LBP). The Project's demolition and construction contractors would be required to comply with CCR Title 17, Division 1, Chapter 8, which includes requirements such as employer provided training, air monitoring, protective clothing, respirators, and hand washing facilities. Mandatory compliance with the requirements of CCR Title 17, Division 1, Chapter 8 would ensure that construction workers and the public are not exposed to significant LBP health hazards during demolition and/or during transport of demolition waste to an appropriate disposal facility, and would ensure that impacts related to LBP remain less than significant.

B. Impact Analysis for Temporary Construction-Related Activities

Heavy equipment (e.g., dozers, excavators, tractors) would be operated on the Project Site during construction. This heavy equipment likely would be fueled and maintained by petroleum-based substances such as diesel fuel, gasoline, oil, and hydraulic fluid, which are considered hazardous if improperly stored or handled. In addition, materials such as paints, adhesives, solvents, and other substances typically used in building construction would be located on the Project Site during construction. Improper use, storage, or transportation of hazardous materials can result in accidental releases or spills, potentially posing health risks to workers, the public, and the environment. This is a standard risk on all construction sites, and there would be no greater risk for improper handling, transportation, or spills associated with the Project than would occur on any other similar construction site. Construction contractors would be required to comply with all applicable federal, State, and local laws and regulations regarding the transport, use, and storage of hazardous construction-related materials, including but not limited requirements imposed by the EPA, DTSC, and the Santa Ana RWQCB. With mandatory compliance with applicable hazardous materials regulations, the Project would not create significant hazard to the public or the environment through routine transport, use, or disposal of hazardous materials during the construction phase, nor would the Project increase the

potential for accident conditions which could result in the release of hazardous materials into the environment. A less-than-significant impact would occur.

C. Impact Analysis for Long-Term Operations

The future building occupant(s) for the Project Site are not yet identified. However, the Project is designed to house warehouse distribution occupants and it is possible that hazardous materials could be used during the course of a future building user's daily operations. State and federal Community-Right-to-Know laws allow the public access to information about the amounts and types of chemicals in use at local businesses. Laws also are in place that requires businesses to plan and prepare for possible chemical emergencies. Any business that occupies the warehouse building on the Project Site and that handles hazardous materials (as defined in Section 25500 of California Health and Safety Code, Division 20, Chapter 6.95) will require a permit from the San Bernardino County Fire Department Hazardous Materials Division in order to register the business as a hazardous materials handler. Such businesses also are required to comply with California's Hazardous Materials Release Response Plans and Inventory Law, which requires immediate reporting to the County of San Bernardino Fire Department and the State Office of Emergency Services regarding any release or threatened release of a hazardous material, regardless of the amount handled by the business, and to prepare a Hazardous Materials Business Emergency Plan (HMBEP). An HMBEP is a written set of procedures and information created to help minimize the effects and extent of a release or threatened release of a hazardous material. With mandatory regulatory compliance, the Project would not pose a significant hazard to the public or the environment through the routine transport, use, storage, emission, or disposal of hazardous materials, nor would the Project increase the potential for accident conditions which could result in the release of hazardous materials into the environment. Based on the foregoing information, potential hazardous materials impacts associated with long-term operation of the Project are regarded as less than significant. (DEIR, p. 4.7-13 – 4.7-16)

MM 4.7-1 Prior to the issuance of a grading permit, the Project Applicant shall prepare a Soil Management Plan (SMP). The SMP shall include explicit instructions for the appropriate handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. The general contractor will be required to follow the requirements of the SMP and stop work to make notification to the environmental team if any potential impacts are observed at any time the environmental team is not already on-site. The SMP also requires air monitoring activities to monitor the air downwind of the Project Site and appropriate Health and Safety Plans that will be employed by site workers. The SMP shall identify specific requirements intended to protect human health when soil in certain areas of known or suspected impacts are disturbed for any reason, including, without limitation, as a result of demolition, utility installation/repair, soil excavation, drilling, grading/filling activities, stockpile generation, soil management, loading, and transportation. Requirements of the SMP include:

a. Health and Safety Plan (HASP): A HASP will be prepared and in effect for all activities associated with the SMP and other activities at the Project Site.

Contractors working onsite are expected to be operating under their own health and safety plans.

b. Environmental Monitoring: In accordance with SCAQMD Rules, air monitoring will be necessary in areas where potential PCE contaminated soil are to be disturbed. Air monitoring for dust may also be required in other areas. An air monitoring/health and safety professional will be present during relevant activities and responsibilities will include recording monitoring data on field sheets, which will be kept as part of Project documentation. c. Soil Monitoring: Soils impacted by PCE that are encountered during site redevelopment will be characterized and documented. The monitoring and sampling activities to be performed include:

- Visual observation performed to detect areas of soil that may be impacted by PCE or other non-VOC hazardous materials, if encountered.
- Screening for PCEs using field instruments to document new or previously undetected sources of PCEs.
- Soil sampling and chemical testing performed to evaluate concentrations of PCE.

d. Proper Soil Handling: If impacted soil is encountered, the area will be delineated as necessary with cones, caution tape, stakes, chalk, or flagging, and the area will not be disturbed further until an environmental professional is onsite for observation and determination of whether testing and/or excavation work is required. Stockpile staging areas will be delineated prior to the start of excavation. All excavations will conform to applicable regulations, including Cal/OSHA Construction Safety Orders. The specific equipment, means, and methods to be utilized for soil removal, handling, and disposition will be selected based on the nature of the work to be conducted and its location on the site. If excavation is conducted during the rainy season (October through April), provisions will need to be made to prevent offsite migration of sediment in runoff.

e. Fugitive Dust and Vapor Control: Appropriate procedures will be implemented to control the generation of airborne dust by soil removal activities, including, but not limited to, the use of water as a dust suppressant or stopping activities that have the potential to generate fugitive dust in the event wind conditions change creating an uncontrollable condition.

f. Excavation and Stockpiling: Impacted soil that is excavated and not immediately removed from the site will be stockpiled onsite and covered with plastic sheeting to control dust and minimize exposure to precipitation and wind. If a stockpile remains onsite during the rainy season, a perimeter

sediment barrier, constructed of material, such as straw bales or fiber roll, will also be installed. The stockpiles will be inspected biweekly at a minimum. During stockpile removal, only the working face of the stockpile will be uncovered. If the stockpiled impacted soil is to be transported offsite for disposal or recycling, the soil will be profiled for waste characteristics. Soil samples will be analyzed for parameters required by the disposal/recycling facility.

g. Responding to Unknown Conditions: If previously unknown impacted soil is suspected (based on visual staining, odors, photo ionization detector readings, or other observations), the area will be delineated and construction activity will cease in this area, and sampling of the unknown material will occur using USEPA methodology. Analysis will be conducted for TPH, metals, and/or VOCs, as appropriate. Analytical results will be compared to applicable regulatory screening levels. Based on this comparison, a determination will be made regarding soil disposition (reuse on-site, off-site transport, and disposal/recycling, etc.). Additionally, if any UST or other subsurface features are encountered, a similar approach will be taken, and appropriate permitting, as necessary, will be obtained for the removal of the feature(s). Any permitted removals will be conducted with appropriate regulatory oversight, documentation, and reporting.

h. Imported fill: As appropriate, offsite soils brought to the site for use as backfill (import fill), if necessary, will be tested in general conformance with the DTSC Information Advisory Clean Imported Fill Material document.

i. Post-construction Requirements: If contaminated soil is left in place, the location of this soil will be surveyed or recorded by use of geographic positioning system equipment. Following the completion of construction, excavation, and disposition activities, a summary report will be prepared. The report will include a summary of activities, locations of soil sources and final disposition of contaminated soil, and estimated quantities of materials. Additionally, removal of any USTs or other subsurface features, if encountered, will be conducted under appropriate permits (if any) and documented in applicable reports for submittal to the Ontario Fire Department, or other regulatory agency, as appropriate.

Mitigation measure MM 4.7-1 would result in the preparation of a SMP for the Project. The SMP identifies requirements intended to protect human health when soil in certain areas of known or suspected areas are disturbed for any reason, including, without limitation, as a result of demolition, utility installation/repair, soil excavation, drilling, grading/filling activities, stockpile generation, soil management, loading, and transportation. Requirements of the SMP include protocols for the HASP, environmental monitoring, proper soil handling (if impacted soil is encountered), fugitive dust and vapor control, excavation and stockpiling, soil monitoring, soil monitoring, responding to unknown

conditions, imported fill, and postconstruction requirements. With the implementation of mitigation measure MM 4.7-1, the risk of exposure of hazardous materials to the workers and the public through the routine transport, use, or disposal of contaminated or potentially contaminated soils or accident conditions would be less than significant.

4.4 TRIBAL CULTURAL RESOURCES

4.4.1 THRESHOLD A

Impact Statement: The Project has the potential to cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a. *Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources code Section 5024.1(k), or*

b. *A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of the Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.*

❑ **Finding**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.11.5 of the DEIR. Due to the Project Site's location in an area where Native American tribes are known to have a cultural affiliation, there is the possibility that pre/protohistoric archaeological resources, including tribal cultural resources, could be encountered during ground-disturbing construction activities. The Project is required to comply with Mitigation Measures MM 4.3-1 through 4.3-3, which would reduce impacts to less than significant. The Planning Commission has determined that changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the EIR.

❑ **Substantial Evidence**

No prehistoric resource sites, features, places, or landscapes were identified on the Project Site that are either listed or eligible for listing in the California Register of Historic Places. No resources were identified on the Project Site that meet any of the four criteria listed above to be eligible for the California Register and no pre/protohistoric resource sites or isolates are known to exist on the Project Site. (BFSA, 2022) Furthermore, no substantial evidence was presented to or found by the City that led to the identification of any resources on the Project Site that in the City's discretion had the potential to be considered a tribal cultural resource.

As part of the AB 52 consultation process required by State law, the City sent notification of the Project to Native American tribes with possible traditional or cultural affiliation to the Project area. The City consulted with each tribe that requested consultation. During the course of the tribal consultation process, tribal monitoring was requested during the Project's ground-disturbing construction activities. Due to the Project Site's location in an area where Native American tribes are known to have a cultural affiliation, there is the possibility that pre/protohistoric archaeological resources, including tribal cultural resources, could be encountered during ground-disturbing construction activities. In the event that a tribal cultural resource, as defined in Public Resources Code Section 21074, were to be found on the Project Site during construction – and not properly identified and treated – a significant impact would occur. Mitigation is required.

As discussed under EIR Subsection 4.3, the Project Site does not contain a known cemetery site and human remains have not been previously discovered on the Site. Mandatory compliance with State law (California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98) would ensure that, in the unlikely event that human remains are discovered during Project construction, the remains would be identified in accordance with proper protocols and the remains would be treated or disposed with appropriate dignity. Accordingly, the Project would not result in a substantial adverse effect to tribal cultural resources associated with human remains. (DEIR, pp. 4.11-4 – 4.11-5)

Refer to Mitigation Measures MM 4.3-1 and MM 4.3-3, above.

Implementation of MMs 4.3-1 through 4.3-3 would ensure the proper identification and subsequent treatment of any significant tribal cultural resources that may be encountered during ground-disturbing activities associated with Project development. With implementation of the required mitigation, the Project's potential impact to significant tribal cultural resources would be reduced to less-than-significant.

5.0 ENVIRONMENTAL IMPACTS THAT REMAIN SIGNIFICANT AND UNAVOIDABLE AFTER MITIGATION

The Ontario Planning Commission finds the project would result in significant and unavoidable impacts in the following impact categories after implementation of all feasible mitigation measures: Transportation. In accordance with CEQA Guidelines Section 15092(b)(2), the Planning Commission of the City of Ontario cannot approve the project unless it first finds (1) under Public Resources Code Section 21081(a)(3), and CEQA Guidelines Section 15091(a)(3), that specific economic, legal, social technological, or other considerations, including provisions of employment opportunities to highly trained workers, make infeasible the mitigation measures or project alternatives identified in the EIR; and (2) under CEQA Guidelines section 15092(b), that the remaining significant effects are acceptable due to overriding concerns described in the CEQA Guidelines Section 15093 and, therefore, a statement of overriding considerations has been prepared.

5.1 TRANSPORTATION

5.1.1 THRESHOLD B

Impact Statement: The Project would conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).

❑ **Findings**

Potential impacts of the Project related to Threshold a are discussed in detail in Section 4.11.6 of the DEIR. The Project is required to implement Mitigation Measure 4.10-1, which would reduce VMT impacts to the extent feasible.

❑ **Substantial Evidence**

Changes to State CEQA Guidelines were adopted in December 2018, which requires all lead agencies to adopt vehicle miles traveled (VMT) as a replacement for automobile delay-based level of service (LOS) as the new measurement for identifying transportation impacts for land use projects. This statewide mandate took effect on July 1, 2020. To aid in this transition, the Governor's Office of Planning and Research (OPR) released a Technical Advisory on Evaluating Transportation Impacts in CEQA. Based on the Technical Advisory, the City of Ontario has developed and adopted their own VMT methodologies and thresholds, which were adopted by City Council in June 2020. City Guidelines identify projects that meet certain VMT screening criteria may be presumed to result in a less than significant transportation impact. The City of Ontario utilizes the San Bernardino County Transportation Authority (SBCTA) VMT Screening Tool. The Screening Tool allows users to select an assessor's parcel number (APN) to determine if a project's location meets one or more of the screening thresholds for land use projects identified in the City Guidelines. The City Guidelines lists the following VMT screening criteria:

- Transit Priority Area (TPA) Screening
- Low VMT Area Screening

- Project Type Screening

A land use project need only meet one of the above screening criteria to result in a less than significant impact.

A. TPA Screening

Consistent with guidance identified in the City Guidelines, projects located within a Transit Priority Area (TPA) (i.e., within ½ mile of an existing "major transit stop" or an existing stop along a "high quality transit corridor") may be presumed to have a less than significant impact absent substantial evidence to the contrary. However, the presumption may not be appropriate if a project:

- Has a Floor Area Ratio (FAR) of less than 0.75;
- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization); or
- Replaces affordable residential units with a smaller number of moderate or high-income residential units.

The Screening Tool was utilized to locate the Project Site and its proximity to a TPA. The Project Site is not located within ½ mile of an existing major transit stop, or along a high-quality transit corridor. Therefore, the Project would not meet the TPA Screening threshold.

B. Low VMT Area Screening

As noted in the Technical Advisory, "Residential and office projects that locate in areas with low VMT and that incorporate similar features (density, mix of uses, and transit accessibility) will tend to exhibit similarly low VMT." The City Guidelines state that projects may be presumed to have a less than significant VMT impact if located in an already low VMT generating traffic analysis zones (TAZs) that generates a VMT per service population (SP) that does not exceed the Citywide average under General Plan Buildout condition VMT per service population. The Screening Tool uses the subregional San Bernardino Transportation Analysis Model (SBTAM) to measure VMT performance within individual TAZ's within the region. The Project's physical location based on parcel number is selected in the Screening Tool to determine the TAZ in which the Project will reside. The Project's TAZs VMT per service population was compared to Citywide average buildout VMT per service population. The parcel containing the Project was selected and the Screening Tool was run for origin destination (OD) VMT per service population, and results showed the Project is not located within a low VMT generating zone. Therefore, the Project would not meet the Low VMT Area Screening threshold.

C. Project Type Screening

The City Guidelines identify that local serving retail less than 50,000 square feet or other local serving essential services (e.g., day care centers, public schools, medical/dental office buildings, etc.) are presumed to have a less than significant impact absent substantial evidence to the contrary. The Project

as intended does not contain any local serving uses. Additionally, the City Guidelines state that small projects generating fewer than 110 daily vehicle trips or less may be presumed to have a less than significant impact, subject to discretionary approval by the City. As shown in Table 4.10-1, the Project currently generates an average of 316 vehicle trips per day. Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition, 2021. The Project is anticipated to generate 476 daily vehicle trip-ends per day. Therefore, the Project is anticipated to generate 160 net new average daily trips, exceeding the 110 daily vehicle trip threshold, and the Project would not meet the Project Type Screening threshold.

D. VMT Analysis

As the Project was not found to meet any of the aforementioned VMT screening criteria, a project level VMT analysis (Technical Appendix J to the DEIR) was prepared to assess the Project's potential impact to VMT. Consistent with City Guidelines and standard VMT calculation methods, total VMT is calculated from SBTAM's OD trip matrices and then divided by a project's service population to derive the VMT efficiency metric VMT per service population. Table 4.10-6, Total VMT, presents Project generated total VMT calculated as the total of passenger car, light-duty, medium-duty, and heavy-duty truck trips.

The City Guidelines have identified following recommended threshold: a significant impact would occur if the project VMT per Service Population exceeds the Citywide average for Service Population under General Plan Buildout Conditions. The Project's baseline and buildout VMT per service population is calculated by dividing by the total VMT the service population or in this case the number of employees generated1 . As shown in Table 4.10-7, Project VMT per Service Population, the City of Ontario has identified a VMT per SP significance threshold of 27.61, which is the City of Ontario's General Plan Buildout with the TOP model. As shown below, the Project would exceed the City's VMT per SP impact threshold for both the baseline and TOP buildout conditions (Urban Crossroads, 2023a). Therefore, impacts would be significant. (DEIR, pp. 4.10-11 – 4.10-14)

MM 4.10-1 Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours).

Transportation Demand Management Plan (TDMP) strategies in the form of commute trip reduction program measures were reviewed for the purpose of reducing Project related VMT impacts (i.e., commute trips). The feasibility and level of effectiveness of each trip reduction measure was determined based on the location of the Project Site and the Handbook for Analyzing Greenhouse Gas

Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity (2021 Handbook). As the future building tenant(s) is not currently known for the Project, the effectiveness of commute trip reduction measures such as carpooling and vanpooling cannot be determined with certainty. In addition to specific tenancy considerations, locational context is also a major factor relevant to the potential application and effectiveness of TDMP measures. Given the Project Site's location in an industrial area with no nearby transit routes, an incomplete sidewalk and bikeway system, and a lack of nearby residential areas that made walking or biking to work easy, the Project Site location is not favorable to reduce VMT per service population to below a level of significance.

Under the most favorable circumstances and ideal conditions a project can realize a maximum reduction of 45% in commute VMT through implementation of the trip reduction program measures listed below. However, ideal conditions are rarely realized as variables such as a project's locational context limitation (i.e., non-urban areas). Additionally, to achieve ideal conditions a project must achieve one hundred percent employee participation and maximum employee eligibility, which are not generally expected. The proposed Project would require a minimum VMT per service population reduction of 25.58% to achieve a less than significant impact, which cannot be assured for the proposed Project. The 2021 Handbook lists the following possible trip reduction measures.

- T-5 – Implement Commute Trip Reduction Marketing (up to 4.0% reduction)
- T-8 – Provide Ridesharing Program (up to 8% reduction)
- T-9 – Implement Subsidized or Discounted Transit Program (up to 5.5% reduction)
- T-10 – Provide End-of-Trip Facilities (up to 4.4% reduction)
- T-11 – Provide Employer-Sponsored Vanpool (up to 20.4% reduction)
- T-12 – Price Workplace Parking (up to 20.0% reduction)
- T-13 – Implement Employee Parking Cash-Out (up to 12.0% reduction)

Mitigation measure MM 4.10-1 will reduce the Project's VMT per service population by some percentage based on the level of participation achieved, but based on the above-described factors, it is not feasible to reduce VMT to below a level of significance. However, as the Project area and surrounding communities develop as envisioned under the City of Ontario General Plan (TOP), new residential, retail, and industrial development would be implemented. These actions could collectively alter transportation patterns, improve the region's jobs/housing ratio, reduce VMT, and support implementation of new or alternative TDM measures. With the implementation of mitigation measure MM 4.10-1, VMT is expected to be reduced, but the Project's impacts related to VMT would still be significant and unavoidable.

6.0 CUMULATIVE IMPACTS

The CEQA Guidelines define a "cumulative impact" as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines Section 15355). Regarding the Project's potential to result in cumulative impacts, the City hereby finds as follows:

6.1 AESTHETICS

The Project's effects to scenic views of the San Gabriel Mountains, if any, would be localized to the immediate Project Site area and would not extend beyond the public viewing areas that immediately about the Project Site (East Airport Drive). The views that would be affected only occur abutting the Project Site and the Project does not contain any off-site components that could adversely affect scenic views that occur elsewhere in the City. Furthermore, the Project's impacts to local scenic views are inherently site specific and not influenced or exacerbated by effects to scenic views that may occur at other, off-site properties. Because of the site-specific nature of these impacts, there would be no direct or indirect connection to similar potential issues or cumulative effects to or from other properties pursuant to Threshold "a."

As noted under the analysis of Threshold "b," the Project Site is not located within close proximity to any designated State scenic routes and does not contain any scenic resources. Therefore, the Project has no potential contribute to a cumulatively significant impact to scenic resources within a designated scenic route corridor.

Under existing conditions, the area surrounding the Project Site is entirely developed with industrial land uses. No new or pending development projects are known to occur in the area surrounding the Project Site. Accordingly, the Project would not contribute to cumulatively considerable impacts to local visual quality. Notwithstanding, as with the Project, any re-development in the surrounding area would be subject to applicable development regulations and design standards, including, but not limited to the Ontario Development Code. Mandatory compliance to applicable development regulations and design standards would ensure that developments would incorporate high quality building materials, site design, and landscaping to preclude potential conflicts with applicable zoning and other regulations governing visual quality.

With respect to potential cumulative light and glare impacts, the Project would be required to comply with City's Development Code, which sets standards for exterior lighting/fixtures. The restriction on unshielded light fixtures and "spill over" lighting enforced by these lighting regulations has the effect of minimizing light and glare that would affect daytime views and/or create sky glow. Additionally, development projects with artificial light sources in surrounding jurisdictions would be required to comply with the light reduction requirements applicable in their respective jurisdiction. Although cumulative development in the Project's surrounding area is expected to introduce new sources of lighting and potentially reflective materials, the required compliance with the applicable legal standard and code requirements would ensure that future cumulative development does not introduce substantial sources of lighting or glare. As such, the Project would not contribute to cumulatively-considerable, adverse impacts to the existing daytime or nighttime views of the Project Site or its surroundings. (DEIR, pp. 4.1-12 – 4.1-13)

6.2 AIR QUALITY

Based on SCAQMD guidance, any exceedance of a regional or localized threshold for criteria pollutants also is considered to be a cumulatively-considerable effect, while air pollutant emissions that fall below applicable regional and/or localized thresholds are not considered cumulatively considerable. As discussed in the analysis under Threshold "b," the criteria pollutant emissions from Project construction and operation would be far less than the SCAQMD regional thresholds of significance. Therefore, the Project's emissions would not be considered cumulatively considerable. Furthermore, the Project would not conflict with the 2016 AQMP and is not considered cumulatively considerable.

As discussed under the analysis for Threshold "c," all Project-related construction- and operational localized air pollutant emissions – including DPM – would not exceed the applicable SCAQMD thresholds of significance. According to the SCAQMD's Mates V study and data visualization tool, which includes an emissions inventory of toxic air contaminants based on 2016-2018 data, the cancer risk in the Project Site's zip code (91761) is 600 per million, which indicates that the air toxics cancer risk in this zip code was higher than 93.0% of the SCAQMD population at the time the data was collected (SCAQMD, 2021). As regulatory requirements have become more stringent, however, air quality has improved and health risks have decreased, despite an increase in the number of warehouses across the Inland Empire and the SCAB (Ramboll, 2023). Because the Project's contribution to health risk would fall far below the SCAQMD's threshold of significance, and the SCAQMD is the regulatory authority responsible for air quality in the SCAB in which the Project site is located, the Project's contribution is not considered cumulatively-considerable.

As indicated in the analysis of Threshold "d," above, there are no Project components that would expose a substantial number of sensitive receptors to objectionable odors. There are no known sources of offensive odors in the Project area. Because the Project's construction and operation would not create substantial and objectionable odors and because there are no sources of objectionable odors in the areas immediately surrounding the Project Site, there is no potential for odors from the Project Site to commingle with odors from nearby development projects and expose nearby sensitive receptors to substantial, offensive odors. Accordingly, implementation of the Project would result in a less-than significant cumulative impact related to odors. (DEIR, pp. 4.2-36 – 4.2-37)

6.3 CULTURAL RESOURCES

Record searches indicate the absence of significant historical sites and resources on the Project Site; therefore, implementation of the Project has no potential to contribute towards a significant cumulative impact to historical sites and/or resources.

The potential for Project construction to result in cumulatively-considerable impacts to prehistoric archaeological resources were also analyzed in conjunction with other projects located in the traditional use areas of Native American tribes that are affiliated to the Project Site. Development activities on the Project Site would not impact any known prehistoric archaeological resources and the likelihood of uncovering previously unknown prehistoric archaeological resources during Project construction are low due to the magnitude of surface and subsurface disturbance that has occurred on the Site to-date. Nonetheless, the remote potential exists for subsurface prehistoric archaeological resource that meet the CCR Section 15064.5 definition of a significant archaeological resource to be discovered

beneath the surface of the Project Site during Project-related construction activities and on and beneath other development project sites in the region during construction activities. Accordingly, the Project has the potential to contribute to a significant cumulatively-considerable impact to prehistoric archaeological resources, if such resources are unearthed during Project construction, for which mitigation is required. As discussed below, with implementation of mitigation, cumulatively considerable impacts would be less than significant.

Mandatory compliance with the provisions of California Health and Safety Code Section 7050.5 as well as Public Resources Code Section 5097 et seq., would assure that all future development projects within the region treat human remains that may be uncovered during development activities in accordance with prescribed, respectful and appropriate practices, thereby avoiding significant cumulative impacts. (DEIR, pp. 4.3-9 – 4.3-10)

6.4 ENERGY

The Project and other new development projects within the cumulative study area would be required to comply with all of the same applicable federal, State, and local regulatory measures aimed at reducing fossil fuel consumption and the conservation of energy. Accordingly, the Project would not cause or contribute to a significant cumulatively considerable impact related to conflicts with a State\ or local plan for renewable energy efficiency. (DEIR, p. 4.4-8)

6.5 GEOLOGY AND SOILS

With the exception of erosion hazards, potential hazardous effects related to geologic and soil conditions addressed under Thresholds "a," "c," "d," and "e" are unique to the Project Site, and inherently restricted to the specific property proposed for development. That is, issues including fault rupture, seismic ground shaking, liquefaction, landslides, and expansive soils would involve effects to (and not from) a proposed development project, are specific to conditions on the subject property, and are not influenced or exacerbated by the geologic and/or soil hazards that may occur on other, off-site properties. Further, as noted in the foregoing analysis, all potential Project-related direct and indirect impacts related to potential hazardous effects related to geologic and soil conditions would be precluded through mandatory conformance with the CBSC, Ontario Development Code, other standard regulatory requirements, and the site-specific geotechnical recommendations contained within the Project's geotechnical investigation, which will be incorporated into the Project's design via conditions of approval. Because of the site-specific nature of these potential hazards and the measures to address them, there would be no direct or indirect connection to similar potential issues or cumulative effects to or from other properties. As discussed under Threshold "b", regulatory requirements mandate that the Project incorporate design measures during construction and long-term operation to ensure that significant erosion impacts do not occur. Other development projects in the vicinity of the Project Site would be required to comply with the same regulatory requirements as the Project to preclude substantial adverse water and wind erosion impacts. Because the Project and other projects within the cumulative study area would be subject to similar mandatory regulatory requirements to control erosion hazards during construction and longterm operation, cumulative impacts associated with wind and water erosion hazards would be less than significant. The Project's potential to result in cumulative impacts to paleontological resources (Threshold "f") is similar to that of other projects located in the region that are underlain by older alluvial soils. Because the older alluvial soils present on the Project

Site contain high paleontological sensitivity and because this geologic layer is present throughout the City of Ontario and southern California, the potential to impact paleontological resources is a cumulatively. (DEIR, pp. 4.5-12 – 4.5-13)

6.6 GREENHOUSE GAS EMISSIONS

GCC occurs as the result of global emissions of GHGs. An individual development project does not have the potential to result in direct and significant GCC-related effects in the absence of cumulative sources of GHGs. The CEQA Guidelines emphasize that the effects of GHG emissions are cumulative and should be analyzed in the context of CEQA's requirements for cumulative impacts analysis (See CEQA Guidelines Section 15130[f]). Accordingly, the analysis provided in subsection 4.6.4 reflects a cumulative impact analysis of the effects related to the Project's GHG emissions, which concludes that the Project would not exceed the applicable threshold of significance and that the Project would not conflict with an applicable GHG-reduction plans, policies, or regulations. (DEIR, pp. 4.6-24)

6.7 HAZARDOUS AND HAZARDOUS MATERIALS

As discussed above under the responses to Thresholds "a" and "b," the Project's construction and operation would be required to comply with all applicable federal, state, and local regulations to ensure proper use, storage, and disposal of hazardous substances. Although the end user(s) of the Project Site are not presently known, if businesses that use or store hazardous materials occupy the Project, the business owners and operators would be required to comply with all applicable federal, state, and local regulations to ensure proper use, storage, and disposal of hazardous substances. Such uses also would be subject to additional review and permitting requirements by the San Bernardino County Fire Department. Similarly, any other developments in the area proposing the construction of uses with the potential for use, storage, or transport of hazardous materials also would be required to comply with applicable federal, State, and local regulations, and such uses would be subject to additional review and permits from their local oversight agency. Although there is on-site contamination present, compliance with mitigation measure MM 4.7-1 would ensure isolation of any impacts to the Project Site and would not have the ability to impact the surrounding area. Therefore, the potential for release of toxic substances or hazardous materials into the environment, either through accidents or due to routine transport, use, or disposal of such materials, would be reduced to a less-than-significant cumulative level. Accordingly, the Project's potential to contribute to a cumulatively significant hazardous materials impact would be less than significant.

The Project Site is not located within one-quarter mile of a school; therefore, the Project has no potential effect on students in relation to the use, handling, and transport of hazardous materials and would have no impact.

As indicated under Threshold "d," facilities in the site vicinity are not considered to be an REC to the Site. Because the Project Site is not classified as a hazardous materials site, there is no potential for the Project to contribute to, or exacerbate, adverse environmental effects resulting from other hazardous materials sites in the Project vicinity.

As discussed above under the response to Threshold "e," the Project is not a noise-sensitive land use and would not be adversely affected by noise from operations at the ONT. In addition, the Project would not introduce any land use to the Project Site that would conflict with the ONT ALUCP. Therefore, the Project would not result in a safety hazard or excessive noise for people residing or

working in the Project area and would not contribute to a cumulatively considerable impact associated with airport hazards. The Project Site does not contain any emergency facilities nor does it serve as an emergency evacuation route; thus, there is no potential for the Project to contribute to any cumulative impacts associated with an adopted emergency response plan or emergency evacuation plan.

As discussed above under Threshold "g," the Project Site is not located within or in close proximity to areas identified as being subject to wildland fire hazards and would have no potential to contribute to adverse, cumulative wildland fire hazards. (DEIR, pp. 4.7-17 – 4.7-18)

6.8 HYDROLOGY AND WATER QUALITY

The cumulative impact analysis considers construction and operation of the Project in conjunction with other development projects in the vicinity of the Project Site and projects located in the Santa Ana River Basin and Chino Groundwater Basin.

A. Water Quality

Project construction and the construction of other projects in the cumulative study area would have the potential to contribute waterborne pollution, including erosion and siltation, to the Santa Ana River Watershed. Pursuant to the requirements of the State Water Resources Control Board and the Santa Ana RWQCB, all construction projects that disturb 1 or more acres of land area are required to obtain coverage for construction activities under the State's General Construction NPDES Permit. In order to obtain coverage, an effective Site-specific SWPPP is required to be developed and implemented. The SWPPP must identify potential on-site pollutants and identify an effective combination of erosion control and sediment control measures to reduce or eliminate discharge of pollutants to surface waters. In addition, the Project Applicant and all cumulative developments in the Santa Ana River Basin would be required to comply with the Santa Ana RWQCB's Santa Ana River Basin Water Quality Control Program, which establishes water quality standards for ground and surface waters of the region. Compliance with these mandatory regulatory requirements, would ensure that development projects within the Santa Ana River watershed, including the proposed Project, would not contribute substantially to water quality impairments during construction. Operational activities on the Project Site would be required to comply with the Project's WQMP to minimize the amount of waterborne pollution, including erosion and sediment, discharged from the Site. Other development projects within the watershed would similarly be required by law to prepare and implement Site-specific WQMPs to ensure that runoff does not substantially contribute to water quality violations. Accordingly, operation of the Project would not contribute to cumulatively considerable water quality effects.

B. Groundwater Supplies and Management

The Project incorporates design features that would allow surface runoff to infiltrate into the groundwater basin. Other development projects would similarly be required by applicable lead agencies to incorporate design features that facilitate percolation (e.g., through minimum landscaped/permeable area requirements, water quality/detention basins, infiltration basins). Also, as previously noted, implementation of the Project would not result in substantial adverse effects to local groundwater supplies or groundwater recharge. Thus, no component of the Project would obstruct with or prevent implementation of the management plan for the Chino Groundwater Basin, and other development projects within the Chino Groundwater Basin would be prohibited from any activity that would endanger the health and sustainability of the groundwater basin. Based on the lack of impacts

to groundwater, the provision of design measures that would facilitate percolation, and compliance with applicable Chino Groundwater Basin management plans, cumulative development would not result in a considerable, adverse effect to local groundwater supplies.

C. Flooding

Construction of the Project and other development projects within the Santa Ana River watershed would be required to comply with federal, State, and local regulations and applicable regional and local master drainage plans in order to mitigate flood hazards both on- and off-site. Compliance with federal, State, and local regulations and applicable drainage plans would require development sites to be protected from flooding during peak storm events (i.e., 100-year storm) and also would not allow development projects to expose downstream properties to increased flooding risks during peak storm events. In addition, future development proposals within the Santa Ana River Basin would be required to prepare hydrologic and hydraulic calculations, subject to review and approval by the responsible City Engineer, to demonstrate that substantial on- and/or off-site flood hazards would not occur. As discussed under the response to Threshold "c," the Project is designed to ensure that runoff from the Project Site during peak storm events is reduced relative to existing conditions. Because the Project and all other developments throughout the Santa Ana River Basin, would need to comply with federal, State, and local regulations to ensure that stormwater discharges do not substantially exceed existing volumes or exceed the volume of available conveyance infrastructure, a substantial cumulative impact related to flood hazards would not occur.

Additionally, the Project Site is not located within a special flood hazard area or in an area subject to inundation. Accordingly, development on the Project Site would have no potential to impede or redirect flood flows and a cumulatively-considerable impact would not occur. (DEIR, pp. 4.8-17 – 4.8-18)

6.9 NOISE

A. Construction Noise

Construction activities associated with the proposed Project, especially activities involving heavy equipment, would create intermittent periods of noise when construction equipment is in operation and cause a short-term increase in ambient noise levels. As shown in Table 4.9-5, the peak noise level anticipated during construction activities are estimated to reach a maximum noise level of 38.6 dBA Leq at receiver R4 (represents the existing noise Hyatt Place Ontario/Rancho Cucamonga at 4760 Mills Circle, approximately 3,872 feet northwest of the Project Site) which does not exceed the construction noise threshold of 80 dBA Leq. Therefore, Project construction-related activities would result in less than significant noise impacts. Because the Project's construction noise levels would be less than significant, construction noise would be temporary in nature, and the Project and other cumulative projects would not combine with Projectrelated construction; cumulative construction impacts would be less than significant.

B. Stationary Noise

The analysis presented for Threshold "a" addresses the Project's contribution of noise to existing cumulative noise sources (i.e., ambient noise) in the Project area. As previously shown in this Subsection, the Project's noise contribution would not be perceptible to noise-sensitive receptors in the

Project area during daytime or nighttime hours. The Project's permanent stationary noise impacts would not be cumulatively-considerable.

C. Traffic Noise

The analysis presented under Threshold "a" evaluates the Project's traffic noise contribution along study area roadways. As summarized in that analysis, due to the low traffic volumes generated by the Project, the off-site traffic noise levels generated by the Project are considered less than significant, therefore, would not be cumulatively-considerable under near- or long-term conditions.

D. Groundborne Vibration and Noise

During construction, the Project's peak vibration impacts would occur during the grading phase when large pieces of equipment, like bulldozers, are operating on-site. (During the non-grading phases of Project construction, when smaller pieces of equipment are used on-site, the Project's vibration would be minimal.) Vibration effects diminish rapidly from the source; therefore, the only reasonable sources of cumulative vibration in the vicinity of the Project Site could occur on properties abutting these sites. As described above, there are no known active or pending construction projects abutting the Project Site that would overlap with the Project's proposed construction schedule. Accordingly, there is no potential for the Project to contribute to the exposure of persons to substantial temporary groundborne vibration or noise. Under long-term conditions, the Project would not include or require equipment or activities that would result in perceptible groundborne vibration beyond the Project Site. Trucks would travel to and from the Project Site along local roadways; however, vibration levels for heavy trucks operating at the posted speed limits on paved surfaces are not perceptible beyond the roadway. The Project would not cumulatively-contribute to the exposure of persons to excessive groundborne vibration or noise levels during long-term operation.

E. Airport Noise

The Project would not involve the construction, operation, or use of any public airports or public use airports. There are no conditions associated with implementation of the Project that would contribute airport noise or exposure of additional people to unacceptable levels of airport noise. Accordingly, the Project would have no potential to cumulatively-contribute to impacts associated with noise from a public airport, public use airport, or private airstrip. Additionally, the Project Site and the immediately surrounding area are not subject to substantial airport- or air traffic-related noise. Accordingly, there is no potential for cumulative development to expose persons residing or working in the Project area to excessive airport-related noise levels. (DEIR, pp. 4.9-22 – 4.9-23)

6.10 TRANSPORTATION

As described under the response to Threshold "a," the Project would not conflict with an applicable program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities and, thus, would not cumulatively contribute to a conflict or obstruction with an applicable transportation-related program. The City Guidelines, consistent with OPR's Technical Advisory states that cumulative impacts on VMT "… metrics such as VMT per capita or VMT per employee, i.e., metrics framed in terms of efficiency (as recommended below for use on residential and office projects), cannot be summed because they employ a denominator. A project that falls below an efficiency-based threshold that is aligned with long-term goals and relevant plans has

no cumulative impact distinct from the project impact. Accordingly, a finding of a less than significant project impact would imply a less than significant cumulative impact and vice versa. This is similar to the analysis typically conducted for greenhouse gas emissions, air quality impacts, and impacts that utilize plan compliance as a threshold of significance." Since the Project was found to have a significant and unavoidable impact at the project level, it is considered to be cumulatively-considerable and therefore to have a significant cumulative impact as well. The Project would not contribute to a significant cumulative impact under the topics discussed under Thresholds "c" and "d" because the Project would not cause or exacerbate existing transportation design safety concerns or adversely affect emergency access and there are no cumulative development projects adjacent to the Project Site that could contribute additive effects that could degrade motor vehicle or pedestrian safety or emergency vehicle access in proximity to the Project Site. (DEIR, p. 4.10-15)

6.11 TRIBAL CULTURAL RESOURCES

The potential for Project construction to result in cumulatively-considerable impacts to tribal, religious, and cultural resources were analyzed in conjunction with other projects located in southwestern San Bernardino County and northwestern Riverside County that occur in the same tribal influence areas as the Project Site. The other development projects within these areas would have a similar potential to uncover tribal cultural resources during construction activities. Therefore, the potential for Project construction to impact tribal cultural resources is a cumulatively-considerable impact for which mitigation is required. (DEIR, p. 4.11-5)

6.12 UTILITIES AND SERVICE SYSTEMS

This cumulative impact analysis considers development of the Project Site in conjunction with other development projects and planned development within the service area for the respective utility provides or the service area for specific facilities (e.g., wastewater treatment facilities). As with the Project, each individual related development project would require the construction of necessary infrastructure (water and wastewater lines, storm drain facilities, dry utilities, and others) to serve the project. Each individual development project is subject to review for utility capacity to avoid unanticipated interruption of service or inadequate supplies. Coordination with the utility providers would allow for the provision of utility services to the Project and other developments. The Project and other planned projects are subject to connection and service fees to offset increased demand and assist in facility expansion and service (at the time of need). Therefore, the Project impacts would not contribute to a significant cumulative impact associated with construction of utility infrastructure or provision of utility services. OMUC has sufficient potable water supplies to meet existing and future demands through the year 2040 under normal, single-dry, and multiple dry years. As such, the Project would not contribute to a cumulatively considerable impact on water supply. According to IEUA's 2020 UWMP, the current wastewater treatment capacity of RP-1 is 44 MGD, although it currently treats approximately 21 MGD. As such, there is adequate existing and proposed capacity to provide wastewater treatment for the Project and cumulative development. Therefore, the Project would not result in a significant cumulative impact on wastewater treatment facilities. The City, including the Project Site and cumulative development, are within the service area of the Badlands Sanitary Landfill or El Sobrante Landfill and a majority of the City's solid waste is disposed of at the Badlands Sanitary Landfill or El Sobrante Landfill. The remaining portions of the City's solid waste are disposed of at landfills with adequate capacity throughout the County and surrounding counties within the State. The

solid waste generated by construction and operation of the Project would represent nominal portions of daily disposal capacities at existing landfill facilities. The existing landfill facilities have sufficient daily capacity to handle solid waste during the Project's construction and operation and would not directly result in the need for expanded solid waste disposal facilities. Further, the Project would adhere to applicable local and State regulations during both construction and long-term operation to reduce solid waste generation. Other cumulative development would be required to comply with such regulations. Therefore, the Project would not have a significant cumulative impact related to solid waste disposal and compliance with regulations addressing the reduction of solid waste generation and disposal. (DEIR, pp. 4.12-12 – 4.12-13)

7.0 OTHER CEQA CONSIDERATIONS

7.1 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

The State CEQA Guidelines require EIRs to address any significant irreversible environmental changes that would be involved with the proposed action should it be implemented (CEQA Guidelines § 15126.2[c]). An environmental change would fall into this category if: a) the project would involve a large commitment of non-renewable resources; b) the primary and secondary impacts of the project would generally commit future generations to similar uses; c) the project involves uses in which irreversible damage could result from any potential environmental accidents; or d) the proposed consumption of resources is not justified (e.g., the project results in the wasteful use of energy).

❑ Finding

The Project's potential to result in significant irreversible impacts is discussed in detail in Section5.2 of the DEIR. Based on the entire record, the City finds that the Project the Project would not result in significant irreversible environmental changes.

❑ Substantial Evidence

Determining whether the Project may result in significant irreversible environmental changes requires a determination of whether key non-renewable resources would be degraded or destroyed in such a way that there would be little possibility of restoring them. Natural resources, in the form of construction materials and energy resources, would be used in the construction of the proposed Project. The consumption of these natural resources would represent an irreversible change to the environment; however, development of the Project Site would have no measurable adverse effect on the availability of such resources, including resources that may be non-renewable (e.g., construction aggregates, fossil fuels). Additionally, the Project is required by law to comply with the California Green Building Standards Code (CALGreen), which will minimize the Project's demand for energy, including energy produced from non-renewable sources. A more detailed discussion of Project energy consumption is provided in EIR Subsection 4.4, *Energy*.

Implementation of the Project would commit the Project Site to one light industrial building. The potential warehouse land uses for the Project are compatible with the existing industrial land uses that are located east, west, and south of the Project Site and also compatible with the use of East Airport Drive (which abuts the Project Site on the south) as a City-designated truck route. Accordingly, the Project and its environmental effects would not compel or commit surrounding properties to land uses other than those that are existing today or those that are planned by the City of Ontario General Plan. For this reason, the Project would not result in a significant, irreversible change to nearby, offsite properties.

EIR Subsection 4.7, *Hazards and Hazardous Materials*, provides an analysis of the potential for hazardous materials to be transported to/from the Project Site and/or used on the Project Site during construction and operation. As concluded in Subsection 4.7, mandatory compliance with federal, State, and local regulations related to hazardous materials handling, storage, and use by all Project construction contractors (near term) and occupants (long-term) would ensure that any hazardous

materials used on-site would be safely and appropriately handled to preclude any irreversible damage to the environment that could result if hazardous materials were released from the Site.

As discussed in detail under EIR Subsection 4.5, *Energy*, use of the Project for warehouse would not result in a wasteful, inefficient, or unnecessary consumption of energy. Accordingly, the Project would not result in a significant, irreversible change to the environment related to energy use.

Based on the above, Project construction and operation would require the commitment of limited, slowly renewable and non-renewable resources. This commitment of resources would not be substantial and would be consistent with regional and local growth forecasts and development goals for the area. The loss of such resources would not be highly accelerated when compared to existing conditions, and such resources would not be used in an inefficient or wasteful manner. Project construction and operation would adhere to the sustainability requirements of Title 24, Green Building Code, and CALGreen. Therefore, the Project would not result in the commitment of large quantities of natural resources that would result in significant irreversible environmental changes. (DEIR, pp. 5.5-1 – 5.5-2)

7.2 GROWTH INDUCING IMPACTS

CEQA requires a discussion of the ways in which the Project could be growth-inducing. The State CEQA Guidelines identify a project as growth-inducing if it would foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment (CEQA Guidelines § 15126.2[d]).

❑ Finding

The Project's potential to result in growth-inducing impacts is discussed in detail in Section 5.3 of the DEIR. Based on the entire record, the City finds that the Project would not directly or indirectly induce growth in the surrounding area which could result in a significant adverse effect to the environment.

❑ Substantial Evidence

CEQA requires a discussion of the ways in which the proposed Project could be growth inducing. The CEQA Guidelines identify a project as growth inducing if it would foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment (CEQA Guidelines Section 15126.2(d)). New employees and new residential populations represent direct forms of growth. These direct forms of growth have a secondary effect of expanding the size of local markets and inducing additional economic activity in the area..

A project could indirectly induce growth at the local level by increasing the demand for additional goods and services associated with an increase in population or employment and thus reducing or removing the barriers to growth. This typically occurs in suburban or rural environs where population growth results in increased demand for service and commodity markets responding to the new population of residents or employees.

According to regional population projections included in SCAG's Connect SoCal, the City of Ontario's population is projected to grow by 96,900 residents between 2016 and 2045 (approximately 1.94% annual growth). Over this same time period, employment in the City is expected to add 55,400 new jobs (approximately 1.6% annual job growth) (SCAG, 2020b) Additionally, The Ontario Plan 2050 (TOP 2050) projected a total of 129,562 dwelling units, 261,91,779 sq ft of non-residential uses, 410,492 residents and 296,002 jobs in 2050. (Ontario, 2022b) Economic growth would likely take place as a result of the Project's operation. The Project's employees (short-term construction and long term operational) would purchase goods and services in the region, but any secondary increase in employment associated with meeting these goods and services demands is expected to be accommodated by existing goods and service providers and, based on the amount of existing and planned future commercial and retail services available in areas near the Project Site, would be highly unlikely to result in any unanticipated, adverse physical impacts to the environment. In addition, the Project would generate approximately 75 employees per shift, a majority of which would likely be filled by residents of the housing units either already built or planned for development within the City of Ontario and nearby incorporated and unincorporated areas. Accordingly, because it is anticipated that most of the Project's future employees would already be living in the City of Ontario or the larger Inland Empire area, the Project's introduction of employment opportunities on the Project Site would not induce substantial growth in the area.

Under CEQA, growth inducement is not considered necessarily detrimental, beneficial, or of little significance to the environment. Typically, growth-inducing potential of a project would be considered significant if it fosters growth or a concentration of population in excess of what is assumed in applicable master plans, land use plans, or in projections made by regional planning agencies such as SCAG. Significant growth impacts also could occur if a project provides infrastructure or service capacity to accommodate growth beyond the levels currently permitted by local or regional plans and policies. In general, growth induced by a project is considered a significant impact if it directly or indirectly affects the ability of agencies to provide needed public services, or if it can be demonstrated that the potential growth significantly affects the environment in some other way.

The Project is consistent with the industrial land use designations applied to the Project Site by the Policy Plan. The area surrounding the Project Site consists of industrial warehouses to the south, east, and west and Southern Pacific railroad to the north with industrial uses beyond. Development of the Project Site is not expected to place short-term development pressure on abutting properties because these areas are already built-out. Based on the foregoing analysis, the Project would not result in substantial, adverse growth-inducing impacts. (DEIR, pp. 5.5-2 – 5.5-3)

7.3 IMPACTS CONSIDERED LESS THAN SIGNIFICANT

Section 15128 of the State CEQA Guidelines states that "an EIR shall contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the EIR." The Project's Notice of Preparation for the DEIR, both of which are included in *Technical Appendix A* to the DEIR, determined that implementation of the Project would clearly have no potential to result in significant impacts under eight (8) environmental issue areas: agriculture and forestry resources, biological resources, land use

and planning, mineral resources, population and housing, public services, recreation, and wildfire. These impacts are addressed in Section 3.0 of these Findings. (DEIR, pp. 5.5-3 – 5.5-4)

8.0 ALTERNATIVES

8.4.1 ALTERNATIVES CONSIDERED AND REJECTED

An EIR is required to identify any alternatives that were considered by the Lead Agency but were rejected as infeasible. Among the factors described by CEQA Guidelines §15126.6 in determining whether to exclude alternatives from detailed consideration in the EIR are: a) failure to meet most of the basic project objectives, b) infeasibility, or c) inability to avoid significant environmental impacts. With respect to the feasibility of potential alternatives to the proposed Project, CEQA Guidelines §15126.6(f)(1) notes:

> *"Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries…and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site…"*

In determining an appropriate range of alternatives to be evaluated in this EIR, a number of possible alternatives were initially considered and, for a variety of reasons, rejected. Alternatives were rejected because either: 1) they could not accomplish the basic objectives of the Project, 2) they would not have resulted in a reduction of significant adverse environmental impacts, or 3) they were considered infeasible to construct or operate.

1. Alternative Sites

CEQA requires that the discussion of alternatives focus on alternatives to the Project or its location that are capable of avoiding or substantially lessening any significant effects of the Project. The key question and first step in the analysis is determining whether any of the significant effects of the project would be avoided or substantially lessened by developing the project at another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR (CEQA Guidelines §15126.6(f)(2)).

As discussed above, the Project would result in a significant and unavoidable VMT impact. Development of the Project in an alternative location in the general vicinity of the Project site would not reduce the VMT impact, as trip lengths would not substantially reduce such that the VMT impact could be relieved. Also, placing the Project in a different location would result in similar less-than-significant environmental impacts as would occur with implementation of the Project at its proposed location because the Project's environmental effects are primarily related to vehicles traveling to/from the Project site (air pollutant and greenhouse gas emissions) and not related to the presence of sensitive resources on the Project site or its location near sensitive receptors. Vehicle-related impacts are a direct reflection of the Project's expected operational characteristics, regardless of the property where the Project is located. In fact, if an alternative site were selected for the Project that was located farther from major arterial roads that are designated truck routes, like East Airport Drive for example, or

regional freeways like I-15 and I-10, than the Project Site, the severity of the Project's VMT impacts would increase as miles traveled for vehicles going to/from the Project would increase.
Similarly, there are no existing, developed sites for sale that are a similar size as the Project site within close proximity to the key freeway infrastructure and that could reasonably be controlled by the Project Applicant for the purpose of developing the Project. Furthermore, the Project Applicant does not hold ownership control over any other adequately sized parcels of land in or near the Project site that could be used as an alternative location for the proposed Project. CEQA does not require sites that are not owned by the landowner or that could not be reasonably acquired by the landowner to be considered as an alternative to the Project.

Therefore, because an alternative location is not available that would avoid or substantially lessen the significant environmental effects of the Project, and because the Project Applicant does not have ownership control over, and cannot reasonably obtain ownership control over, any other parcels of land of adequate size in the jurisdiction of the City that could accommodate the Project, an alternative location alternative is not required to be analyzed. Accordingly, this alternative is not further considered in the DEIR.. (DEIR, pp. 6-4 – 6-5)

8.4.2 NO PROJECT/ NO DEVELOPMENT

The No Project/No Development Alternative considers no development on the Project site beyond what occurs on the site under existing conditions (as described in EIR Section 3.0). As such, the Alternative is considered to be the scenario where the existing grain processing company and corn storage and distribution facility are retained and the facility continues to its current operation into the future. It is acknowledged, however, that continuing the existing uses is a presumption for purposes of analysis herein and in reality the operator of those facilities may not continue operations and the site could become unoccupied and unused under the scenario of the No Project Alternative. Under this alternative, no improvements would be made to the Project site and none of the Project's internal parking, utility, and other infrastructure improvements would occur. This alternative was selected by the City to compare the environmental effects of the proposed Project with an alternative that would leave the Project site undeveloped in its general existing conditions.

Implementation of the No Project/No Development Alternative would result in no physical environmental impacts to the Project Site beyond those that have historically occurred on the Project Site. All potentially significant effects of the Project would be avoided by the selection of this Alternative. Because the No Project/No Development Alternative would not redevelop the Project Site and would not expand economic development or facilitate job creation, the No Project Alternative would fail to meet all of the Project's objectives. (DEIR, pp. 6-6 – 6-9)

Thus, the Planning Commission finds that each of the reasons set forth above is an independent ground for rejecting the No Project/No Development Alternative, and by itself, independent of any other reason, justifies rejection of the No Project/No Development Alternative, and hereby rejects the No Project/No Development Alternative.

8.4.3 REDUCED BUILDING AREA ALTERNATIVE

The Reduced Building Area Alternative considers a proposal where the Project site would be redeveloped with two uses: a light industrial building and a trailer parking lot. Under this Alternative, a 135,169 s.f. light industrial building (including related site improvements such as truck loading/unloading areas and parking, passenger vehicle parking, landscaping, signage, and public utility connections) would be developed on the eastern portion of the Project site and a trailer parking lot would be developed on the western portion of the Project site. This alternative was selected to evaluate a scenario that would reduce the total building area on the Project site relative to the Project but still allow productive industrial use of the entire Project site.

Based on the reduced building size, daily net new vehicle trip-ends per day would be proportionally decrease by approximately 50 percent and net new average daily trips under this alternative would be less than 110 daily vehicle trips. The Reduced Building Area Alternative would meet the Project Type Screening threshold and VMT impacts would be less than significant and would eliminate the Project's significant and unavoidable VMT impact. Additionally, the Reduced Building Area Alternative would reduce the Project's less-than-significant impacts to air quality, energy, greenhouse gas emissions, and utilities and service systems. All other impacts from the Reduced Building Alternative would be similar to the Project. However, the Reduced Building Area Alternative would meet Project Objectives "A" and "B" less effectively than the Project due to the reduction in building area on-site. The Reduced Building Area Alternative would meet all of the Project's other objectives. (DEIR, pp. 6-10 – 6-14)

Thus, the Planning Commission finds that each of the reasons set forth above is an independent ground for rejecting the Reduced Intensity Alternative, and by itself, independent of any other reason, justifies rejection of the Reduced Building Area Alternative, and hereby rejects the Reduced Building Area Alternative.

8.4.4 REDUCED INTENSITY ALTERNATIVE

The Reduced Intensity Alternative considers a proposal where the Project site would be redeveloped with an industrial building with a total square footage of 63,500 s.f. and the balance of the site would be cleared of existing uses but would not be developed. This represents a reduction in development of 206,837 s.f. compared to the Project (an approximate 76.5 percent reduction). Under this alternative, no high-cube cold storage uses would occur. Access to the site would be similar to the Project with a proportional reduction in the number of passenger vehicle and truck parking spaces. This alternative was selected to evaluate a scenario that would reduce the total building size on the Project site, eliminate the high-cube cold storage use, and would not take into account elimination of existing trips generated by the existing uses in order to achieve a less-than-significant VMT impact. With a building size of 63,500 s.f. and taking no credit for the elimination of existing vehicle trips serving the existing uses on the site, a 63,500 s.f building would generate fewer than 110 daily trips and meet the City's small project screening criteria for a less-than-significant VMT impact.

Based on the reduced building size, the Reduced Intensity Alternative is calculated to generate 108 daily vehicle trip-ends per day; therefore, net new average daily trips under this alternative would be less than 110 daily vehicle trips. The Reduced Intensity Alternative would meet the Project Type

Screening threshold and VMT impacts would be less than significant. The Reduced Intensity Alternative would eliminate the Project's significant and unavoidable VMT impacts. The Reduced Intensity Area Alternative would reduce the Project's less-than-significant impacts to air quality, energy, greenhouse gas emissions, noise, and utilities and service systems and reduce the potential for impacts to cultural, paleontological, and tribal cultural resources. All other impacts from the Reduced Intensity Alternative would be similar to the Project. However, the Reduced Intensity Alternative would meet Project Objectives "A" and "B" less effectively than the Project due to the reduction in building area on-site and employees compared to the Project. The Reduced Intensity Alternative would meet all of the Project's other objectives. (DEIR, pp. 6-14 – 6-18)

Thus, the Planning Commission finds that each of the reasons set forth above is an independent ground for rejecting the Reduced Intensity Alternative, and by itself, independent of any other reason, justifies rejection of the Reduced Intensity Alternative, and hereby rejects the Reduced Intensity Alternative.

8.4.5 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The No Project/No Development Alternative has the least impact to the environment because it would not involve any construction activities or warehouse operations. There would be no impacts associated with a cumulatively considerable VMT impact. This impact is considered significant and unavoidable for the Project. While this alternative would avoid the significant effect of the Project, it would not receive any benefits from the drainage improvements or water quality features that would be constructed by the Project. Additionally, none of the Project objectives would be met. If a "no project" alternative is identified as the environmentally superior alternative then the EIR shall also identify an environmentally superior alternative among the other alternatives (see CEQA Guidelines Section 15126.6(e)(2)). The Reduced Building Area Alternative is identified as the environmentally superior alternative because the Reduced Building Area Alternative would result in the greatest reduction of environmental impacts among the remaining alternatives as summarized in Table 6-1. The reduction in impacts is due to the fact that the use would have reduced vehicular trips, which would result in a reduction in VMT impacts; however, the Reduced Building Area Alternative would only partially meet two of the Project's objectives. (DEIR, pp. 6-18 – 6-19)

9.0 STATEMENT OF OVERRIDING CONSIDERATIONS

This Section specifically addresses §15093 of the CEQA Guidelines, which requires the City, acting as the Lead Agency, to balance the benefits of the Project against its significant and unavoidable adverse environmental impacts and determine whether the benefits which will accrue from the development of the Project outweigh its significant and unavoidable impacts. If the City finds that the major benefits of the Project outweigh its significant and unavoidable adverse environmental impacts, the City may approve the Project. Each of the separate benefits listed below are hereby determined to be, in itself, and independent of the Project's other benefits, the basis for overriding all significant and unavoidable environmental impacts identified in the EIR.

As set forth in Section 3.0, above, the EIR identified all of the Project's adverse environmental impacts and mitigation measures that can reduce the Project's impacts to less-than-significant level where feasible, or to the lowest feasible levels. Mitigation imposed by the City must have a proportional nexus to the Project's impacts. As further set forth in Section 5.0, the DEIR presents evidence that implementing the Project would cause or contribute to impacts that would remain significant and unavoidable even after the imposition of all feasible mitigation measures. Finally, as set forth in Section 7.0, there are no feasible alternatives to the Project that would mitigate the Project's significant and avoidable impacts to less-than-significant level or avoid those environmental impacts while still attaining most of the Project's basic objectives. Based on the facts presented throughout this document, the City makes the following finding:

- ❑ **Finding**

As the CEQA Lead Agency for the proposed Project, the City has reviewed the Project description and the alternatives to the Project, as presented in the EIR, and the City fully understands the Project and its alternatives. Further, the City finds that all potential adverse environmental impacts and all feasible mitigation measures to reduce the impacts from the Project have been identified in the DEIR, FEIR, and public testimony. Having considered the potential for the Project to cause or contribute to significant and unavoidable adverse impacts to Transportation, the City's Planning Commission hereby determines that all feasible mitigation measures with proportional nexus to the Project's impacts have been adopted to reduce or avoid the significant and unavoidable impacts identified in the EIR, and that no additional feasible mitigation or alternatives are available to further reduce or avoid significant impacts. Further, the City's Planning Commission finds that economic, social, and other considerations of the Project outweigh the Project's unavoidable impacts to Transportation and that approval of the Project is appropriate. In making this finding, the Planning Commission finds that each of the Project benefits separately and individually outweighs all of the unavoidable adverse environmental effects identified in the EIR and therefore finds those impacts to be acceptable. The Project would meet the following objectives:

A. To expand economic development and facilitate job creation in the City of Ontario by redeveloping the property with a new, in-demand industrial use adjacent to an already-established industrial area.

B. To attract employment-generating businesses to the City of Ontario to reduce the need for members of the local workforce to commute outside the area for employment.

C. To develop industrial buildings with loading bays in close proximity to designated truck routes and the State highway system to avoid or shorten heavy truck-trip lengths on City and regional roads.

D. To attract businesses that can expedite the delivery of goods to consumers and businesses in the City of Ontario and beyond.

E. To develop a project that has architectural design and operational characteristics that complement other existing and planned buildings in the immediate vicinity of the Project Site and minimize conflicts with other nearby land uses.

F. To develop a property that has access to available infrastructure, including roads and utilities.

Furthermore, substantial evidence in the record demonstrates that approval and implementation of the Project will provide the benefits listed below:

a) As set forth in detail in the Findings, all feasible mitigation measures have been imposed to reduce Project environmental effects to less than significant levels.

b) The Project would develop the property with an employment-generating use;

c) The Project would attract new employment-generating business to Ontario, thereby reducing the needs for the local workforce to commute outside the area for employment;

d) The Project would increase the amount of available warehouse space in the City of Ontario;

e) The new jobs provided by the Project will create direct and indirect economic benefits, such as increased tax income to the City and increased spending on goods and services;

f) Approval of the Project will result in the Project's monetary contributions to established fee programs including, but not limited to, the City's Development Impact Fee (DIF) which will be directed to needed local road improvements;

In conclusion, the Planning Commission finds that the foregoing benefits provided through approval of the Project outweigh the identified significant adverse environmental impacts. The Planning Commission further finds that each of the individual benefits discussed above outweighs the unavoidable adverse environmental effects identified in the Final EIR and, therefore, finds those impacts to be acceptable. The Planning Commission further finds that each of the benefits listed above, standing alone, is sufficient justification for the Planning Commission to override these unavoidable environmental impacts.

10.0 ADDITIONAL FACTS ON RECORD

10.1 CUSTODIAN OF RECORD

The documents and materials that constitute the record of proceedings on which these findings have been based are located at the City of Ontario Planning Department, 303 East B Street, Ontario, CA 91764. The custodian for these records is Thomas Grahn, Senior Planner. This information is provided in compliance with Public Resources Code § 21081.6.

CEQA Requirements

The California Environmental Quality Act (CEQA) requires that when a public agency completes an environmental document that includes measures to mitigate or avoid significant environmental effects, the public agency must adopt a Mitigation Monitoring and Reporting Program (MMRP) for the changes to the project that it has adopted or made a condition of project approval in order to mitigate or avoid significant environmental impacts. The appropriate reporting or monitoring plan must be designed to ensure compliance during project implementation (Public Resources Code §21081.6).

The City of Ontario will coordinate the monitoring of the mitigation measures and regulatory requirements with each applicable City department or division, while various City departments/divisions would be responsible for monitoring and verifying compliance of specific mitigation measures and regulatory requirements (see the beginning on page 3). Monitoring will include: 1) verification that each mitigation measure and regulatory requirement has been implemented; 2) recordation of the actions taken to implement each mitigation measure and regulatory requirement; and 3) retention of records in the project file.

Project Objectives

The objectives of the proposed 5355 East Airport Drive Project (the "Project") include the following:

A. To expand economic development and facilitate job creation in the City of Ontario by re-developing the property with a new, in-demand industrial use adjacent to an already-established industrial area.

B. To attract employment-generating businesses to the City of Ontario to reduce the need for members of the local workforce to commute outside the area for employment.

C. To develop industrial buildings with loading bays in close proximity to designated truck routes and the State highway system to avoid or shorten heavy truck-trip lengths on City and regional roads.

D. To attract businesses that can expedite the delivery of goods to consumers and businesses in the City of Ontario and beyond.

E. To develop a project that has architectural design and operational characteristics that complement other existing and planned buildings in the immediate vicinity of the Project Site and minimize conflicts with other nearby land uses.

F. To develop a property that has access to available infrastructure, including roads and utilities.

Overview of the Project

The Project site is located at 5355 East Airport Drive in the City of Ontario, San Bernardino County, California. The Project entails a Development Plan (PDEV22-017). The Project Applicant is proposing to redevelop the site with approximately 270,337 square feet (s.f.) of building floor area, including

255,337 s.f. of warehouse space and 15,000 s.f. of mezzanine. Refer to EIR Section 3.0, *Project Description*, for a detailed description of the Project.

Mitigation Monitoring and Reporting Plan

This MMRP delegates responsibilities for monitoring the implementation of the 5355 East Airport Drive Project mitigation measures and applicable regulatory requirements, and allows responsible City entities flexibility and discretion in determining how best to monitor implementation. Monitoring procedures will vary according to the type of mitigation measure or regulatory requirement. The timing for monitoring and reporting is described in the monitoring and reporting summary table, below. Adequate monitoring requires demonstration of monitoring procedures and implementation of mitigation measures and regulatory requirements.

In order to enhance the effectiveness of the monitoring program, the City will utilize existing systems where appropriate. These inspectors are familiar with a broad range of regulatory issues and will provide first line oversight for much of the monitoring program during construction activities.

Program Changes

If minor changes are required to this MMRP, they will be made in accordance with the California Environmental Quality Act (CEQA) and would be permitted after further review by the City. Such changes could include reassignment of monitoring and reporting responsibilities and/or minor modifications to mitigation measures that achieve the same or better end results. No change will be permitted unless the Mitigation Monitoring and Reporting Program continues to satisfy the requirements of Public Resources Code §21081.6.

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
Aesthetics						
The Project would not result in significant adverse impacts related to aesthetics. No mitigation is required.						
Air Quality						
The Project would not result in significant adverse impacts related to air quality. No mitigation is required.						
Cultural Resources						
MM 4.3-1	Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities: a. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work). "Ground-disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching[1]	Prior to the issuance of a grading permit.; Project Applicant/Project Archaeologist	During Ground-Disturbing Activities; City of Ontario Community Development Department (Planning)			

[1] Tribal monitoring shall cease once all ground disturbance activities have been completed with respect to the property or portion thereof. Example: Once excavation, grading, trenching, etc. have occurred tribal monitoring shall cease.

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
	b. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the earlier of the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. c. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground-disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered TCRs, including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any discovered Native American (ancestral) human remains and burial goods. Copies of monitor logs will be provided to the project applicant/lead agency upon written request to the Tribe. d. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh to					

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
	the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh TCRs. e. Upon discovery of any TCRs, all construction activities in the immediate vicinity of thediscovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh monitor and/or Kizh archaeologist. The Kizh will recover and retain all discovered TCRs in the form and/or manner the Tribe deems appropriate, in the Tribe's sole discretion, and for any purpose the Tribe deems appropriate, including for educational, cultural and/or historic purposes.					
MM 4.3-2	Unanticipated Discovery of Human Remains and Associated Funerary Objects: a. Native American human remains are defined in PRC 5097.98 (d)(1) as an inhumation or cremation, and in any state of decomposition or skeletal completeness. Funerary objects, called associated grave goods in Public Resources Code Section 5097.98, are also to be treated according to this statute. b. If Native American human remains and/or grave goods discovered or recognized on the project site, then all construction activities shall immediately cease. Health and Safety Code Section 7050.5	During grading and excavation operation; Project Archaeologist/ Native American Monitor	During grading and excavation operation; City of Ontario Community Development Department (Planning)

	in origin (non-TCR) shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. f. Any discovery of human remains/burial goods shall be kept confidential to prevent further disturbance.					
MM 4.3-3	Procedures for Burials and Funerary Remains: a. As the Most Likely Descendant ("MLD"), the Koo-nas-gna Burial Policy shall be implemented. To the Tribe, the term "human remains" encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. b. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created. c. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture,	During grading and excavation operation; Project Archaeologist	During grading and excavation operation; City of Ontario Community Development Department (Planning)			

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
	are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials. d. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to					
Energy						
The Project would not result in significant adverse impacts related to energy. No mitigation is required.						
Geology and Soils						
MM 4.5-1	Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Ontario that a qualified paleontologist ("paleontologist") has been retained by the Project Applicant or contractor to conduct monitoring of excavation activities in olde alluvium soils and has the authority to halt and redirect earthmoving activities in the event that suspected paleontological resources are unearthed.	Prior to the issuance of a grading permit; Project Applicant	Prior to the issuance of a grading permit; City of Ontario Community Development Department (Planning)			
MM 4.5-2	The paleontologist shall conduct full-time monitoring during grading and excavation operations in undisturbed Holocene and late Pleistocene old alluvial fan deposits starting at a depth of five (5) feet	During grading and excavation operations; Project Contractor, Project	During grading and excavation operations; City of Ontario Community

				Initials	Date	Remarks
	below the existing ground surface. The paleontologist shall be equipped to salvage fossils if they are unearthed to avoid construction delays and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. The paleontologist shall be empowered to temporarily halt or divert equipment to allow for the removal of abundant and large specimens in a timely manner. Monitoring may be reduced if the potentially fossiliferous units are not present in the subsurface, or if present, are determined upon exposure and examination by the paleontologist to have a low potential to contain or yield fossil resource.	Paleontologist	Development Department (Planning)			
MM 4.5-3	Recovered specimens shall be properly prepared to a point of identification and permanent preservation, including screen washing sediments to recover small invertebrates and vertebrates, if necessary. Identification and curation of specimens into the collections of the Division of Geological Sciences, San Bernardino County Museum, shall be required for discoveries of significance as determined by the paleontological monitor.	During grading and excavation operations; Project Paleontologist	During grading and excavation operations; City of Ontario Community Development Department (Planning)			
MM 4.5-4	A final monitoring and mitigation report of findings and significance shall be prepared, including lists of all fossils recovered, if any, and necessary maps and graphics to accurately record the original location of the specimens. The report shall be submitted to the City of Ontario prior to issuance of the first occupancy permit. 				Initials	Date	Remarks
The Project would not result in significant adverse impacts related to greenhouse gas emissions. No mitigation is required.						
Hazards and Hazardous Materials						
MM 4.7-1	Prior to the issuance of a grading permit, the Project Applicant shall prepare a Soil Management Plan (SMP). The SMP shall include explicit instructions for the appropriate handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. The general contractor will be required to follow the requirements of the SMP and stop work to make notification to the environmental team if any potential impacts are observed at any time the environmental team is not already on-site. The SMP also requires air monitoring activities to monitor the air downwind of the Project Site and appropriate Health and Safety Plans that will be employed by site workers. The SMP shall identify specific requirements intended to protect human health when soil in certain areas of known or suspected impacts are disturbed for any reason, including, without limitation, as a result of demolition, utility installation/repair, soil excavation, drilling, grading/filling activities, stockpile generation, soil management, loading, and transportation. Requirements of the SMP include: a. Health and Safety Plan (HASP): A HASP will be prepared and in effect for all activities associated with the SMP and other activities at the Project Site. Contractors working onsite are expected to be operating under their own health and safety plans.	Prior to the issuance of a grading permit; Project Applicant	Prior to the issuance of a grading permit; City of Ontario Community Development Department (Planning & Building)			

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
	b. Environmental Monitoring: In accordance with SCAQMD Rules, air monitoring will be necessary in areas where potential PCE contaminated soil are to be disturbed. Air monitoring for dust may also be required in other areas. An air monitoring/health and safety professional will be present during relevant activities and responsibilities will include recording monitoring data on field sheets, which will be kept as part of Project documentation. c. Soil Monitoring: Soils impacted by PCE that are encountered during site redevelopment will be characterized and documented. The monitoring and sampling activities to be performed include: · Visual observation performed to detect areas of soil that may be impacted by PCE or other non-VOC hazardous materials, if encountered. · Screening for PCEs using field instruments to document new or previously undetected sources of PCEs. · Soil sampling and chemical testing performed to evaluate concentrations of PCE. d. Proper Soil Handling: If impacted soil is encountered, the area will be delineated as necessary with cones, caution tape, stakes, chalk, or flagging, and the area will not be disturbed further until an environmental professional is onsite for observation					

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
	and determination of whether testing and/or excavation work is required. Stockpile staging areas will be delineated prior to the start of excavation. All excavations will conform to applicable regulations, including Cal/OSHA Construction Safety Orders. The specific equipment, means, and methods to be utilized for soil removal, handling, and disposition will be selected based on the nature of the work to be conducted and its location on the site. If excavation is conducted during the rainy season (October through April), provisions will need to be made to prevent offsite migration of sediment in runoff. e. Fugitive Dust and Vapor Control: Appropriate procedures will be implemented to control the generation of airborne dust by soil removal activities, including, but not limited to, the use of water as a dust suppressant or stopping activities that have the potential to generate fugitive dust in the event wind conditions change creating an uncontrollable condition. f. Excavation and Stockpiling: Impacted soil that is excavated and not immediately removed from the site will be stockpiled onsite and covered with plastic sheeting to control dust and minimize exposure to precipitation and wind. If a stockpile remains onsite during the rainy season, a perimeter sediment barrier, constructed of material, such as straw bales or fiber roll, will also be installed. The stockpiles will be inspected biweekly at a minimum. During stockpile

				Initials	Date	Remarks
	removal, only the working face of the stockpile will be uncovered. If the stockpiled impacted soil is to be transported offsite for disposal or recycling, the soil will be profiled for waste characteristics. Soil samples will be analyzed for parameters required by the disposal/recycling facility. g. Responding to Unknown Conditions: If previously unknown impacted soil is suspected (based on visual staining, odors, photo ionization detector readings, or other observations), the area will be delineated and construction activity will cease in this area, and sampling of the unknown material will occur using USEPA methodology. Analysis will be conducted for TPH, metals, and/or VOCs, as appropriate. Analytical results will be compared to applicable regulatory screening levels. Based on this comparison, a determination will be made regarding soil disposition (reuse on-site, off-site transport, and disposal/recycling, etc.). Additionally, if any UST or other subsurface features are encountered, a similar approach will be taken, and appropriate permitting, as necessary, will be obtained for the removal of the feature(s). Any permitted removals will be conducted withappropriate regulatory oversight, documentation, and reporting. h. Imported fill: As appropriate, offsite soils brought to the site for use as backfill (import fill), if necessary, will be tested in general conformance with the DTSC Information Advisory Clean Imported Fill Material					

No.	Mitigation Measure	Time Frame and Responsible Party for Implementation	Time Frame and Responsible Party for Monitoring	Verification of Compliance		
				Initials	Date	Remarks
	document. i. Post-construction Requirements: If contaminated soil is left in place, the location of this soil will be surveyed or recorded by use of geographic positioning system equipment. Following the completion of construction, excavation, and disposition activities, a summary report will be prepared. The report will include a summary of activities, locations of soil sources and final disposition of contaminated soil, and estimated quantities of materials. Additionally, removal of any USTs or other subsurface features, if encountered, will be conducted under appropriate permits (if any) and documented in applicable reports for submittal to the Ontario Fire Department, or other regulatory agency, as appropriate.					
Hydrology and Water Quality						
The Project would not result in significant adverse impacts related to hydrology and water quality. No mitigation is required.						
Noise						
The Project would not result in significant adverse impacts related to noise. No mitigation is required.						
Transportation						
MM 4.10-1	Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will	Prior to the issuance of a certificate of occupancy; Building operator	Prior to the issuance of a certificate of occupancy; City of Ontario Community Development Department (Planning)

RESOLUTION NO. PC24-037

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF ONTARIO, CALIFORNIA, APPROVING FILE NO. PDEV22-017, A DEVELOPMENT PLAN TO CONSTRUCT A 270,337 SQUARE FOOT INDUSTRIAL BUILDING ON 13.08 ACRES OF LAND FOR PROPERTY LOCATED AT 5355 EAST AIRPORT DRIVE, WITHIN THE IH (HEAVY INDUSTRIAL) ZONING DISTRICT, AND MAKING FINDINGS IN SUPPORT THEREOF—APNS: 0238-052-29 AND 0238-052-20.

WHEREAS, PROLOGIS ("Applicant") has filed an Application for the approval of a Development Plan, File No. PDEV22-017, as described in the title of this Resolution (hereinafter referred to as "Application" or "Project"); and

WHEREAS, the Application applies to 13.08 acres of land located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district, and is presently improved with five industrial structures. All existing structures and improvements will be demolished to allow for construction of the 270,337 square-foot industrial warehouse building; and

WHEREAS, on April 5, 2022, the Applicant submitted the Application to construct a 270,337 square-foot industrial building on 13.08 acres of land located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district; and

WHEREAS, the property abutting the Project site to the north is a Southern Pacific Railroad right-of-way, and properties beyond are developed with existing industrial land uses within the IH (Heavy Industrial) zoning district of the Shea Business Center. The property to the south of the Project site (across Airport Drive Street) is zoned IH (Heavy Industrial) and consists of two existing warehouse buildings. The property to the east of the Project site is in the IH (Heavy Industrial) zoning district and is developed with an industrial gas supplier. The property to the west of the Project site is in the IH (Heavy Industrial) zoning district and is developed with a Verizon facility; and

WHEREAS, the proposed building has been situated on the center of the site, and is set back approximately 180 to 200 feet from Airport Drive, 77 feet from the west property line, 72 feet from the east property line, and 40 feet from the north property line; and

WHEREAS, the building is designed to accommodate up to two tenants, with offices located at the southeast and southwest corners of the building, fronting East Airport Drive. Off-street parking is located all around the building, with the heaviest concentration around the office areas; and

WHEREAS, a truck yard area, with 54 dock-high loading doors, is located on the south side of the building (center of building). The loading area will be screened from

street views by portions of the building and 14-foot-tall decorative screen walls with decorative tube steel gates, that have been designed to match the building architecture; and

WHEREAS, the Project has provided off-street parking pursuant to the "Warehouse and Distribution" parking standards specified in the Development Code. The Project requires and provides 251 passenger vehicle parking spaces. Additionally, the Project requires 14 tractor-trailer parking spaces and has provided 48 tractor-trailer parking spaces; and

WHEREAS, the proposed industrial warehouse building will be of concrete tilt-up construction and designed in a Contemporary Architectural style that exemplifies the type of high-quality architecture promoted by the Ontario Development Code and The Ontario Plan; and

WHEREAS, the IH (Heavy Industrial) zoning district requires a minimum 10 percent landscape coverage for interior lots, and 12.72 percent will be provided, in compliance with the Ontario Development Code requirements; and

WHEREAS, the Application is a project pursuant to the California Environmental Quality Act, commencing with Public Resources Code Section 21000, et seq. (hereinafter referred to as "CEQA"); and

WHEREAS, the 5355 East Airport Drive Final Environmental Impact Report (State Clearinghouse No. 2022090006) was prepared (hereinafter referred to as "final EIR"), in which development and use of the Project site was discussed; and

WHEREAS, the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations was made available to the public and to all interested agencies for review and comment pursuant to CEQA, the State CEQA Guidelines and the City of Ontario Local CEQA Guidelines; and

WHEREAS, Ontario Development Code Table 2.02-1 (Review Matrix) grants the Planning Commission the responsibility and authority to review and act on the subject Application; and

WHEREAS, the Project has been reviewed for consistency with the Housing Element of the Policy Plan component of The Ontario Plan, as State Housing Element law (as prescribed in Government Code Sections 65580 through 65589.8) requires that development projects must be consistent with the Housing Element, if upon consideration of all its aspects, it is found to further the purposes, principals, goals, and policies of the Housing Element; and

WHEREAS, the Project is located within the Airport Influence Area of Ontario International Airport, which encompasses lands within parts of San Bernardino, Riverside, and Los Angeles Counties, and is subject to, and must be consistent with, the policies and criteria set forth in the Ontario International Airport Land Use Compatibility Plan (hereinafter referred to as "ALUCP"), which applies only to jurisdictions within San Bernardino County, and addresses the noise, safety, airspace protection, and overflight impacts of current and future airport activity; and

WHEREAS, City of Ontario Development Code Division 2.03 (Public Hearings) prescribes the manner in which public notification shall be provided and hearing procedures to be followed, and all such notifications and procedures have been completed; and

WHEREAS, on March 18, 2024, the Development Advisory Board (DAB) conducted a hearing regarding the subject Application and voted to continue the Project to the next available DAB meeting to allow staff to work with the applicant to revise draft conditions of approval; and

WHEREAS, on April 15, 2024, the DAB conducted a hearing to consider the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations prepared pursuant to CEQA, the State CEQA Guidelines, and the City of Ontario Local CEQA Guidelines, and concluded said hearing on that date, voting to issue Decision No. DAB24-010, recommending that the Planning Commission approve the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations; and

WHEREAS, on April 15, 2024, the DAB conducted a hearing regarding the subject Application and concluded said hearing on that date, voting to issue Decision No. DAB24-011, recommending the Planning Commission approve the Project, subject to the conditions of approval appended to the attached Resolution; and

WHEREAS, as the first action on the Project, on May 28, 2024, the Planning Commission conducted a hearing to consider for the final EIR, Mitigation Monitoring and Reporting Program, Findings and Statement of Overriding Considerations, each prepared pursuant to CEQA, the State CEQA Guidelines, and the City of Ontario Local CEQA Guidelines, and continued the Project for further consideration; and

WHEREAS, on May 28, 2024, the Planning Commission of the City of Ontario conducted a hearing to consider the Development Plan (File No. PDEV22-017), and continued the Project for further consideration; and

WHEREAS, on August 27, 2024, the Planning Commission of the City of Ontario conducted a hearing to consider the Development Plan (File No. PDEV22-017), and concluded said hearing on that date; and

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, IT IS HEREBY FOUND, DETERMINED, AND RESOLVED by the Planning Commission of the City of Ontario, as follows:

SECTION 1: ***Housing Element Compliance.*** Pursuant to the requirements of California Government Code Chapter 3, Article 10.6, commencing with Section 65580, as the decision-making authority for the Project, the Planning Commission finds that based upon the facts and information contained in the Application and supporting documentation, at the time of Project implementation, the project is consistent with the Housing Element of the Policy Plan (General Plan) component of The Ontario Plan, as the project site is not one of the properties in the Housing Element Sites Inventory contained in Tables B-1 and B-2 of the Housing Element Technical Report.

SECTION 2: ***Airport Land Use Compatibility Plan ("ALUCP") Compliance.*** The California State Aeronautics Act (Public Utilities Code Section 21670 et seq.) requires that an Airport Land Use Compatibility Plan be prepared for all public use airports in the State; and requires that local land use plans and individual development proposals must be consistent with the policies set forth in the adopted Airport Land Use Compatibility Plan.

(1) On April 19, 2011, the City Council of the City of Ontario approved and adopted the Ontario International Airport Land use Compatibility Plan, establishing the Airport Influence Area for Ontario International Airport, which encompasses lands within parts of San Bernardino, Riverside, and Los Angeles Counties, and limits future land uses and development within the Airport Influence Area, as they relate to noise, safety, airspace protection, and overflight impacts of current and future airport activity. As the decision-making authority for the Project, the Planning Commission has reviewed and considered the facts and information contained in the Application and supporting documentation against the ONT ALUCP compatibility factors, including [1] Safety Criteria (ONT ALUCP Table 2-2) and Safety Zones (ONT ALUCP Map 2-2), [2] Noise Criteria (ONT ALUCP Table 2-3) and Noise Impact Zones (ONT ALUCP Map 2-3), [3] Airspace protection Zones (ONT ALUCP Map 2-4), and [4] Overflight Notification Zones (ONT ALUCP Map 2-5). As a result, the Planning Commission, therefore, finds and determines that the Project, when implemented in conjunction with the conditions of approval, will be consistent with the policies and criteria set forth within the ONT ALUCP; and

SECTION 3: ***Concluding Facts and Reasons.*** Based upon the substantial evidence presented to the Planning Commission during the above-referenced hearing,

and upon the specific findings set forth in Sections 1 and 2, above, the Planning Commission hereby concludes as follows:

(1) ***The proposed development at the proposed location is consistent with the goals, policies, plans and exhibits of the Vision, Policy Plan (General Plan), and City Council Priorities components of The Ontario Plan.*** The proposed Project is located within the Industrial land use district of the Policy Plan Land Use Map, and the IH (Heavy Industrial) zoning district. The development standards and conditions under which the proposed Project will be constructed and maintained, is consistent with the goals, policies, plans, and exhibits of the Vision, Policy Plan (General Plan), and City Council Priorities components of The Ontario Plan. The proposed development is consistent with the goals, policies, plans, and exhibits of the Vision, Policy Plan (General Plan), and City Council Priorities components of The Ontario Plan, as the Project will contribute to the establishment of a dynamic, progressive city containing distinct neighborhoods and districts that foster a positive sense of identity and belonging among residents, visitors, and businesses (Goal CD1). Furthermore, the Project will promote the City's policy to take actions that are consistent with the City being a leading urban center in Southern California, while recognizing the diverse character of our existing viable neighborhoods (Policy CD1-1*)*; and

(2) ***The proposed development is compatible with those on adjoining sites in relation to location of buildings, with particular attention to privacy, views, any physical constraint identified on the site and the characteristics of the area in which the site is located.*** The Project has been designed consistent with the requirements of the City of Ontario Development Code and the IH (Heavy Industrial) zoning district, including standards relative to the particular land use proposed (270,337 square foot industrial warehouse), as-well-as building intensity, building and parking setbacks, building height, number of off-street parking and loading spaces, on-site and off-site landscaping, and fences, walls and obstructions; and

(3) ***The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project.*** The Planning Commission has required certain safeguards, and impose certain conditions of approval, which have been established to ensure that: [i] the purposes of the Development Code are maintained; [ii] the Project will not endanger the public health, safety or general welfare; [iii] the Project will not result in any significant environmental impacts; [iv] the Project will be in harmony with the area in which it is located; and [v] the Project will be in full conformity with the Vision, City Council Priorities and Policy Plan components of The Ontario Plan; and

(4) ***The proposed development is consistent with the development standards and design guidelines set forth in the Development Code, or applicable***

***specific plan or planned unit development*.** The proposed Project has been reviewed for consistency with the general development standards and guidelines of the Development Code that are applicable to the proposed Project, including building intensity, building and parking setbacks, building height, amount of off-street parking and loading spaces, parking lot dimensions, design and landscaping, bicycle parking, on-site landscaping, and fences and walls, as-well-as those development standards and guidelines specifically related to the particular land use being proposed (industrial warehouse with a 0.47 FAR). As a result of this review, the Planning Commission has determined that the Project, when implemented in conjunction with the conditions of approval, will be consistent with the development standards and guidelines described in the Development Code.

SECTION 4: ***Planning Commission Action.*** Based upon the findings and conclusions set forth in Sections 1 through 3, above, the Planning Commission hereby APPROVES the herein described Application, subject to each and every condition set forth in the Department reports attached hereto as "Attachment A," and incorporated herein by this reference.

SECTION 5: ***Indemnification.*** The Applicant shall agree to defend, indemnify and hold harmless, the City of Ontario or its agents, officers, and employees from any claim, action or proceeding against the City of Ontario or its agents, officers or employees to attack, set aside, void, or annul this approval. The City of Ontario shall promptly notify the Applicant of any such claim, action, or proceeding, and the City of Ontario shall cooperate fully in the defense.

SECTION 6: ***Custodian of Records.*** The documents and materials that constitute the record of proceedings on which these findings have been based are located at the City of Ontario City Hall, 303 East "B" Street, Ontario, California 91764. The custodian for these records is the City Clerk of the City of Ontario.

SECTION 7: ***Certification to Adoption.*** The Secretary shall certify to the adoption of the Resolution.

- - - - - - - - - - - - - -

The Secretary Pro Tempore for the Planning Commission of the City of Ontario shall certify as to the adoption of this Resolution.

I hereby certify that the foregoing Resolution was duly and regularly introduced, passed and adopted by the Planning Commission of the City of Ontario at a regular meeting thereof held on the 27th day of August 2024, and the foregoing is a full, true and correct copy of said Resolution, and has not been amended or repealed.

Nicola Ricci
Planning Commission Chairperson

ATTEST:

Henry K. Noh
Planning Director and
Secretary to the Planning Commission

STATE OF CALIFORNIA)
COUNTY OF SAN BERNARDINO)
CITY OF ONTARIO)

I, Gwen Berendsen, Secretary Pro Tempore of the Planning Commission of the City of Ontario, DO HEREBY CERTIFY that foregoing Resolution No. PC24-037, was duly passed and adopted by the Planning Commission of the City of Ontario at their regular meeting held on August 27, 2024, by the following roll call vote, to wit:

AYES: Dean, DeDiemar, Gage, Lampkin, Ricci

NOES: None

ABSENT: Anderson, Del Turco

ABSTAIN: None

Project Description: A Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land (0.47 FAR) located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district**;** (APN(s): 0238-052-20 & 0238-052-29); **submitted by Prologis.**

Prepared By: Thomas Grahn, Senior Planner
Phone: 909.395.2413 (direct)
Email: tgrahn@ontarioca.gov

The Planning Department, Land Development Section, conditions of approval applicable to the above-described Project, are listed below. The Project shall comply with each condition of approval listed below:

1.0 Standard Conditions of Approval. The project shall comply with the *Standard Conditions for New Development*, adopted by City Council Resolution No. 2017-027 on April 18, 2017. A copy of the *Standard Conditions for New Development* may be obtained from the Planning Department or City Clerk/Records Management Department.

2.0 Special Conditions of Approval. In addition to the *Standard Conditions for New Development* identified in condition no. 1.0, above, the project shall comply with the following special conditions of approval:

2.1 Time Limits.

(a) Development Plan approval shall become null and void 2 years following the effective date of application approval, unless a building permit is issued and construction is commenced, and diligently pursued toward completion, or a time extension has been approved by the Planning Director. This condition does not supersede any individual time limits specified herein, or any other departmental conditions of approval applicable to the Project, for the performance of specific conditions or improvements.

2.2 General Requirements. The Project shall comply with the following general requirements:

(a) All construction documentation shall be coordinated for consistency, including, but not limited to, architectural, structural, mechanical, electrical, plumbing, landscape and irrigation, grading, utility and street improvement plans. All such plans shall be consistent with the approved entitlement plans on file with the Planning Department.

(b) The project site shall be developed in conformance with the approved plans on file with the City. Any variation from the approved plans must be reviewed and approved by the Planning Department prior to building permit issuance.

(c) The herein-listed conditions of approval from all City departments shall be included in the construction plan set for project, which shall be maintained on site during project construction.

2.3 Architecture.

(a) Exterior building wall materials, roof types and colors shall be shown on development construction drawings.

(b) Roof access ladders shall be located on the inside of the building.

(c) All building drainage gutters, down spouts, vents, etc., shall be completely concealed from public view or shall be architecturally compatible (decorative) with the exterior building design and color.

(d) All tower elements on the building(s) shall be fully walled and finished on all sides and include detailing appropriate to the architectural style proposed, so as to be a fully three-dimensional, four-sided element of the building, to the satisfaction of the Planning Director. The term "tower elements" means architectural elements of the building that are that are substantially taller than the adjacent parapet wall or roof, as determined by the Planning Director.

(e) At locations where changes in parapet wall height meet, the taller parapet must return into the building for a minimum distance of 6 FT, so that the actual thickness of the parapet wall cannot be observed or readily discerned.

2.4 Landscaping.

(a) The Project shall provide and continuously maintain landscaping and irrigation systems in compliance with the provisions of Ontario Development Code Division 6.05 (Landscaping).

(b) Comply with the conditions of approval of the Planning Department; Landscape Planning Division.

(c) Landscaping shall not be installed until the Landscape and Irrigation Construction Documentation Plans required by Ontario Development Code Division 6.05 (Landscaping) have been approved by the Landscape Planning Division.

(d) Changes to approved Landscape and Irrigation Construction Documentation Plans, which affect the character or quantity of the plant material or irrigation system design, shall be resubmitted for approval of the revision by the Landscape Planning Division, prior to the commencement of the changes.

2.5 Walls and Fences. All Project walls and fences shall comply with the requirements of Ontario Development Code Division 6.02 (Walls, Fences and Obstructions).

(a) Within industrial zoning districts, walls and fences within the front yard building setback area shall not exceed 6 feet in height, with at least 90 percent of the vertical surface open and non-view obstructing and shall be setback a minimum of 5 feet behind the street property line.

(b) Long expanses of fence or wall (50 or more FT in length) adjacent to a public right-of-way shall have offset areas (decorative pilasters or a jog in the wall) along its length and shall be architecturally designed to prevent monotony. Construction plans shall include wall plans and details that show compliance with this condition of approval.

(c) The height of a wall or fence shall be measured on the exterior side, at the highest point of the natural ground or finished grade at the base of the fence or wall to the top of the fence or wall above the same base point.

(d) For gated sites, sufficient area shall be provided in front (exterior side) of vehicular access gates, to allow stacking of at least one tractor/trailer outside of the public street right-of-way.

(e) Development plans and construction drawings shall indicate materials, colors, and height of proposed and existing walls/fences and shall include a cross-section of walls/fences indicating adjacent grades. Walls shall be designed as an integral part of the architecture for the development.

(f) Walls shall be treated with a graffiti-proof coating at locations visible to the public.

2.6 Refuse Storage (Trash Enclosures).

(a) All refuse shall be stored in an appropriate container. Furthermore, all refuse containers shall be stored within a City-approved enclosure, which shall be designed so as to be consistent with the building architecture on the project site.

(b) The number of enclosures, and their precise locations, dimensions, and design shall be provided consistent with the *Solid Waste Department Refuse and Recycling Planning Manual* (the manual may be obtain online at http://www.ontarioca.gov/sites/default/files/Ontario-Files/Municipal-Utilities-Company/planning_manual-2016_update.pdf).

(c) Signs clearly identifying all recycling and refuse collection areas, and the materials accepted for recycling shall be posted adjacent to all points of access to each trash enclosure.

(d) Trash enclosures shall be bordered by a minimum 5-FT wide planter and screened with landscaping on all exposed sides, excluding the side with bin access gates.

2.7 Parking, Circulation and Access.

(a) The Project shall comply with the applicable off-street parking, loading and lighting requirements of City of Ontario Development Code Division 6.03 (Off-Street Parking and Loading).

(b) All drive approaches shall be provided with an enhanced pavement treatment. The enhanced paving shall extend from the back of the approach apron, into the site, to the first intersecting drive aisle or parking space.

(c) Areas provided to meet the City's parking requirements, including off-street parking and loading spaces, access drives, and maneuvering areas, shall not be used for the outdoor storage of materials and equipment, nor shall it be used for any other purpose than parking.

(d) The required number of off-street parking spaces and/or loading spaces shall be provided at the time of site and/or building occupancy. All parking and loading spaces shall be maintained in good condition for the duration of the building or use.

(e) Parking spaces specifically designated and conveniently located for use by the physically disabled shall be provided pursuant to current accessibility regulations contained in State law (CCR Title 24, Part 2, Chapters 2B71, and CVC Section 22507.8).

(f) Implementation and operation of access restrictions such as gates and/or barrier arms shall provide proper access to police, fire, emergency services and waste and recycling collection services, subject to City review and approval.

(g) The use of compact parking spaces is not permitted.

(h) Wheel stops shall be provided where necessary, to protect structures and parked vehicles.

(i) Striping of parking spaces, aisles, and driveways conforming to the provisions of Development Code Division 6.03 (Off-Street Parking and Loading), and directional signs conforming to the provisions of Development Code Division 8.01 (Sign Regulations), shall be provided.

(j) Bicycle parking facilities, including bicycle racks, lockers, and other secure facilities, shall be provided in conjunction with development projects pursuant to current regulations contained in CALGreen (CAC Title 24, Part 11). Final design and placement of bicycle parking facilities shall be subject to Planning Department review and approval.

2.8 Outdoor Loading and Storage Areas.

(a) Loading facilities shall be designed and constructed pursuant to Development Code Division 6.03 (Off-Street Parking and Loading).

(b) Areas designated for off-street parking, loading, and vehicular circulation and maneuvering, shall not be used for the outdoor storage of materials or equipment.

(c) Outdoor loading and storage areas, and loading doors, shall be screened from public view pursuant to the requirements of Development Code Paragraph 6.02.025.A.2 (Screening of Outdoor Loading and Storage Areas, and Loading Doors) Et Seq.

(d) Outdoor loading and storage areas shall be provided with gates that are view-obstructing by one of the following methods:

(i) Construct gates with a perforated metal sheet affixed to the inside of the gate surface (50 percent screen); or
(ii) Construct gates with minimum one-inch square tube steel pickets spaced at maximum 2-inches apart.

(e) The development shall maintain a minimum of 47 off-street trailer parking spaces. Dock-high loading zones intended for tractor-trailers shall have a clear dimension of 12 FT wide by 45 FT long. All at-grade loading doors shall have a 12-FT wide by 18-FT deep unobstructed loading zone directly in front of the door, free of access drives.

(f) Truck loading and maneuvering areas in front of dock-high loading areas shall require a clear area of 120 FT.

(g) Loading areas shall be designed to provide for backing and maneuvering completely on-site, and not from a public street.

(h) Loading areas shall not encroach into landscape or building setbacks.

(i) All loading doors, areas, and activities shall be completely screened from public view, as well as from public, residential, and commercial uses, whether on the same lot or on neighboring properties, by a decorative masonry wall. Chain link fencing with slats or tennis windscreen material shall not be used as screening for storage areas.

(j) The height of screen and wing walls shall be determined by a sight-line analysis/wall section plan. The sight-line analysis/wall section plan shall show that all roll-up doors will be screened from view from adjoining parcels and public streets. The following criteria shall apply:

(i) Roll-up doors and openings in the screen wall shall be positioned such that the doors are not visible from the street.
(ii) Screening shall include a combination of screen walls, sight-obscuring gates, ornamental landscaping, and/or portions of the building such that the roll-up doors are not visible from the public street.
(iii) Upon Planning Department request, a "horizontal height mockup" shall be constructed for review and approval by Planning Department staff to verify adequacy of screen wall height from the freeway and streets. Mockup should be located at the lowest elevation on the site.

(k) The minimum gate height for screen wall openings shall be established based upon the corresponding wall height, as follows:

Screen Wall Height	***Minimum Gate Height***
14 feet:	10 feet
12 feet:	9 feet
10 feet:	8 feet

Screen Wall Height	*Minimum Gate Height*
8 feet:	8 feet
6 feet:	6 feet

2.9 Site Lighting.

(a) All off-street parking facilities shall be provided with nighttime security lighting pursuant to Ontario Municipal Code Section 4-11.08 (Special Residential Building Provisions) and Section 4-11.09 (Special Commercial/Industrial Building Provisions), designed to confine emitted light to the parking areas. Parking facilities shall be lighted from sunset until sunrise, daily, and shall be operated by a photocell switch.

(b) Unless intended as part of a master lighting program, no operation, activity, or lighting fixture shall create illumination on any adjacent property.

2.10 Mechanical and Rooftop Equipment.

(a) All exterior roof-mounted mechanical, heating and air conditioning equipment, and all appurtenances thereto, shall be completely screened from public view by parapet walls or roof screens that are architecturally treated so as to be consistent with the building architecture.

(b) All ground-mounted utility equipment and structures, such as tanks, transformers, HVAC equipment, and backflow prevention devices, shall be located out of view from a public street, or adequately screened through the use of landscaping and/or decorative low garden walls.

2.11 Security Standards. The Project shall comply with all applicable requirements of Ontario Municipal Code Title 4 (Public Safety), Chapter 11 (Security Standards for Buildings).

2.12 Signs.

(a) All Project signage shall comply with the requirements of Ontario Development Code Division 8.1 (Sign Regulations).

2.13 Sound Attenuation. The Project shall be constructed and operated in a manner so as not to exceed the maximum interior and exterior noise levels set forth in Ontario Municipal Code Title 5 (Public Welfare, Morals, and Conduct), Chapter 29 (Noise).

2.14 Environmental Requirements.

(a) The environmental impacts of this project were previously reviewed in conjunction with File No. PSP18-001, a Specific Plan for which the Merrill Commerce Center Specific Plan Environmental Impact Report (State Clearinghouse No. 2019049079) was previously adopted by the City Council on 2/2/2021. This application introduces no new significant environmental impacts. The City's "Guidelines for the Implementation of the California Environmental Quality Act ("CEQA")" provide for the use of a single environmental assessment in situations where the impacts of subsequent projects are adequately analyzed. The previously

adopted mitigation measures shall be a condition of project approval and are incorporated herein by this reference.

(b) The Project shall be designed and constructed in compliance with the associated Greenhouse Gas Reduction Measures Screening Table for this Project.

(c) If human remains are found during project grading/excavation/construction activities, the area shall not be disturbed until any required investigation is completed by the County Coroner and Native American consultation has been completed (if deemed applicable).

(d) If any archeological or paleontological resources are found during project grading/excavation/construction, the area shall not be disturbed until the significance of the resource is determined. If determined to be significant, the resource shall be recovered by a qualified archeologist or paleontologist consistent with current standards and guidelines, or other appropriate measures implemented.

2.15 Indemnification. The applicant shall agree to defend, indemnify and hold harmless, the City of Ontario or its agents, officers, and employees from any claim, action or proceeding against the City of Ontario or its agents, officers or employees to attack, set aside, void or annul any approval of the City of Ontario, whether by its City Council, Planning Commission or other authorized board or officer. The City of Ontario shall promptly notify the applicant of any such claim, action or proceeding, and the City of Ontario shall cooperate fully in the defense.

2.16 Additional Fees.

(a) Within 5 days following final application approval, the Notice of Determination ("NOD") filing fee shall be provided to the Planning Department. The fee shall be paid by check, made payable to the "Clerk of the Board of Supervisors", which shall be forwarded to the San Bernardino County Clerk of the Board of Supervisors, along with all applicable environmental forms/notices, pursuant to the requirements of the California Environmental Quality Act ("CEQA"). Failure to provide said fee within the time specified will result in the extension of the statute of limitations for the filing of a CEQA lawsuit from 30 days to 180 days.

(b) After the Project's entitlement approval, and prior to issuance of final building permits, the Planning Department's Plan Check and Inspection fees shall be paid at the rate established by resolution of the City Council.

2.17 Public Art. The Project is subject to the requirements of the City's Public Art Ordinance (Ontario Municipal Code Section 5-33.05. Private Art for Public Enjoyment in Commercial and Industrial Development Projects).

2.18 Final Occupancy. The Project Architect of record will certify that construction of each building site and the exterior elevations of each structure shall be completed in compliance with the approved plans. Any deviation to approved plans shall require a resubmittal to the Planning Department for review and approval prior to construction. The Occupancy Release Request Form/Architect Certificate of Compliance shall be provided prior to final occupancy. After the receipt of this Certification, the Planning Department will conduct a final site and exterior elevations inspection. The Owner's Representative and Contractor shall be present.

2.19 Additional Requirements.

(a) The Project requires minimum 251 passenger vehicle parking spaces and provides 167 passenger vehicle parking spaces within the passenger vehicle only parking lots on the east and west sides of the proposed building. The remaining 84 parking spaces shall be provided within the truck yard area when required by tenant operations, provided a minimum of 14 trailer parking spaces are maintained.

(b) Cold storage shall not exceed 10 percent of the building floor area.

3546 Concours Street, Suite 100
Ontario, CA 91764

☒	**Preliminary Plans (dated 7/14/2023) meet the Standard Conditions for New Development and have been approved considering that the following conditions below be met upon submittal of the landscape construction documents.**
☐	**Preliminary Plans (dated) have not been approved. Corrections noted below are required before Preliminary Landscape Plan approval.**

A RESPONSE SHEET IS REQUIRED WITH RESUBMITTAL OR PLANS WILL BE RETURNED AS INCOMPLETE.
Landscape construction plans with plan check number may be emailed to:
landscapeplancheck@ontarioca.gov

PREVIOUS COMMENTS – Fourth Request

Civil/ Site Plans

1. Before permit issuance, stormwater infiltration devices located in landscape areas shall be reviewed and plans approved by the Landscape Planning Division. Any stormwater devices in parkway areas shall not displace street trees.
2. Show and dimension transformers set back 5' from paving all sides. Coordinate with landscape plans.
3. Note for compaction to be no greater than 85% at landscape areas. All finished grades at 1 ½" below finished surfaces. Slopes to be maximum 3:1.
4. Dimension, show and call out for step-outs at parking spaces adjacent to planters; a 12" wide monolithic concrete curb, DG paving or pavers with edging.
5. Add Note to Grading and Landscape Plans: Landscape areas where compaction has occurred due to grading activities and where trees or stormwater infiltration areas are located shall be loosened by soil fracturing. For trees, a 12'x12'x18" deep area; for stormwater infiltration, the entire area shall be loosened. Add the following information on the plans: The backhoe method of soil fracturing shall be used to break up compaction. A 4" layer of Compost is spread over the soil surface before fracturing is begun. The backhoe shall dig into the soil lifting and then drop the soil immediately back into the hole. The bucket then moves to the adjacent soil and repeats. The Compost falls into the spaces between the soil chunks created. Fracturing shall leave the soil surface quite rough with large soil clods. These must be broken by additional tilling. Tilling in more Compost to the surface after fracturing per the soil report will help create an A horizon soil. Imported or reused Topsoil can be added on top of the fractured soil as needed for grading. The Landscape Architect shall be present during this process and provide

certification of the soil fracturing. For additional reference, see Urban Tree Foundation – Planting Soil Specifications

Landscape Plans

6. During plan check, coordinate with Ontario Municipal Utilities Company (OMUC) to submit irrigation plans for recycled water systems to omucwaterquality@ontarioca.gov. OMUC shall review and approve irrigation systems utilizing recycled water prior to final landscape approval. Submit an electronic approval letter or memo from OMUC with resubmittal of the landscape package.
7. Landscape construction plans shall meet the requirements of the Landscape Development Guidelines. See http://www.ontarioca.gov/landscape-planning/standards
8. After a project's entitlement approval, the applicant shall pay all applicable fees for landscape plan check and inspections at a rate established by resolution of the City Council. Landscape construction plans with building permit number for plan check may be emailed to: landscapeplancheck@ontarioca.gov

THIS PROJECT SHALL COMPLY WITH THE REQUIREMENTS SET FORTH IN THE GENERAL STANDARD CONDITIONS OF APPROVAL ADOPTED BY THE CITY COUNCIL (RESOLUTION NO. 2017-027) AND THE PROJECT SPECIFIC CONDITIONS OF APPROVAL SPECIFIED HEREIN. ONLY APPLICABLE CONDITIONS OF APPROVAL ARE CHECKED. THE APPLICANT SHALL BE RESPONSIBLE FOR THE COMPLETION OF ALL APPLICABLE CONDITIONS OF APPROVAL PRIOR TO FINAL MAP OR PARCEL MAP APPROVAL, ISSUANCE OF PERMITS AND/OR OCCUPANCY CLEARANCE, AS SPECIFIED IN THIS REPORT.

1. PRIOR TO FINAL MAP OR PARCEL MAP APPROVAL, APPLICANT SHALL:

Check When Complete

☐ 1.01 Dedicate to the City of Ontario, the right-of-way, described below: ☐

_____ feet on _____

Property line corner 'cut-back' required at the intersection of _____ and _____.

☐ 1.02 Dedicate to the City of Ontario, the following easement(s): _____ ☐

_____

☐ 1.03 Restrict vehicular access to the site as follows: _____ ☐

☐ 1.04 Vacate the following street(s) and/or easement(s): ☐

A. All interfering on-site easements shall be quitclaimed, vacated, and/or submit non-interference letter from affected owner/utility company.

☐ 1.05 Submit a copy of a recorded private reciprocal use agreement or easement. The agreement or easement shall ensure, at a minimum, common ingress and egress and joint maintenance of all common access areas and drive aisles. ☐

☐ 1.06 Provide (original document) Covenants, Conditions and Restrictions (CC&Rs) as applicable to the project and as approved by the City Attorney and the Engineering and Planning Departments, ready for recordation with the County of San Bernardino. The CC&Rs shall provide for, but not be limited to, common ingress and egress, joint maintenance responsibility for all common access improvements, common facilities, parking areas, utilities, median and landscaping improvements and drive approaches, in addition to maintenance requirements established in the Water Quality Management Plan (WQMP), as applicable to the project. The CC&Rs shall also address the maintenance and repair responsibility for public improvements/utilities (sewer, water, storm drain, recycled water, etc.) located within open space/easements. In the event of any maintenance or repair of these facilities, the City shall only restore disturbed areas to current City Standards. ☐

☐ 1.07 For all development occurring south of the Pomona Freeway (60-Freeway) and within the specified boundary limits (per Boundary Map found at *http://tceplumecleanup.com/*), the property developer/owner is made aware of the South Archibald Trichloroethylene (TCE) Plume "Disclosure Letter". Property owner may wish to provide this Letter as part of the Real Estate Transfer Disclosure requirements under California Civil Code Section 1102 et seq. This may include notifications in the Covenants, Conditions and Restrictions (CC&Rs) or other documents related to property transfer and disclosures. Additional information on the plume is available from the Santa Ana Regional Water Quality Control Board at *http://geotracker.waterboards.ca.gov/profile_report?global_id=T10000004658.* ☐

☐ 1.08 File an application for Reapportionment of Assessment, together with payment of a reapportionment processing fee, for each existing assessment district listed below. Contact the Financial Services Department at (909) 395-2124 regarding this requirement. ☐

(1) _____

(2) _____

☐ 1.09 Prepare a fully executed Subdivision Agreement (on City approved format and forms) with accompanying security as required, or complete all public improvements. ☐

☐ 1.10 Provide a monument bond (i.e. cash deposit) in an amount calculated by the City's approved cost estimate spreadsheet (available for download on the City's website: www.ontarioca.gov) or as specified in writing by the applicant's Registered Engineer or Licensed Land Surveyor of Record and approved by the City Engineer, whichever is greater. ☐

☐ 1.11 Provide a preliminary title report current to within 30 days. ☐

☐ 1.12 File an application, together with an initial deposit (if required), to establish a Community Facilities District (CFD) pursuant to the Mello-Roos Community Facilities District Act of 1982. The application and fee shall be submitted a minimum of four (4) months prior to final subdivision map approval, and the CFD shall be established prior to final subdivision map approval or issuance of building permits, whichever occurs first. The CFD shall be established upon the subject property to provide funding for various City services. An annual special tax shall be levied upon each parcel or lot in an amount to be determined. The special tax will be collected along with annual property taxes. The City shall be the sole lead agency in the formation of any CFD. Contact Investment and Revenue Resources at (909) 395-2341 to initiate the CFD application process. ☐

☐ 1.13 Ontario Ranch Developments: ☐

☐ 1) Provide evidence of final cancellation of Williamson Act contracts associated with this tract, prior to approval of any final subdivision map. Cancellation of contracts shall have been approved by the City Council.

☐ 2) Provide evidence of sufficient storm water capacity availability equivalents (Certificate of Storm Water Treatment Equivalents).

☐ 3) Provide evidence of sufficient water availability equivalents (Certificate of Net MDD Availability).

☐ 1.14 Other conditions: _____ ☐

2. PRIOR TO ISSUANCE OF ANY PERMITS, APPLICANT SHALL:

A. GENERAL
(Permits includes Grading, Building, Demolition and Encroachment)

☐ 2.01 Record Parcel Map/Tract Map No. _____ pursuant to the Subdivision Map Act and in accordance with the City of Ontario Municipal Code. ☐

☐ 2.02 Submit a PDF of the recorded map to the City Engineer's office. ☐

☐ 2.03 Note that the subject parcel is a recognized parcel in the City of Ontario per _____. ☐

☐ 2.04 Note that the subject parcel is an 'unrecognized' parcel in the City of Ontario and shall require a Certificate of Compliance to be processed unless a deed is provided confirming the existence of the parcel prior to the date of March 4, 1972. ☐

☒ **2.05 Apply for a:** ☐

☐ Certificate of Compliance with a Record of Survey;

☒ **Lot Line Adjustment to merge APNs 0238-052-29, 0238-052-20, & 0238-052-22 (Record a Conforming Deed with the County of San Bernardino within six months of the recordation of the Lot Line Adjustment to conform the new LLA legal description. Submit a copy of the recorded Conforming Deed to the Engineering Department.);**

☐ Make a Dedication of Easement.

☐ 2.06 Provide (original document) Covenants, Conditions and Restrictions (CC&R's), as applicable to the project, and as approved by the City Attorney and the Engineering and Planning Departments, ready for recordation with the County of San Bernardino. The CC&R's shall provide for, but not be limited to, common ingress and egress, joint maintenance of all common access improvements, common facilities, parking areas, utilities and drive approaches in addition to maintenance requirements established in the Water Quality Management Plan (WQMP), as applicable to the project. ☐

☐ 2.07 For all development occurring south of the Pomona Freeway (60-Freeway) and within the specified boundary limits (per Boundary Map found at http://tceplumecleanup.com/), the property developer/owner is made aware of the South Archibald Trichloroethylene (TCE) Plume "Disclosure Letter". Property owner may wish to provide this Letter as part of the Real Estate Transfer Disclosure requirements under California Civil Code Section 1102 et seq. This may include notifications in the Covenants, Conditions and Restrictions (CC&Rs) or other documents related to property transfer and disclosures. Additional information on the plume is available from the Santa Ana Regional Water Quality Control Board at http://geotracker.waterboards.ca.gov/profile_report?global_id=T10000004658. ☐

☒ **2.08 Submit a soils/geology report.** ☐

☒ **2.09 Other Agency Permit/Approval: Submit a copy of the approved permit and/or other form of approval of the project from the following agency or agencies:** ☐

- ☐ State of California Department of Transportation (Caltrans)
- ☐ San Bernardino County Road Department (SBCRD)
- ☐ San Bernardino County Flood Control District (SBCFCD)
- ☐ Federal Emergency Management Agency (FEMA)
- ☐ Cucamonga Valley Water District (CVWD) for sewer/water service
- ☐ United States Army Corps of Engineers (USACE)
- ☐ California Department of Fish & Game
- ☒ **Inland Empire Utilities Agency (IEUA) – for connection to existing IEUA Recycled Water Line**
- ☐ Other: _____

☒ **2.10 Dedicate to the City of Ontario the right-of-way described below:** ☐

- **20 feet on East Airport Drive to achieve ultimate ROW of 50 feet on property frontage of APN 0238-052-29.**

Property line corner 'cut-back' required at the intersection of _____ and _____.

☐ 2.11 Dedicate to the City of Ontario the following easement(s):_____ ☐

_____

☒ **2.12 Vacate the following street(s) and/or easement(s):** ☐

A. All interfering on-site easements shall be quitclaimed, vacated, and/or submit non-interference letter from affected owner/utility company.

☐ 2.13 Ontario Ranch Developments: ☐

☐ 1) Submit a copy of the permit from the San Bernardino County Health Department to the Engineering Department and the Ontario Municipal Utilities Company (OMUC) for the destruction/abandonment of the on-site water well. The well shall be destroyed/abandoned in accordance with the San Bernardino County Health Department guidelines.

☐ 2) Make a formal request to the City of Ontario Engineering Department for the proposed temporary use of an existing agricultural water well for purposes other than agriculture, such as grading, dust control, etc. Upon approval, the Applicant shall enter into an agreement with the City of Ontario and pay any applicable fees as set forth by said agreement.

☐ 3) Design proposed retaining walls to retain up to a maximum of three (3) feet of earth. In no case shall a wall exceed an overall height of nine (9) feet (i.e. maximum 6-foot high wall on top of a maximum 3-foot high retaining wall.

☒ **2.14** **Submit a security deposit to the Engineering Department to guarantee construction of the public improvements required herein valued at 100% of the approved construction cost estimate. Security deposit shall be in accordance with the City of Ontario Municipal Code. Security deposit will be eligible for release, in accordance with City procedure, upon completion and acceptance of said public improvements.** ☐

☒ **2.15** **The applicant/developer shall submit all necessary survey documents prepared by a Licensed Surveyor registered in the State of California detailing all existing survey monuments in and around the project site. These documents are to be reviewed and approved by the City Survey Office.** ☐

☒ **2.16** **Pay all Development Impact Fees (DIF) to the Building Department. Storm Drain Development Impact Fee, approximately $293,401.95, shall be paid to the Building Department. Final fee shall be determined based on the approved site plan and the DIF rate at the time of payment.** ☐

☒ **2.17** **Other conditions:** ☐

- **Provide a preliminary title report current to within 30 days.**

B. PUBLIC IMPROVEMENTS
(See attached Exhibit 'A' for plan check submittal requirements.)

☒ **2.18** **Design and construct full public improvements in accordance with the City of Ontario Municipal Code, current City standards and specifications, master plans and the adopted specific plan for the area, if any. These public improvements shall include, but not be limited to, the following (checked boxes):**

Improvement	East Airport Drive (3)			
Curb and Gutter	☒ **New; 36 ft. from C/L (1)** ☐ Replace damaged ☒ **Remove and replace (2)**	☐ New; ___ ft. from C/L ☐ Replace damaged ☐ Remove and replace	☐ New; ___ ft. from C/L ☐ Replace damaged ☐ Remove and replace	☐ New; ___ ft. from C/L ☐ Replace damaged ☐ Remove and replace
AC Pavement	☐ Replacement ☒ **Widen 11 additional feet along frontage, including pavm't Transitions for APN: 0238-052-29**	☐ Replacement ☐ Widen ____ additional feet along frontage, including pavm't transitions	☐ Replacement ☐ Widen ____ additional feet along frontage, including pavm't transitions	☐ Replacement ☐ Widen ____ additional feet along frontage, including pavm't transitions
PCC Pavement (Truck Route Only)	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing
Drive Approach	☒ **New** ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace
Sidewalk	☒ **New** ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace
ADA Access Ramp	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace
Parkway	☒ **Trees** ☒ **Landscaping (w/irrigation)**	☐ Trees ☐ Landscaping (w/irrigation)	☐ Trees ☐ Landscaping (w/irrigation)	☐ Trees ☐ Landscaping (w/irrigation)
Raised Landscaped Median	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace	☐ New ☐ Remove and replace

Fire Hydrant	☒ **New / Upgrade** ☐ Relocation	☐ New / Upgrade ☐ Relocation	☐ New / Upgrade ☐ Relocation	☐ New / Upgrade ☐ Relocation
Sewer (see Sec. 2.C)	☒ **Main** ☒ **Lateral**	☐ Main ☐ Lateral	☐ Main ☐ Lateral	☐ Main ☐ Lateral
Water (see Sec. 2.D)	☐ Main ☒ **Service**	☐ Main ☐ Service	☐ Main ☐ Service	☐ Main ☐ Service
Recycled Water (see Sec. 2.E)	☒ **Main** ☒ **Service**	☐ Main ☐ Service	☐ Main ☐ Service	☐ Main ☐ Service
Traffic Signal System (see Sec. 2.F)	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing
Traffic Signing and Striping (see Sec. 2.F)	☒ **New** ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing
Street Light (see Sec. 2.F)	☒ **New / Upgrade** ☐ Relocation	☐ New / Upgrade ☐ Relocation	☐ New / Upgrade ☐ Relocation	☐ New / Upgrade ☐ Relocation
Bus Stop Pad or Turn-out (see Sec. 2.F)	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing	☐ New ☐ Modify existing
Storm Drain (see Sec. 2G)	☐ Main ☐ Lateral	☐ Main ☐ Lateral	☐ Main ☐ Lateral	☐ Main ☐ Lateral
Fiber Optics (see Sec. 2K)	☒ **Conduit / Appurtenances**	☐ Conduit / Appurtenances	☐ Conduit / Appurtenances	☐ Conduit / Appurtenances
Overhead Utilities	☒ **Underground** ☐ Relocate	☐ Underground ☐ Relocate	☐ Underground ☐ Relocate	☐ Underground ☐ Relocate
Removal of Improvements	_____ _____ _____	_____ _____ _____	_____ _____ _____	_____ _____ _____
Other Improvements	_____ _____ _____	_____ _____ _____	_____ _____ _____	_____ _____ _____

Specific notes for improvements listed in item no. 2.18, above:

1. **From West Property Line to about 399' Easterly.**
2. **From East Property Line to about 813' Westerly.**
3. **New curb & gutter, sidewalk, parkway is required for any removal of driveways.**

☒ **2.19** **Construct a 2" asphalt concrete (AC) grind and overlay on the following street(s):** ☐
1. East Airport Drive along property frontage from curb to centerline.

☐ 2.20 Reconstruction of the full pavement structural section, per City of Ontario Standard Drawing number 1011, may be required based on the existing pavement condition and final street design. Minimum limits of reconstruction shall be along property frontage, from street centerline to curb/gutter. ☐

☐ 2.21 Make arrangements with the Cucamonga Valley Water District (CVWD) to provide ☐ water service ☐ sewer service to the site. This property is within the area served by the CVWD and Applicant shall provide documentation to the City verifying that all required CVWD fees have been paid. ☐

☒ **2.22** **Overhead utilities shall be under-grounded, in accordance with Title 7 of the City's Municipal Code (Ordinance No. 2804 and 2892). Developer may pay in-lieu fee, for undergrounding of utilities in accordance with Section 7-7.302.e of the City's Municipal Code based on estimate approved by the City Engineer.** ☐

☐ 2.23 Other conditions: ☐
_____

C. SEWER

☐ 2.24 A _____inch sewer main is available for connection by this project in _____ ☐
(Ref: Sewer Drawing Number: _____)

☒ **2.25** **Design and construct a sewer main extension. A sewer main is not available for direct connection. The closest main is approximately 20 feet away.** ☐
(Ref: Sewer Drawing Number: S10194)

☐ 2.26 Submit documentation that shows expected peak loading values for modeling the impact of the subject project to the existing sewer system. The project site is within a deficient public sewer system area. Applicant shall be responsible for all costs associated with the preparation of the model. Based on the results of the analysis, Applicant may be required to mitigate the project impact to the deficient public sewer system, including, but not limited to, upgrading of existing sewer main(s), construction of new sewer main(s) or diversion of sewer discharge to another sewer. ☐

☒ **2.27** **Other conditions:** ☐
1. See attached Exhibit B for additional Sewer Conditions of approval from OMUC.

D. WATER

☒ **2.28** **A 12 inch water main is available for connection by this project in East Airport Drive.** ☐
(Ref: Water Drawing Number: W11120 & W11121)

☐ 2.29 Design and construct a water main extension. A water main is not available for direct connection. The closest main is approximately _____ feet away. ☐

☒ **2.30** **Other conditions:** ☐
1. See attached Exhibit B for additional Water Conditions of approval from OMUC.

E. RECYCLED WATER

☒ **2.31** **An 8-inch recycled IEUA recycled water main is available for connection by this project west of Wineville Avenue.** ☐

☒ **2.32** **Design and construct an on-site recycled water system for this project.** ☐

☐ 2.33 Design and construct an on-site recycled water ready system for this project. A recycled water main does not currently exist in the vicinity of this project but is planned for the near future. If Applicant would like to connect to this recycled water main when it becomes available, the cost for the connection shall be borne solely by the Applicant. ☐

☒ **2.34** **Submit one (1) electronic copy, in PDF format, of the Engineering Report (ER), for the use of recycled water to OMUC's Water Quality Programs at OMUCWQPlanCheck@ontarioca.gov for review and subsequent submittal to the California State Water Board (Division of Drinking Water) for final approval.** ☐

Note: Review and approval process may take up to three (3) months. Contact the OMUC's Water Quality Programs at (909) 395-2678 or email OMUCWQPlanCheck@ontarioca.gov regarding this requirement.

☒ **2.35** **Submit one (1) electronic copy, in PDF format, of the Landscape Plans (on-site & off-site) to OMUC's Water Quality Programs at OMUCWQPlanCheck@ontarioca.gov for review and approval.**

☒ **2.36** **Other conditions:** ☐

1. **See attached Exhibit B for additional Recycled Water Conditions of approval from OMUC.**

F. TRAFFIC / TRANSPORTATION

☐ 2.37 Submit a focused traffic impact study, prepared and signed by a Traffic/Civil Engineer registered in the State of California. The study shall address, but not be limited to, the following issues as required by the City Engineer: ☐

1. On-site and off-site circulation
2. Traffic level of service (LOS) at 'build-out' and future years
3. Impact at specific intersections as selected by the City Engineer

☐ 2.38 New traffic signal installations shall be added to Southern California Edison (SCE) customer account number # 2-20-044-3877. ☐

☒ **2.39** **Other conditions:** ☐

1. **The Applicant/Developer shall be responsible to design and construct street improvements along property frontage on Airport Drive in accordance with conditions issued by City's Land Development Division. These, and all other street improvements required herein, shall include, but not be limited to, concrete curb and gutter, sidewalk, LED street lights, signing and striping, and parkway landscaping.**
2. **Design and construct all proposed driveways in accordance with City of Ontario Standard Drawing No. 1204 for Commercial Driveways.**
3. **The Applicant/Developer shall restripe and maintain striping on Airport Drive along project frontage limits.**
4. **Property frontage along Airport Drive shall be signed "No Parking Anytime".**
5. **The Applicant/Developer shall be responsible to design and construct in-fill public street lights and a potential new service along its project frontage on Airport Drive. Street lighting shall be LED-type and in accordance with City's Approved Material List LED Luminaires. The Applicant/Developer shall also install smart nodes on all new street light fixtures along project frontage.**
6. **All landscaping, block walls, and other obstructions shall be compatible with the stopping sight distance requirements per City of Ontario Standard Drawing No. 1309.**
7. **The Applicant/Developer's engineer-of-record shall meet with City Engineering staff prior to designing and submitting for plan check the signing/striping and street lighting design plans to define limits of improvements.**

G. DRAINAGE / HYDROLOGY

☒ **2.40** **A 14-foot-wide catch basin is available to accept flows from this project on the Northeast corner of Airport Drive and Wineville Ave. (Ref: Storm Drain Drawing Number: D10420).** ☐

☒ **2.41** **Submit a hydrology study and drainage analysis, prepared and signed by a Civil Engineer registered in the State of California. The study shall be prepared in accordance with the San Bernardino County Hydrology Manual and City of Ontario standards and guidelines. Additional drainage facilities, including, but not limited to, improvements beyond the project frontage, may be required to be designed and constructed, by Applicant, as a result of the findings of this study.** ☐

☐ 2.42 An adequate drainage facility to accept additional runoff from the site does not currently exist downstream of the project. Design and construct a storm water detention facility on the project site. 100-year post-development peak flow shall be attenuated such that it does not exceed 80% of pre-development peak flows, in accordance with the approved hydrology study and improvement plans. ☐

☐ 2.43 Submit a copy of a recorded private drainage easement or drainage acceptance agreement to the Engineering Department for the acceptance of any increase to volume and/or concentration of historical drainage flows onto adjacent property, prior to approval of the grading plan for the project. ☐

☐ 2.44 Comply with the City of Ontario Flood Damage Prevention Ordinance (Ordinance No. 2409). The project site or a portion of the project site is within the Special Flood Hazard Area (SFHA) as indicated on the Flood Insurance Rate Map (FIRM) and is subject to flooding during a 100-year frequency storm. The site plan shall be subject to the provisions of the National Flood Insurance Program. ☐

☐ 2.45 Other conditions: _____ ☐

H. STORM WATER QUALITY / NATIONAL POLLUTANT DISCHARGE AND ELIMINATION SYSTEM (NPDES)

☐ 2.46 401 Water Quality Certification/404 Permit – Submit a copy of any applicable 401 Certification or 404 Permit for the subject project to the City project engineer. Development that will affect any body of surface water (i.e. lake, creek, open drainage channel, etc.) may require a 401 Water Quality Certification from the California Regional Water Quality Control Board, Santa Ana Region (RWQCB) and a 404 Permit from the United States Army Corps of Engineers (USACE). The groups of water bodies classified in these requirements are perennial (flow year round) and ephemeral (flow during rain conditions, only) and include, but are not limited to, direct connections into San Bernardino County Flood Control District (SBCFCD) channels.
If a 401 Certification and/or a 404 Permit are not required, a letter confirming this from Applicant's engineer shall be submitted.
Contact information: USACE (Los Angeles District) (213) 452-3414; RWQCB (951) 782-4130. ☐

☒ **2.47** **Submit a Water Quality Management Plan (WQMP). This plan shall be approved by the Engineering Department prior to approval of any grading plan. The WQMP shall be submitted, utilizing the current San Bernardino County Stormwater Program template, available at: http://www.sbcounty.gov/dpw/land/npdes.asp.** ☐

☐ 2.48 Design and construct a Connector Pipe Trash Screen or equivalent Trash Treatment Control Device, per catch basin located within or accepting flows tributary of a Priority Land Use (PLU) area that meets the Full Capture System definition and specifications, and is on the Certified List of the State Water Resources Control Board. The device shall be adequately sized per catch basin and include a deflector screen with vector control access for abatement application, vertical support bars, and removable component to facilitate maintenance and cleaning. ☐

☐ 2.49 Other conditions: _____ ☐

J. SPECIAL DISTRICTS

☐ 2.50 File an application, together with an initial deposit (if required), to establish a Community Facilities District (CFD) pursuant to the Mello-Roos Community Facilities District Act of 1982. The application and fee shall be submitted a minimum of four (4) months prior to final subdivision map approval, and the CFD shall be established prior to final subdivision map approval or issuance of building permits, whichever occurs first. The CFD shall be established upon the subject property to provide funding for various City services. An annual special tax shall be levied upon each parcel or lot in an amount to be determined. The special tax will be collected along with annual property taxes. The City shall be the sole lead agency in the formation of any CFD. Contact Investment and Revenue Resources at (909) 395-2341 to initiate the CFD application process. ☐

☐ 2.51 Other conditions: _____ ☐

K. FIBER OPTIC

☒ **2.52 A 2" fiber optic line is available for connection by this project in East Airport Drive. (Ref: Fiber Optic Drawing Number: O10174)** ☐

☒ **2.53 Design and construct fiber optic system to provide access to the City's conduit and fiber optic system per the City's Fiber Optic Master Plan. Building entrance conduits shall start from the closest OntarioNet hand hole constructed along the project frontage in the ROW and shall terminate in the main telecommunications room for each building. Conduit infrastructure shall interconnect with the primary and/or secondary backbone fiber optic conduit system at the nearest OntarioNet hand hole. Generally located approximately 250 feet from the west side of the property line on the south side of East Airport Drive.** ☐

☒ **2.54 Refer to the City's Fiber Optic Master Plan for design and layout guidelines. Contact the Broadband Operations Department at (909) 395-2000, regarding this requirement.** ☐

3. PRIOR TO ISSUANCE OF A CERTIFICATE OF OCCUPANCY, APPLICANT SHALL:

☒ **3.01 Set new monuments in place of any monuments that have been damaged or destroyed as a result of construction of the subject project. Monuments shall be set in accordance with City of Ontario standards and to the satisfaction of the City Engineer.** ☐

☒ **3.02 Complete all requirements for recycled water usage.** ☐

☒ 1) Procure from the OMUC a copy of the letter of confirmation from the California Department of Public Health (CDPH) that the Engineering Report (ER) has been reviewed and the subject site is approved for the use of recycled water.

☒ 2) Obtain clearance from the OMUC confirming completion of recycled water improvements and passing of shutdown tests and cross connection inspection, upon availability/usage of recycled water.

☒ 3) Complete education training of on-site personnel in the use of recycled water, in accordance with the ER, upon availability/usage of recycled water.

☒ **3.03 The applicant/developer shall submit all final survey documents prepared by a Licensed Surveyor registered in the State of California detailing all survey monuments that have been preserved, revised, adjusted or set along with any maps, corner records or Records of Survey needed to comply with these Conditions of Approvals and the latest edition of the California Professional Land Survey Act. These documents are to be reviewed and approved by the City Survey Office.** ☐

☐ 3.04 Ontario Ranch Projects: For developments located at an intersection of any two collector or arterial streets, the applicant/developer shall set a monument if one does not already exist at that intersection. Contact the City Survey office for information on reference benchmarks, acceptable methodology and required submittals. ☐

☒	3.05	**Confirm payment of all Development Impact Fees (DIF) to the Building Department.**	☐
☒	3.06	**Submit electronic copies (PDF and Auto CAD format) of all approved improvement plans, studies and reports (i.e. hydrology, traffic, WQMP, etc.).**	☐

4. PRIOR TO FINAL ACCEPTANCE, APPLICANT SHALL:

☒	4.01	**Complete all Conditions of Approval listed under Sections 1-3 above.**	☐
☒	4.02	**Pay all outstanding fees pursuant to the City of Ontario Municipal Code, including but not limited to, plan check fees, inspection fees and Development Impact Fees.**	☐
☒	4.03	**The applicant/developer shall submit a written request for the City's final acceptance of the project addressed to the City Project Engineer. The request shall include a completed Acceptance and Bond Release Checklist, state that all Conditions of Approval have been completed and shall be signed by the applicant/developer. Upon receipt of the request, review of the request shall be a minimum of 10 business days. Conditions of Approval that are deemed incomplete by the City will cause delays in the acceptance process.**	☐
☒	4.04	**Submit record drawings (PDF) for all public improvements identified within Section 2 of these Conditions of Approval.**	☐

EXHIBIT 'A'

ENGINEERING DEPARTMENT
First Plan Check Submittal Checklist

Project Number: PDEV22-017

The following items are required to be included with the first plan check submittal:

1. ☒ **A copy of this check list**
2. ☒ **Payment of fee for Plan Checking**
3. ☒ **Digital copy of Engineering Cost Estimate (on City form) with engineer's wet signature and stamp.**
4. ☒ **Digital copy of project Conditions of Approval**
5. ☒ **Include a PDF (electronic submittal) of each required improvement plan at every submittal.**
6. ☐ Two (2) sets of Potable and Recycled Water demand calculations (include water demand calculations showing low, average and peak water demand in GPM for the proposed development and proposed water meter size).
7. ☒ **Digital copy of Public Street improvement plan with street cross-sections**
8. ☐ Digital copy of Public Water improvement plan (include water demand calculations showing low, average and peak water demand in GPM for the proposed development and proposed water meter size)
9. ☒ **Digital copy of Recycled Water improvement plan (include recycled water demand calculations showing low, average and peak water demand in GPM for the proposed development and proposed water meter size and an exhibit showing the limits of areas being irrigated by each recycled water meter)**
10. ☒ **Digital copy of Public Sewer improvement plan**
11. ☐ Digital copy of Public Storm Drain improvement plan
12. ☒ **Digital copy of Public Street Light improvement plan**
13. ☒ **Digital copy of Signing and Striping improvement plan**
14. ☒ **Digital copy of Fiber Optic plan (include Auto CAD electronic submittal)**
15. ☐ Digital copy of HOA Landscape improvement plans. Show corner sight line distance per engineering standard drawing 1309.
16. ☐ Digital copy of CFD Landscape improvement plans. Show corner sight line distance per engineering standard drawing 1309.
17. ☒ **Digital copy of Dry Utility plans within public right-of-way (at a minimum the plans must show existing and ultimate right-of-way, curb and gutter, proposed utility location including centerline dimensions, wall to wall clearances between proposed utility and adjacent public line, street work repaired per Standard Drawing No. 1306. Include Auto CAD electronic submittal)**
18. ☐ Digital copy of Traffic Signal improvement plan and One (1) copy of Traffic Signal Specifications with modified Special Provisions. Please contact the Traffic Division at (909) 395-2154 to obtain Traffic Signal Specifications.
19. ☒ **Digital copy of Water Quality Management Plan (WQMP), including one (1) copy of the approved Preliminary WQMP (PWQMP).**

20. ☒ **Digital copy of Hydrology/Drainage study**

21. ☒ **Digital copy of Soils/Geology report**

22. ☐ Payment for Final Map/Parcel Map processing fee

23. ☐ Digital copy of Final Map/Parcel Map

24. ☐ Digital copy of approved Tentative Map

25. ☒ **Digital copy of Preliminary Title Report (current within 30 days)**

26. ☐ Digital copy of Traverse Closure Calculations

27. ☐ One (1) set of supporting documents and maps (legible copies): referenced improvement plans (full size), referenced record final maps/parcel maps (full size, 18"x26"), Assessor's Parcel map (full size, 11"x17"), recorded documents such as deeds, lot line adjustments, easements, etc.

28. ☒ **Digital copy of Engineering Report and an electronic file (include PDF format electronic submittal) for recycled water use**

29. ☒ **Other:**
    - **Digital copy of the LLA form (include all the items in the LLA application checklist)**

Exhibit 'B'

CITY OF ONTARIO
MEMORANDUM

ONTARIO MUNICIPAL UTILITIES COMPANY

DATE: August 10, 2023
TO: Angela Truong, Engineering Department
Fred Addison, Engineering Department
CC: Thomas Grahn, Planning Department

FROM: Jeff Krizek, Utilities Engineering Division (QCR: HY)
SUBJECT: DPR4 (Sub04 Rev03) & Utilities Engineering Conditions of Approval (COAs) (**#9409**)
PROJECT NO.: **PDEV22-017**

BRIEF DESCRIPTION:

PDEV22-017: *PDEV22-017 - A Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land (0.47 FAR) located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district (APNs: 0238-052-29 and 0238-052-20).*

OMUC UTILITIES ENGINEERING DIVISION
CONDITIONS OF APPROVAL

CONDITIONS OF APPROVAL: *The Ontario Municipal Utilities Company (OMUC) Utilities Engineering Division recommends this application for approval subject to the Conditions of Approval outlined below and compliance with the City's Design Development Guidelines, Specifications Design Criteria, and City Standards. The Applicant shall be responsible for the compliance with and the completion of all the following applicable Conditions of Approval prior to the following milestones and subject to compliance with City's Design Development Guidelines, Specifications Design Criteria, and City Standards:*

General Conditions:

1. Standard Conditions of Approval: Project shall comply with the requirements set forth in the Amendment to the Standard Conditions of Approval for New Development Projects adopted by the City Council (Resolution No. 2017-027) on April 18, 2017, or as amended or superseded by Council Resolution; as well as project-specific conditions/requirements as outlined below.

Prior to Issuance of Any Permits (Grading, Building, Demolition and Encroachment), unless other timeline milestones are specified by individual conditions below, the Applicant Shall:

General Conditions (Section 2.A, Other conditions): The Applicant shall comply with the following:

2. Inherited Requirements and Conditions of Approval: Not Applicable.
3. Final Utilities Systems Map (USM): Submit a Final Utilities Systems Map (USM) as part of the precise grading plan submittal that meets all the City's USM requirements. These requirements include to show and label all existing and proposed utilities (including all appurtenances such as backflow devices, DCDAs, etc.), sizes, points of connection, and any easements. The final utility design shall comply with all Division of Drinking Water (CCR §64572) Separation Requirements. See Utility Systems Map (USM) Requirements document for details.
4. Unused Service Abandonment: All adjacent water services (along with connected appurtenances) and sewer laterals and main stubs along the frontages of the project site not used to provide service to this Development Project shall be abandoned back to the main in accordance with City Standards and Practices.

Sanitary Sewer Conditions (Section 2.C): The Applicant shall comply with the following:

5. Sanitary Sewer Main Improvements:
    a. Install 8-inch Public Sewer Main in Airport Drive connecting to existing public sewer manhole west of the Project site and extend easterly in Airport Drive to a point that will serve the entire Project.
6. Sanitary Sewer Service:
    a. Each building and its onsite private sewer system shall discharge wastewater to the Public Sanitary Sewer System through a Public Sewer Lateral per Standard #2003. The quantity of Public Sewer Laterals for each building shall be limited to the minimum necessary to meet all of the conditions of approved and as limited by the City.
    b. Public Sewer Laterals and Storm Water Quality Improvements: No storm water quality improvements (infiltration, detention, retention, bioswale, etc) shall be installed above or within 5 feet of any Public Sewer Lateral.
7. Private Onsite Sewer System and Plumbing: The Onsite Sewer System shall be privately maintained by the property owner and shall meet the following requirements:
    a. For wastewater flows for non-residential uses:
        i. The Onsite sewer system and building plumbing shall be designed in such a way that the sanitary domestic wastewater flows leave the building separately from non-sanitary wastewater flows (industrial, process, or kitchen, etc.) and the line for non-sanitary wastewater flows can be upgraded in the future to have pretreatment equipment and devices on it, as required by a Wastewater Discharge Permit.
        ii. Each building and each connection from the Onsite Sewer System to the Public Sewer System shall have an onsite monitoring manhole prior to the point of connection with the Public Sewer System.
    b. Private Onsite Sewer and Storm Water Quality Improvements: No storm water quality improvements (infiltration, detention, retention, bioswale, etc) shall be installed above or within 5 feet of any Private Onsite Sewer pipes.
8. Wastewater Discharge: For Non-Residential Uses: each Occupant of the building, or units, as applicable, shall apply for a Wastewater Discharge Permit for their Establishment, and shall comply with all the requirements of their Wastewater Discharge Permit. Requirements of Wastewater Discharge Permit may include, but not limited to include installing a monitoring manhole, clarifier, interceptor, or other wastewater pretreatment equipment.
9. Septic Systems:
    a. Abandon any existing septic tank(s) on the property per State, County, and City standards.
    b. Onsite Wastewater Treatment Systems (OWTS) are not allowed. Entire Project shall connect to Public Sewer.

Potable Water Conditions (Section 2.D): The Applicant shall comply with the following:

10. Potable Water Service:
    a. Domestic Service:
        i. Each building shall have its own potable water service and meter with backflow prevention device connected to the Public Potable Water System.
    b. Irrigation Service: For landscape irrigation uses that are not served by Recycled Water, the landscape irrigation uses shall have a separate irrigation water service and meter with backflow prevention device connected to the Public Potable Water System separate from the domestic water uses and the onsite plumbing systems shall be also separate from each other.
        i. Community Service District (CFD) Maintained Irrigation Areas: Any irrigated areas that are to be maintained by a Community Service District (CFD) and not by the property owner or owners association require irrigation services and meters separate from those that are maintained by the property owner or owners association.
    c. Backflow Prevention: Each Meter connected to the Public Potable Water System that serves any use that is more than one (1) single family residential unit or any non-residential use requires a backflow prevention device.

d. Fire Water Service: For onsite private Fire System uses:

   i. Where the domestic water service and meters connected to the Public Potable Water System that serves any use that is more than one (1) single family detached residential unit, or any non-residential use: if an onsite private fire system is required, then a separate Fire Service with Double Check Detector Assembly (DCDA) per City Standard #4208 connected to the Public Potable Water System is required, to serve the onsite private fire system. The onsite fire system and onsite domestic water plumbing system shall be separate.

e. Fire Hydrants:

   i. Fire Hydrants along Public Potable Water Mains shall be installed to be spaced a maximum of 300 feet apart or per Fire Department Standards/Requirements, whichever is closer.

   ii. Existing Public Fire Hydrants along the Project frontage that do not meet current City Standards shall be abandoned back to main and replaced with new Fire Hydrants that meet current City Standards.

f. Private Onsite Water System and Plumbing: The Onsite Water Systems (Domestic, Fire, Irrigation) shall be privately maintained by the property owner.

g. Relocated Services: For any existing service with appurtenances to be relocated, the service shall be abandoned back to the main connection and the service and appurtenances shall be installed new per related City Standards.

Recycled Water Conditions (Section 2.E): The Applicant shall comply with the following:

11. City Ordinance 2689: This development shall comply with City Ordinance 2689 and make use of recycled water for all approved uses, including but not limited to landscape irrigation for HOA maintained areas and parks. Appropriately sized public and private mains shall be installed throughout the Project to meet this requirement, as approved by the City.

12. Recycled Water Mains Improvements:

    a. Install 8-inch Recycled Water main in Airport Drive connecting to the existing IEUA Recycled Water west of Wineville Avenue and extending easterly in Airport Drive to the easterly property line of the Project.

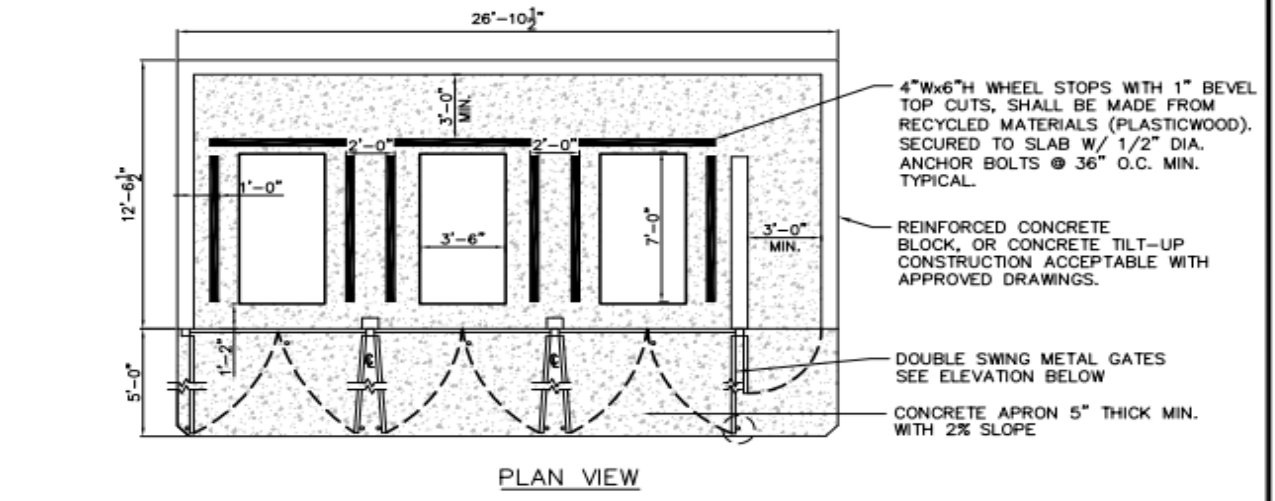
13. Recycled Water Service: In order to comply with City Ordinance 2689:

    a. Recycled Water Services with Meters:
       i. Private Property Owner Maintained Uses: Each parcel/lot shall have its own separate Recycled Water Service with Meter serving the parcel/lot for Private Property Owner Maintained Landscape Irrigation Uses. If Recycled Water is going to be used for uses other than Landscape Irrigation, then a second separate Recycled Water Service with Meter is required to serve the non-Landscape Irrigation uses.
       ii. Community Service District (CFD) Maintained Irrigation Areas: Any irrigated areas that are to be maintained by a Community Service District (CFD) and not by the property owner or owners association require irrigation services and meters separate from those that are maintained by the property owner or owners association

14. RW Program Requirements: In order to receive RW service, the applicant shall comply with each of the following:
    a. Prior to Precise Grading Plan Approval and Building Permits Issuance:
       i. Provide two hard copies and the digital files (in PDF and AutoCAD format) for both on-site and off-site utility plans, including landscape and irrigation improvements.
       ii. Submit an **Engineering Report (ER)** to the City detailing recycled water usage for review and approval by the City and the State. The review process for the ER is typically 3 months. City will coordinate the State's approval of the ER.
       iii. For details, contact OMUCWQPlanCheck@ontarioca.gov.
    b. Prior to Occupancy Release/Finalizing:
       i. Pass start-up and cross-connection test successfully.
       ii. Provide evidence demonstrating the training of on-site supervisor or designee as determined in the ER.

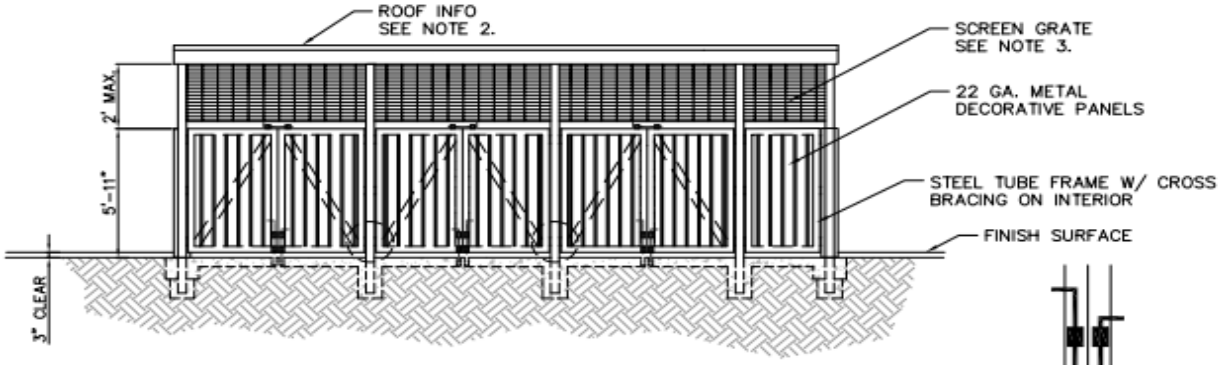
CITY OF ONTARIO
MEMORANDUM

FROM: **Heather Lugo, MA, Police Department**



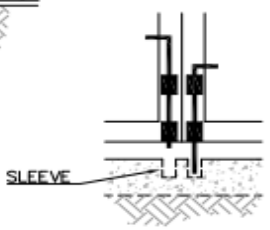
DATE: **March 6, 2024 REVISED March 26, 2024**

SUBJECT: **PDEV22-017 - A Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land (0.47 FAR) located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district (APNs: 0238-052-29 and 0238-052-20).**



The "Standard Conditions of Approval" contained in Resolution No. 2017-027 apply. The applicant shall read and be thoroughly familiar with these conditions, including, but not limited to, the requirements below.

- Required lighting for all walkways, driveways, doorways, parking lots, hallways and other areas used by the public shall be provided. Lights shall operate via photosensor. Photometrics shall be provided to the Police Department and include the types of fixtures proposed and demonstrate that such fixtures meet the vandal-resistant requirement. Planned landscaping shall not obstruct lighting.
- Rooftop addresses shall be installed on the buildings as stated in the Standard Conditions. The numbers shall be at a minimum 6 feet tall and 2 foot wide, in reflective white paint on a flat black background, and oriented with the bottom of the numbers towards the addressed street. Associated letters shall also be included.
- The Applicant shall comply with construction site security requirements as stated in the Standard Conditions.
- Per conversation with John Carter – Prologis is building the "shell" of the building. Cameras would be added during the tenant build of the project. Applicant shall install a video surveillance system on the site. Cameras shall cover at a minimum all entry doors, all cash registers, and at least one camera shall capture any vehicle utilizing the drive-thru. Cameras shall be positioned to maximize the coverage of patrons and vehicles in these areas. Cameras shall record at least 15 frames per second and at a minimum of 640x480 lines of resolution. Recordings shall be stored for a minimum of 30 days and made available upon request to any member of the Ontario Police Department.
- All exterior electrical outlets shall be secured and locked.
- All exterior water spigots / water supply sources shall be secured and locked.
- Trash enclosure shall be fully secured/enclosed by locks, mesh, and screen grate to reduce crime and encampment opportunities for homeless persons.



The Applicant is invited to contact Heather Lugo at (909) 408-1074 with any questions or concerns regarding these conditions.

COMMERCIAL/INDUSTRIAL REFUSE, RECYCLING AND ORGANICS ENCLOSURE (THREE 4–6 CU. YD. BINS)

CITY OF ONTARIO
MEMORANDUM

TO: **Thomas Grahn, Senior Planner**
Planning Department

FROM: **Paul Ehrman, Sr. Deputy Fire Chief/Fire Marshal**
Fire Department

DATE: **October 3, 2023**

SUBJECT: **PDEV22-017 - A Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land (0.47 FAR) located at 5355 East Airport Drive, within the IH (Heavy Industrial) zoning district (APNs: 0238-052-29 and 0238-052-20). (*Revision 3*).**

☒ The plan **does** adequately address Fire Department requirements at this time.

☒ Standard Conditions of Approval apply, as stated below.

SITE AND BUILDING FEATURES:

A. 2019 CBC Type of Construction: III-B

B. Type of Roof Materials: Panelized

C. Ground Floor Area(s): 255,337 Sq. Ft.

D. Number of Stories: 1 w/ Mezzanine

E. Total Square Footage: 270,337 Sq. Ft.

F. 2019 CBC Occupancy Classification(s): S-1

CONDITIONS OF APPROVAL:

1.0 GENERAL

☒ 1.1 The following are the Ontario Fire Department ("Fire Department") requirements for this development project, based on the current edition of the California Fire Code (CFC), and the current versions of the Fire Prevention Standards ("Standards.") It is recommended that the applicant or developer transmit a copy of these requirements to the on-site contractor(s) and that all questions or concerns be directed to the Bureau of Fire Prevention, at (909) 395-2029. For copies of Ontario Fire Department Standards please access the City of Ontario web site at www.ontarioca.gov/Fire/Prevention.

☒ 1.2 These Fire Department conditions of approval are to be included on any and all construction drawings.

2.0 FIRE DEPARTMENT ACCESS

☒ 2.1 Fire Department vehicle access roadways shall be provided to within 150 ft. of all portions of the exterior walls of the first story of any building, unless specifically approved. Roadways shall be paved with an all-weather surface and shall be a minimum of twenty-four (24) ft. wide. See Standard #B-004.

☒ 2.2 In order to allow for adequate turning radius for emergency fire apparatus, all turns shall be designed to meet the minimum twenty five feet (25') inside and forty-five feet (45') outside turning radius per Standard #B-005.

☒ 2.3 Fire Department access roadways that exceed one hundred and fifty feet (150') in length shall have an approved turn-around per Standard #B-002.

☒ 2.4 Access drive aisles which cross property lines shall be provided with CC&Rs, access easements, or reciprocating agreements, and shall be recorded on the titles of affected properties, and copies of same shall be provided at the time of building plan check.

☒ 2.5 "No Parking-Fire Lane" signs and /or red painted curbs with lettering are required to be installed in interior access roadways, in locations where vehicle parking would obstruct the minimum clear width requirement. Installation shall be per Standard #B-001.

☒ 2.6 Security gates or other barriers on fire access roadways shall be provided with a Knox brand key switch or padlock to allow Fire Department access. See Standards #B-003, B-004 and H-001.

☒ 2.7 Any time PRIOR to on-site combustible construction and/or storage, a minimum twenty-four (24) ft. wide circulating all weather access roads shall be provided to within 150 ft. of all portions of the exterior walls of the first story of any building, unless specifically approved by fire department and other emergency services.

3.0 WATER SUPPLY

☒ 3.1 The required fire flow per Fire Department standards, based on the 2019 California Fire Code, Appendix B, is 4000 gallons per minute (g.p.m.) for 4 hours at a minimum of 20 pounds per square inch (p.s.i.) residual operating pressure.

☒ 3.2 Off-site (public) fire hydrants are required to be installed on all frontage streets, at a minimum spacing of three hundred foot (300') apart, per Engineering Department specifications.

☒ 3.3 Buildings that exceed 100,000 square feet in floor area shall provide an onsite looped fire protection water line around the building(s.) The loops shall be required to have two or more points of connection from a public circulating water main.

☒ 3.4 The water supply, including water mains and fire hydrants, shall be tested and approved by the Engineering Department and Fire Department prior to combustible construction to assure availability and reliability for firefighting purposes.

4.0 FIRE PROTECTION SYSTEMS

☒ 4.1 On-site private fire hydrants are required per Standard #D-005, and identified in accordance with Standard #D-002. Installation and locations(s) are subject to the approval of the Fire Department. An application with detailed plans shall be submitted, and a construction permit shall be issued by the Fire Department, prior to any work being done.

☒ 4.2 Underground fire mains which cross property lines shall be provided with CC & R, easements, or reciprocating agreements, and shall be recorded on the titles of affected properties, and copies of same shall be provided at the time of fire department plan check. The shared use of private fire mains or fire pumps is allowable only between immediately adjacent properties and shall not cross any public street.

☒ 4.3 An automatic fire sprinkler system is required. The system design shall be in accordance with National Fire Protection Association (NFPA) Standard 13. All new fire sprinkler systems, except those in single family dwellings, which contain twenty (20) sprinkler heads or more shall be monitored by an approved listed supervising station. An application along with detailed plans shall be submitted, and a construction permit shall be issued by the Fire Department, prior to any work being done.

☒ 4.5 Fire Department Connections (FDC) shall be located on the address side of the building within one hundred fifty feet (150') of a public fire hydrant on the same side of the street. Provide identification for all fire sprinkler control valves and fire department connections per Standard #D-007. Raised curbs adjacent to Fire Department connection(s) shall be painted red, five feet either side, per City standards.

☒ 4.6 A fire alarm system is required. The system design shall be in accordance with National Fire Protection Association (NFPA) Standard 72. An application along with detailed plans shall be submitted, and a construction permit shall be issued by the Fire Department, prior to any work being done.

☒ 4.7 Portable fire extinguishers are required to be installed prior to occupancy per Standard #C-001. Please contact the Fire Prevention Bureau to determine the exact number, type and placement required.

5.0 BUILDING CONSTRUCTION FEATURES

☒ 5.1 The developer/general contractor is to be responsible for reasonable periodic cleanup of the development during construction to avoid hazardous accumulations of combustible trash and debris both on and off the site.

☒ 5.2 Approved numbers or addresses shall be placed on all new and existing buildings in such a position as to be plainly visible and legible from the street or road fronting the property. Multi-tenant or building projects shall have addresses and/or suite numbers provided on the rear of the building. Address numbers shall contrast with their background. See Section 9-1 6.06 of the Ontario Municipal Code and Standards #H-003 and #H-002.

☒ 5.6 Knox ® brand key-box(es) shall be installed in location(s) acceptable to the Fire Department. All Knox boxes shall be monitored for tamper by the building fire alarm system. See Standard #H-001 for specific requirements.

☒ 5.7 Placards shall be installed in acceptable locations on buildings that store, use or handle hazardous materials in excess of the quantities specified in the CFC. Placards shall meet the requirements of National Fire Protection Association (NFPA) Standard 704.

6.0 OTHER SPECIAL USES

☒ 6.1 The storage, use, dispensing, or handling of any hazardous materials shall be approved by the Fire Department, and adequate fire protection features shall be required. If hazardous materials are proposed, a Fire Department Hazardous Materials Information Packet, including Disclosure Form and Information Worksheet, shall be completed and submitted with Material Safety Data Sheets to the Fire Department along with building construction plans.

☒ 6.2 Any High Piled Storage, or storage of combustible materials greater than twelve (12') feet in height for ordinary (Class I-IV) commodities or storage greater than six feet (6') in height of high hazard (Group A plastics, rubber tires, flammable liquids, etc.) shall be approved by the Fire Department, and adequate fire protection features shall be required. If High Piled Storage is proposed, a Fire Department High Piled Storage Worksheet shall be completed and detailed racking plans or floor plans submitted prior to occupancy of the building.

☒ 6.3 Underground fuel tanks, their associated piping and dispensers shall be reviewed, approved, and permitted by Ontario Building Department, Ontario Fire Department, and San Bernardino County Fire Department Hazardous Materials Division. In fueling facilities, an exterior emergency pump shut-off switch shall be provided.

CITY OF ONTARIO PLANNING DEPARTMENT

Appeal Application Form

303 East B Street, Ontario, California 91764 Phone: 909.395.2036 / Fax: 909.395.2420

Dear Applicant:

In an effort to improve customer service and ensure development projects are processed as quickly as possible, the Planning Department finds it necessary to remind its clients that complete application submittals are crucial to the plan review process. In the past, accepting incomplete applications has led to errors and time delays at the end of the review process. I do not want this to happen to you.

Consequently, the Planning Department staff will only accept complete applications at time of submittal. All items listed on the enclosed application form must be provided before the Planning Department counter staff can accept your application for filing. Please review these minimum requirements prior to submitting your application, as counter staff do not have the authority to waive these requirements.

Please remember that failure to provide all of the required plans and information will result in significant time delays in the processing of your application. If you have any questions regarding the necessity of any particular item requested on the application form, please feel free to contact the Planning Department counter supervisor to discuss your questions.

The Planning Department looks forward to a continued efficient and professional relationship with you in the future. If you have any questions, comments, or concerns regarding this matter, please feel free to contact the Planning Department at (909) 395-2036.

Respectfully,

Henry K. Noh
Planning Director

ATTENTION!

The City of Ontario strives to provide you with efficient and effective service in a businesslike manner. We are committed to the principle that every interaction you have with the City must be based on honesty and integrity.

City employees are prohibited by law from soliciting or accepting money, services, or gifts of any kind in connection with the discharge of their duties.

If you are approached or are aware of any violation of this policy, please immediately contact any of the following:

Scott Ochoa, City Manager .....(909) 395-2396 or sochoa@ontarioca.gov
Mike Lorenz, Police Chief ..... (909) 395-2710 or mlorenz@ontarioca.gov
Ethics Line .....(800) 500-0333

CITY OF ONTARIO PLANNING DEPARTMENT

Appeal Application Form

303 East B Street, Ontario, California 91764 Phone: 909.395.2036 / Fax: 909.395.2420

Instructions:

1. *Pursuant to Ontario Development Code Division 2.04 (Appeals), any person having legal standing may appeal and action or decision to the Appeal Authority, including but not limited to an applicant, resident, business owner, or any person owning real property within the City, that is aggrieved by an interpretation, action, or decision made by any City agency or department, or by an Approving Authority.*

2. *Within 10 days following the action or decision being appealed, an appeal request must be filed with the Planning Department on an Appeal Application Form, along with the required filing fees. The appeal request must include a statement identifying the specific action or decision that is being appealed, the specific grounds for the appeal, and the relief requested from the Appeal Authority.*

3. *An appeal of an action or decision made by an Approving Authority following a hearing, is limited to those matters raised during the hearing and contained in an appeal statement. The Appeal Authority cannot consider any matter that was not raised during the hearing before the Approving Authority and contained in the appeal statement.*

4. *The Appeal Authority that will hear the appeal request is limited to taking testimony and making its decision based solely on the specific grounds specified by the appellant in the Appeal Application Form, insofar as they make an adequate claim pursuant to Ontario Development Code Section 2.04.010. When the decision of an Approving Authority is appealed, you are limited to raising only those issues you or someone else raised during the hearing before the Approving Authority and stated in the Appeal Application Form.*

SUBJECT OF APPEAL

This application is hereby filed pursuant to Ontario Development Code Division 2.04 (Appeals), appealing a decision or action of the following Authority:

☐ Department/Agency Head ☐ Development Advisory Board ☐ Zoning Administrator

☐ Historic Preservation Subcommittee ☐ Historic Preservation Commission ☒ Planning Commission

Project File No(s).: PDEV22-017; SCH No. 2022090006 Date of Action/Decision: August 27, 2024

The application being appealed requests the following *(attach additional sheets as necessary)*:

File No. PDEV22-017 seeks certification of a Final Environmental Impact Report (State Clearinghouse No. 202209006) and approval of a Development Plan.

Please see attached letter.

List the specific action(s) or decision(s) that is/are being appealed (attach additional sheets as necessary):

CARE CA appeals all actions taken by the Planning Commission at the August 27, 2024 hearing relating to File No. PDEV22-017.

These actions include certification of a Final Environmental Impact Report (State Clearinghouse No. 202209006), adoption of a Mitigation Monitoring and Reporting Program and a Statement of Overriding Considerations, in conjunction with approval of a Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land located at 5355 East Airport Drive, and related findings.

APPEAL STATEMENT

Please check the box that best describes your reason(s) for the appeal:

- ☐ Abuse of discretion.
- ☐ Decision was not supported by the record.
- ■ Abuse of discretion and decision was not supported by the record.

State the specific grounds for the appeal and the relief requested (please be specific and attach additional sheets if necessary):

The Planning Commission's certification of the Final EIR and approval of the development plan were contrary to law and unsupported by the record. The Final EIR failed to comply with CEQA by failing to accurately disclose potentially significant impacts, failing to support its significance findings with substantial evidence, and failing to mitigate the Project's significant impacts to the greatest extent feasible. The Planning Commission lacked substantial evidence to make the findings in Section 4.02.025(D) of the City of Ontario Municipal Code necessary to approve the development plan.

CARE CA respectfully requests that the City set a hearing on this appeal, and that the City Council uphold this appeal, vacate the Planning Commission's approval of the Project, and direct staff to revise and recirculate the EIR to comply with CEQA before the Project can be reconsidered for approval.

Please see attached letter.

APPELLANT ACKNOWLEDGEMENT

I, the undersigned, hereby certify that the statements and information provided in this **Appeal Application Form**, and in any attached exhibits, present the data and information required for this application to the best of my ability, and that the facts, statements and information presented are true and correct to the best of my knowledge and belief.

Date: September 5, 2024 Signature:

Re: Appeal to City Council of Planning Commission Approval of the 5355 East Airport Drive Project (File No. PDEV22-017; SCH No. 2022090006)

Dear Mayor Leon, Mayor pro tem Porada, City Council Members, Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit this appeal to the City Council of the Planning Commission's ("Commission") August 27, 2024 approvals of the 5355 East Airport Drive Project (File No. PDEV22-017; SCH No. 2022090006) ("Project"), proposed by Prologis Inc. ("Applicant").

The scope of the Commission's determination for File No. PDEV22-017 includes certification of a Final Environmental Impact Report (State Clearinghouse No. 202209006) ("FEIR"), including the adoption of a Mitigation Monitoring and Reporting Program and a Statement of Overriding Considerations, in conjunction with approval of a Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land located at 5355 East Airport Drive, and related findings.

printed on recycled paper

CARE CA submitted comments on the Project's Draft EIR ("DEIR") on October 5, 2023 during the public review period required by Section 15087 of the California Environmental Quality Act ("CEQA") Guidelines.[1] CARE CA's comments on the DEIR demonstrated that the DEIR failed to comply with CEQA by failing to accurately disclose potentially significant health risk, air quality, GHG, energy, and soil contamination impacts, failing to support its significance findings with substantial evidence, and failing to mitigate the Project's significant impacts to the greatest extent feasible, in violation of CEQA.

The City subsequently prepared the FEIR, which the City claims fully resolves the issues identified in CARE CA's comments and by other commenters. But CARE CA submitted comments demonstrating that the FEIR fails to meet CEQA's requirements. Staff reports prepared for the Planning Commission erroneously claim that that the FEIR has adequately addressed CARE CA's comments. This is incorrect. The staff reports mainly reiterate the flawed reasoning and conclusions of the FEIR. As such, although the City has prepared several documents which purport to respond to CARE CA's comments, the City has not resolved the issues raised in CARE CA's comments and the FEIR remains in violation of CEQA. The Planning Commission's approval of the Project and certification of the FEIR violated CEQA and land use laws because the City has not complied with its duty to disclose and mitigate the Project's potentially significant environmental and land use impacts, and the Planning Commission's approval findings were not supported by substantial evidence.

CARE CA hereby appeals all actions taken by the Commission with regard to the Project under File No. PDEV22-017. This appeal is timely filed in compliance with the Ontario Development Code.[2] The reasons for this appeal are set forth herein and in the attachments, which include CARE CA's comments on the DEIR,[3] FEIR,[4] and two letters to the Planning Commission responding to staff reports

[1] 14 Cal. Code Regs. §§ 15000 et seq.; *see* Cal. Pub. Res. Code §§ 21000 et seq.
[2] Section 2.04.010(B)(1).
[3] **Attachment A**: Letter from Adams Broadwell Joseph & Cardozo ("ABJC") to City re: Comments on the Draft Environmental Impact Report for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) (October 5, 2023).
[4] **Attachment B**: Letter from ABJC to City re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006) (April 15, 2024).

printed on recycled paper

prepared for the Project.[5] We incorporate by reference the attached comments and exhibits, which are in the City's record of proceedings for the Project.[6]

The Commission abused its discretion and failed to proceed in the manner required by law by approving the Project in reliance on a deficient CEQA document and without substantial evidence to support the approval findings.[7] CARE CA respectfully requests that the City Council vacate the Commission's approval of the Project.

A. Standing to Appeal and Statement of Interest

Section 2.04.010(B)(1) of the Ontario Development Code provides that the decision of the Approving Authority may be appealed within 10 days of the action or decision. Because the Planning Commission approved the Project on August 27, the final day to submit an appeal is September 6. Thus, this appeal is timely filed.

Section 2.04.005 of the Code provides that "[a]ny person having legal standing, including but not limited to an applicant, resident, business owner, or any person owning real property within the City, that is aggrieved by an interpretation, action or decision made pursuant to this Development Code by any City agency or department, or by an Approving Authority, may appeal such action to the Appeal Authority in accordance with the provisions of this Division."

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County. CARE CA's comments on the DEIR, FEIR, to the Planning Commission, and this appeal, detail the specific issues over which CARE CA is aggrieved by the Planning Commission's decision.

printed on recycled paper

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

B. The Commission's Certification of the FEIR Was Contrary to Law and Unsupported by the Record

As summarized below, and demonstrated fully in the attached comments, the FEIR fails to adequately analyze and mitigate the project's potentially significant impacts.

The FEIR fails to analyze the full scope of the Project – CEQA requires that an EIR analyze the reasonably foreseeable consequences of the Project, but the Project's FEIR fails to analyze the Project's reasonably foreseeable use as a parcel hub (a use that generates 2.6 times more trips than analyzed). The City has argued that the Project is not envisioned as a parcel hub and its design would not support use as a parcel hub, but the Project plainly meets the description of a potential high cube parcel hub in Institute of Transportation Engineers ("ITE") land use code 156 (the Project would have adequate parking, square footage, and ceiling height). Any claim that the Project is not envisioned as a parcel hub is not supported by substantial evidence because the City has acknowledged that the Project is proposed as a speculative development and the user(s) of the building is not known at this time. Thus, the FEIR must be revised to analyze the heightened environmental impacts from the Project's potential use as a parcel hub.

printed on recycled paper

Similarly, the FEIR fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach, which are longer than the trips analyzed in the FEIR. Longer truck trips are associated with greater emissions of criteria air pollutants and GHG emissions. CARE CA presented numerous comment letters from the South Coast Air Quality Management District ("SCAQMD") recommending that warehouses just like this one analyze trips to the Ports, and presented studies showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario.

The FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines. CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[8] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[9] Here, the FEIR fails to analyze the feasibility and effectiveness of measures including onsite solar facilities, electric vehicle charging, and others discussed in CARE CA's comments. The City maintains that discussion of energy consumption measures is not required for this Project because its energy impacts are less than significant, but makes the same error as the lead agency in *CCEC* because the EIR in that case also identified a less-than-significant energy impact.[10]

The FEIR's analysis of cumulative air quality impacts is inadequate because it fails to consider the Project's impacts in the context of the numerous other warehouses existing and planned in the area. The City's approach to cumulative impacts, relying on SCAQMD guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable. CARE CA's comments demonstrated that this approach fails to meet CEQA's standards in light of the controlling caselaw,[11] the Attorney General's recent litigation on this issue in *People of the State of California v. City of Fontana*,[12] and pending updates to the SCAQMD significance thresholds for cumulative impacts in response to this litigation. At no point have the City's responses meaningfully addressed the caselaw proscribing the City's invalid approach to cumulative impacts. The responses primarily reiterate that the City is complying with current SCAQMD guidance (as opposed to the pending updates to

[8] (2014) 225 CA4th 173.

printed on recycled paper

the guidance). The FEIR must be revised to include a legally adequate discussion of cumulative impacts.

Regarding the Project's individual health risk impacts, CARE CA's air quality expert presented substantial evidence demonstrating that the FEIR's quantified health risk analysis underestimates impacts. For example, the HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. CARE CA's air quality expert also demonstrated that the HRA failed to account for building downwash and relied on unreliable input values. The City has not revised its HRA to address these flaws and others identified in Dr. Clark's comments.

Regarding hazards, the FEIR identifies significant vapor intrusion impacts due to PCE contamination, but improperly defers formulation of mitigation measures. The FEIR fails to specify whether passive/engineered vapor intrusion mitigation may be employed as opposed to removal of all impacted soil, does not quantify the impacts associated with each form of mitigation (e.g. construction impacts associated with excavation, removal and backfilling contaminated soil versus impacts of installing vapor intrusion barriers), and does not commit the City or the Applicant to specific binding mitigation. The body of the FEIR also fails to disclose potentially significant impacts resulting from ethylbenzene concentrations in excess of the commercial/industrial screening level of 163 micrograms per cubic meter.

As a result of these issues and others raised in CARE CA's prior comments, the FEIR is deficient as a matter of law and its conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR. As such, the Commission's certification of the FEIR was contrary to law and unsupported by the record. The Planning Commission's approval decision must be vacated, and the EIR must be revised and recirculated in compliance with CEQA.

C. The Commission's Approval of the Development Plan Was Contrary to Law and Unsupported by the Record

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the

printed on recycled paper

minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[13]

The Project would have a significant and unavoidable VMT impact. And the Project has potentially health risk, air quality, GHG, energy, and soil contamination impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City lacked substantial evidence to make the requisite findings to approve the Project. A revised EIR must be recirculated before the Project can be approved.

D. CONCLUSION

CARE CA respectfully requests that the City set a hearing on this appeal, and that the City Council uphold this appeal, vacate the Planning Commission's approval of the Project, and direct staff to revise and recirculate the EIR to comply with CEQA before the Project can be reconsidered for approval.

Sincerely,

Aidan P. Marshall

Re: Comments on the Draft Environmental Impact Report for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017)

Dear Mr. Grahn and Mr. Zeledon:

We are writing on behalf of Californians Allied for a Responsible Economy ("CARE CA") to provide comments on the Draft Environmental Impact Report ("DEIR") prepared by the City of Ontario ("City") for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant").

The Project site is located on 13.08 acres at 5355 East Airport Drive in the City of Ontario, in San Bernardino County, California (Assessor Parcel Numbers: 0238-052-29 and 0238- 052-20). The Project proposes to demolish all existing on-site structures and redevelop the site as a warehouse distribution facility with approximately 270,337 square feet (sf') of building area and 54 south-facing loading dock doors. Of the total building square footage, the Project design allocates 255,337 sf for ground floor space and 15,000 sf for mezzanine space. Development of the Project site would require demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The proposed building would be a one-story, 49-foot-tall speculative warehouse/distribution facility with ancillary office space.

printed on recycled paper

The Project design includes surface parking with 251 parking spaces including 126 standard automobile parking stalls, 7 accessible parking stalls, 25 electric vehicle parking stalls, 93 additional standard stalls within the truck court, and 48 truck trailer parking spaces.

Based on our review of the DEIR and supporting documentation, we conclude that the DEIR fails to comply with the requirements of the California Environmental Quality Act ("CEQA")[1]. The DEIR fails to adequately analyze the Project's cumulative impacts in light of the community's existing pollution burden resulting from similar warehouse projects, and fails to propose feasible and enforceable mitigation measures to reduce those impacts to a less than significant level, as required by CEQA. The DEIR also underestimates potentially significant air quality, greenhouse gas ("GHG"), and energy impacts by failing to concretely describe the Project – which may have significantly greater cold storage uses, transport refrigeration units ("TRUs"), and backup generators than disclosed in the DEIR. The DEIR also impermissibly fails to identify specific and effective mitigation to reduce the Project's significant Vehicle Miles Traveled ("VMT") impact to the greatest extent feasible before declaring the impact significant and unavoidable.[2] The DEIR's transportation analysis also underestimates VMT and resultant GHG emissions. We reviewed the DEIR and its technical appendices with the assistance of transportation expert Norm Marshall.[3] We reserve the right to supplement these comments at a later date, and at any later proceedings related to this Project.[4]

As explained in these comments, the DEIR lacks substantial evidence to support its conclusions with regard to the Projects' impacts relating to air quality, health risks, greenhouse gases, energy, and transportation. The City may not approve the Project until the City revises and recirculates the Project's DEIR to adequately analyze the Project's significant direct, indirect and cumulative impacts, and incorporates all feasible mitigation measures to avoid or minimize these impacts to the greatest extent feasible.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Fontana and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. LEGAL BACKGROUND

CEQA requires public agencies to analyze the potential environmental impacts of their proposed actions in an EIR.[5] "The foremost principle under CEQA is that the Legislature intended the act to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language."[6]

---

[5] PRC § 21100.

[6] *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal ("Laurel Heights I")* (1988) 47 Cal.3d 376, 390 (internal quotations omitted).

CEQA has two primary purposes. First, CEQA is designed to inform decisionmakers and the public about the potential significant environmental effects of a project.[7] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'"[8] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return."[9] As the CEQA Guidelines explain, "[t]he EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected."[10]

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring consideration of environmentally superior alternatives and adoption of all feasible mitigation measures.[11] The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced."[12] If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[13]

While courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."[14] As the courts have explained, a

6752-004j

prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process."[15] "The ultimate inquiry, as case law and the CEQA guidelines make clear, is whether the EIR includes enough detail 'to enable who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'"[16]

III. THE PROJECT DESCRIPTION IS INADEQUATE

The DEIR does not meet CEQA's requirements because it fails to include an accurate and complete Project description, rendering the entire analysis inadequate. California courts have repeatedly held that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[17] CEQA requires that a project be described with enough particularity that its impacts can be assessed.[18] Without a complete project description, the environmental analysis under CEQA is impermissibly limited, thus minimizing the project's impacts and undermining meaningful public review.[19] Accordingly, a lead agency may not hide behind its failure to obtain a complete and accurate project description.[20]

CEQA Guidelines section 15378 defines "project" to mean "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[21] "The term "project" refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term project does not mean each separate governmental approval."[22]

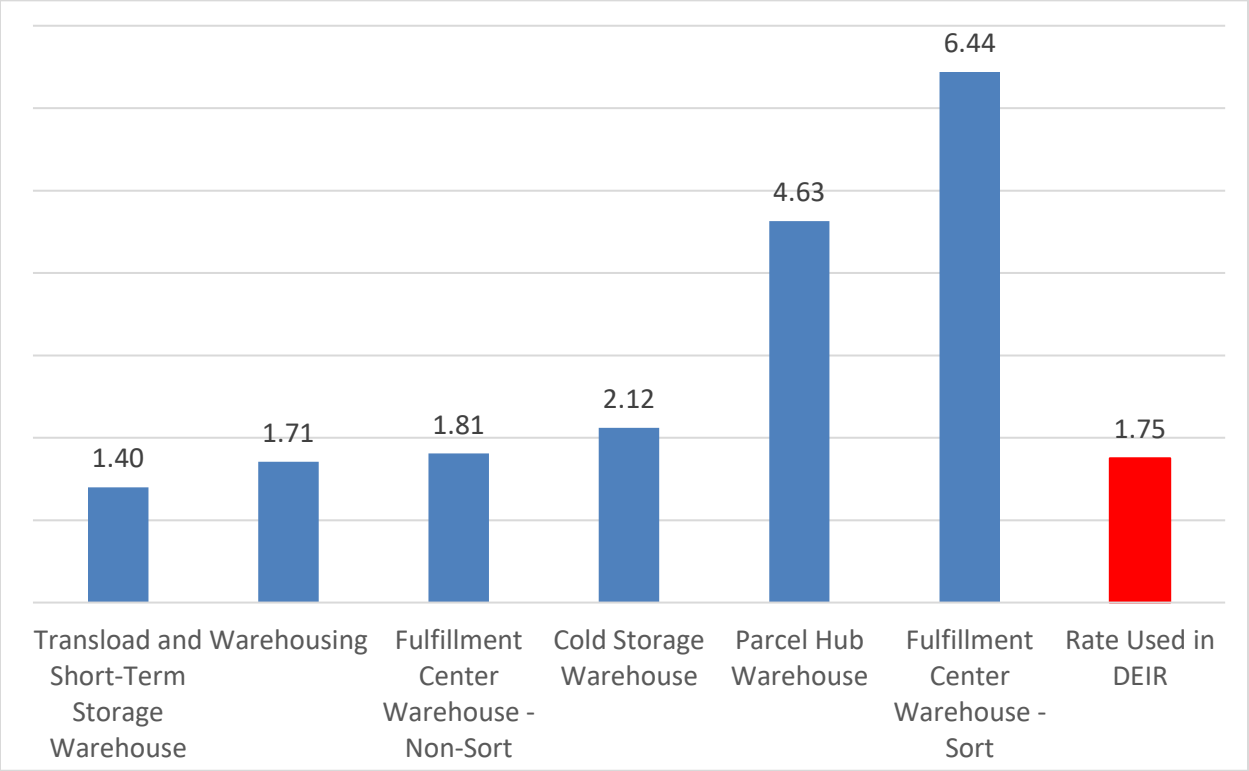
[22] *Id.*, § 15378(c).
6752-004j



Courts have explained that a complete description of a project must "address not only the immediate environmental consequences of going forward with the project, but also all "*reasonably foreseeable* consequence[s] of the initial project."[23] "If a[n]…EIR…does not adequately apprise all interested parties of the true scope of the project for intelligent weighing of the environmental consequences of the project, informed decisionmaking cannot occur under CEQA and the final EIR is inadequate as a matter of law."[24]

A. The DEIR Fails to Describe the Project's End Uses with Sufficient Particularity to Adequately Evaluate Trips Generated by the Project

The DEIR assumes that the Project would include approximately 27,034 sf of high-cube cold storage uses (10% of the building space), with remaining portions of the building consisting of warehouse uses.[25] The DEIR explains that the Project's end users are unknown.[26] In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the Institute of Transportation Engineers ("ITE") Trip Generation Manual for the proposed Project's land uses was utilized.[27] For purposes of the trip generation assessment, the DEIR used ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse). Transportation expert Norm Marshall explains that these land use codes are just one of many land use codes potentially applicable to the Project.[28] The figure below shows other warehousing land use codes and compares trips generated by each land use.

[23] *Laurel Heights I,* 47 Cal. 3d 376, 398 (emphasis added); *see also Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 449-50.

[25] DEIR, pg. 3-13.
[26] DEIR, pg. 4.7-17.
[27] DEIR, pg. 4.10-5.
[28] Marshall Comments, pg. 4.
6752-004j

Figure 1: Trip Generation Rates for Different Warehouse Categories (Trips Per 1000 Square Feet per Day)[29]

The DEIR fails to address why the other land use codes shown above are inapplicable to the Project. And the DEIR fails to provide sufficient information about the Project's expected uses and configuration for the public and decisionmakers to ascertain which of these end uses are possible for the Project. This informational defect affects the entire DEIR, as different types of warehousing have different environmental impacts.

Mr. Marshall explains that the land use code selected by the DEIR may drastically underestimate the Project's GHG and VMT impacts. Specifically, the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[30] A greater number of trips generated results in greater traffic impacts and greater emissions of GHGs. Given the large uncertainty in the trips generated by the Project, the DEIR fails to meet CEQA's requirement that a project be

[29] Marshall Comments, pg. 5.
[30] *Id.*

described with enough particularity that its impacts can be assessed.[31] Mr. Marshall recommends two approaches to resolve this issue: either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.[32] The City should revise and recirculate the DEIR to correct these deficiencies and to present a revised trip generation analysis which reflects reasonably foreseeable conditions at the Project site, or condition Project approval on the limitations assumed in the DEIR.

B. The DEIR Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

The DEIR assumes, without support, that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space), with remaining portions of the building consisting of warehouse uses.[33] The DEIR states that a limitation of 10% of the building for potential cold storage is based on the Project Applicant's understanding of the cold storage market demand.[34] However, this assumption, even if based on a reasonable interpretation of current market conditions, is subject to fluctuate during the life of the Project and is not otherwise reflected in any enforceable conditions related to Project use.

In order for the City to rely on the Applicant's 10% cold storage assumption in the CEQA document, the DEIR would need to include binding measures or conditions which limit warehouse use at the Project to no more than 10% cold storage. Absent such a restriction, the DEIR may substantially estimate the air quality, public health, and energy impacts of cold storage use at the Project site.

Cold storage warehouse generates greater environmental impacts than a high cube warehouse. Cold storage generates more trips per square foot and has higher energy impacts due to the low temperatures required by the facility's transport refrigeration units ("TRUs") and on-site storage. TRUs are refrigeration systems powered by integral diesel engines.[35] The refrigeration systems are used to control the environment of temperature-sensitive products transported in insulated

---

[32] Marshall Comments, pg. 5.
[33] DEIR, pg. 3-13.
[34] *Id.*
[35] California Air Resources Board, 2022 TRU Technology Assessment, pg. 1, https://ww2.arb.ca.gov/sites/default/files/2022-10/CARB%202022%20TRU%20Technology%20Assessment%2010-14-22.pdf.

trucks, trailers, shipping containers, or railcars. The California Air Resources Board ("CARB") states that TRUs emit diesel particulate matter ("DPM"), fine particulate matter ("PM2.5"), oxides of nitrogen ("NOx"), and GHGs while in transit and during stationary operation at refrigerated warehouses or distribution centers, grocery stores, seaport facilities, intermodal railyards, and other locations of operation. CARB explains that communities near facilities where TRUs operate bear a disproportionate health burden:

> PM2.5 pollution contributes to more fatalities than other air pollutants and can lodge deep in the lungs or pass through the lungs to enter the blood stream and affect the heart, brain, and other organs. Adverse health effects from long-term exposure to PM2.5 pollution include increased risk of heart attacks and heart disease, impaired lung development in children, the development and exacerbation of asthma, and premature death. NOx is a precursor to ozone, which can cause irritation and damage lung tissue, worsen asthma and chronic illnesses including obstructive pulmonary disease and reduce lung function.[36]

CARB also explains that TRUs' emissions of GHGs contribute towards climate change,[37] and that TRUs generate noise impacts: "TRU operations produce noise that can be problematic when deliveries that often occur late evening or early morning are near residential neighborhoods, hotels, hospitals, and elder care facilities… One study conducted by LSA Associates found that a diesel-powered TRU operating at high idle produces an A-weighted decibel (dBA) noise rating of 104 dBA, while a diesel truck at idle produces a noise rating of 96 dBA."[38]

By assuming the Project will only include 10% cold storage, the DEIR may drastically underestimate the Project's impacts in each of these areas. The DEIR does not provide supporting evidence demonstrating that cold storage uses would be limited to 10% of the Project site for the duration of the Project's life. Due to ever-increasing population and market demands in Southern California, it is also reasonably foreseeable that the Project may attract end users, either now or in future years of the Project's life, which require more than 10% cold storage. As a result, the DEIR's assumption is not supported by substantial evidence.

[36] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[37] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[38] California Air Resources Board, 2022 TRU Technology Assessment, pg. 17-18.

In the California Attorney General's ("AG") guidance for warehouse projects, the AG recommends that, unless a developer adopts mitigation measures limiting cold storage impacts, the developer should record a covenant on the title of the underlying property to ensuring that the property cannot be used to provide refrigerated warehouse space.[39] The City should include such a title restriction for the Project unless the DEIR's 10% cold storage assumption is revised to analyze and mitigate impacts associated with a more conservative and fact-based cold-storage use percentage.

C. The Project Description Fails to Include Reasonably Foreseeable Backup Generators

The DEIR fails to disclose potential backup/emergency stationary generators for the Project's operations. The DEIR's project description does not address whether backup generators are a reasonably foreseeable component of the Project, and the DEIR's technical analyses assume no backup generators will be installed for operations. The DEIR does not disclose any conditions or mitigation measures that limit or prevent use of backup generators. Thus, the DEIR must disclose and analyze the potential use of backup generators because (1) they a reasonably foreseeable consequence of the Project, and (2) the use of backup generators will expand the Project's environmental effects.[40]

In *East Oakland Stadium Alliance v. City of Oakland*,[41] the Court of Appeal upheld an EIR's analysis of emissions from backup generators. The EIR's analysis assumed that generators would operate for 50 hours of testing and maintenance annually, while allocating no time for actual emergency use. In discussing the lead agency's duty to analyze backup generator emissions, the Court stated that "if the annual need for emergency generator use is reasonably foreseeable, the EIR was not entitled to disregard such use merely because it would occur at unpredictable times."[42] The Court explained that use of a generator was reasonably foreseeable because, "[a]s noted in the EIR, some parts of the Bay Area are subject to

---

[39] *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act (Updated September 2022)*, pg. 9, available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf ("Unless the owner of the facility records a covenant on the title of the underlying property ensuring that the property cannot be used to provide refrigerated warehouse space, constructing electric plugs for electric transport refrigeration units at every dock door and requiring truck operators with transport refrigeration units to use the electric plugs when at loading docks.").

predictable, sustained power outages undertaken to reduce the risk of fire."[43] Thus, "[t]he EIR was required to make neither a generally applicable nor a worst-case assumption; rather it was required to make a reasonable estimate of likely annual use of the generators at the project site."[44]

Here, as in *East Oakland Stadium Alliance*, back-up generators are a reasonably foreseeable consequence of the Project due to increasingly common Public Safety Power Shutoff ("PSPS") events and extreme heat events. Extreme heat events ("EHE") are defined as periods where in the temperatures throughout California exceed 100 degrees Fahrenheit.[45] From January 2019 through December 2019, Southern California Edison reported 158 of their circuits underwent a PSP event.[46] In Los Angeles County, two circuits had 4 PSPS events during that period, lasting an average of 35 to 38 hours. The total duration of the PSPS events lasted between 141 hours to 154 hours in 2019. According to the California Public Utilities Commission (CPUC) de-energization report[47] in October 2019, there were almost 806 PSPS events that impacted almost 973,000 customers (~7.5% of households in California) of which ~854,000 of them were residential customers. The California Air Resources Board estimates that with 973,000 customers impacted by PSPS events in October 2019, approximately 125,000 back-up generators were used by customers to provide electricity during power outage.[48] The widespread use of back-up generators to adapt to PSPS and EHE events suggests that back-up generators are a reasonably foreseeable consequence of the Project.

Further demonstrating that backup generators are reasonably foreseeable is that the DEIR assumes that 10% of the building (27,034 sf) would be cold storage.[49] A cold storage warehouse has the ability to keep temperature sensitive items in a

temperature-controlled environment, which requires a constant energy supply to power refrigeration. Cold storage warehouses thus commonly utilize backup generators.[50] Backup generators commonly rely on fuels such as natural gas or diesel,[51] and thus can significantly impact air quality, GHG emissions, and public health through toxic DPM emissions.[52] Since the Project may include cold storage, it is reasonably foreseeable that the Project would require on-site backup generators.

Generators can emit criteria air pollutants, greenhouse gases, and toxic air contaminants ("TACs"). Backup generators commonly rely on fuels such as natural gas or diesel,[53] and thus can significantly impact public health through DPM

emissions.[54] Diesel back-up generators emit significant amounts of Nitrogen Oxides ("NOx"), sulfur dioxides ("SO2"), particulate matter ("PM10"), carbon dioxide ("CO2"), carbon monoxide ("CO"), and volatile organic compounds ("VOC").[55] Omission of a generator system results in an underestimation of the Project's air quality, greenhouse gas, and health risk impacts.

In sum, omission of the Project's generator results in an underestimation of the Project's air quality, greenhouse gas, energy, and health risk impacts. The DEIR must be revised to resolve this project description inconsistency and correct the affected impacts analyses to accurately disclose the Project's potentially significant impacts.

IV. THE DEIR FAILS TO DISCLOSE, ANALYZE AND MITIGATE POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a Project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact

Diesel-fired engines also produce significantly greater amounts of fine particulates and toxics emissions compared to natural gas fired equipment."), available at http://www.aqmd.gov/home/permits/emergency-generators#Fact2.

must be supported by accurate scientific and factual data.[56] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[57]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by CEQA.[58] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[59] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[60]

Additionally, CEQA requires agencies to commit to all feasible mitigation measures to reduce significant environmental impacts.[61] In particular, the lead agency may not make required CEQA findings, including finding that a project impact is significant and unavoidable, unless the administrative record demonstrates that it has adopted all feasible mitigation to reduce significant environmental impacts to the greatest extent feasible.[62]

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[63]

A. The DEIR Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

An EIR must evaluate a cumulative impact if the project's incremental effect combined with the effects of other projects is "cumulatively considerable."[64] This determination is based on an assessment of the project's incremental impacts "viewed in connection with the effects of past project, the effects of other current projects, and the effects of probable future projects."[65] Proper cumulative impact analysis is vital because "the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant when considered individually, but assume threatening dimensions when considered collectively with other sources with which they interact."[66]

1. The DEIR Fails to Provide a List of Cumulative Projects

The CEQA Guidelines set forth two methods for satisfying the cumulative impacts analysis requirement: the list of projects approach and the summary of projections approach.[67] Under the former, an adequate discussion of cumulative impacts requires "a list of past, present, and probable future projects producing related or cumulative impacts…"[68] Relevant factors when compiling a list of related projects include the environmental resource being examined and the location and type of the project.[69] The Guidelines expressly recognize that project type may be important "when the impact is specialized, such as a particular air pollutant or mode of traffic."[70]

Here, the DEIR states that it uses a combination of the two methods as appropriate for each impact analysis:

> The summary of projections approach is used in this EIR, except for the evaluation of cumulative transportation effects (for purposes of demonstrating General Plan policy compliance) and vehicular-related air

[64] CEQA Guidelines § 15130(a).

[69] *Id.*, § 15130(b)(2).
[70] *Id.*

quality, greenhouse gas, and noise impacts, for which the analysis combines the summary of projections approach with the manual addition of past, present, and reasonably foreseeable projects ("combined approach"). The City determined the combined approach to be appropriate because long-range planning documents contain a sufficient amount of information to enable an analysis of cumulative effect for all subject areas, with the exception of transportation (and vehicular-related air quality, greenhouse gas, and noise effects), which requires a greater level of detailed study.[71]

However, the DEIR fails to provide a list of cumulative projects. And the appendices containing the air quality, greenhouse gas, and noise analyses do not consider past, present, and reasonably foreseeable projects. The air quality, greenhouse gas, and noise analyses should be revised to include consideration of cumulative projects, as recommended by the DEIR itself.

2. The DEIR's Cumulative Air Emissions Analysis Does Not Comply with CEQA or Attorney General Warehouse Guidance

The DEIR fails to adequately analyze the Project's cumulative air quality emissions. The DEIR asserts that, under South Coast Air Quality Management District ("SCAQMD") guidance, any exceedance of a regional or localized threshold for criteria pollutants also is considered to be a cumulatively-considerable effect, while air pollutant emissions that fall below applicable regional and/or localized thresholds are not considered cumulatively-considerable.[72]

The DEIR fails to note that SCAQMD's approach is outdated, as evidenced by its ongoing process to update its cumulative impacts guidance.[73] The DEIR's approach has been also rejected by the courts for failing to comply with CEQA's requirement that a project mitigate impacts that are "cumulatively considerable."[74] The City's failure to actually examine the Project's cumulative air quality impacts violates CEQA's requirement to analyze cumulative impacts.

---

[71] DEIR, pg. 4-2.
[72] DEIR, Appendix B, pg. 53.
[73] See e.g., http://www.aqmd.gov/docs/default-source/ceqa/documents/wgm-3_20230124.pdf?sfvrsn=6.
[74] PRC § 21083(b)(2); 14 CCR § 15130; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692, 719-21.

The leading case on this issue is *Kings County Farm Bureau v. City of Hanford*.[75] In *Kings County*, the city prepared an EIR for a 26.4-megawatt coal-fired cogeneration plant. Notwithstanding the fact that the EIR found that the project region was out of attainment for PM_{10} and ozone, the city failed to incorporate mitigation for the project's cumulative air quality impacts from project emissions because it concluded that the Project would contribute "less than one percent of area emissions for all criteria pollutants."[76] The city reasoned that, because the project's air emissions were small in ratio to existing air quality problems, that this necessarily rendered the project's "incremental contribution" minimal under CEQA. The court rejected this approach, finding it "contrary to the intent of CEQA." The court stated:

> We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's "ratio" theory, the greater the over-all problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term "collectively significant" in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development. The EIR improperly focused upon the individual project's relative effects and omitted facts relevant to an analysis of the collective effect this and other sources will have upon air quality.[77]

The DEIR's analysis is similarly flawed because while the DEIR admits that the Project region is out of attainment for ozone, PM_{10}, and $PM_{2.5}$, the City fails to analyze or mitigate the Project's emissions' cumulative air quality impacts.[78] Given that there are multiple existing large warehouses immediately adjacent to the proposed Project site,[79] as well as the proliferation of warehouse projects in the region and San Bernardino County, the DEIR is inadequate in its analysis of the Project's potentially significant cumulative air quality impacts.

---

[75] *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692 ("Kings County"); *see also, Friends of Oroville v. City of Oroville* (2013) 219 Cal. App. 4th 832, 841-42.

[76] *Id.* at 719.

[77] *Id.* at 721.

[78] DEIR, pg. 5.2-17.

[79] DEIR, pg. 2-4, Figure 2-1.

The SCAQMD approach used in the DEIR also directly conflicts with the AG recent guidance document setting forth best practices for evaluating the environmental impacts of warehouse projects like this one under CEQA.[80] With respect to cumulative air quality and GHG emissions analysis, the Attorney General's guidance states that best practices include "[w]hen analyzing cumulative impacts, thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[81]

The DEIR's cumulative air quality impacts analysis does not comply with CEQA. The City must prepare a revised EIR that properly evaluates and mitigates such impacts.

3. The DEIR's Health Risk Analysis Fails to Consider the Health Impacts of Cumulative Emissions from Nearby Warehouses

The DEIR's analysis of cumulative health risks is flawed for the same reason as the air quality analysis. The DEIR points to guidance from SCAQMD to reason that emissions of TACs are considered significant if a quantified health risk analysis ("HRA") shows an increased risk of greater than 10 in 1 million.[82] And the DEIR provides that Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable, and vice versa.[83] This approach is inadequate because it fails to analyze the Project's cumulative effects with the existing and proposed warehouses surrounding the Project site.

CEQA provides that the incremental effects of an individual project are cumulatively considerable if the effects are significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."[84] Courts have held that where a community already

---

[80] *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act* (Updated September 2022), available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf .
[81] *Id.*, pg. 7.
[82] DEIR, Appendix B2, pg. 5.
[83] *Id.*
[84] CEQA requires a lead agency consider whether the combined effects from both the proposed project and other projects would be "cumulatively considerable." (CEQA Guidelines, § 15130, subd. (a).) The incremental effects of an individual project are cumulatively considerable if the effects are

bears a high pollution burden, a lead agency must consider "whether any additional amount" of pollution caused by the project "should be considered significant in light of the serious nature" of the existing problem.[85]

Here, the DEIR's approach of using a project-level analysis as a substitute for a cumulative impacts analysis fails to address that the Project would be impacting a community already bearing a high pollution burden. The DEIR's CalEEMod output sheets show the community' pollution burden as scoring 91.1 in AQ-Ozone, 95.7 in AQ-PM, and 96.6 in AQ-DPM.[86] A high score reflects a higher pollution burden compared to other census tracts in the state, with a maximum CalEnviroScreen score of 100.[87] Despite this high pollution burden, the DEIR concludes that the Project would not contribute to cumulative impacts because its own impacts would result in an increased risk of less than 10 in 1 million. This analysis violates principles of *Kings County Farm Bureau v. City of Hanford* and guidance from Attorney General. The City must revise and recirculate a DEIR that analyzes the Project's potentially significant cumulative health risk impacts.

B. The DEIR's Quantified Health Risk Analysis Underestimates Operational Mobile Source Impacts

The DEIR includes an HRA addressing the Project's construction and operational impacts. The operational HRA is flawed because it omits analysis of TRUs.[88]

As explained above, TRUs emit DPM, PM2.5, NOx, and GHGs while in transit and during stationary operation at refrigerated warehouses or distribution centers, grocery stores, seaport facilities, intermodal railyards, and other locations of operation.[89] CARB explains that communities near facilities where TRUs operate bear a disproportionate health burden:

---

significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." (Id., §§ 15065, subd. (a)(3), 15355, subd. (b).)

6752-004j

> PM2.5 pollution contributes to more fatalities than other air pollutants and can lodge deep in the lungs or pass through the lungs to enter the blood stream and affect the heart, brain, and other organs. Adverse health effects from long-term exposure to PM2.5 pollution include increased risk of heart attacks and heart disease, impaired lung development in children, the development and exacerbation of asthma, and premature death. NOx is a precursor to ozone, which can cause irritation and damage lung tissue, worsen asthma and chronic illnesses including obstructive pulmonary disease and reduce lung function.[90]

Thus, the omission of TRUs in the DEIR's HRA results in an underestimate of the Project's health risk impacts. The DEIR's significance findings are thus not supported by substantial evidence. The DEIR must be revised to adequately disclose the health risk impacts from TRUs.

C. The DEIR Underestimates Project VMT and Mobile Source GHGs

Transportation expert Norm Marshall explains that the DEIR potentially underestimates average trip lengths for both trucks and passenger vehicles.[91] Longer trip lengths results in greater impacts (including air quality, GHGs, and VMT). As a result, the analyses that rely on these trip lengths lack the support of substantial evidence. The DEIR air quality analysis relies on the follow trip lengths:

> To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.[92]

The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explains that SCAQMD does not make a recommendation that these trip distances be used for warehouse project EIRs.[93] Rather, the AG's guidance document for warehouse projects states:

---

[90] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[91] Marshall Comments, pp. 6-7.
[92] DEIR, Appendix B1, pg. 37.
[93] Marshall Comments, pg. 6-7.
6752-004j

> CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur.[94]

In contrast to the approach recommended by the AG, the DEIR's estimated trip distances did not account for the Project's likely trip destinations. Mr. Marshall explains that, while it may be too early to determine specific truck trip origins and destinations, it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR.[95] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The DEIR's analysis thus likely underestimates trip distances.

The DEIR also underestimates lengths of passenger trips generated by the Project. Mr. Marshall observes that CalEEMod trip lengths were used for passenger trips.[96] But in the DEIR's VMT analysis, the DEIR acknowledges that the Project's VMT per service population, i.e., the VMT per worker, is significantly higher than the average for the City of Ontario, and therefore, also significantly higher than the regional average.[97] Mr. Marshall explains that the average auto trip lengths should be increased from the default values to account for the VMT-inefficient project location. Thus, the DEIR's analysis lacks the support of substantial evidence, and must be revised.

D. The DEIR Fails to Identify All Feasible VMT Mitigation Measures

The DEIR concludes that the Project would result in a significant and unavoidable VMT impact despite mitigation included in the DEIR. Specifically, the DEIR estimates that the Project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.[98] The DEIR identifies the following mitigation for this significant impact:

---

[94] Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act (Updated September 2022), pg. 7.
[95] Marshall Comments, pg. 7.

> MM 4.10-1: Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours).[99]

This measure fails to meet CEQA's standards for mitigation. CEQA provides that if the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[100] Further, EIRs must mitigate significant impacts through measures that are "fully enforceable through permit conditions, agreements, or other legally binding instruments."[101] Deferring formulation of mitigation measures is generally impermissible.[102] If identification of specific mitigation measures is impractical until a later stage in the Project, specific performance criteria must be articulated and further approvals must be made contingent upon meeting these performance criteria.[103] Mitigation that does no more than allow approval by a county department without setting enforceable standards is inadequate.[104]

Here, the measure improperly defers identification of specific VMT-reducing mitigation measures to a future date. MM 4.10-1 does not commit to any particular measures to reduce VMT. Nor does the DEIR articulate specific performance criteria to ensure that impacts would be mitigated to the greatest extent feasible. Mr. Marshall notes that, while MM 4.10-1 lists potential measures to reduce VMT,

---

[99] DEIR, pg. S-24.
[100] PRC § 21081(a)(3), (b); CEQA Guidelines §§ 15090(a), 15091(a), 15092(b)(2)(A), (B); *Covington v. Great Basin Unified Air Pollution Control Dist*. (2019) 43 Cal.App.5th 867, 883.
[101] CEQA Guidelines, § 15126.4, subd. (a)(2).
[102] *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 308-309; Pub. Resources Code, § 21061.
[103] *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1359, 1393; *Quail Botanical*, *supra*, 29 Cal.App.4th at pg. 1604, fn. 5.
[104] *Endangered Habitats League, Inc. v. County of Orange,* (2005) 131 Cal.App.4th 777, 794.
6752-004j

there is no clear commitment or description of the measures.[105] Mr. Marshall explains that the measures listed in MM 4.10-1 can be formulated in a variety of ways that determine the magnitude of VMT reductions.[106] MM 4.10-1 is thus improperly deferred mitigation that does no more than allow approval by a county department without setting enforceable standards.[107]

As a result of this improper deferral of mitigation, the DEIR also fails to comply with CEQA's requirement to reduce all significant effects on the environment to the greatest extent feasible. MM 4.10-1 must be revised to clearly require the all feasible VMT-reducing measures be adopted until the expected 28.47% excess VMT is mitigated.

V. CONCLUSION

For the reasons discussed above, the DEIR for the Project is inadequate under CEQA. It must be revised to provide legally adequate analysis of, and mitigation for, all of the Project's potentially significant impacts. These revisions will necessarily require that the DEIR be recirculated for additional public review. Until the DEIR has been revised and recirculated, as described herein, the City may not lawfully approve the Project.

Thank you for your consideration of these comments. Please include them in the record of proceedings for the Project.

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

I have reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I make the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

Significant and Unavoidable VMT impact

The DEIR states that the project would have a "Significant and Unavoidable [VMT] Impact." (DEIR, p. S-24)

DEIR Appendix J, "IE Distribution Center #14 Vehicle Miles Traveled (VMT) Analysis," evaluates the project relative to the City of Ontario's VMT screens and concludes:

- TPA [Transit Priority Area] screening criteria is not met.
- Low VMT Area screening criteria is not met.
- Project Type screening criteria is not met.

As the project fails these screens, a full VMT analysis was performed using the San Bernardino Transportation Analysis Model (SBTAM). The table below copied from DEIR Appendix J, p. 9 summarizes the results of this analysis.

TABLE 10: PROJECT COMPARISON TO CITY OF ONTARIO VMT THRESHOLD

	Baseline	Buildout Year
Impact Threshold	27.61	27.61
Project	33.84	35.47
Percent Change	+22.56%	+28.47%
Potentially Significant?	Yes	Yes

As shown in the reproduced table, the proposed project would exceed the City's VMT threshold by 22.56% in the baseline year and by an even larger 28.47% in the buildout year (2050).

The VMT Mitigation Described in the VMT is Inadequate

The City of Ontario's VMT Resolution adopted June 16, 2020, reiterates General Plan Mobility Element M1-2: **"Mitigation of impacts. We require development to mitigate its traffic impacts."**

In the case of the proposed project, full mitigation would reduce VMT to below the threshold, i.e., the 28.47% excess VMT in the horizon year would be eliminated. The EIR should quantify the expected VMT reduction from mitigation. Unless the reduction is sufficient to achieve the VMT threshold, the EIR should justify why greater mitigation is infeasible.

The VMT mitigation described in the DEIR is:

> **MM 4.10-1** Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours). (DEIR, p. S-24)

The above wording is ambiguous. Is this a commitment to include all the measures listed, or only to a subset of the measures. For the included measures, what are the magnitudes of the different incentives. Are the included measures voluntary or mandatory? Is monitoring included? What is the total VMT reduction from the package, and is this reduction sufficient to adequately address the expected 28.47% excess VMT in the horizon year? If the planned reduction is not achieved, what are the consequences?

The California Air Pollution Control Officers Association (CAPCOA) provides on quantifying VMT mitigation measures in its publication *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity: Designed for Local Governments, Communities, and Project Developers (Final Draft, December 2021)*. It states:

> The Handbook builds on CAPCOA's previous efforts to provide accurate and reliable quantification measures. In 2010, CAPCOA published *Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emissions Reductions from Greenhouse Gas Mitigation Measures* (hereafter referred to as the "2010 Handbook"). Since that time, climate science has evolved and GHG reduction practices have advanced in sophistication. New priorities have also arisen, such as strengthening climate resilience and infusing health and equity into integrated planning efforts. Therefore, CAPCOA decided it was time to develop an updated and expanded resource to provide the latest data and methods to quantify GHG emissions reductions, climate change vulnerability reductions, and equity improvements in a single resource: The Handbook. (p. 2-3)

The Handbook makes a critical distinction between voluntary and mandatory Commuter Trip Reduction ("CTR") programs:

T-5 Implement Commute Trip Reduction Program (Voluntary) – up to 4% VMT reduction:

> Voluntary CTR programs must include the following elements to apply the VMT reductions reported in literature. ▪ Employer-provided services, infrastructure, and incentives for alternative modes such as ridesharing (Measure T-8), discounted transit (Measure T-9), bicycling (Measure T-10), vanpool (Measure T-11), and guaranteed ride home. ▪ Information, coordination, and marketing for said services, infrastructure, and incentives (Measure T-7). (*Handbook*, p. 83)

T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

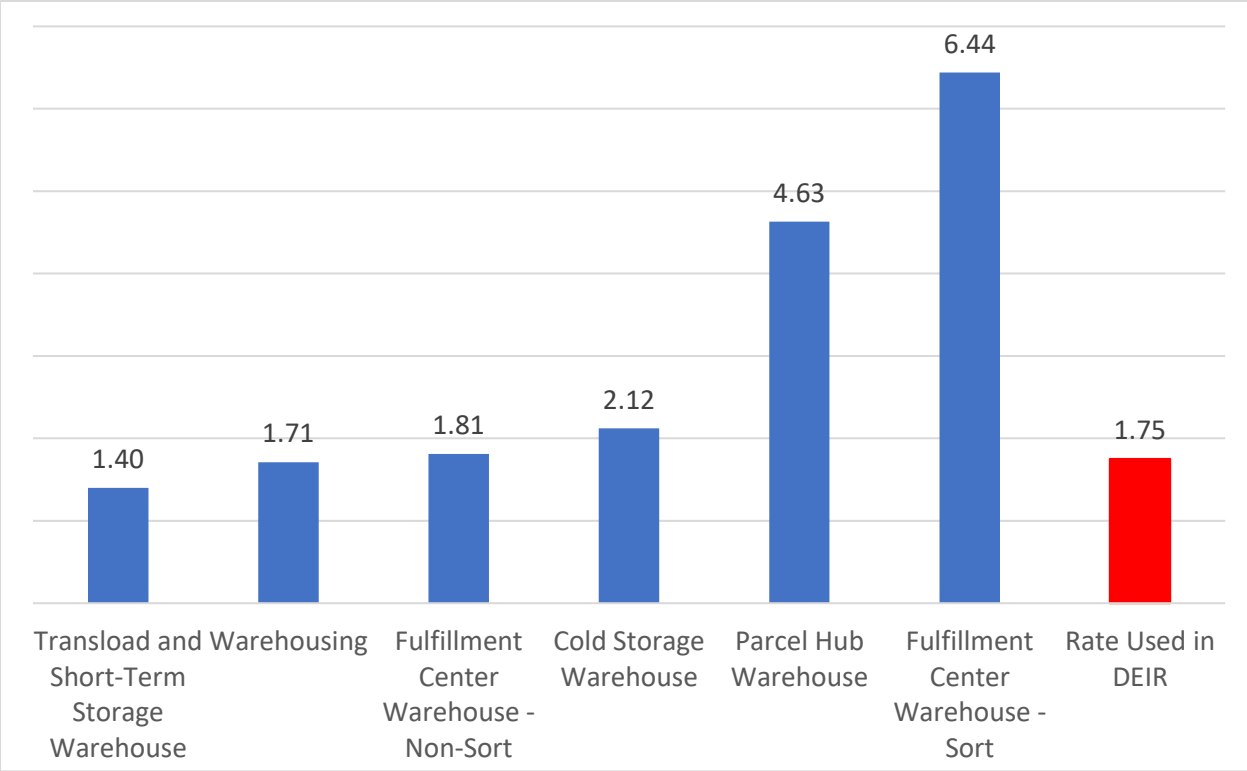
A 26% reduction at this site may be impossible given the relatively poor transit , bicycle and walk accessibility plus long commute distances that making walking and biking impractical. The DEIR states:

> Public transit service in the region is provided by Omnitrans, a public transit agency that serves various jurisdictions within San Bernardino County. There are no public transit routes that run adjacent to the Project Site under existing conditions. The nearest transit routes to the Project Site are Route 61 which has a stop located along Fourth Street, approximately 0.9 mile north of the Project Site and Route 82 which has a stop located at South Etiwanda and Jurupa Avenue, approximately 1.2 miles southeast of the Project Site. There are no existing bicycle facilities within the vicinity of the Project Site. The closest bike route to the Project Site is a Class III bike route located along Ontario Mills Parkway, approximately 0.4 mile north of the Project Site. There are no sidewalks on either side of East Airport Drive, with the exception of a small portion along the adjacent development frontage directly to the west at 5351 East Airport Drive. (DEIR, p. 2-11)

Furthermore, ridesharing and vanpooling would be complicated by a geographically dispersed workforce and likely multiple shifts.

Joining with other employers would be beneficial. The more employers that support these VMT reduction programs, the stronger these programs will be, and the regional benefit of participating may be greater than just the onsite VMT reductions. For example, a vanpool could include multiple employers IE Commuter, a program of the San Bernardino County Transportation Authority in partnership with the Riverside County Transportation Commission, offers a full range of services to help employers set up and manage VMT reduction programs.[1]

Achieving significant VMT mitigation for this project may be impossible – but mitigation must be fully specified and quantified for the project to be properly evaluated.



Project Trip Generation Could Be Much Higher Than Assumed

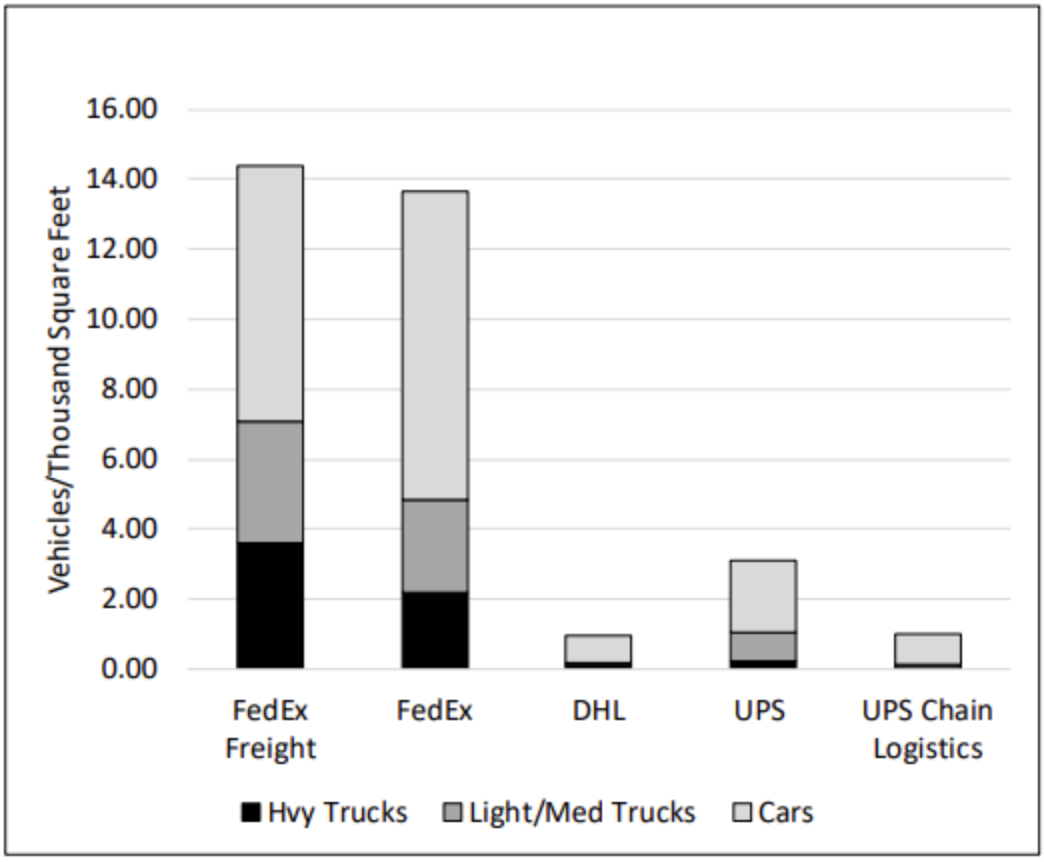
The project is comprised of a 270,377 square feet warehouse building. (DEIR, Appendix K, p. 1) The tenants have not been identified, and the nature of the operations are unknown at this time. For the purpose of estimating project trip generation, the DEIR assumes a mix of 90% warehousing and 10% high-cube cold storage. (DEIR, Appendix K, p. 1) This mix is highly speculative, and the project may not even include either of the assumed trip generation categories.

The DEIR estimates trip generation based on the rates in the Institute of Transportation Engineers ("ITE") *Trip Generation* manual. *Trip Generation* includes other categories of warehouses. As shown in the figure below, the trip generation rates applied in the DEIR are much lower than rates for some other warehouse categories.

[1] https://www.iecommufter.org/rp2/home/EmployerSupport

Trip Generation Rates for Different Warehouse Categories (Trips Per 1000 Square Feet per Day)

The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.



A 2019 study of warehouse trip generation done by WSP for the Western Riverside COG documented even higher trip generation rates.[2] This study was based on counts at 16 warehouses, segmented between 11 fulfillment centers and 5 parcel hubs.

The observed trip generation rates at two of the parcel hub sites are even higher than the rates shown in the figure above.. As shown in the figure below, the highest trip generation rates were observed at two of the parcel hubs, with rates of about 14 trips per 1000 square feet per day, i.e., 8 times the rate used in the DEIR.

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

[2] https://wrcog.us/AgendaCenter/ViewFile/Agenda/_02212019-292

Exhibit 11: Daily Trip Generation Rates at Parcel Hubs

Project VMT and GHG Emissions Could Be Much Higher Than Assumed

Any underestimate of trip generation translates into underestimated GHG emissions. It is likely that the DEIR also underestimates average trip lengths.

The DEIR air quality analysis (Appendix B1) states:

> To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages. (DEIR, Appendix B1, p. 37)

The DEIR misstates that these truck trip distances are "recommended" by SCAQMD. The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[3] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any

[3] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf

use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[4] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

The Attorney General's September 2022 guidance: *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act*[5] states:

> CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur. (p. 7)

While it is too early to determine truck trip origins and destinations, it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The DEIR states that CalEEMod trip lengths were used for passenger trips:

> In order to determine emissions from passenger car vehicles, CalEEMod defaults for trip length and trip purpose were utilized. (DEIR, Appendix F, p. 56)

In the VMT analysis, the DEIR documents that the project's VMT per service population, i.e., the VMT per worker, is significantly higher than the average for the City of Ontario, and therefore, also significantly higher than the regional average. Therefore, the average auto trip lengths should be increased from the default values to account for the VMT-inefficient project location.

Underestimating truck and passenger vehicle VMT translates to underestimating GHG as well.

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Mr. Ochoa, Development Advisory Board Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant"), including the Final Environmental Impact Report ("FEIR") prepared by the City of Ontario ("City"). The FEIR and development plan will be considered at the April 15, 2024 Development Advisory Board meeting as Agenda Item B. The Board will make a recommendation to the Planning Commission regarding certification of the EIR and approval of the Development Plan application.[1]

CARE CA submitted comments on the Draft EIR ("DEIR") on October 5, 2023, accompanied by expert comments, showing that the DEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant cumulative impacts, air quality and public health impacts,

[1] Staff Report, pg. 1. The Staff Report incorrectly states that the Board recommendation to the Planning Commission is to "adopt the draft EIR." (pg. 8). However, the operative CEQA document for the Project is currently the FEIR, which includes both the Draft EIR and the City's responses to comments on the Draft EIR.

printed on recycled paper

greenhouse gas ("GHG") emissions, energy and transportation impacts. We reviewed the Board Staff Report, the FEIR, and its technical appendices with the assistance of transportation expert Norm Marshall[2] and air quality expert Dr. James Clark.[3] The FEIR contains responses to CARE CA's comments. However, it fails to meaningfully address or correct major flaws CARE CA and its experts identified in the DEIR.

As explained herein, the FEIR still underestimates the number of trips generated by the Project and the distance of Project-related truck trips, thus continuing to underestimate the severity of the Project's public health, air quality, GHG, and transportation impacts. The FEIR also continues to assume that cold storage uses would be limited to 10% of the Project, reasoning that a condition of approval will limit cold storage to 10% of the Project's square footage, but no such condition of approval is included in the conditions of approval attached to the Staff Report. The FEIR still fails to provide an adequate cumulative impacts analysis that considers the Project's combined impacts with other existing and proposed industrial developments near the Project, in violation of CEQA. And the FEIR's quantified health risk analysis still underestimates impacts. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

The Staff Report incorrectly concludes that the "draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[4] The Staff Report recommends that the Planning Commission adopt the draft EIR[5] and approve the Project's Development Plan Application.[6] These recommendations are unsupported due to the major flaws in the Project's environmental review.

CARE CA urges the Board to recommend that the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

[2] Mr. Marshall's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit B**.
[4] Staff Report, PDEV22-017 – Draft Environmental Impact Report, pg. 7, Part 3: Decision, Section 1.
[5] *Id.*, pg. 8, Part 3, Section 4.
[6] Staff Report, PDEV22-017, Part 3, Section 5.

printed on recycled paper

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

A. CARE CA Has a Direct Interest in Enforcing Compliance with CEQA and Land Use Laws

The City, in FEIR Response A-3, claims that CARE CA's "primary interest is securing jobs through a project labor agreement."[7] This statement is an improper ad hominem attack on members of the public who submitted comments on the Draft EIR. It is also incorrect, unsupported by any facts in the record, and contrary to the purpose of an FEIR's responses to comments, which is to "describe the disposition of each significant environmental issue that is raised by commenters,"[8] not to attack the commenter.

The FEIR's statement appears intended solely to influence City decisionmakers to disregard the valid environmental concerns raised in CARE CA's

[7] FEIR, pg. 2-37.
[8] Pub Res. Code §21091(d); 14 Cal Code Regs §§15088(c), 15132(d), 15204(a); *City of Long Beach v Los Angeles Unified Sch. Dist.* (2009) 176 Cal. App. 4th 889, 904.

printed on recycled paper

comments, and distract from the substantial evidence presented by CARE CA's experts regarding the Project's unmitigated environmental and public health impacts. This is an improper use of an FEIR, which is intended to ensure that "public participation in the environmental review process is meaningful."[9] It is also irrelevant, because community groups, labor organizations, and other members of the public have standing under CEQA to participate in the public comment period required by law, and California courts have explained that ad hominem responses are irrelevant.[10]

The FEIR's statement is also factually incorrect. For decades, labor organizations like the union members of CARE CA have relied on the CEQA process to enforce environmental and public health protections – *including worker health protections* – for new development projects as a means of ensuring a safe working and living environment for the public, including themselves and their families. CEQA is especially important to union members who construct projects because they are the first in line to be exposed to health and safety impacts that exist onsite – impacts like soil contamination, air pollution from construction equipment, and excess noise. For many, CEQA has become the only place where communities of color, which includes workers represented by labor unions, have a voice in the process of developing projects in their communities.

California unions regularly participate as interested members of the public in the CEQA process. Their participation has led to decades of stronger air quality and toxic material controls at construction sites and housing developments, lowered emissions at industrial sites, increased electrification and renewable gas and fuels, reductions in GHG emissions, reduced construction noise and traffic in residential areas, improved water quality, water conservation, and protections for natural landscapes and sensitive biological resources. Union participation in the CEQA process has resulted in improved analysis and mitigation in agencies' CEQA documents, and, in some cases, successful litigation requiring agencies to comply with CEQA where the issues unions raised were not resolved during the administrative process. In short, ***union participation in the CEQA process leads to cleaner, safer, and more sustainable development in the State***. This is exactly what CEQA is designed to accomplish – protecting people and the environment through active public engagement in the environmental process.

[9] *City of Long Beach,* 176 Cal. App. 4th at 904.

[10] *Bakersfield Citizens for Local Control v. City of Bakersfield* (Cal. Ct. App. 2004) 124 Cal.App.4th 1184, 1196 ("[W]e will not dignify with extended comment [developer]'s complaint that BCLC is just a 'front' for a grocery worker's union whose disgruntled members feel threatened by nonunionized Wal-Mart's entry into the grocery business. As will be explained, BCLC has standing to pursue this litigation and it exhausted its administrative remedies. This is sufficient.")

printed on recycled paper

Public agencies have also acknowledged unions for their valuable contribution to the environmental review process. For example, when approving the Elk Hills project, the California Energy Commission Presiding Commissioner Michal Moore praised and thanked union coalition California Unions for Reliable Energy ("CURE") for its participation in the proceeding: **"We never would've gotten to some of the places that we did, and the resolution that we did, if it hadn't been for the – the dogged efforts of [CURE]…we came to a good place, and probably couldn't have gotten to that good place without some of the tension and – and rigor that was applied. So, thank you very much**."[11] During the evidentiary hearings, a Commissioner "**thank[ed] CURE for the technical help that Phyllis Fox [CURE expert] offered us, and certainly offered me an education that I wasn't going to get any other place**."[12]

Some unions work on constructing and operating projects after they participate in the environmental permitting process. Some developers and critics allege this means that unions are using CEQA to induce developers to enter into project labor agreements, then abandon the environmental issues – just as the FEIR does here. These allegations are not only false, they demonstrate a fundamental misunderstanding of union participation. When the unions work on projects they have challenged, ***they do not walk away from the environmental and public health issues they raise. They enforce them through binding mitigation and environmental settlement agreements***. This is consistent with CEQA's environmental purpose, and with the historic values of organized labor to solve problems, engage in civic discourse and activism, advocate for safe working conditions, and effect changes that improve their members' lives and communities.[13]

CARE CA asks that the City revise the EIR to remove this inaccurate and improper statement about CARE CA, and any other unsupported statements of dislike made about other members of the public who commented on the DEIR.

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[14] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[15]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by law.[16] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[17] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[18]

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[19]

CEQA requires that a lead agency evaluate and prepare written responses to comments in an FEIR.[20] Agencies are required to provide "detailed written response to comments . . . to ensure that the lead agency will fully consider the environmental consequences of a decision before it is made, that the decision is well informed and open to public scrutiny, and the public participation in the environmental review process is meaningful."[21] When a comment raises a "significant environmental issue," the written responses must describe the

disposition of each such issue raised by commentators.[22] Specifically, the lead agency must address the comment "in detail giving reasons why" the comment was "not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice."[23]

A. The FEIR Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the DEIR showed that the DEIR underestimated trips generated by the Project by relying on inappropriate Institute of Transportation Engineers ("ITE") land use codes, thus underestimating the Project's GHG and VMT impacts. Specifically, the DEIR relied on ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse), when other land use codes are applicable to the Project that have much higher trip generation rates. In particular, Mr. Marshall explained that the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[24]

The FEIR responds that the Project's design would not support a high-cube (sort) fulfillment center or high-cube parcel hub, pointing to the Project's square footage and number of parking spaces.[25] The FEIR states that the Project's anticipated use and size (270,377 sf) most closely aligns with the ITE Warehousing land use category. But Mr. Marshall explains that the Project's size equally aligns with ITE Land Use 156: High Cube Parcel Hub Warehouse, which accounts for warehouses with at least 200,000 gross square feet of floor area.[26] Mr. Marshall also explains that the Project's proposed number of parking spaces would further enable the Project to function as a High Cube Parcel Hub Warehouse.

In sum, the FEIR offers no support for is continued reliance on low trip generation rates. As a result, the City continues to rely on potentially underestimated trip generation rates which do not accurately reflect the Project's operational impacts. To the contrary, substantial evidence shows that trip generation rates could be 2.6 times greater than analyzed. To ensure adequate analysis and mitigation of this impact, Mr. Marshall recommends either applying a

printed on recycled paper

significantly more conservative trip generation rate, or implementing a condition of approval that trip generation will not exceed the number assumed in the EIR.[27] The EIR must be revised and recirculated to provide an accurate analysis of trip generation.

B. The FEIR Still Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

CARE CA's comments on the DEIR showed that the City lacked substantial evidence to assume that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space).[28] In Response A-7, the FEIR states that the City has added a condition of approval to the Project limiting cold storage to 27,034 sf (10% of the total sf).[29] But there is currently no indication any such condition of approval will be required. The April 15, 2024 Development Advisory Board agenda packet contains a Draft Development Advisory Board decision,[30] Land Development Division conditions of approval,[31] Landscape Planning Division conditions of approval,[32] Engineering Division conditions of approval,[33] and City of Ontario memoranda containing conditions of approval.[34] None of these documents contain a condition limiting the Project's cold storage uses. The FEIR's conclusion that the environmental impacts associated with cold storage would be limited to just 10% of the Project site therefore remains unsupported.

As explained in CARE CA's comments on the DEIR, cold storage warehouses generate greater environmental impacts than other types of warehouse.[35] CARE CA urges the City to revise and recirculate the EIR to analyze the impacts of additional cold storage use at the Project site, or to add a mitigation measure with a title restriction limiting cold storage to 10%.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the DEIR fails to consider the cumulative impacts of past, present, and probable future projects producing related or cumulative

printed on recycled paper

impacts. The DEIR's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[36] CARE CA's comments explained that rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and information requirements of CEQA, per caselaw such as *Kings County Farm Bureau v. City of Hanford*.[37] CARE CA also explained that SCAQMD's cumulative impacts significance thresholds, adopted in 2003, are being revised to reflect current conditions. The updated cumulative impacts significance thresholds will reflect projects' existing background MATES cancer risk and additional criteria such as whether the project would generate a high volume of diesel-fueled trucks.[38] CARE CA also discussed the Attorney General's guidance on cumulative impacts, which states that best practices include "thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[39]

In Responses 14, 15, and 16, the FEIR responds that "The Draft EIR and underlying technical studies were prepared in a matter consistent to the SCAQMD recommendation for determining cumulative impacts." The FEIR's response is non-responsive because it does not address the City's failure to comply with CEQA's legal standards for evaluating cumulative impacts that were discussed in CARE CA's comments. The FEIR also does not address the pending updates to SCAQMD's cumulative impacts methodology, which are statedly prepared in response to recent CEQA cases such as *People of the State of California v. City of Fontana.*[40]

In *People of the State of California v. City of Fontana,* the Attorney General's petition for writ of mandate challenged a Mitigated Negative Declaration ("MND")

printed on recycled paper

that erroneously applied SCAQMD guidance in the same way as the instant EIR. The petition explained:

> [T]he MND's cumulative air quality impact analysis does not account for—or even acknowledge—the multitude of other warehouses near the Project. Rather than consider the environmental setting within which the Project will be situated, the MND simply states that the Project will not result in a cumulatively considerable increase in emissions because the Project's individual air quality impacts will be less than significant. The MND even applies this reasoning to its analysis of health impacts from localized emissions, despite making no attempt to determine or disclose the severity of the existing health impacts from localized emissions in the community.[41]

The petition further explained that merely citing to SCAQMD guidance does not justify a failure to analyze a Project's cumulative impacts:

> The MND cites Appendix D of an August 2003 white paper published by the South Coast Air Quality Management District ("SCAQMD") entitled "White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution" ("2003 SCAQMD White Paper"). **To the extent that the 2003 SCAQMD White Paper asserts that any project with less than significant individual air quality impacts also necessarily has less than significant cumulative air quality impacts, it is inconsistent with CEQA** for at least the reasons stated above. Moreover, the 2003 SCAQMD White Paper lacks substantial evidence to support such a contention, and thus the MND's reliance on it violates CEQA. (Cal. Code Regs., tit. 14, § 15064.7, subd. (c).) The MND further violated CEQA by failing to provide substantial evidence to support its reliance on the 2003 SCAQMD White Paper, Appendix D as "guidance." (Ibid.) Finally, even if the MND's reliance on the 2003 SCAQMD White Paper were proper and supported by substantial evidence, the MND did not consider other evidence—such as public comments and the existence of many other sources of pollution near the Project site—showing that the Project could have a significant cumulative air quality impact. (See Cal. Code Regs., tit. 14, § 15064, subd. (b).) [emphasis added][42]

printed on recycled paper

The Attorney General's litigation resulted in a settlement which requires compliance with an ordinance adopted on April 12, 2022 that establishes sustainability standards for warehouses in Fontana, including standards intended to address cumulative air quality impacts. For example, the standards include requirements that rooftop solar panels supply 100% of power for non-refrigerated portions of facilities with buildings over 400,000 square feet, trees in automobile parking areas, zero emission motorized operational equipment, other equipment electrification requirements, and solar-ready buildings roofs.[43] These are just a few examples of feasible mitigation available to reduce cumulative air quality impacts, in compliance with CEQA.

The FEIR for the instant Project suffers from the same lack of analysis and legal errors as the MND in the Attorney General's Fontana litigation. As a result of its refusal to analyze cumulative impacts, the FEIR fails to disclose or mitigate potentially significant local and regional cumulative impacts. In sum, the FEIR has not responded to CARE CA's comments on this issue and fails to remedy the City's inadequate cumulative impacts analysis. The Project cannot be approved until the City revises and recirculates an EIR that analyzes the Project's potentially significant cumulative impacts.

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

The City prepared a Mobile Source Health Risk Assessment ("HRA") to analyze health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project.[44]

The HRA underestimates the Project's operational health risk impacts on residential receptors and workers by failing to account for building downwash in the AERMOD analysis.[45] Dr. Clark explains that building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution.[46] This downwash effect leads to higher ground-level concentration of chemicals emitted from sources.[47]

---

[43] *Id.*, Stipulation For Entry Of Final Judgment On Consent, available at https://climatecasechart.com/wp-content/uploads/case-documents/2022/20220414_docket-CIVSB2121605-CIVSB2121829_stipulation.pdf.
[44] DEIR, Appendix B2, pg. 25.
[45] Clark Comments, pg. 3.
[46] *Id.*
[47] *Id.*

printed on recycled paper

The HRA also underestimates the Project's health risk impacts by relying on non-standard daily breathing rates for sensitive receptors. Dr. Clark explains that the HRA unjustifiably relies on breathing rates lower than recommended by the Office of Environmental Health Hazard Assessment's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.[48]

CEQA requires an accurate analysis of human health impacts. CEQA Guidelines Section 15065(a)(4) provides that the City is required to find a project will have a significant impact on the environment and require an EIR if the environmental effects of a project will cause a substantial adverse effect on human beings. The Supreme Court has also explained that CEQA requires the lead agency to disclose the health consequences that result from exposure to a project's air emissions.[49] Courts have held that an environmental review document must disclose a project's potential health risks to a degree of specificity that would allow the public to make the correlation between the project's impacts and adverse effects to human health.[50]

Because the City's analysis underestimates the Project's health risk impacts, the City fails to meet CEQA's requirement to accurately disclose the Project's impacts on public health and support its conclusions with substantial evidence. A revised HRA must be included in a recirculated EIR.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the DEIR underestimates truck trip lengths by applying a truck trip length of 15.3 miles for 2-axle trucks, 14.2 miles for 3-axle trucks, and 40 miles for 4+-axle trucks. The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explained that the City must consider the reasonably foreseeable distance to the Project's likely trip destinations.[51] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The FEIR responds in Response A-18:

> The commenter fails to provide any evidentiary basis for the arbitrary number of 60 miles it suggests using… In fact, these recommendations are in direct opposition of the SCAQMD's recommended truck travel distance for warehousing projects within its jurisdiction (based on SCAG regional travel

[48] *Id.* at 5.

[51] Marshall Comments, pg. 7.

printed on recycled paper

> demand data)… The commenter's recommended trip lengths are not supported by any substantial evidence provided by the SCAQMD and contradicts published material from SCAQMD that was utilized in the underlying analysis.[52]

The FEIR misinterprets the SCAQMD guidance. SCAQMD itself regularly comments on warehouse projects that it is essential to analyze the distance from warehouse projects to likely destinations and has emphasized that agencies should not rely solely on the 40-mile average trip length identified in its guidance. For example, SCAQMD recently commented on a warehouse project proposed for a location at a similar distance from the Ports as the instant Project:

> South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan. However, it is essential to note that **the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way**. Thus, **South Coast AQMD staff is concerned about underestimating truck emissions** due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the **more conservative trip length between 40 to 70 miles**, of which 40 miles could be used for local and **70 miles for Port trips** and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.[53]

---

[52] FEIR, pg. 2-43.

[53] **Exhibit C**, containing the following comment letters: SCAQMD, Comments on the Draft Subsequent Environmental Impact Report for the Hemlock Warehouse Development Project (SCH No.: 2009091089) (November 22, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/november-2023/SBC231011-05.pdf; also attached as Attachment B to Mr. Marshall's comments; SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf; SCAQMD, Comments on Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2 (September 11, 2015), pg. 3, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/september/deiroptimus.pdf?sfvrsn=2 ("Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances

printed on recycled paper

In sum, the FEIR is incorrect when it states that CARE CA's recommendation to use a 60-mile truck trip length for trips to Ports of Los Angeles and Long Beach is not supported by substantial evidence. Rather, it is the FEIR's truck trip length assumptions which are not supported by substantial evidence – SCAQMD does not recommend blind reliance on truck trip lengths of 15.3 miles, 14.2 miles, and 40 miles for warehouse projects such as the instant Project for which longer trips to and from the ports are reasonably foreseeable.

Dr. Clark's comments also discuss the relationship between the ports and warehouses like this Project. Dr. Clark discusses the large percentage of goods passing through the ports, the number of truck trips generated by the ports, and observes that the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.[54] Substantial evidence therefore demonstrates that the Project's truck trip lengths are underestimated, resulting in underestimation of transportation, air quality, and GHG impacts. The Project cannot be approved until this error is corrected in a revised and recirculated EIR.

F. The FEIR Fails to Include Sufficient Investigation into Energy Conservation Measures

The DEIR and FEIR do not include sufficient investigation into energy conservation measures that might be available or appropriate for the Project. In the DEIR, the City concludes that energy impacts of the Project would be less than significant because the Project's construction and operations would comply with state regulations.[55] But as discussed below, the Project's environmental review does not sufficiently consider energy conservation measures like solar facilities, use of alternate fuel sources, and passive energy efficiency measures to ensure the Project's energy consumption would not be wasteful, inefficient, or unnecessary. The FEIR briefly addresses some energy conservation measures in Responses B-59, B-56, and B-53, but only to explain that none are required because air quality impacts are less than significant. This analysis fails to meet CEQA's requirements.

CEQA requires an environmental document to discuss mitigation measures for significant environmental impacts, including "measures to reduce the wasteful,

---

described in the DEIR."); SCAQMD, Comments on Draft Environmental Impact Report (DEIR) for the Proposed Westgate Specific Plan (SCH No. 1995052002) (March 5, 2015), pg. 5, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/march/deirwestgate.pdf?sfvrsn=4; SCAQMD, Comments on Draft Mitigated Negative Declaration (Draft MND) for the Proposed Colton – DEXUS Project (February 1, 2013), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2013/february/colton-dexus.pdf.

[54] Clark Comments, pg. 6.

[55] DEIR, pg. 4.4-5, 6.

printed on recycled paper

inefficient, and unnecessary consumption of energy."[56] The CEQA Guidelines require discussion of energy conservation measures when relevant, and provide examples in Appendix F:[57]

1) Potential measures to reduce wasteful, inefficient and unnecessary consumption of energy during construction, operation, maintenance and/or removal. The discussion should explain why certain measures were incorporated in the project and why other measures were dismissed.
2) The potential of siting, orientation, and design to minimize energy consumption, including transportation energy, increase water conservation and reduce solid waste.
3) The potential for reducing peak energy demand.
4) Alternate fuels (particularly renewable ones) or energy systems.
5) Energy conservation which could result from recycling efforts.

Courts have rejected EIRs that fail to include adequate analysis investigation into energy conservation measures that might be available or appropriate for a project.[58] In *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[59] the Court of Appeal reviewed an EIR for a shopping center on undeveloped agricultural land. The EIR concluded that, due to the proposed project's compliance with Title 24 guidelines and regulations, the project would be expected to have a less-than-significant impact regarding the wasteful, inefficient, or unnecessary consumption of energy. But the lead agency's EIR did not include discussion regarding the different renewable energy options that might be available or appropriate for the project. The Court held "the City's EIRs failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options."[60] The lead agency argued that compliance with the Building Code sufficed to address energy impact concerns for the project.[61] But the Court explained:

> Although the Building Code addresses energy savings for components of a new commercial construction, it does not address many of the considerations required under Appendix F of the CEQA Guidelines… These considerations include whether a building should be constructed at all, how large it should

[56] Pub. Resources Code, § 21100(b)(3); *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912, 930.

printed on recycled paper

> be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Here, a requirement that Gateway II comply with the Building Code does not, by itself, constitute an adequate assessment of mitigation measures that can be taken to address the energy impacts during construction and operation of the project.[62]

Here, the FEIR lacks analysis of common energy consumption measures in violation of CEQA Guidelines Appendix F. The FEIR fails to analyze the feasibility of onsite solar facilities, such as rooftop, parking lot, or ground-level solar photovoltaics. This analysis must address considerations such as the technical and economic feasibility of installing solar facilities on the Project site, the potential size of the Project's solar zone, and the potential magnitude of mitigation provided by installing solar facilities. The FEIR also fails to evaluate the extent to which mobile source energy consumption could be reduced during Project operations through electric vehicle charging infrastructure (above what is required by existing regulations).

The FEIR acknowledges that a diesel backup generator may be required for Project operations,[63] but fails to evaluate measures to reduce this source of energy consumption, such as use of alternative fuel sources.

The FEIR also fails to evaluate the feasibility of more stringent idling requirements over existing requirements.[64]

The FEIR's discussion of construction energy conservation measures also violates CEQA Guidelines Appendix F. The City's energy analysis fails to evaluate the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators.[65]

The FEIR contains responses briefly addressing the measures discussed above.[66] But the responses simply state: "[a]s concluded in Section 4.2, Air Quality, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking

---

printed on recycled paper

into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32)… Thus, the City determines that additional mitigation is not warranted."[67] This type of response does not evaluate the feasibility or effectiveness of energy-conservation measures, and thus does not provide the analysis required by CEQA Guidelines Appendix F.

In sum, the FEIR's energy analysis fails adequately analyze measures to reduce the wasteful, inefficient, and unnecessary consumption of energy, and fails to meaningfully address Appendix F's considerations of whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope.[68] This analysis must be provided in a revised and recirculated EIR.

III. THE BOARD CANNOT MAKE THE REQUISITE FINDINGS TO RECOMMEND APPROVAL OF THE PROJECT

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[69]

The Staff Report states that the Project meets this requirement, but this finding lacks support.[70] The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project.

[67] FEIR, Response B-57.
[68] *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 CA4th 256, 264.
[69] Section 4.02.025(D)(3).
[70] Staff Report, PDEV22-017, Part 3, Section 4.

printed on recycled paper

For the same reason, the Staff Report lacks support to make the following finding in recommending adoption of the FEIR: "[t]he draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project."[71]

A revised EIR must be recirculated before the Project can be recommended for approval.

IV. CONCLUSION

As is explained herein, the FEIR's air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to recommend certification of the FEIR or under the City of Ontario Municipal Code to approve the Project's development plan. CARE CA urges the Board to recommend that the City revise and recirculate the EIR before any further action is taken on the Project.

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

In October 2023, I reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I made the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

Now, I have reviewed the responses to these comments made in the project's Final Environmental Impact Review ("FEIR") dated February 2024.

Truck trip lengths – The FEIR repeats the false assertion that the truck trip lengths follow SCAQMD's recommendations (FEIR, A-18, p. 2-43). In my October 2023 comments, I addressed this, writing:

> The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[1] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[2] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

To prove that this is not a general SCAQMD recommendation for all warehouses, I attach SCAQMD's November 22, 2023 comments on the Hemlock Warehouse Development Project Draft SEIR in the City of Fontana. That Draft SEIR applied the same truck trip lengths as used in the 5355 East Airport Drive DEIR and FEIR. SCAQMD's comments state:

> However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project. (p. 2)

SCAQMD is making the same point I made in my October 2023 comments where I wrote:

> it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The FEIR does not use SCAQMD- recommended truck trip lengths. SCAQMD instead recommends: "**Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project**."

[1] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf
[2] https://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/sclc_warehouse-presentation-final.pdf

VMT mitigation – The FEIR continues to state that the proposed project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.

However, the FEIR states that these impacts cannot be mitigated because "measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant." (FEIR A-24, p. 2-44)

My October 2023 comments recommended requiring CAPCOA T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – that can provide up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

A smaller mandatory reduction may be appropriate for this project, with this requirement passed on to the tenant, but it is not sufficient to claim that no significant mitigation is possible.

In addition, the attached SCAQMD comments on the Hemlock Warehouse Development Project recommends several mitigation measures targeting truck emissions, including:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks,
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the final CEQA document, and
- Provide electric vehicle (EV) charging stations and electrical hookups for truckers. (p.3)

Trip generation

In my October 2023 comments, I provided data on different types of warehouses that have significantly higher trip generation rates than the 1.75 trips per 1000 sq. ft. assumed in the DEIR and FEIR. These include:

> The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

The FEIR argues that the highest generators that I discussed in my October 2023 comments could not be accommodated because ". . . the layout of the site with 251 parking spaces would not reasonable accommodate the on-site parking required to support these uses."

This point about parking may be valid for the highest generators per 1000 sq. ft. but not for the intermediate generators. The DEIR and FEIR estimate only 270 passenger car trips per day (DEIR Appendix K, p. 5), i.e., 135 vehicles in and 135 cars out. Therefore, if all cars were employees and they all worked the same single shift, the parking lot utilization would never exceed 54%. With multiple shifts and non-employee passenger car trips, the parking lot utilization would be much

lower. Therefore, the parking lot is designed to support many more trips than assumed in the DEIR and FEIR.

The 251 parking spaces are consistent with ITE Land Use 156: High Cube Parcel Hub Warehouse. This use is described:

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. A high-cube warehouse can be free-standing or located in an industrial park. A high-cube parcel hub warehouse typically serves as a regional and local freight-forwarder facility for time sensitive shipments via airfreight and ground carriers. A site can also include truck maintenance, wash, or fueling facilities. Some limited assembly and repackaging may occur within the facility.

Given the uncertainty concerning the proposed project and its size, 270,377 sq. ft., it could foreseeably end up being a High-Cube-Parcel-Hub Warehouse as defined above.

The number of parking spaces provided also is consistent with this usage. The trip generation rate for this category is 4.63 trips per 1000 sq. ft., i.e. 2.6 times the rate used in the DEIR and FEIR. This rate includes 0.58 truck trips per 1000 sq. ft. Therefore, the passenger car rate is 4.05 trips per 1000 sq. ft. As a High-Cube-Parcel-Hub Warehouse, the proposed project would generate 1095 passenger car trips per day.

The DEIR states:

> For the purposes of this EIR, the Project is assumed to be operational 24 hours per day, seven days per week, with exterior loading and parking areas illuminated at night. (DEIR, p. 3-13)

This suggests multiple shifts each day.

Some of the passenger car trips would not be parking long term, including trips dropping off and picking up workers, and miscellaneous service trips, all of which include both and entering trip and an exiting trip. However, even if all passenger car trips involved parking long-term, all the trips could be accommodated with the planned 251 parking spaces if each space is occupied an average of 2.18 times per day.

As I stated in my October 2023 comment letter:

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

Attn: Mr. Aidan Marshall

Subject: Comments On Final Environmental Impact Report (FEIR) 5355 East Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the City of Ontario (the City) FEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the Project consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

Specific Comments

1. The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.

A review of the AQ Analysis and the Mobile Source Health Risk Assessment show that building downwash was not incorporated into the AERMOD analysis of the Project. Building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from nearby stacks. A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity. This downwash effect leads to higher ground-level concentration of chemicals emitted from sources. The downwash effect increases as the relative difference between the release height and top of the building increases.[1] Using a lower height for the building will underestimate the potential ground level concentrations of pollutants associated with the Project operation.

For the closest receptors to the site, this difference will create an additional air quality impact that is not accounted for in the City's analysis. In addition to incorporating the building downwash impacts of the Project buildings, the AERMOD model should also incorporate the building downwash for receptors near the Project. Receptors farther away will still be subject to the downwash effect given the assumed emission height release incorporated into the model. Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[2] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). The City should address the impact of this issue in a revised DEIR.

[1] The so-called good engineering practice height (GEP) of the source. The GEP is defined in Section 123 of the Clean Air Act as "the height necessary to ensure that emissions from a stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies or wakes which may be created by the source itself, nearby structures or nearby terrain obstacles."

[2] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

2. The Air Quality Analysis Relies On An Input Value From AP-42 That Is Rated As Poor And May Be Unreliable

The CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42. According to the AP-42 FAQ - E = Poor. Factor is developed from C and D rated test data from a very few number of facilities, and there may be reason to suspect that the facilities tested do not represent a random sample of the industry. There also may be evidence of variability within the source category population. This means that there is a lot of uncertainty in the AQ analysis regarding the amount of particulate matter that will be emitted from the construction phase of the Project. The City should assess the impacts of this variable in a revised DEIR.

3. The Health Risk Analysis Incorporates Non-Standard Daily Breathing Rates For Sensitive Receptors Analyzed In The HRA

According to the FEIR, a health risk assessment was prepared in accordance with SCAQMD's guidance. For purposes of this Health Risk Assessment, receptors include both residential and non-residential (worker) land uses in the vicinity of the Project. These receptors are included in the Health Risk Assessment since residents and workers may be exposed at these locations over a long-term duration of 30 and 25 years, respectively.[3]

The input values utilized in the HRA analysis included a variety of daily breathing rates that are favorable to reducing the potential health impacts. The HRA states that "Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines."[4] The values listed in Table 2-7 include both the 95 percent upper confidence limit (95% UCL) values (for age *in utero* exposure and age 0 to 2) and the 80th percentile values for the remaining age groups (age 2 to 16 and age 16 to 30).

[3] Urban Crossroads. 2022. 5355 East Airport Drive Mobile Source Health Risks Assessment. Prepared by Urban Crossroads. August 30, 2022. pg 5

[4] Urban Crossroads. 2022. 5355 East Airport Drive Mobile Source Health Risks Assessment. Prepared by Urban Crossroads. August 30, 2022. pg 19-20

The risk estimates for ages 2 to 30 is off by a factor of 1.3.

TABLE 2-7: EXPOSURE ASSUMPTIONS FOR INDIVIDUAL CANCER RISK (30 YEAR RESIDENTIAL)

Age	Daily Breathing Rate (L/kg-day)	Age Specific Factor	Exposure Duration (years)	Fraction of Time at Home	Exposure Frequency (days/year)	Exposure Time (hours/day)
-0.25 to 0	361	10	0.25	0.85	350	24
0 to 2	1,090	10	2	0.85	350	24
2 to 16	572	3	14	0.72	350	24
16 to 30	261	1	14	0.73	350	24

Figure 2: Daily Breathing Rates Utilized In HRA

The 2015 Air Toxic Hot Spots Program Guidance Manual [5] notes that residential estimates use 95th percentile breathing rates in Table 5.6. Table 5.6 shows values of 745 L/kg BW-day for children age 2 to 16 and 335 L/kg BW-day for adults age 16 to 30.

Table 5.6 Point Estimates of Residential Daily Breathing Rates for 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years (L/kg BW-day)

	3rd Trimester[a]	0<2 years	2<9 years	2<16 years	16<30 years	16<70 years
	L/kg-day					
Mean	225	658	535	452	210	185
95th Percentile	361	1090	861	745	335	290

[a] 3rd trimester **breathing rates** based on breathing rates of pregnant women using the assumption that the dose to the fetus during the 3rd trimester is the same as that to the mother.

The City's analysis is therefore incomplete, is not consistent with the guidance from OEHHA, and must be corrected in a revised final environmental impact report for the Project.

4. The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to the operations air quality analysis of Project,[6] the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for

[5] Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, http://oehha.ca.gov/air/hot_spots/hotspots2015.html

[6] Urban Crossroads. 2022. 5355 East Airport Drive Air Quality Impact Analysis. August 30. 2022. Pg 37

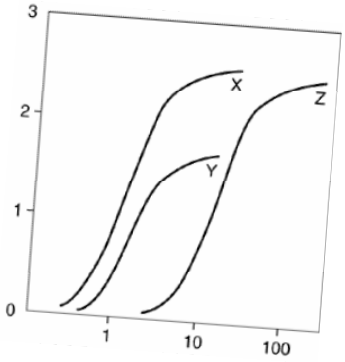
3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.

This statement does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately 700 million square feet, an increase of 20 percent over the last five years"),[7] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[8] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[9] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the Regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised final environmental impact report should be prepared to address these substantial concerns.



Sincerely,

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well recognized toxicologist, air modeler, and health scientist. He has 20 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

Significant projects performed by Dr. Clark include the following:

LITIGATION SUPPORT

Case: James Harold Caygle, et al, v. Drummond Company, Inc. Circuit Court for the Tenth Judicial Circuit, Jefferson County, Alabama. Civil Action. CV-2009

Client: Environmental Litgation Group, Birmingham, Alabama

Dr. Clark performed an air quality assessment of emissions from a coke factory located in Tarrant, Alabama. The assessment reviewed include a comprehensive review of air quality standards, measured concentrations of pollutants from factory, an inspection of the facility and detailed assessment of the impacts on the community. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Rose Roper V. Nissan North America, et al. Superior Court of the State Of California for the County Of Los Angeles – Central Civil West. Civil Action. NC041739

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to multiple chemicals, including benzene, who later developed a respiratory distress. A review of the individual's medical and occupational history was performed to prepare an exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to respiratory irritants. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: O'Neil V. Sherwin Williams, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to petroleum distillates who later developed a bladder cancer. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Summary judgment for defendants.

Case: Moore V., Shell Oil Company, et al. Superior Court of the State Of California for the County Of Los Angeles

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to chemicals while benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Raymond Saltonstall V. Fuller O'Brien, KILZ, and Zinsser, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Richard Boyer and Elizabeth Boyer, husband and wife, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-7G.

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: JoAnne R. Cook, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-9R

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of an individual exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Patrick Allen And Susan Allen, husband and wife, and Andrew Allen, a minor, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-W

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Michael Fahey, Susan Fahey V. Atlantic Richfield Company, et al. United States District Court Central District of California Civil Action Number CV-06 7109 JCL.

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Constance Acevedo, et al., V. California Spray-Chemical Company, et al., Superior Court of the State Of California, County Of Santa Cruz. Case No. CV 146344

Dr. Clark performed a comprehensive exposure assessment of community members exposed to toxic metals from a former lead arsenate manufacturing facility. The former manufacturing site had undergone a DTSC mandated removal action/remediation for the presence of the toxic metals at the site. Opinions were presented regarding the elevated levels of arsenic and lead (in attic dust and soils) found throughout the community and the potential for harm to the plaintiffs in question.

Case Result: Settlement in favor of defendant.

Case: Michael Nawrocki V. The Coastal Corporation, Kurk Fuel Company, Pautler Oil Service, State of New York Supreme Court, County of Erie, Index Number I2001-11247

Client: Richard G. Berger Attorney At Law, Buffalo, New York

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the

known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Judgement in favor of defendant.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model will be used to estimate acute and chronic exposure concentrations to multiple contaminants and will be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

Client – Los Angeles Alliance for a New Economy (LAANE), Los Angeles, California

Dr. Clark is advising the LAANE on air quality issues related to current flight operations at the Los Angeles International Airport (LAX) operated by the Los Angeles World Airport (LAWA) Authority. He is working with the LAANE and LAX staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client – City of Santa Monica, Santa Monica, California

Dr. Clark is advising the City of Santa Monica on air quality issues related to current flight operations at the facility. He is working with the City staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client: Omnitrans, San Bernardino, California

Dr. Clark managed a public health survey of three communities near transit fueling facilities in San Bernardino and Montclair California in compliance with California Senate Bill 1927. The survey included an epidemiological survey of the effected communities, emission surveys of local businesses, dispersion modeling to determine potential emission concentrations within the communities, and a comprehensive risk assessment of each community. The results of the study were presented to the Governor as mandated by Senate Bill 1927.

Client: Confidential, San Francisco, California

Summarized cancer types associated with exposure to metals and smoking. Researched the specific types of cancers associated with exposure to metals and smoking. Provided causation analysis of the association between cancer types and exposure for use by non-public health professionals.

Client: Confidential, Minneapolis, Minnesota

Prepared human health risk assessment of workers exposed to VOCs from neighboring petroleum storage/transport facility. Reviewed the systems in place for distribution of petroleum hydrocarbons to identify chemicals of concern (COCs), prepared comprehensive toxicological summaries of COCs, and quantified potential risks from carcinogens and non-carcinogens to receptors at or adjacent to site. This evaluation was used in the support of litigation.

Client – United Kingdom Environmental Agency

Dr. Clark is part of team that performed comprehensive evaluation of soil vapor intrusion of VOCs from former landfill adjacent residences for the United Kingdom's Environment

Agency. The evaluation included collection of liquid and soil vapor samples at site, modeling of vapor migration using the Johnson Ettinger Vapor Intrusion model, and calculation of site-specific health based vapor thresholds for chlorinated solvents, aromatic hydrocarbons, and semi-volatile organic compounds. The evaluation also included a detailed evaluation of the use, chemical characteristics, fate and transport, and toxicology of chemicals of concern (COC). The results of the evaluation have been used as a briefing tool for public health professionals.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: Ameren Services, St. Louis, Missouri

Managed the preparation of a comprehensive human health risk assessment of workers and residents at or near an NPL site in Missouri. The former operations at the Property included the servicing and repair of electrical transformers, which resulted in soils and groundwater beneath the Property and adjacent land becoming impacted with PCB and chlorinated solvent compounds. The results were submitted to U.S. EPA for evaluation and will be used in the final ROD.

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark is managing the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark is assisting the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of perchlorate in environment. Dr. Clark evaluated the production, use, chemical characteristics, fate and transport, toxicology, and remediation of perchlorate. Perchlorates form the basis of solid rocket fuels and have recently been detected in water supplies in the United States. The results of this research

were presented to the USEPA, National GroundWater, and ultimately published in a recent book entitled *Perchlorate in the Environment.*

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Confidential, San Francisco, California

Identified and analyzed fifty years of epidemiological literature on workplace exposures to heavy metals. This research resulted in a summary of the types of cancer and non-cancer diseases associated with occupational exposure to chromium as well as the mortality and morbidity rates.

Client: Confidential, San Francisco, California

Summarized major public health research in United States. Identified major public health research efforts within United States over last twenty years. Results were used as a briefing tool for non-public health professionals.

Client: Confidential, San Francisco, California

Quantified the potential multi-pathway dose received by humans from a pesticide applied indoors. Part of team that developed exposure model and evaluated exposure concentrations in a comprehensive report on the plausible range of doses received by a specific person. This evaluation was used in the support of litigation.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client – United Kingdom Environmental Agency

Oversaw a comprehensive toxicological evaluation of methyl-*tertiary* butyl ether (M*t*BE) for the United Kingdom's Environment Agency. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of M*t*BE. The results of the evaluation have been used as a briefing tool for public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of *tertiary* butyl alcohol (TBA) in municipal drinking water system. TBA is the primary breakdown product of M*t*BE, and is suspected to be the primary cause of M*t*BE toxicity. This evaluation will include available information on the production, use, chemical characteristics, fate and transport in the environment, absorption, distribution, routes of detoxification, metabolites, carcinogenic potential, and remediation of TBA. The results of the evaluation were used as a briefing tool for non-public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of methyl *tertiary* butyl ether (MTBE) in municipal drinking water system. MTBE is a chemical added to gasoline to increase the octane

rating and to meet Federally mandated emission criteria. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of MTBE. The results of the evaluation have been were used as a briefing tool for non-public health professionals.

Client – Ministry of Environment, Lands & Parks, British Columbia

Dr. Clark assisted in the development of water quality guidelines for methyl tertiary-butyl ether (MTBE) to protect water uses in British Columbia (BC). The water uses to be considered includes freshwater and marine life, wildlife, industrial, and agricultural (e.g., irrigation and livestock watering) water uses. Guidelines from other jurisdictions for the protection of drinking water, recreation and aesthetics were to be identified.

Client: Confidential, Los Angeles, California

Prepared physiologically based pharmacokinetic (PBPK) assessment of lead risk of receptors at middle school built over former industrial facility. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Client: Confidential, Atlanta, Georgia

Researched potential exposure and health risks to community members potentially exposed to creosote, polycyclic aromatic hydrocarbons, pentachlorophenol, and dioxin compounds used at a former wood treatment facility. Prepared a comprehensive toxicological summary of the chemicals of concern, including the chemical characteristics, absorption, distribution, and carcinogenic potential. Prepared risk characterization of the carcinogenic and non-carcinogenic chemicals based on the exposure assessment to quantify the potential risk to members of the surrounding community. This evaluation was used to help settle class-action tort.

Client: Confidential, Escondido, California

Prepared comprehensive Preliminary Endangerment Assessment (PEA) of dense non-aqueous liquid phase hydrocarbon (chlorinated solvents) contamination at a former printed circuit board manufacturing facility. This evaluation was used for litigation support and may be used as the basis for reaching closure of the site with the lead regulatory agency.

Client: Confidential, San Francisco, California

Summarized epidemiological evidence for connective tissue and autoimmune diseases for product liability litigation. Identified epidemiological research efforts on the health effects of medical prostheses. This research was used in a meta-analysis of the health effects and as a briefing tool for non-public health professionals.

Client: Confidential, Bogotá, Columbia

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of a 13.7 hectares plastic manufacturing facility in Bogotá, Colombia The risk assessment was used as the basis for the remedial goals and closure of the site.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally cadmium) and VOCs from soil and soil vapor at 12-acre former crude oilfield and municipal landfill. The site is currently used as a middle school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and was used as the basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Managed remedial investigation (RI) of heavy metals and volatile organic chemicals (VOCs) for a 15-acre former manufacturing facility. The RI investigation of the site included over 800 different sampling locations and the collection of soil, soil gas, and groundwater samples. The site is currently used as a year round school housing approximately 3,000 children. The Remedial Investigation was performed in a manner

that did not interrupt school activities and met the time restrictions placed on the project by the overseeing regulatory agency. The RI Report identified the off-site source of metals that impacted groundwater beneath the site and the sources of VOCs in soil gas and groundwater. The RI included a numerical model of vapor intrusion into the buildings at the site from the vadose zone to determine exposure concentrations and an air dispersion model of VOCs from the proposed soil vapor treatment system. The Feasibility Study for the Site is currently being drafted and may be used as the basis for granting closure of the site by DTSC.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally lead), VOCs, SVOCs, and PCBs from soil, soil vapor, and groundwater at 15-acre former manufacturing facility. The site is currently used as a year round school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and will be basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of VOC vapor intrusion into classrooms of middle school that was former 15-acre industrial facility. Using the Johnson-Ettinger Vapor Intrusion model, the evaluation determined acceptable soil gas concentrations at the site that did not pose health threat to students, staff, and residents. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client –Dominguez Energy, Carson, California

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of 6-acre portion of a 500-acre oil and natural gas production facility in Carson, California. The risk assessment was used as the basis for closure of the site.

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Draft Subsequent Environmental Impact Report (Draft SEIR) for the Hemlock Warehouse Development Project (Proposed Project) (SCH No.: 2009091089)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The City of Fontana is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Draft SEIR

Based on the Draft SEIR, the Lead Agency proposes demolishing the existing development to construct and operate a warehouse facility for 882,000 square feet on the 40.01-acre site at 11115 Hemlock Avenue, Fontana.[1] A portion of the warehouse facility would be used for cold storage, approximately 220,500 square feet or 25 percent of the warehouse.[2] The Proposed Project would have 114 dock doors on the east and west sides of the building[3] associated with 562 truck trips per day.[4] Regional access to the Proposed Project site via Interstate 10, State Route 60, and Interstate 15, and local access via Santa Ana Avenue and Jurupa Avenue. [5] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (e.g., residential units) is approximately 900 feet southeast and southwest of the Proposed Project site. Construction of the Proposed Project is anticipated to take approximately 15 months.[6]

South Coast AQMD Staff's Comments on the Draft SEIR

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

In the Draft SEIR, the Lead Agency discusses the determination of truck emissions for the Proposed Project and states that "…*CalEEMod defaults were utilized for trip length and the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2) trucks, 14.2*

[1] Draft SEIR. Page 3-1 and 3-2.
[2] *Ibid*. Page 3-9.
[3] *Ibid*.
[4] *Ibid*. Appendix F- Traffic Impact Analysis. Page 40.
[5] *Ibid*. Page 3-1.
[6] *Ibid*. Page 3-10.

miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages from the Traffic Impact Analysis prepared for the Project (Appendix F), which resulted in an overall truck trip length of 29.9 miles with an assumption of 100% primary trips for the proposed warehouse.[7]"

South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan.[8] However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

User-Defined Land Use Subtype in the California Emissions Estimator Model (CalEEMod) Analysis

In the operational CalEEMod output files, besides the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes, "user-defined industrial" is added.[9] According to the CalEEMod User Guide, the "user-defined" may be selected to characterize project land use subtypes not included in CalEEMod. If selected, all data on the Land Use screen will need to be input manually. [10] However, lot acreage and the floor square area use are all set to zero under the "user-defined industrial" land use subtype.

In addition, the truck information (e.g., truck trips) is input under the "user-defined industrial" but not in the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes for the Proposed Project. This possibly leads to underestimating the heavy-duty truck emissions for warehouse activities since no data is filled under this "user-defined industrial" land use subtype. Therefore, it is recommended that the Lead Agency explain why the land use is separated in the CalEEMod analysis and why the truck information is not under the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtype and revise the analysis as necessary in the final CEQA document.

Additional Recommended Air Quality and Greenhouse Gases Mitigation Measures

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. To further reduce the Proposed Project's air quality impacts, and in addition to SWIP SP FEIR Mitigation Measures

[7] *Ibid*. Page 5.1-22
[8] South Coast Air Quality Management District, Preliminary Draft Staff Report: Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce.
[9] *Ibid*. Appendix B - Air Quality Impact Analysis. CalEEMod Operational and LST Output Files.
[10] California Emissions Estimator Model (CalEEMod) Version 2022.1 User Guide. Access at: https://www.caleemod.com/documents/user-guide/CalEEMod_User_Guide_v2022.1.pdf

MM 4.2-1a to MM 4.2-1f, MM 4.2-2a to MM4.2-2l, and MM 4.2-5a, South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in the Final EIR.

Mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft SEIR may include the following:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks, such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. Given the state's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks, such as the Advanced Clean Trucks Rule[11] and the Heavy-duty Low NOx Omnibus Regulation,[12] ZE and NZE trucks will become increasingly more available to use. The Lead Agency should require a phase-in schedule to incentivize the use of these cleaner operating trucks to reduce any significant adverse air quality impacts. South Coast AQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency. At a minimum, require the use of a 2010 model year[13] that meets CARB's 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks. All heavy-duty haul trucks should meet CARB's lowest optional low-NO_x standard starting in 2022.[14] Where appropriate, include environmental analyses to evaluate and identify sufficient electricity and supportive infrastructures in the Energy and Utilities and Service Systems Sections in the CEQA document. Include the requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with project construction to document that each truck used meets these emission standards and make the records available for inspection. The Lead Agency should conduct regular inspections to the maximum extent feasible to ensure compliance.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.
- Provide electric vehicle (EV) charging stations or, at a minimum, provide electrical infrastructure, and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

Mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft SEIR may include the following:

[11] CARB. June 25, 2020. Advanced Clean Trucks Rule. Accessed at: https://ww2.arb.ca.gov/our-work/programs/advanced-cleantrucks.

[12] CARB has recently passed a variety of new regulations that require new, cleaner heavy-duty truck technology to be sold and used in the state. For example, on August 27, 2020, CARB approved the Heavy-Duty Low NOx Omnibus Regulation, which will require all trucks to meet the adopted emission standard of 0.05 g/hp-hr starting with engine model year 2024. Accessed at: https://ww2.arb.ca.gov/rulemaking/2020/hdomnibuslownox.

[13] CARB adopted the statewide Truck and Bus Regulation in 2010. The Regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. More information on the CARB's Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.

[14] CARB's optional low-NOx emission standard is available at: https://ww2.arb.ca.gov/our-work/programs/optional-reduced-nox-standards.

- Maximize the use of solar energy by installing solar energy arrays.
- Use light-colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices and appliances.

Design considerations for the Proposed Project that the Lead Agency should consider reducing air quality and health risk further impacts include the following:

- Clearly mark truck routes with trailblazer signs so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, daycare centers, etc.).
- Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.
- Design the Proposed Project such that any truck check-in point is inside the Proposed Project site to ensure no trucks are queuing outside.
- Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.
- Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

The South Coast AQMD staff also suggests the Lead Agency review the references (listed below) and consider including the additional recommended mitigation measures in the final CEQA document:

- State of California – Department of Justice: Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act[15]
- South Coast AQMD 2022 South Coast Air Quality Management Plan,[16] specifically:
    - Appendix IV-A – South Coast AQMD's Stationary and Mobile Source Control Measures
    - Appendix IV-B – CARB's Strategy for South Coast
    - Appendix IV-C – SCAG's Regional Transportation Strategy and Control Measures
- United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation[17]

South Coast AQMD Air Permits and Role as a Responsible Agency

The Draft SEIR assumes in the analysis that an emergency diesel-powered fire pump and emergency diesel-powered generator would be used for the Proposed Project.[18] Hence, air permits from South Coast AQMD would be required, and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead

[15] State of California – Department of Justice. Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act. Access at: https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf
[16] 2022 South Coast AQMP. Access at: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan
[17] United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation. Access at: https://www.epa.gov/mobile-source-pollution/environmental-justice-and-transportation
[18] *Ibid*. Page 5.2-13.

Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to review the above-mentioned document. The City of Jurupa Valley is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments which are organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Recirculated Draft EIR

Based on the Recirculated Draft EIR, the Proposed Project is comprised of the development of the 80.8-acre property with five industrial buildings ("Building 1," "Building 2," "Building 3," "Building 4," and "Building 5") totaling 1,118,102 square feet (s.f.). Building 1 would include 309,870 s.f. of building area, Building 2 would include 388,222 s.f. of building area, Building 3 would include 174,364 s.f. of building area, Building 4 would include 275,958 s.f. of building area, and Building 5 would include 35,688 s.f. of building area. The Recirculated Draft EIR states that although the future tenant(s) of the building is not known, industrial uses would allow for high-cube fulfillment, manufacturing, and general light industrial services.[1] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (residential development) is located adjacent to the Proposed Project site, approximately 240 feet southeast of the Proposed Project. Construction of the Proposed Project is anticipated to occur in a single phase, commence in January 2023, and be completed in June 2024.[2] The Proposed Project is located on the southeast corner of Montana Avenue and 25th Street.[3]

South Coast AQMD Staff's Comments

> *The CalEEMod Land Use(s) Subtype Assumptions (Combining Manufacturing and General Light Industrial) in the Appendix B- Air Quality Impact Analysis May Have Underestimated the Worst-Case Operational Air Quality Impacts*

In accordance with the project description outlined in the Recirculated Draft EIR, the construction of five industrial buildings totaling 1,194,170 square feet is proposed on 80.8 acres

[1] Recirculated Draft EIR Page 26.
[2] Appendix B, Air Quality Impact Analysis. Page 146.
[3] Recirculated Draft EIR Page 26.

of land. It is important to note that the document does not currently specify the future tenants for these five buildings.[4] However, based on the footnote in Appendix B- Air Quality Impact Analysis of the Recirculated Draft EIR, the analysis assumes that the project site will be divided into two equal parts for analytical purposes. Specifically, half of the site, totaling 597,085 square feet, is designated for manufacturing land uses, while the remaining half, also 597,085 square feet, is allocated for general light industrial land uses.[5]

According to the CalEEMod User Guide - Version 2022.1, it explicitly states the characteristics of "Light Industrial Land Use Subtype: *"Light industrial use facilities are free-standing facilities devoted to a single use, the facilities that have an emphasis on activities other than manufacturing and typically have minimal office space. Typical light industrial activities include printing, material testing, and assembly of data processing equipment. This land use subtype must be less than 50,000 square feet"*.[6] Therefore, the allocation of 597,085 square feet for this purpose contradicts the guidelines provided in the CalEEMod User Guide. Moreover, the general light industrial activities are expected to generate less emissions and involve fewer total daily truck trips[7] compared to the manufacturing or other industrial land uses. The current assumption has led to an underestimation of emissions. South Coast AQMD staff recommends that the Lead Agency conduct a more conservative analysis using the "worst-case" scenario in CalEEMod modeling and correct the land use sub-type used in CalEEMod to ensure accuracy and compliance with guidelines.

Potential Underestimation of Emissions Due to Inaccurate On-site Distance for the Trucks and Passenger Vehicles During Project Operation

The Recirculated Draft EIR notes that CalEEMod Version 2022 lacks the capacity to distinguish between On-site and Off-site emissions during operation. Consequently, the analysis relies on the assumption that 0.5 mile is the maximum allowable On-site distance for both trucks and passenger vehicles. However, the aerial map of the On-site vehicle route (truck movements) as identified in Exhibit 2-B in Appendix C of the Recirculated Draft EIR indicates that the actual On-site distance of the route exceed 0.7 mile, which is greater than the 0.5-mile assumption upon which the emission estimates are based. Therefore, the On-site emissions appear to have been underestimated. For this reason, T the Lead Agency is recommended to either revise the calculations to reflect an On-site route distance of 0.7 mile or provide a comprehensive explanation and justification of the methodology employed in relying on the 0.5-mile On-site assumption parameter.

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

Appendix B of the Recirculated Draft EIR, explains that air quality impact analysis was based on the assumption that the average truck trip length is 30.34 miles for general light industrial and manufacturing uses. However, the project site is located 70 to 80 miles away from the Ports of Los Angeles and Long Beach which means that the air quality analysis underestimated the

[4] Recirculated Draft EIR Page 26.
[5] Appendix B, Air Quality Impact Analysis. Page 14 in PDF.
[6] *CalEEMod User Guide - Version 2022.1.
[7] Appendix Q, VMT Analysis. Page 12.

emissions from trucks traveling from the Ports to the project site. For this reason, the Lead Agency is recommended to revise the calculations in the Final EIR by taking a project-specific approach to the vehicle trip length and trip rates by applying more conservative trip lengths such as designating 40 miles for local trips and 80 miles for Port-related trips. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

Warehouse Cold Storage Land Use and the Associated Emissions from Transport Refrigeration Units (TRU)

The project description in the Recirculated Draft EIR does not explain whether the Proposed Project intends to allocate a portion of the warehouse land use for cold storage. Cold storage warehouses utilize more trucks and trailers equipped with TRUs than warehouses without cold storage. As a result, the Lead Agency is recommended to revise the project description in the Final EIR to explain whether cold storage would be a part of the Proposed Project and provide an estimate for the number of TRU trucks and trailers associated with the operation of the warehouses with cold storage. If there are potential uses for TRUs, the Lead Agency is recommended to revise the calculations in the Final EIR to quantify the emissions from the TRUs in addition to the operational truck emissions.

Incorrect Pollutant Averaging Time and Underestimation of Ground-Level Pollutants Near Buildings in Health Risk Assessment (HRA),

South Coast AQMD staff's review of the construction and operational HRA modeling files noted that the ANNUAL[8] keyword was selected for the pollutant averaging time in the control pathway in the AERMOD model. However, according to the South Coast AQMD Risk Assessment Procedures v8.1 and South Coast AQMD Modeling Guidance for AERMOD,[9] a detailed HRA utilizing AERMOD should be run using the pollutant averaging time PERIOD and 1-hour.

In addition, South Coast AQMD staff's review of the modeling files noted that industrial buildings were not included in the building downwash option in the AERMOD dispersion model during operation which resulted in an underestimation of the ground-level pollutant concentrations near the buildings.

Thus, the Lead Agency is recommended to: 1) re-run the construction and operational HRAs to utilize PERIOD and 1-hour averaging time to determine the health risk impacts to the sensitive receptors and off-site workers and include the industrial buildings in the building downwash to analyze more accurate ground-level concentrations; and 2) include the results in the Final EIR.

Inconsistent Emission Rates (lb/day) Calculated from CalEEMod vs. AERMOD

[8] South Coast AQMD Risk Assessment Procedures v8.1. Access at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf
[9] South Coast AQMD Modeling Guidance for AERMOD. Access at: South Coast AQMD Modeling Guidance for AERMOD

South Coast AQMD staff's review of the AERMOD files noted that the diesel particulate matter (DPM) emission rates do not match the data reported in Table 13: Localized Significant Summary of Operations (Onsite Emissions) in Appendix B of the Recirculated Draft EIR which were estimated using CalEEMod. For example, the operational PM10 emission rates presented in Table 13 d are 0.88 pounds per day (lb/day) but the PM10 emissions calculated via AERMOD modeling (including Idling and Onsite emissions) are 0.014 lb/day. This lack of continuity in the emission estimates raises questions about the accuracy of the calculations and warrants a more comprehensive and careful examination of the underlying factors and route causes contributing to this disparity. The Lead Agency is recommended to re-review these calculations and update the Final EIR accordingly with the appropriate corrections.

South Coast AQMD Air Permits and Role as a Responsible Agency

If the implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, spray booths, and etc., air permits from South Coast AQMD will be required and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this

comment letter. Please contact Sahar Ghadimi, Air Quality Specialist, at sghadimi@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the lead agency and should be incorporated into the Final CEQA document.

In the project description, the lead agency proposes the construction of two buildings for warehouse distribution and office space uses totaling approximately 1,037,811 square feet on a 48.4 acre site. The lead agency has projected 1,744 total daily vehicle trips including at least 357 daily truck trips operating at the site. In the Air Quality Section, the lead agency quantified the project's construction and operation air quality impacts and has compared those impacts with the SCAQMD's recommended regional and localized daily significance thresholds. Based on its analyses, the Lead Agency has determined that operational air quality impacts will exceed the recommended regional daily significance threshold for NOx.

The SCAQMD staff has concerns regarding the assumptions used in the air quality analysis, specifically the operational portion of the CalEEMod land use model. Since the proposed project will result in significant NOx impacts, all feasible mitigation measures should be included in the Final CEQA document to further reduce the significant impacts. Details are included in the attachment.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the lead agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. Further, staff is available to work with the lead agency to address these issues and any other questions that may arise. Please contact Jack Cheng, Air Quality Specialist, at (909) 396-2448, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Siting of an Incompatible Land Use

1. Based on information in the DEIR (air quality analyses, the project truck distribution, and by aerial map inspection), the lead agency shows a minimum distance of 15 meters to the nearest sensitive receptor; a residence located southeast of the project site. The SCAQMD staff is concerned that the existing sensitive receptors will be exposed to significant regional and localized operational impacts, mostly from the daily truck activities that will likely operate using diesel fuel.

   As a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land-use decision making process, the California Air Resources Board (CARB) has provided the CARB Air Quality and Land Use Handbook (CARB Land Use Handbook). Based on guidance from thin e CARB Land Use Handbook, CARB recommends a buffer of at least 1,000 feet between land uses that will have 100 or more trucks per day. [1]

   In accordance with the state CEQA Guidelines §15126.4 (a)(1)(D), the lead agency should discuss the proposed siting of this land use and any potential impacts resulting from any proposed mitigation related to the CARB Land Use Handbook guidance in the Final EIR.

Air Quality Analysis

Daily Truck Trip Rate

2. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars and trucks totaling approximately 1,744 daily vehicles) for the proposed Project, but does not use the 0.64 (38.1%) daily truck trip rate from this same reference. Rather, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 (20.43%) daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) to estimate project air quality operational impacts in the CalEEMod modeling. By using the 0.343 Fontana Study daily truck trip rate, trucks are estimated at 357 daily truck trips in the DEIR instead of approximately 664 daily truck trips using the ITE 0.64 daily truck trip rate.

   Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and Final EIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

   Absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

[1] CARB Air Quality and Land Use Handbook: http://www.arb.ca.gov/ch/handbook.pdf

On-Road Truck Trip Length

3. In the CalEEMod output sheets provided in Appendix E of the DEIR appendices, the modeling used a 60 mile one-way trip distance and a 20% trip percentage for trucks moving goods for perspective tenants (C-W) and a 6.9 one-way trip distance and an 80% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). In electronic file "LOG 2 4.03 Air Quality – 7-15 Table 4.3-E Operational Vehicle Trip Assumption", the table indicates a 16.6 mile one-way trip distance and an 80% trip percentage for trucks moving goods for perspective tenants (C-W) and a 60 mile one-way trip distance and a 20% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). The Air Quality Analysis is inconsistent and under estimates air quality impacts. A 60 mile one-way trip distance and 80% trip percentage should be used to model trucks moving goods for the perspective tenants (C-W) and a 6.9 – 16.6 one-way trip distance and 20 % trip percentage should be used by trucks supporting the operations of the proposed facility(C-NW).

   On page 3.0-8 in the project description, the lead agency describes potential truck activities that involve the proposed warehouse trucks. "Goods imported from the Ports of Long Beach and Los Angeles as well as other locations will be delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations." Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

4. Based on a review of the project's emissions calculations in Appendix E – RK Revised AQ, GHG, HRA: Air Quality Analysis[2] (CalEEMod Output Sheets), the lead agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM Air-12 to reduce operational emissions, the lead agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the lead agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the lead agency chooses to include refrigerated warehouses in the air quality analysis then MM Air-12 should be incorporated into the project and remain in the Final EIR.

LST and Health Risk Assessment (HRA) Modeling

5. The lead agency used AERMOD (version 12345) to prepare the dispersion modeling for the HRA even though AERMOD (version 14134) was available for at the time of analysis (10/20/2014). Therefore, SCAQMD staff recommends using AERMOD (version 15181), the most recent available version, to revise the dispersion modeling for this project.

6. The HRA analysis involved the use of separate discrete receptors placed randomly for the sensitive receptors. SCAQMD staff recommends that the lead agency revise the HRA using a receptor grid over the existing residences and areas zoned or planned for residential development, in order to ensure that the maximum impacts to a residential receptor are properly analyzed.

[2] Appendix A: CalEEMod Emissions Model Output.

7. SLINE1, SLINE2, and SLINE3 onsite travel line volume sources do not span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a series of volume sources that spans the entire docking area to ensure that impacts are properly analyzed.

8. STCK1, STCK2, and STCK3 onsite idling point sources should span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a line volume that spans the entire docking area to ensure that impacts are properly analyzed.

9. Based on the site plan in the project description, there are two driveways that access Webster Street where residences are located across from the proposed project site. Traffic exiting the site from Webster Street can then access Ramona Expressway to get on the freeway. Although the project description in the Notice of Availability, the site plan and the computer modeling show truck traffic using only Patterson Avenue north towards Harvey Knox Boulevard to access the 215 Freeway, there is nothing, however, to preclude trucks from using the driveways on Webster Street, passing by existing residences and then accessing Ramona Expressway to get on the freeway. The SCAQMD staff recommends that the Final EIR include a discussion of how the project will stop trucks from using Webster Avenue or include a restriction that would formally restrict Webster Street to passenger vehicles only. If trucks are not formally restricted, then project impacts from truck movement on Webster Street and beyond (i.e., north on Webster Street, or south to Ramona Expressway to access the 215 Freeway) would have been underestimated in the DEIR. These potential impacts should therefore be analyzed in the HRA and included in the Final EIR.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

10. Because the California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic and during project operations, the lead agency has determined that project operation emissions are significant for Oxides of Nitrogen (NOx), primarily from truck activity emissions, the SCAQMD staff therefore recommends the following changes and additional measures that should be incorporated in the Final EIR to reduce exposure to sensitive receptors and reduce potential significant project air quality impacts:

Recommended Changes

MM AQ 4.3H

- Prior to issuance of a building permit, the Project proponent shall provide the City with project specifications, drawings, and calculations that demonstrate that main electrical supply lines and panels have been sized to support heavy truck charging facilities. ~~when these trucks become available. The calculations shall be based on reasonable predictions from currently available truck manufacturer's data. Electrical system upgrades that exceed reasonable costs shall not be required. In addition, the Project will incorporate 2 electric vehicle charging stations for light-duty vehicles.~~ Electrical lines shall be designed and sized to add additional charging stations when a demand is demonstrated. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations.[3] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

[3] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Additional Mitigation Measures

- Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.

- Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors.
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.
- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Should the proposed Project generate significant regional emissions, the lead agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the lead agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the lead agency and project applicant.

Mitigation Measures for Operational Air Quality Impacts (Other)

11. In addition to the mobile source mitigation measures identified above the Lead Agency should incorporate the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from NOx emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Draft Environmental Impact Report (DEIR)
for the Proposed Westgate Specific Plan (SCH No. 1995052002)

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document.

The Lead Agency proposes construction within four village areas that will be divided into 68 total planning development areas on an approximately 964-acre site. Included are up to 6,410 residential units, 50.9 acres of commercial/retail uses, 179.9 acres of business park and professional office uses, 71.6 acres and up to 1.2 million square feet of warehouse/distribution uses, open space/public and private parks, two elementary schools, a high school, landscaping and infrastructure. The four project areas are located by the Interstate 15 (I-15) and State Route 210 (SR-15) Freeways. The air quality analysis assumes a construction period starting in July 2015 showing Phase 1 construction completed as early as 2016, but based on market conditions, overall construction will continue over an approximately 20-year period until project buildout planned for year 2035.

The Lead Agency has determined that estimated construction, operation emissions and cancer risks substantially exceed the SCAQMD recommended thresholds of significance during construction (NOx), operations (VOC, NOx, CO, PM10 and PM2.5, mostly from vehicle operations) and for Toxic Air Contaminants (potential cancer risk from sensitive receptors being sited near diesel particulate emissions (DPM) from vehicles operating on the two freeways). The unmitigated cancer risk of up to 47 in one million from the DPM freeway vehicle would remain 33 in one million with mitigation, which is still substantially above the SCAQMD's recommended CEQA significance threshold for Maximum Incremental Cancer Risk (MICR): 10 in one million or greater lifetime probability of contracting cancer.

Based on its review, the SCAQMD staff has concerns about the assumptions made in the health risk assessment and air quality analyses. The SCAQMD also notes that localized significant emission impacts from on-site project uses were not estimated in the DEIR although emissions from on-site mobile sources at proposed the warehouse/distribution, light industry, commercial/retail and other land uses potentially impact nearby sensitive receptors (i.e., residents, students, school staff, etc.). Therefore, these impacts should be analyzed, compared with appropriate significance thresholds and incorporated into the Project and applicable analyses in the Final EIR to demonstrate the Lead Agency's findings. Finally, since the Lead Agency has determined that project air quality impacts from construction, operations and cancer risk are significant and unavoidable, the SCAQMD staff is concerned that all feasible mitigation pursuant to Section 15126.4 of the CEQA Guidelines has not been incorporated into the project and should be included in the Final CEQA document. Further details are included in the attached pages.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the Lead Agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. The SCAQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist CEQA Section, at (909) 396-3302, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Health Risk Assessment

1. As of December 9, 2006, AERMOD is fully promulgated as a replacement to ISC3, in accordance with Appendix W (http://www.epa.gov/ttn/scram/dispersion_prefrec.htm). AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. AERMOD-ready meteorological data for various meteorological stations within the South Coast Air Basin (SCAB) are available for download free of charge at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/data-for-aermod. The Lead Agency used AERMOD (version 13350) to prepare the dispersion modeling for the Warehouse Health Risk Assessment (HRA) but used AERMOD (version 12060) for the Freeway HRA analysis. Furthermore, while the meteorological data from the SCAQMD Fontana meteorological station was used for both HRA analyses, two different versions of the meteorological data were used. Font2.pfl and Font2.sfc (meteorological data for 2005-2007) and Font7.sfc and Font7.pfl (meteorological data for 2008-2012) are for different years. Given the advancements and bug fixes that occurred in AERMOD between version 12060 and 13350 and 14134 (today's current version), SCAQMD staff recommends that the Lead Agency revise the HRA analyses for both warehouse and freeway using the latest version of AERMOD (version 14134) without the use of Lakes AERMOD-MPI. SCAQMD's modeling guidance for AERMOD can be found at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/modeling-guidance. Please note that when using AERMOD, the regulatory default option should be used (i.e. without the use of the "FASTALL" or "FLAT" options) and the Lakes MPI should not be used without prior SCAQMD or EPA Region 9 approval.

2. The electronic files for the HRA analyses provided by the Lead Agency to SCAQMD staff were incomplete and did not include the receptor file. Therefore, SCAQMD staff was unable to verify the placement of receptors in the HRA analyses. In the event that receptors were not placed in the correct location using a receptor grid of no more than 100-meter spacing over the existing residences and areas zoned or planned for residential development, the health risks reported in the HRA analyses and DEIR could be underestimated. Therefore, SCAQMD staff recommends that the Lead Agency provide a graphic showing the receptor grid placement in the Final EIR.

3. The proposed project includes both two elementary schools and one high school. However, in the analysis, no receptors were placed in those locations to estimate the health risks to the students, teachers and administrative staff at those locations. SCAQMD staff recommends the Lead Agency update the HRA analyses to include the schools as receptors and estimate the health risks at those locations.

4. In the Warehouse HRA analysis, the Lead Agency assumed only 10 minutes of idling for each truck. Since trucks may idle several times on-site, the SCAQMD staff

recommends assuming 15-minutes idling per truck in the HRA analysis, e.g., five minutes entering, five minutes on-site and five minutes exiting, etc.

5. In the DEIR, the Lead Agency analyzed health risk impacts for residential exposure separately from TAC emissions coming from vehicles operating on the I-15 and State SR-15 Freeways. Since residents will be exposed to adverse health impacts from both the freeways (diesel-fueled vehicles operating on the freeways) and project warehouse distribution uses (diesel-fueled trucks operating at the sites), the combined risk from both sources should be totaled and disclosed in the Final EIR, in addition to the separate Maximum Incremental Cancer Risk (MICR) estimates for both sources already included in the DEIR. Otherwise, the potential combined risk is underestimated.

Air Quality Analysis - Operations

Daily Truck Trip Rate

6. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars + trucks totally approximately 2,046 daily vehicles) for the proposed Project, but does not use the 0.64 daily truck trip rate from this same reference.[1] Rather, the Trip Generation Rates use a passenger car daily trip rate of 1.337 vehicles per day and a daily truck trip rate of 0.343 truck trips per day.[2] By using the 0.343 daily truck trip rate, trucks are estimated at 418 daily truck trips in the DEIR instead of approximately 780 daily truck trips using the ITE 0.64 daily truck trip rate. Therefore, absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

Vehicle Fleet Mixture Percentages

7. In the DEIR, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) [3] to estimate project air quality operational impacts in the CalEEMod modeling. Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily

[1] ITE Manual, High Cube Warehouse Distribution Center (ITE Land Use – 152), 0.64 weighted average Truck Trip Generation Rate (trip ends per 1,000 square feet of gross floor area), Page 267.
[2] 1.337 + 0.343 = 1.68.
[3] DEIR, Traffic Impact Analysis, Project Trip Generation, Pages 31 and 37 Project (High Cube Warehouse Distribution Center) Trip Generation (Table 5, (3 of 3).

truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. Specifically, the number of daily trucks using the ITE 0.64 trip rate results in a greater number of daily truck trips: approximately 780 with the ITE 0.64 rate compared with approximately 418 daily trucks using the 0.343 daily truck trip rate based on the trip generation rates used in the Traffic and Circulation Section. Therefore, based on the increase numbers of trucks, the CalEEMod fleet mixture truck subcategories should be proportionally adjusted with the higher numbers of trucks after using the recommended ITE 0.64 daily truck trip rate. In the modeling inputs, however, the individual vehicle category percentages totaled 6.74 percent, which is lower than the percentage of trucks in the Traffic Study. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and FEIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

On-Road Truck Trip Lengths

8. In the DEIR, the Lead Agency does not describe potential truck activities that involve the proposed warehouse trucks. Since goods can be brought from the Ports of Long Beach and Los Angeles as well as other locations and delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations, the Final EIR should include more detailed discussion to justify the trip lengths used in the air quality and health risk affect analyses. In the CalEEMod output sheets provided in Appendix B of the DEIR appendices, the modeling used a 16.6 mile one-way trip distance was used by trucks employed by perspective tenants and an 8.4 one-way trip distance was used by trucks not employed by perspective tenants was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR. If the Lead Agency is uncertain of the types of tenants or the trip lengths, the Lead Agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

9. Based on a review of the project's emissions calculations in Appendix B: Air Quality Technical Appendix [4] (CalEEMod Output Sheets), the Lead Agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM C-12 to reduce

[4] Appendix B: Air Quality Technical Appendix.

Operational Emissions starting on Page 4.C-69, the Lead Agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the Lead Agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the Lead Agency chooses to include refrigerated warehouses in the air quality analysis then MM C-12 should be incorporated into the project and remain in the Final EIR.

Mitigation During Operations (MERV Filters and HVAC Systems)

10. Starting on page 4.C-54, the Lead Agency discusses Health Risk results concluding that during occupancy, adverse air quality impacts from vehicles traveling on the existing I-10 and SR-210 freeways would expose sensitive receptors to substantially significant levels of Toxic Air Contaminants (TACs) even with mitigation due to existing ambient air pollution in the vicinity. The SCAQMD staff recognizes the many factors lead agencies must consider when siting new housing. On page 4.C-70, the Lead Agency is proposing mitigation to reduce the proposed project's significant health impacts. Further, many mitigation measures should be considered in the Final CEQA document that have been proposed for other projects as well to reduce exposure, including building filtration systems, placing the residential units furthest from the freeway, making any windows facing the freeway inoperable, building sound walls, planting vegetation barriers, etc. However, because of the potentially significant health risks involved, it is critical that any proposed mitigation must be carefully evaluated prior to determining if those health risks would be brought below recognized significance thresholds.

Limits to Enhanced Filtration Units

11. The Lead Agency should consider the limitations of the proposed enhanced filtration mitigation (Measure C-16) on page for this project on the housing residents. For example, in a study that SCAQMD conducted to investigate filters[5] similar to those proposed for this project, costs were expected to range from $120 to $240 per year to replace each filter. In addition, because the filters would not have any effectiveness unless there is a HVAC system that draws enough air to support eh filter system and that the HVAC system is fully operable throughout the life of the project. In addition, there may be increased energy costs to the resident. The proposed mitigation also assumes that the filters operate 100 percent of the time while residents are indoors to reduce significant TAC impacts up to 33 in one million compared with the SCAQMD

[5] http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf?sfvrsn=0 . This study evaluated filters rated MERV 13+ while the proposed mitigation calls for less effective MERV 12 or better filters. See also CARB link for the "Status of Research on Potential Mitigation Concepts to Reduce Exposure to Nearby Traffic Pollution" (August 23, 2012): http://www.arb.ca.gov/db/search/search_result.htm?q=Potentiaal+Mitigation+Concepts+to+Reduce+Exposure+to+Nearby+Traffic+Polltion&which=arb_google&cx=006180681887686055858%3Abew1c4wl8hc&srch_words=&cof=FORID%3A11 .

threshold of 10 in one million. It should be noted that these filters have no ability to filter out any toxic gasses from vehicle exhaust and would not reduce exposure when residents are outside of their homes, e.g. children playing outdoors, being around a pool area, residents relaxing or walking outside, working outside on a balcony, cleaning a vehicle, etc. In the Final CEQA document, the presumed effectiveness and feasibility of this mitigation should therefore be evaluated in more detail prior to assuming that it will sufficiently alleviate near truck exhaust exposures. Otherwise, impacts to residents from exposure to TACs will remain substantially significant and unavoidable.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

12. The California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic. During project operations, the Lead Agency has determined that project operation emissions are significant for Volatile Organic Compounds (VOC) and Oxides of Nitrogen (NOx), Carbon Monoxide (CO), Particulate Matter (PM10) and PM2.5, primarily from on-road mobile sources including truck activity emissions. The SCAQMD staff therefore recommends the following change and additional measures that should be incorporated into the Final EIR to reduce exposure to sensitive receptors and reduce project air quality impacts:

Recommended Change:

MM C-13

- The City shall require future commercial and industrial projects (to) promote the expanded use of renewable fuel and low-emission vehicles by including ~~one or both of~~ the following project components: provide preferential parking for ultra-low emission, zero-emission, and alternative-fuel vehicle; and provide electric vehicle charging stations within the development.

Additional Mitigation Measures:

- Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.

- Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors based on guidance from the California Air Resource Board (CARB) guidance.[6]
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site,

[6] CARB: Air Quality and Land Use Handbook: A Community Health Perspective, April 2005, Page4 for Distribution Centers.

the Lead Agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Because the proposed Project generates significant regional emissions, the Lead Agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the Lead Agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency and project applicant.

  At a minimum, require upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the occupant should also be required to accept and use them.

Electric Vehicle (EV) Charging Stations

13. Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2012 Regional Transportation Plan. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, the SCAQMD staff recommends the Lead Agency require the proposed facility and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include

EV charging stations.[7] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

CNG Fueling Station and Convenience Site

14. Because proposed project generate significant regional NOx operational impacts, the SCAQMD staff recommends that the project pro-actively take measures that could reduce emissions sooner rather than later. The SCAQMD staff therefore recommends that the Lead Agency ensure the availability of alternative fueling facility (e.g., natural gas) to serve the project site prior to operation of any large truck operation uses within the project area.

Mitigation Measures for Operational Air Quality Impacts (Other)

15. In addition to the mobile source mitigation measures identified above, the SCAQMD staff recommends the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from VOC, CO, NOx, PM10 and PM2.5 emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Transportation

- Make a commitment to install electric car charging stations (not just wiring infrastructure) for both non-residential and residential uses at the project site.
- Create local "light vehicle" networks, such as neighborhood electric vehicle (NEV) systems.

[7] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Energy

- Make a commitment that the project site will include a solar photovoltaic or an alternate system with means of generating renewable electricity.

Other

- Provide outlets for electric and propane barbecues in residential areas.

Mitigation Measures for Construction Air Quality Impacts

16. Based on a review of the DEIR the Lead Agency determined that the proposed project will result in significant air quality impacts during construction. Specifically, the air quality analysis demonstrated that the proposed project will exceed the SCAQMD's CEQA regional construction significance thresholds for NOx. Therefore, the SCAQMD staff recommends the following changes and additional measures be incorporated into the proposed project and FEIR to reduce significant project impacts in addition to the measures included in the Draft EIR starting on page 4.C-67.

Recommended Change:

MM C-2 During project construction, the City shall require internal combustion engines/construction equipment operating on all future project sites ~~greater than five acres~~ to meet the following:

- ~~At least 50 percent of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 3 emissions standards or better and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

- Consistent with measures that other lead agencies in the region (including Port of Los Angeles, Port of Long Beach, Metro and City of Los Angeles)[8] have enacted, require all on-site construction equipment to meet EPA Tier 3 or higher emissions standards according to the following:

- Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

[8] For example see the Metro Green Construction Policy at: http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

- ~~Post-January 1, 2016, in addition to the Tier 3 standards specified above, an additional 20 percent or more of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 4 emissions standards or better and be outfitted with BACT devices (e.g., and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

Recommended Additions

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NOx emissions requirements.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Encourage construction contractors to apply for SCAQMD "SOON" funds. Incentives could be provided for those construction contractors who apply for SCAQMD "SOON" funds. The "SOON" program provides funds to accelerate clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/home/programs/business/business-detail?title=vehicle-engine-upgrades

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies .

South Coast
Air Quality Management District
21865 Copley Drive, Diamond Bar, CA 91765-4182
(909) 396-2000 • www.aqmd.gov

E-MAILED: FEBRUARY 1, 2013 February 1, 2013

Mr. Mark Tomich, Director, MTomich@ci.colton.ca.us
Development Services, Planning Division
City of Colton
659 N. La Cadena Drive
Colton, CA 92324

**Draft Mitigated Negative Declaration (Draft MND)
for the Proposed Colton – DEXUS Project**

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document. In the project description, the lead agency proposes demolition of the existing 28,000 square foot truck terminal and 18,000 square foot office building. Building construction would include a high-cube warehouse building on the 34.36 acre site. The proposed facility would have 600,046 square feet of building area (12,000 square feet of office area and 588,048 square feet of warehouse/distribution space). The proposed project would include 116 dock doors with parking for 425 standard and handicap spaces, and 42 trailer spaces. Construction is expected to last approximately 10 months and 2014 is the proposed opening year. Although basically zoned for industrial uses, there is a single-family residence located less than a quarter mile northwest of the project site along Agua Mansa Road.

The AQMD staff requests that the lead agency provide additional information regarding the fate of the existing facility. The CEQA analysis assumes it will cease its operations within the boundaries of the South Coast Air Basin (SCAB) by applying the emissions from the current operation to the baseline thus offsetting the projected emissions from the proposed high-cube warehouse use. In addition, the baseline itself may be overestimated by using generalized trip generation estimates instead of the on-site traffic count data to account for vehicle activity and the resulting air quality impacts for the existing operation. Because the determination of significance under CEQA is based on the difference between existing baseline and future project impacts, we recommend that the lead agency provide further substantial evidence for, and re-evaluate where necessary, the baseline and future impacts of this project. If impacts are found to be significant, then additional mitigation may be required to reduce these impacts to a less than significant level. Details regarding these comments and others follow in the attachment.

Please provide the AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. The AQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist – CEQA Section, at (909) 396-3302, if you have any questions regarding these comments.

Sincerely,

Ian MacMillan
Program Supervisor, Inter-Governmental Review
Planning, Rule Development & Area Sources

IM:GM

LAC130115-02
Control Number

Baseline Emissions and the Status of the Existing Use

1. In a telephone conversation staff on or about January 15, 2013, the lead agency staff expressed uncertainty to AQMD staff whether the existing truck terminal business would cease operations completely within the SCAB boundaries or continue its current operations at the site but at a lower level of activity. The lead agency's operational air quality analysis uses the emissions from the existing use as a baseline to offset the estimated long-term air quality impacts from the proposed warehouse use. It is unclear to AQMD staff if the incremental emissions benefit derived from the existing use would actually be realized. Unless there is assurance that the previous facility activities will cease and not move to another location within the SCAB, the lead agency should not include these emissions as a baseline when calculating regional impacts. AQMD staff requests that the lead agency provide additional discussion of the fate of the existing operations and revise the air quality and greenhouse gas analyses, if necessary.

Potential Overestimation of the Existing Facility Baseline Emissions

2. The lead agency has estimated project emissions for the existing truck terminal building activity using the California Emissions Estimator Model (CalEEMod) and using trip rates based on land uses shown in the Institute of Traffic Engineers (ITE) Trip Generation, 8th Edition (2008) and the Truck Trip Generation Study (City of Fontana, August 2003). In addition to these sources, the lead agency included traffic count worksheets in the Revised Traffic Impact Analysis (Kunzman Associates, Inc., October 2012). It is not clear to the AQMD staff why available project-specific traffic count data included in the Draft MND that could be used to analyze vehicle activity and associated emissions for the existing facility were not used to estimate baseline emissions.

   The AQMD staff believes that using the ITE trip rate to calculate baseline vehicle activity may substantially overestimate project vehicle activity and related on-road mobile source emissions compared with the data supplied in the traffic analysis. This is demonstrated, for example, by looking at the volumes supplied in the Traffic Impact Analysis (TIA) for vehicles entering the facility during the AM peak hour shown on page 11 (Figure 5, Existing Morning Peak Hour Intersection Turning Movement Volumes). For Intersection Six (the main entrance into the facility) in Figure 5, the number of vehicles entering and exiting the facility totals 70. From Table 3 of the TIA (Current Development {Truck Maintenance Facility}), the lead agency has estimated, using the ITE trip rate for the General Light Industrial (110) land use, 259 vehicles per hour. This is more than three times the 70 vehicles per hour found from actual traffic counts. Using the ITE trip rate instead of the vehicle data shown from the traffic counts appears to significantly overestimate the existing project baseline emissions. This results in the incremental emissions, i.e., the difference between the existing facility emissions and the emissions for the proposed warehouse facility being

underestimated. The AQMD staff therefore recommends that applicable analyses be revised in the Final MND using the project-specific traffic count data. Alternatively, the lead agency could explain why the project-specific traffic counts should be ignored.

On-Road Truck Trip Length

3. In the CalEEMod input files provided to AQMD staff by the lead agency, an average one-way trip length of 8.3 miles was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Trucks operating from these kinds of facilities often handle goods coming directly from the port areas over 70 miles away as well as potentially serving out of state destinations. Absent tenant-specific trip length information, the AQMD staff recommends a one-way trip length from the project site to the port areas as more appropriate trip length for on-road truck emissions and that applicable analyses in the Final MND be revised. If the lead agency is uncertain of the types of tenants or the trip lengths, the lead agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of Non-Default Truck Trip Rate

4. In the air quality and health effect analyses, the lead agency based its estimates on trip generation rates from the 8th Edition of the Institute of Transportation Engineers (ITE) Report using a non-default trip rate of 1.44 per thousand square of gross floor area (Land Use Code 152 – High-Cube Warehouse). Based on guidance from the California CalEEMod User's Guide, the AQMD staff recommends using a more conservative trip rate of 2.59 per 1,000 square feet. AQMD staff believes a more conservative trip rate is appropriate as the tenant is unknown, and there are no conditions on the project limiting activity to what is analyzed in the MND.

CalEEMod Fleet Mixture Percentage

5. On page 28 of the Draft IS/MND, the lead agency's narration lists the fleet mixture percentages used in the CalEEMod land use model to estimate operational emissions. The narration states that the estimated fleet mixture is approximately 37 percent truck traffic for the proposed warehouse use including 17 percent heavy-heavy duty (HHD); 8 percent medium-heavy duty (MND); and 12 percent light-heavy duty 1 (LHD1). The CalEEMod inputs, however, also include the 3.4 percent Light-Heavy Duty 2 (LHD2) category that was omitted in the narration total. The 3.4 percent LHD2 percentage would therefore increase the overall truck percentage from 37 to 40 percent. In the Final MND, the narration should be revised to be consistent with the CalEEMod fleet percentages shown in the actual modeling.

Localized Significance Thresholds Analysis: Construction and Operations

6. Under Sensitive receptors on page 13 of the Air Quality & Climate Change Assessment and upon an aerial map inspection, a single-family residential property appears to be located within one-quarter mile of the proposed warehouse. We therefore recommend that the lead agency evaluate localized air quality impacts. The AQMD staff requests this evaluation to ensure that any nearby sensitive receptors are not adversely affected by the construction and operational activities that are occurring in close proximity. AQMD guidance for performing a localized air quality analysis can be found at the following web address: http://www.aqmd.gov/ceqa/handbook/LST/LST.html .

Operational Mitigation Measures

7. In the event the lead agency determines that project air quality impacts (regional or localized) for operations will exceed recommended significance thresholds (mostly attributed to mobile source tailpipe emissions from vehicles operating at the proposed facility), the AQMD staff encourages the lead agency to develop a common set of enforceable mitigation measures to reduce those emissions to the maximum extent feasible. As the lead agency is aware, heavy-duty trucks are the largest source of NOx emissions in our basin and NOx emissions must be reduced by approximately two thirds beyond existing rules and regulations in order to meet air quality standards as required by 2023. Without meeting air quality standards, our region faces federally mandated sanctions, including possible loss of transportation funding. AQMD staff therefore recommends that the lead agency consider the feasibility of the following measures to reduce project impacts. Other lead agencies that have imposed these and similar measures include the City of Banning[1], Riverside County[2], City of San Bernardino[3], and the San Pedro Bay Ports[4], among others.

   Recommended additional measures:

   - Lease/purchase documents shall identify that tenants required to implement the following:
   - At project start, all heavy duty trucks entering the property must meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.
   - If the above clean truck requirements are infeasible, a phase-in schedule should be put forth that will feasibly achieve emission reductions as soon as possible, and faster than existing regulations. Should an alternative

[2] Mira Loma Commerce Center: http://www.rctlma.org/online/content/conditions_of_approval.aspx?PERMITNO=pp17788 .
[3] Palm/Industrial Distribution Center http://www.ci.san-bernardino.ca.us/civica/filebank/blobdload.asp?BlobID=11793
[4] Clean Trucks Program http://www.cleanairactionplan.org/cleantrucks/ .

schedule be found necessary, the AQMD staff should be consulted prior to approving the schedule.

- Provide a phase-in schedule and goals for the introduction of zero or near-zero technology trucks (e.g., 10% by 2020, 20% by 2025, etc.) that visit warehouses.

The facility operator will maintain a log of all trucks entering the facility to ensure that on average, the daily truck fleet meets the quantities and emission standards listed in the Draft MND. This log should be available for inspection by city staff at any time.

- The facility operator will ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies [for example, by requiring attendance at CARB approved courses (such as the free, one-day Course #512)].

- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final MND. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Require at least a portion of the fleet to utilize alternative fueled technologies.

- The 2012 Regional Transportation Plan includes a zero-near-zero emissions truck corridor along the SR-60 freeway west of I-15. Because at least a portion of the trucks serving this project may be expected to travel along this route, the project should consider providing onsite alternative fueling infrastructure, such as electric charging stations or natural gas fueling that will help facilitate these low-emitting trucks. This could include ensuring electrical panels and wiring are sufficiently sized to accommodate future needs.

- At a minimum, require tenants upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the tenant should also be required to accept and use them.

- Restrict overnight parking in residential areas. Establish overnight parking within the warehouse/distribution center where trucks can rest overnight.

- Establish area(s) within the facility for repair needs.

- Post signs outside of the facility providing a phone number where neighbors can call if there is a specific issue.

- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.

- Have truck routes clearly marked with trailblazer signs, so trucks will not enter residential areas.
- Identify or develop secure locations outside of residential neighborhoods where truckers that live in the community can park their truck, such as a Park & Ride.
- Provide food options, fueling, truck repair and or convenience store on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Requiring all on-site vehicles (hostlers, forklifts, etc.) to utilize zero or near-zero emission technology.
- Use street sweepers that comply with SCAQMD Rules 1186 and 1186.1.
- Install solar panels on all available roof space. If this isn't feasible, then at a minimum all buildings and electrical infrastructure should be designed to accommodate potential future solar panel upgrades.

Off-Road Construction Equipment Reduced Load Factors

8. In Appendix B (CalEEMod Output) in the air quality assessment, the lead agency estimated project construction impacts using the CalEEMod land use emissions computer model. This model uses default and user-defined settings to estimate emissions based on the land use settings. In the CalEEMod inputs under User Entered Comments, the lead agency has reduced the Construction Phase Off-Road Equipment load factors by 33 percent citing the California Air Resources Board (CARB) as authority for the changes. For example, the default load factor in the CalEEMod model for rubber tired loaders of 54 percent was reduced to 36 percent.

   Based on communication with ARB staff[5] regarding this issue, the AQMD staff confirmed that CARB staff does not recommend reducing the default settings in the current OFFROAD2007 without considering all parameters besides the load factor. Other parameters such as activity level, horsepower, and population all contribute to the emission factor estimate, and selectively changing only one parameter will lead to inaccurate estimates at a project level. For some equipment types, OFFROAD2007 may underestimate emissions while others may be overestimated. Because of these revisions (and others), CARB developed the new OFFROAD2011. The AQMD staff therefore recommends that the lead agency either use existing OFFROAD2007 defaults until OFFROAD2011 is incorporated into CalEEMod later this year or run OFFROAD2011 outside CalEEMod and use those results to modify the CalEEMod construction calculations. Therefore, even though the reductions might not change the lead agency's determination of significance for construction air quality impacts, these reductions related to

[5] Personal communication with Nicole Dolney, June 1, 2012.

reduced off-road equipment load factors are not recommended by the AQMD staff without further substantial evidence to support those emission reductions resulting from their use. Otherwise, the lead agency should commit to enforcing the assumed lower non-substantiated emission factors.

Construction Mitigation Measures

9. Should the lead agency determine that project localized construction air quality impacts will exceed the AQMD recommended daily significance thresholds, the AQMD staff therefore recommends the following mitigation measures during the projected 10 month construction period to reduce adverse air quality impacts from on-site construction emission sources, if applicable and feasible.

   Recommended additions:

   - Limit the amounts of daily soil disturbance to the amounts analyzed in the Draft MND.
   - All clearing, grading, earth-moving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.
   - Apply non-toxic soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more).
   - All trucks hauling dirt, sand, soil, or other loose materials are to be covered.
   - Sweep streets at the end of the day if visible soil is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water).

   Further, other lead agencies in the region including LA County Metro, the Port of Los Angeles, and the Port of Long Beach have also enacted the following mitigation measures. AQMD staff recommends the following measures to further reduce air quality impacts from construction equipment exhaust:

   - Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
   - Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by

the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or AQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html .

Re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Planning Commission Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant") in the City of Ontario ("City"). The Project's Final Environmental Impact Report ("FEIR") and development plan will be considered at the May 28, 2024 Planning Commission meeting as Agenda Item D. The Commission will consider certification of the FEIR and approval of the Development Plan application.

CARE CA submitted comments on the DEIR and subsequently on the FEIR, accompanied by expert comments, showing that the FEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant air quality, public health, greenhouse gas ("GHG"), energy, transportation, and cumulative impacts. The Staff Report contains responses[1] to CARE CA's comments on the FEIR. However, the responses fail to resolve the major flaws CARE CA and its experts identified in the DEIR.

[1] Letter from T&B Planning Inc. to City, re: 5355 East Airport Drive (PDEV22-017) – Response to April 15, 2024 Comment Letter from CARE CA (May 20, 2024).

printed on recycled paper

We reviewed the Planning Commission Staff Report with the assistance of air quality expert Dr. James Clark.[2]

The Staff Report fails to meaningfully address the flaws in the Project's environmental review. Regarding hazards, the FEIR identifies significant vapor intrusion impacts due to PCE contamination, but improperly defers formulation of mitigation measures. The FEIR also fails to analyze the full scope of the Project – CEQA requires that an EIR analyze the reasonably foreseeable consequences of the Project, but the Project's FEIR fails to analyze the Project's reasonably foreseeable use as a parcel hub (a use that generates more trips than analyzed), and fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach. Regarding cumulative impacts, the Staff Report still fails to meaningfully respond to the legal authority requiring analysis of the Project's impacts in the context of the numerous other warehouses existing and planned in the area. The Staff Report also fails to resolve flaws in the Project's health risk assessment, which still underestimates impacts on sensitive receptors. Regarding energy, the Staff Report provides an analysis of factors in Appendix F the CEQA Guidelines. But the analysis is wholly inadequate because it fails to address applicable energy consumption measures and renewable energy options. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

The Staff Report incorrectly concludes that the "final EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[3] The Staff Report recommends that the Planning Commission adopt the final EIR and approve the Project's Development Plan Application.[4] These recommendations are unsupported by evidence in the record due to the major flaws in the Project's environmental review.

CARE CA urges the Planning Commission to require the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

[2] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Staff Report, Item D - 2573 of 3296.
[4] Staff Report, Item D - 1 of 3296.

printed on recycled paper

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

A. The FEIR Improperly Defers Formulation of Mitigation Measures for Hazardous Materials

The FEIR's Phase I/II Environmental Site Assessment ("ESA") identifies levels of tetrachloroethene ("PCE") in soil vapor samples in excess of current commercial/industrial calculated soil gas screening levels ("SGSLs").[5] The ESA concludes that "PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Site."[6] The FEIR identifies this contamination as a potentially significant impact.[7] Additionally, the ethylbenzene concentration in one soil vapor sample

[5] FEIR, Phase I/II Environmental Site Assessment, pg. vii.
[6] FEIR, Phase I/II Environmental Site Assessment, pg. 11-2.
[7] DEIR, pg. S-17.

printed on recycled paper

exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.[8] The FEIR fails to disclose this significant impact in the body of the FEIR, in violation of CEQA.

The FEIR states that the potentially significant vapor intrusion impacts would be mitigated through imposition of Mitigation Measure ("MM") 4.7-1. This measure requires future preparation of a Soil Management Plan ("SMP"). he SMP will include instructions for handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. But MM 4.7-1 fails to explain how the PCE contamination at the Project site will actually be addressed – whether it will be remediated, capped in place, etc. – and the FEIR lacks a quantitative analysis of the construction impacts associated with that process. The measure states that contaminated soils will be monitored and provides guidance for proper soil handling, but does not specifically state that PCE-contaminated soil will be removed. Under MM 4.7-1, it is unclear if the City will remove PCE-contaminated soil or adopt passive/engineered vapor intrusion mitigation such as installing a vapor barrier or venting. Without clear performance standards and a quantitative analysis of the impacts of the PCE cleanup phase of construction, MM 4.7-1 remains incomplete and ineffective, and the FEIR's construction impact analysis remains incomplete.

MM 4.7-1 improperly defers formulation of mitigation measures related to PCE contamination to a future date.

CEQA Guidelines Section 15126.4 states that formulation of mitigation measures shall not be deferred until some future time. The Guidelines permit an agency to develop the "specific details of a mitigation measure" after project approval "when it is impractical or infeasible to include those details during the project's environmental review."[9] In such circumstances, deferral of mitigation details is permitted if the agency "(1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will [be] considered, analyzed, and potentially incorporated in the mitigation measure."[10] Compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on

[8] FEIR, Phase I/II Environmental Site Assessment, pg. viii.
[9] Guidelines, § 15126.4, subd. (a)(1)(B) (Section 15126.4).
[10] Section 15126.4, subd. (a)(1)(B); *see Save Our Capitol! v. Department of General Services* (2022) 85 Cal.App.5th 1101, 1134 (*Save Our Capitol!*).)

printed on recycled paper

substantial evidence in the record, to reduce the significant impact to the specified performance standards.[11]

Here, the FEIR defers formulation of the PCE mitigation until after Project approval. But the City fails to present any evidence that it would be impractical or infeasible to do so during the Project's environmental review. Based on the evidence before the City, it should be feasible to require and formulate vapor intrusion mitigation. Even if deferral of formulation of mitigation were reasonable in this case, MM 4.7-1 fails to adopt specific performance standards for remediating PCE contamination and the associated vapor intrusion risks. MM 4.7-1 also fails to clearly identify the types of potential actions that may be taken to mitigate the vapor intrusion risk. Thus, the City improperly defers formulation of PCE contamination and vapor intrusion mitigation.

The City also improperly defers formulation of mitigation for the ethylbenzene contamination. As with the PCE contamination, MM 4.7-1 fails to substantiate how this contaminant will be addressed. The FEIR contains no evidence that formulation of mitigation for ethylbenzene contamination is impractical or infeasible, identifies no performance standards, and fails to identify potential mitigation measures. Mitigation for this impact is thus improperly deferred.

B. The City Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the FEIR showed that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse, which has a trip generation rate 2.6 times the rate used in the FEIR. In Response 1-8, the City reiterates its position that analyzing the Project as a combination of the "Warehousing" and "High-Cube Cold Storage Warehouse" land uses is reasonable due to the Project's anticipated use and size.[12]

The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[13] Here, the Project proposes a 270,337-square-foot industrial

[11] *Id.*
[12] Staff Report, Item D - 2466 of 3296; FEIR, pg. 2-39.

printed on recycled paper

building with a proposed height of 46 feet on 13.08 acres of land. A high-cube parcel hub warehouse is a reasonably foreseeable use of this project because "high-cube parcel hub warehouse" is defined in Institute of Transportation Engineers ("ITE") land use code 156 as a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods prior to their distribution to retail locations or other warehouses. And Mr. Marshall's comments on the FEIR demonstrate that the Project site includes adequate parking to support this use. Even if less-intensive warehouse uses are possible for this Project (such as the FEIR's combination of "Warehousing" and "High-Cube Cold Storage Warehouse"), use as a high-cube parcel hub warehouse is a reasonably foreseeable outcome that must be analyzed.

The City's claim that the Project's "anticipated use" does not include a high-cube parcel hub warehouse is irrelevant to the analysis. Courts have held that in this situation, "the identity of a tenant is irrelevant to CEQA review."[14] The court in *Maintain Our Desert Environment v. Town of Apple Valley* explained that "land use entitlements such as conditional use permits and development approvals run with the land and do not belong to the permittee…. had [the developer] developed the Project and then held it out for sale to any interested buyer, no additional CEQA review would have been necessary for the new owner so long as the use was consistent with that that had already been approved."[15] Here, the project that is the subject of the FEIR is a Development Plan to develop an industrial building totaling 270,337 square feet of gross floor area on 13.08 acres and having a FAR of 0.47. This building could be used as a high-cube parcel hub warehouse, so this level of use must be analyzed in the FEIR.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the FEIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. The City's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[16] CARE CA's

[14] *Am. Canyon Cmty. United for Responsible Growth v. City of Am. Canyon* (2006) 145 Cal. App. 4th 1062, 1074 (citing *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 443–449)).

printed on recycled paper

comments provided a discussion of the controlling caselaw,[17] the Attorney General's recent litigation on this issue in *People of the State of California v. City of Fontana*,[18] and pending updates to the SCAQMD significance thresholds for cumulative impacts in response to this litigation. These authorities explain that the City's "drop in the bucket" approach to cumulative impacts does not comply with CEQA.

In Responses 1-10 and 1-11, the Staff Report states: "[t]he commenter is again advised that the SCAQMD is the regulatory authority on air quality charged with the responsibility of ensuring the improvement of air quality in the South Coast Air Basin… The commenter speculates on 'updated thresholds' for air quality impacts. Absent these 'updated thresholds' the EIR properly evaluates air quality impacts in the context of existing thresholds, protocols, and methodologies."[19]

The Staff Report and the FEIR continue to fail to address any of the controlling legal authority on this issue raised in CARE CA's comments. The court in *Environmental Protection Information Center v. California Dept. of Forestry Fire Protection* stated: "[w]e review an agency's decision regarding the inclusion of information in the cumulative impacts analysis under an abuse of discretion standard. 'The primary determination is whether it was reasonable and practical to include the projects and whether, without their inclusion, the severity and significance of the cumulative impacts were reflected adequately.'"[20] CARE CA's comments demonstrate that the SCAQMD individual project significance threshold fail to reflect the significance of cumulative air quality and public health impacts in areas burdened by extensive warehouse development – this Project would add a substantial number of diesel truck trips to routes in an area with a high existing background MATES cancer risk, combining with the emissions of trucks from numerous other warehouses. Analysis of cumulative impacts from past, present, and probable future warehouse projects is feasible. As an example, Dr. Clark's comments present data from Pitzer College's Warehouse CITY tool, which maps existing and proposed warehouses in Los Angeles, Riverside, and San Bernardino Counties.[21] The tool measures metrics including acreage, square footage, and diesel particulate matter and carbon emissions.[22]

printed on recycled paper

The Staff Report's statement that CARE CA speculates as to "updated thresholds" is erroneous because CARE CA's comments link directly to the materials for SCAQMD's working group meetings – these materials discuss updates to the thresholds.[23] The Staff Report's failure to discuss SCAQMD's pending updates is inconsistent with the Staff Report's statement that SCAQMD is the regulatory authority on air quality. In sum, the City's rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and informational requirements of CEQA.

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

CARE CA's comments on the FEIR identify flaws in the City's Mobile Source Health Risk Assessment ("HRA") that underestimate health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project. In Responses 1-12 and 1-13, the Staff Report disputes these flaws. The Staff Report maintains that "[a]ny variant in interpretation of OEHHA guidance such as is suggested by the commenter would not materially affect the EIR health risk significance conclusions" because "the Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site."[24]

The Staff Report's statement regarding distance from sensitive receptors ignores that the Project would generate truck trips impacting sensitive receptors along the City's designated truck routes.[25] The Project's primary truck routes would depend on the Project's future uses. Despite uncertainty regarding the Project's future tenants, the HRA makes an unsubstantiated assumption regarding the Project's primary truck route, shown in the exhibit below.[26]

[26] FEIR, HRA Report, Exhibit 2-C.

printed on recycled paper

EXHIBIT 2-C: MODELED OFF-SITE EMISSION SOURCES

The HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. Trucks could easily travel west on Airport Drive and north along Milliken Avenue, which are both City-designated truck routes.[27] Sensitive receptors including Receptor R6 are located off Milliken Avenue, and could thus be impacted by cumulative truck trips from this Project and other warehouses. The HRA's assumption that trucks would not travel west along Airport Drive underestimates impacts. A revised HRA must be prepared.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the FEIR underestimates truck trip lengths by failing to account for the Project's distance to the Ports of Los Angeles and Long Beach. CARE CA presented numerous comment letters from SCAQMD

[27] The Ontario Plan, Mobility Element, Figure M-04, https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/The%20Ontario%20Plann/Mobility/FIgure%20M-04%20Truck%20Routes.pdf; Clark Comments, pg. 5.

printed on recycled paper

recommending analysis of trips to the Ports, and presented evidence showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario. In Response 1-16, the Staff Report states:

> The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, Project Description, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages.

The Staff Report apparently dismisses the SCAQMD comments as inapplicable without providing any evidence demonstrating that the Project's truck trips would be limited to the local 40-mile average trip lengths analyzed in the FEIR, and without considering the additional guidance from SCAQMD contained in the letters which explains that truck trips to and from the ports should be analyzed. Many of the SCAQMD letters recommending consideration of the distance to the Ports were in regard to "spec" warehouses with unknown tenants, just like the Project.[28] The Staff Report and the FEIR's responses fail to respond to this guidance with good faith, reasoned analysis,[29] and still fail to provide any evidence demonstrating that goods brought in and out of the Project's warehouses would primarily come from short-distance truck trips.

The Staff Report's statement that it is speculative to assume trucks may travel to the Ports of Los Angeles and Long Beach also misstates the applicable legal standard. The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical

[28] SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf ("the future tenant(s) of the building is not known").

printed on recycled paper

change in the environment."[30] Here, the Project proposes a 270,337-square-foot industrial building with a proposed height of 46 feet on 13.08 acres of land. CARE CA's comments contain evidence showing that trips to the Ports are a reasonably foreseeable outcome of a warehouse like this (citing to the massive volume of goods moving to and from the Ports, and recommendations from SCAQMD).[31] In light of this evidence, the City's assumption that trucks would not travel to the Ports is speculative, unsupported by substantial evidence, and is a failure to analyze a reasonably foreseeable use permitted by the Development Plan.

This letter contains additional substantial evidence showing that trips to the Ports are reasonably foreseeable. The National Center for Sustainable Transportation ("NCST"), sponsored by the California Department of Transportation, prepared a research report titled "Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns" in 2017.[32] The report analyzed Southern California Association of Governments ("SCAG") data on warehouses in the six counties that comprise the SCAG region (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura). The report finds that **56% of the facilities in the SCAG region receive goods from the Port of Los Angeles and Long Beach**, and around 50% deliver to Southern California warehouses, retail stores or manufacturing plants.[33] This data suggests that trips to the Ports are reasonably foreseeable, and that it would be speculative not to account for distance to the Ports.

In June 2014, SCAQMD staff conducted a business survey of warehouse operators in the SCAQMD region.[34] The survey found that **42% of goods going to high-cube warehouses in the SCAQMD region originated from the Ports**, per the figure below.[35]

printed on recycled paper

Origin and Destination of Goods

22 of 34 high cube warehouse respondents provided the origins and destinations of goods flowing to and from their facility. Major trends seen in the charts below include:

- The ports of Los Angeles and Long Beach make up a large share of imported goods yet only a minor component of exported goods
- Approximately 1 in 5 truck trips occurs between warehouses
- Approximately 1 in 7 truck trips involves an out of state location
- Approximately 1 in 10 truck trips involves a rail yard

During discussion at the April 15, 2024 Development Advisory Board hearing, a City consultant suggested that if the Project only makes truck trips to other warehouses, it would not be necessary to evaluate distance to the Ports. The figure above shows that only a small percentage of goods come from other warehouses and that the lion's share of goods are from the Ports. Thus, it would be speculative to disregard the Project's distance from the Ports in analyzing its impacts.

CARE CA's prior comments discussed the volume of goods passing through the Ports. 32 percent of all containers in the U.S. move through the Ports.[36]

[36] SCAG, ConnectSocal, Technical Report re Goods Movement (Adopted September 3, 2020), pg. 9, available at https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_goods-movement.pdf?1606001690.

printed on recycled paper

Approximately 40 percent of the total U.S.-Asia trade is served by the Ports, and 40 percent of the imports entering the Ports are transloaded or cross-docked.[37]

Substantial evidence also demonstrates the demand for port-related warehouse space is expected to expand. SCAG's 2012-2035 Regional Transportation Plan forecasts that "Demand for port-related warehouse space is projected to grow at a faster pace than demand for domestic warehousing… As space near the San Pedro Bay Ports reaches capacity, port warehousing will push out to the Inland Empire…. By 2035, the region may experience a shortfall of more than 228 million square feet in warehouse space relative to demand."[38] The table below reflects SCAG's forecasts for growth in demand for port-related warehouse space. The growth in the port-related market is expected to be much higher than the domestic market.[39]

Table 2.4 2014-2040 Minimum and Maximum Growth in Unconstrained Occupied Warehouse Space by Cargo Market across Alternate Scenarios

	Growth Percentage Range		Annualized Growth Rate Range	
Cargo Market	Min.	Max.	Min.	Max.
Port-related market	56%	83%	1.7%	2.4%
Border Crossing-related market	75%	165%	2.2%	3.8%
Domestic market	26%	39%	0.9%	1.3%
Total	**31%**	**45%**	**1.1%**	**1.4%**

Source: SCAG Warehouse Space Forecasting Model, Version 1.0, developed in June 30, 2016.

In sum, substantial evidence demonstrates that trips to the Ports are reasonably foreseeable for a spec warehouse proposed in the SCAG region, like this one. The lack of a specific tenant identified for the Project does not justify omission

[37] SCAG, Industrial Warehousing in the SCAG Region – Task 3: Assessment of Supply Chain Strategies and Implications for Future Development (April 2018), Pg. 1-4, 1-5, https://scag.ca.gov/sites/main/files/file-attachments/task3_supplychaintrends.pdf?1604268170. (Transloading refers to transferring of import cargo from ocean containers into domestic 53-foot containers and trailers for onward movement to U.S. inland destinations via rail or truck. Crossdocking is a type of transloading in which the cargo is transloaded within approximately 24 hours of arriving at the transload facility.).

printed on recycled paper

of this analysis. As a result of this omission, the FEIR underestimates transportation, air quality, and GHG impacts.

F. The FEIR Still Fails to Include Sufficient Investigation into Energy Conservation Measures

CARE CA commented that the FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines.[40] CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[41] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[42]

In Response 1-20, the Staff Report suggests that discussion of energy consumption measures is not required for this Project because its energy impacts are less than significant.[43] The City continues to make the same error as the lead agency in *CCEC* because the EIR in that case also identified a less-than-significant energy impact.[44] The court held that the EIR must nonetheless analyze energy consumption measures.[45]

Response 1-20 provides a "CEQA Guidelines Appendix F Energy Analysis" in Table 1-1.[46] Table 1-1 addresses factors listed in Appendix F, subdv. II(C), but fails to include any discussion of renewable energy options. As explained in *CCEC*, an EIR fails to comply with the requirements of Appendix F by not discussing or analyzing renewable energy options.[47] And as explained in CARE CA's prior comments, this FEIR must analyze the feasibility and effectiveness of measures including onsite solar facilities, electric vehicle charging, alternative fuel sources for the backup generators, more stringent idling requirements, and use of existing power sources during construction rather than generators.

The Staff Report contains additional responses regarding energy in Responses 1-21 to 1-25, but none address the feasibility of reducing energy

printed on recycled paper

consumption through onsite solar facilities. Response 1-21 states that the City need not evaluate using alternative fuel sources for backup generators because their emissions would be less-than-significant.[48] Again, the Staff Report makes the same mistake proscribed in *CCEC* by assuming no analysis of energy consumption measures is required if the Project's energy impact is less-than-significant.[49]

In Response 1-22, the City states that it would be infeasible to set more stringent idling requirements over existing requirements because there is no enforcement mechanism that the City can assure to enforce adherence.[50] But the City is authorized under Development Code Section 4.02.025(E) to impose conditions of approval to protect public health and mitigate environmental impacts. Section 4.02.025(E)(3) states that "All conditions of approval or requirements authorized by this Section are enforceable in the same manner and to the same extent as any other applicable requirement of this Development Code." Unenforceability is thus not a valid reason not to consider a more stringent idling requirement.

In Response 1-23, the Staff Report states that the FEIR adequately evaluated the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators during construction. The Response seems to misunderstand the nature of CARE CA's comment by discussing how "new dry utility infrastructure would be installed underground."[51] Instead, the FEIR should have included a discussion on the feasibility of a measuring limiting use of diesel generators during construction.

In Response 1-25, the Staff Report states that it meaningfully addresses Appendix F's considerations of "whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope."[52] But neither the Staff Report nor the FEIR contain this analysis.

In sum, the FEIR's energy analysis remains wholly inadequate. The Staff Report and the FEIR make no attempt to evaluate the feasibility of onsite renewable energy generation and storage, and fail to consider the feasibility of electric vehicle charging beyond existing requirements. And the Staff Report's

printed on recycled paper

responses to proposed energy consumption measures in Responses 1-21 to 1-25 are generally nonresponsive and fail to meet CEQA's requirements.

III. THE COMMISSION CANNOT MAKE THE REQUISITE FINDINGS TO APPROVE THE PROJECT

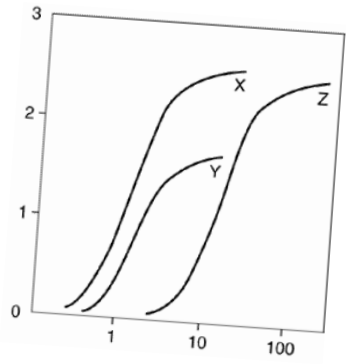
Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[53]

The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant vapor intrusion, health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project. A revised EIR must be recirculated before the Project can be recommended for approval.

IV. CONCLUSION

As is explained herein, the FEIR's hazards, air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to certify the FEIR or under the City of Ontario Municipal Code to approve the Project's Development Plan. CARE CA urges the Commission to require the City revise and recirculate the EIR before any further action is taken on the Project.

Sincerely,



Aidan P. Marshall

Attn: Mr. Aidan Marshall

Subject: Comments On Staff Report For Final Environmental Impact Report (DEIR) 5355 Esat Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the August 2023 City of Ontario's (the City) DEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the draft EIR consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

In the Meeting Agenda for the May 28th, 2024 City of Ontario Planning Commission/Historic Preservation Meeting Agenda, the City included responses from T&B Planning (T&B) to comments on the Final EIR for the Project provided by CARE CA. The responses from T&B for the City in total claim that no new information has been provided within the comments. This assertion is not supported by the information provided within the responses from CARE.

Specific Comments

1. Comment 1-12: The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.

T& B claims that building downwash is not appropriate for volume or area sources. This is incorrect. The choice to model the idling trucks, which are movable discrete point sources onsite below the line of the building roof, is a controllable feature in the AERMOD model. Volume sources are defined in the AERMOD Users Guide as included a variety of industrial sources, such as building roof monitors, multiple vents, and conveyor belts.[1] Volume sources are characterized as having a defined specific release height above the ground, an initial lateral dimension of the volume, and an initial vertical dimension. While the assumption that roadways and idling trucks in the Health Risk Assessment can be modeled as a line of volume sources, it must be pointed out that emissions from idling trucks and moving trucks will come from the exhaust pipe(s) to the engine, releasing diesel particulate matter (DPM) from a raised pipe at a specific rate (a point source). Therefore, the use of building downwash in the model to ensure that the modeled concentrations are not underestimated is appropriate. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). T&B, in Response 1-12, states that the Project's Air Quality Impact Analysis experts (Technical Appendix B1 of the Draft EIR) have concluded that truck idling emissions sources resulting from the Project would not be materially affected by downwash, but it is important to note that the HRA does not quantify the effects of downwash. The City should address the impact of this issue in a Revised DEIR.

2. Comment 1-41: The Air Quality Analysis Relies On An Input Value From AP-42 That

[1] U.S. EPA. 2023. User's Guide for the AMS/EPA Regulatory Model (AERMOD). Pg 3-68

Is Rated As Poor And Maybe Unreliable

T&B's response that the impact from a poorly rated AP-42 value is incorporated into the analysis is not new evidence is not supported by the evidence in the FEIR. As was noted in my prior comments, the CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42, which according to U.S. EPA may not represent a random sample of the industry. The City's response to the questioning of the rating of the emission factor was qualitative at best, failing to show any quantitative analysis of the potential impacts. The City should assess the impacts of this variable in a Revised DEIR.

3. Comment 1-16: The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to T&B's response, the Project is proposed as a speculative development and the user(s) of the building. T&B goes on to state that it is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. This line of reasoning clearly conflicts with the goals of CEQA to analyze the foreseeable and reasonable emissions from the Project.

This statement also does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately

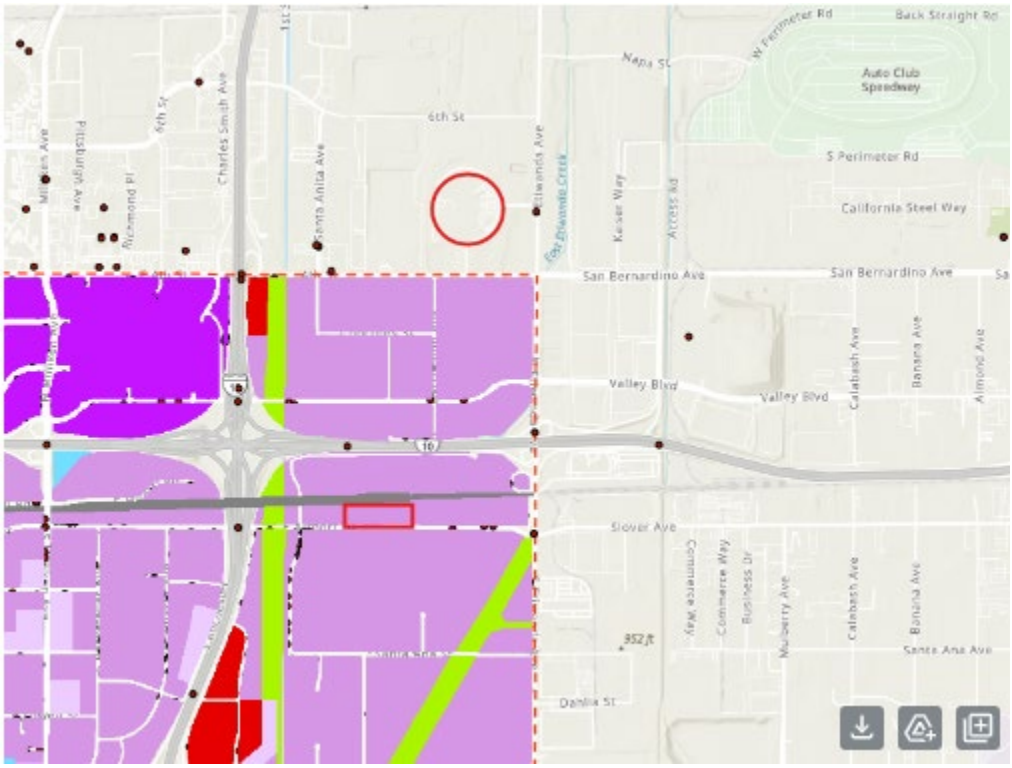
700 million square feet, an increase of 20 percent over the last five years"),[2] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[3] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[4] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a R-FEIR.

4. Additional Comments On The FEIR

a. The Truck Route Assumed For The Project Site Ignores The Traffic Constraints Of The Project Site

The truck route assumed in the FEIR assumes traffic will only exit the Project Site and turn left on East Airport Drive to S. Etiwanda Avenue. This route requires the trucks using the Project Site to cross (turn left out of the Project Site) Airport drive and to cross South Etiwanda Drive (turn left onto S. Etiwanda Avenue). The assumed distance to the 10 freeway is approximately 0.8 mile. An alternate route for traffic was not assessed in the FEIR which is longer than the primary route, but would have fewer traffic challenges for the drivers. Assuming trucks exit the Project Site and turn right (avoiding the delay getting across Airport Drive) then turn right on South Milliken Avenue, the vehicles will also be able to reach the 10 Freeway. The distance for this route is approximately 1.6 miles and is closer to the residential properties identified in the FEIR. The City must consider this alternate route and the air quality impacts in a R-FEIR.

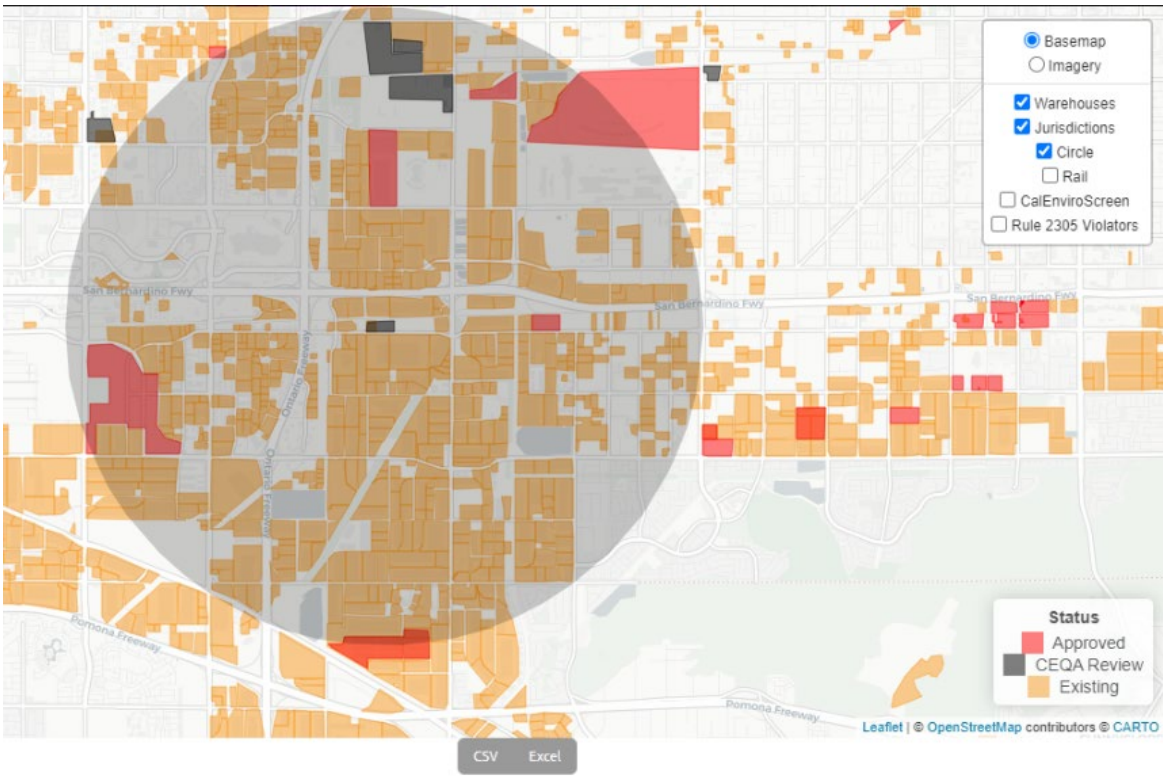


b. The HRA And Air Quality Analysis Failed To Assess A Receptor Closer To The Project Site Than The Residential Properties To The Northwest – The San Bernardino County West Valley Detention Center

[2] Available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf

[3] https://data.bts.gov/stories/s/Container-TEU/x3fb-aeda/

[4] U.S. Dept. of Transportation, Federal Highway Administration, FHWA Operations Support – Port Peak Pricing Program Evaluation (2020), available at https://ops.fhwa.dot.gov/publications/fhwahop09014/sect2.htm



The HRA and Air Quality Analysis failed to consider a significant receptor near the Project Site. The San Bernardino County West Valley Detention Center is located approximately 5,600 feet north northeast of the Project Site at 9500 Etiwanda Ave in Rancho Cucamonga. The Detention Center houses approximately 3,347 inmates and 600 workers.

The Detention Center is nearly 3,000 feet closer to the Project Site, and is nearer the proposed truck route, than the residential property identified in the HRA. The City must assess the impacts of the Project emissions on this receptor center in a revised DEIR.

c. The Cumulative Analysis Of The Project Failed To Consider The Significant Number Of Existing Warehouse Projects In The Vicinity

Based on the current analysis of warehouse projects within a 5-kilometer radius (3.1 miles) of the Project Site, there are 595 current warehouses, totaling 126,400,000 square feet of floor space.

Those projects account for 85,000 truck trips per day, which emit 117.6 lbs of DPM and 13, 243 lbs of NOx per day. There is an additional 7,400,000 square feet of warehousing that is either approved or undergoing CEQA review (includes the Airport Site). The cumulative impacts must be considered in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised draft environmental impact report should be prepared to address these substantial concerns.

Sincerely,

Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Planning Commission Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant") in the City of Ontario ("City"). The Project's Final Environmental Impact Report ("FEIR") and development plan will be considered at the August 27, 2024 Planning Commission meeting as Agenda Item B. The Commission will consider certification of the FEIR and approval of the Development Plan application.

On May 28, 2024, the Planning Commission conducted a hearing to consider the Project and continued the Project for further consideration. In advance of the hearing, CARE CA submitted comments on the FEIR showing that the FEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant air quality, public health, greenhouse gas ("GHG"), energy, transportation, and cumulative impacts. The Staff Report contains responses[1] to CARE CA's comments on the FEIR. However, the responses fail to resolve the major flaws CARE CA and its experts identified in the FEIR. The

[1] Letter from T&B Planning Inc. to City, re: 5355 East Airport Drive (PDEV22-017) – Response to May 28, 2024 Comment Letter from CARE CA (August 8, 2024).

printed on recycled paper

responses primarily claim that any issues raised by CARE CA have already been addressed in the FEIR and prior responses. This is incorrect. As shown herein, the City's responses fail to resolve the legal deficiencies identified in CARE CA's comments, and do not bring the FEIR into compliance with CEQA. The Project's environmental review remains inadequate.

We reviewed the Planning Commission Staff Report with the assistance of air quality expert Dr. James Clark[2] and transportation expert Norm Marshall.[3]

CARE CA urges the Planning Commission to require the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

A. The FEIR Improperly Defers Formulation of Mitigation Measures for Hazardous Materials

The Project's Phase I/II Environmental Site Assessment shows that ethylbenzene concentration in one soil vapor sample exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.[4] CARE CA commented that the FEIR fails to disclose this impact in the body of the FEIR or analyze the resultant health impacts on people, in violation of CEQA.[5] The Court in *Banning Ranch Conservancy v. City of Newport Beach* explained:

> The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. "[I]nformation 'scattered here and there in EIR appendices,' or a report 'buried in an appendix,' is not a substitute for "a good faith reasoned analysis...."[6]

In Responses CARE-5 and CARE-6, the Staff Report still fails to address this critical informational defect. The responses simply state that the Media Management Plan explains the mitigation procedures that will be undertaken for all earthwork that involves chemically impacted soil.[7] But the Media Management Plan provides only general guidance on how impacted soil would generally be

[7] Staff Report, Letter from T&B Planning Inc., pg. 2-3.

printed on recycled paper

addressed – it does not address the FEIR's informational flaw of failing to disclose whether ethylbenzene contamination is a significant impact requiring mitigation.

CARE CA also commented that the FEIR improperly defers formulation of mitigation for PCE and ethylbenzene contamination. It is unclear whether the City will remove PCE and ethylbenzene contaminated soil or adopt passive/engineered vapor intrusion mitigation such as installing a vapor barrier or venting. Responses CARE-5 and CARE-6 state that the Media Management Plan explains the mitigation procedures that will be undertaken for all earthwork that involves chemically impacted soil.[8] But the Media Management Plan simply describes best practices for any required earthwork activities at the Project site. The Plan does not specify whether passive/engineered vapor intrusion mitigation may be employed as opposed to removal of all impacted soil, does not quantify the impacts associated with each form of mitigation (e.g. construction impacts associated with excavation, removal and backfilling contaminated soil versus impacts of installing vapor intrusion barriers), and does not commit the City of the Applicant to specific binding mitigation. As such, the Staff Report fails to address CARE CA's comments regarding the Project's significant soil contamination issues.

B. The City Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the FEIR demonstrated that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse, which has a trip generation rate 2.6 times the rate used in the FEIR. Responses CARE-7 and CARE-8 state that "the Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates" and "no further response is required."[9] Response CARE-8 further states that "[b]ased on the Project's design, there is no reasonable possibility that the Project could be used as a parcel hub."[10]

The City has not provided substantial evidence in support of this claim. Conversely, transportation expert Mr. Marshall discusses the Project's features in detail, demonstrating that it could be used as a parcel hub.[11] Mr. Marshall and CARE CA's comments demonstrate that the proposed structure has adequate square feet to support use as a parcel hub (at least 200,000 sf), has a ceiling height

[11] Marshall Comments, pg. 4-5.

printed on recycled paper

of 24 feet or more, and has adequate parking.[12] The City fails to rebut this evidence with any evidence.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the FEIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. In summary, the City's approach to cumulative impacts is that emissions of criteria air pollutants or toxic air contaminants that do not exceed *individual* project thresholds set by South Coast Air Quality Management District ("SCAQMD") are also not *cumulatively* considerable.[13] CARE CA's comments explained that rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and information requirements of CEQA, per caselaw such as *Kings County Farm Bureau v. City of Hanford*.[14]

Responses CARE-9 and CARE-10 state that the FEIR and prior responses to comments already adequately responded to these comments, and no further response is necessary.[15] But at no point have the City's responses meaningfully addressed the caselaw proscribing the City's invalid approach to cumulative impacts. Response CARE-11 reiterates that the City is complying with current South Coast Air Quality Management District ("SCAQMD") guidance, as opposed to pending updates to the cumulative impacts guidance. Again, this response ignores the underlying legal mandates for these updates, which include recent CEQA cases such as *People of the State of California v. City of Fontana.*[16]

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

CARE CA commented that the City's Mobile Source Health Risk Assessment ("HRA") underestimates health risk impacts on sensitive receptors. One issue is that the HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. Trucks could easily travel west on

---

[12] *Id.*; CARE CA letter to City re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006) (May 28, 2024), pg. 6.

printed on recycled paper

Airport Drive and north along Milliken Avenue, which are both City-designated truck routes. Response CARE-13 states that "[e]ven if trucks travel to and from the Project site along the route as the commenter suggested, it would not materially affect the EIR health risk significance conclusions, as the risks are well below the significance threshold."[17] This statement is not supported by any quantitative analysis. Further, the claim that risks are well below the significance threshold is based on calculations that assume trucks would travel east, away from sensitive receptors. Thus, the City's response is not supported by substantial evidence.

CARE CA's air quality expert also demonstrated that the HRA failed to account for building downwash and relied on unreliable input values. Responses CARE-27 and CARE-28 state that no additional response is required regarding these issues. Dr. Clark's comments, attached, demonstrate that the HRA's methodological flaws and unsupported conclusions have not been resolved.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the FEIR underestimates truck trip lengths by failing to account for the Project's distance to the Ports of Los Angeles and Long Beach. CARE CA presented numerous comment letters from SCAQMD recommending that warehouse project's analyze trips to the Ports, and presented evidence showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario. Responses CARE-14 and CARE-15 respond that "[t]he commenter raises no new or additional environmental issues" and "no further response is required."[18]

Further response is necessary because the City's previous response (Response 1-16) in the May 28, 2024 Staff Report erroneously stated that the SCAQMD guidance is inapplicable to this Project because this Project would be a speculative warehouse.[19] But as explained in CARE CA's prior comments, SCAQMD advises

[17] Staff Report, Letter from T&B Planning Inc., pg. 4.
[18] Staff Report, Letter from T&B Planning Inc., pg. 5.
[19] "The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, Project Description, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages."

printed on recycled paper

speculative warehouses to analyze trips to the Ports.[20] The City has not corrected this omission or meaningfully addressed this issue.

In response to the studies presented in CARE CA's comments showing that trips to the Ports are reasonably foreseeable, Response CARE-16 argues that the studies show that it is more likely that the Project will not service the Ports.[21] But as explained in CARE CA's prior comments, an EIR must analyze reasonably foreseeable consequences of a project.[22] Here, the Project proposes a 270,337-square-foot industrial building with a proposed height of 46 feet on 13.08 acres of land. CARE CA's comments contain evidence showing that trips to the Ports are a reasonably foreseeable outcome of a warehouse like this (citing to quantitative evidence regarding the massive volume of goods moving to and from the Ports, as well as specific recommendations from SCAQMD).[23] In light of this evidence, the City's assumption that trucks would not travel to the Ports is unsupported by substantial evidence and is a failure to analyze a reasonably foreseeable use permitted by the Development Plan, as required by CEQA.

F. The FEIR Still Fails to Include Sufficient Investigation into Energy Conservation Measures

CARE CA commented that the FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines.[24] CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[25] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[26] Response CARE-17 states "[t]his comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required."[27]

printed on recycled paper

Further response is necessary because the City has not yet analyzed the feasibility and effectiveness of measures including onsite solar facilities, such as rooftop, parking lot, or ground-level solar photovoltaics. The City has not addressed considerations such as the technical and economic feasibility of installing solar facilities on the Project site, the potential size of the Project's solar zone, and the potential magnitude of mitigation provided by installing solar facilities. The City has not evaluated the extent to which mobile source energy consumption could be reduced during Project operations through electric vehicle charging infrastructure (above what is required by existing regulations).

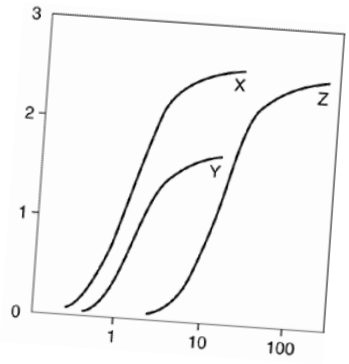
Response CARE-18 simply states that the Project would be solar ready, but this information does not meet CEQA's requirements discussed herein and in CARE CA's prior comments. As such, the Project's energy analysis remains inadequate.

II. CONCLUSION

As is explained herein, the Staff Report does not correct major flaws in the FEIR's hazards, air quality, health risk, energy, and transportation analyses. The Project's environmental review remains substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the City cannot make the requisite findings under CEQA to certify the FEIR or under the City of Ontario Municipal Code to approve the Project's Development Plan.

CARE CA urges the Commission to comply with CEQA and require the City revise and recirculate the EIR before any further action is taken on the Project.

Sincerely,



Aidan P. Marshall

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Aidan Marshall

Subject: Response To Comments Prepared By T&B Planning for City of Ontario Regarding 5355 East Airport Drive, City of Ontario, CA PDEV22-017

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed the August 8, 2024 Memorandum from T&B Planning regarding the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Specific Comments

1. **CARE-4/CARE-5: Failure To Disclose Impacts Of Ethylbenzene Concentrations In The Subsurface Soils At The Site And Development of Mitigation Measures For Worker Safety.**

T&B's response refers us to the Media Management Plan (Attachment F to the Final EIR). Despite the statement from T&B. that attachment F to the Final EIR is the Media Management Plan from Farallon, it is clear that the file was never attached to the FEIR that is posted at the City of Ontario's website. The Plan is attached to Item B starting on

page 3039 of the 3379 included in the pdf. According to the Media Management Plan the subject property will be redeveloped as an approximately 250,000 square foot (footprint) warehouse. This is different from the 270,337 square foot industrial building description of the project listed in the Planning Commission Agenda Report.

This comment was specifically to address concerns over the presence of at least two known carcinogens (PCE and ethylbenzene) that were measured onsite in the soil and or soil vapor at the site. Mitigation of the carcinogens prior to initiating redevelopment of the property would ensure workers safety onsite. The Media Management Plan states that "if Contractor encounters an unanticipated condition, the Contractor will stop work, secure the work area, and notify Prologis within 24 hours of discovery of the condition. Prologis will identify and contact the appropriate entity to respond to the unanticipated condition. The procedures that will be followed in the event that an unanticipated subsurface structure is discovered are summarized below:

- A licensed Contractor or an Environmental Professional will remove and containerize any observed residual liquid, sludge, or sediment in the subsurface structure, and will characterize the residual material(s) as required by the waste-receiving facility(ies);
- The Contractor will remove the subsurface structure in compliance with applicable laws and regulations, and under permit from and oversight by the applicable regulatory agency, if required;
- Soil removal actions will be performed in accordance with the procedures outlined in this MMP; and
- The area will be cleared after any required regulatory authorization has been obtained from the permitting agency, so work may proceed."

This approach relies upon the construction workers onsite being able to identify environmental hazards that may not necessarily include visible staining of soils or visible emissions. Prior to any demolition of the site, preparation of a site-specific remedial action work (RAW) plan should be initiated to protect workers onsite. The purpose of the RAW would be to: 1) present and evaluate existing Site conditions; 2) establish appropriate removal action objectives (RAOs) for protection of human health and the environment; and 3) evaluate alternatives and

identify a final recommendation for a removal action at the Site that is protective of human health and the environment.

2. CARE-14, CARE-15, CARE-16, and CARE-29: The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to T&B's response no new or additional environmental issues have been raised with these comments. The EIR's flaws have not been resolved regarding the average trip length in the air quality analysis. T&B quotes from the National Center for Sustainable Transportation (NCST) report on Southern California Warehouse and Distribution Center Facilities noting that "the study also stated that "around 62% of the facilities in the SCAG region (approximately 4,900 buildings) are facilities larger than 50,000 sf mainly serving non-port related services. Most of the flow of goods by truck (85% of trips) found in the area is associated with local or intra-regional trips while international shippers have a higher use share of rail and air networks. Activities at port-related warehouses which locate in the Gateway cities focus mainly in transloading, deconsolidation and some value added services. National and international distribution centers are found mainly in the Inland Empire region."[1]

T&B fails to include the next paragraph which notes[2] "Among the six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) that comprise the SCAG region, Los Angeles (31.2%), Riverside (21.2%) and San Bernardino (30.2%) account for the largest share of total miles of primary freight network (SCAG, 2016). Consequently, the majority of the facilities (larger than 50,000 sq. ft.) are located in these counties. In terms of the available land for new warehouses, the Inland Empire shows the highest availability (Figure 2) (SCAG, 2009). *56% of the facilities receive goods from the Port of Los Angeles and Long Beach, and around 50% deliver to Southern California warehouses, retail stores or manufacturing plants." (Emphasis added)*. Clearly the NCST report

[1] NCST. 2017. Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns: A Research Report from the National Center for Sustainable Transportation. Prepared by Miguel Jaller and Leticia Pineda. Dated July 2017. Pg. 6

[2] Ibid Pg. 6-7.

validates that the majority of facilities in the SCAG region receive goods from the Ports of Los Angeles and Long Beach.

As I previously stated in comments on the Project, the 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710. Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the Regional burden and resulting in a potentially significant impact.

3. CARE 20: Emissions From Diesel Generators.

T&B states that "The intermittent use of a backup generator during either construction or operation would not result in a substantial or measurable amount of emissions, since by the very nature of the activity, it would be short-term, intermittent, and infrequent. Thus, contrary to the commenter's assertion, measures to reduce this source of temporary and intermittent use of energy is not required. The City's experts disagree with the commenter and no further response is required" This comment ignores the essence of the comment, which is that the site will have an additional stationary source of diesel particulate matter (DPM) onsite that was not accounted for in the air quality analysis.

As was noted in the EIRs, the primary toxic air contaminant (TAC) associated with the project will be DPM. Diesel exhaust, in particular DPM, is classified by the State of California as a TAC. TACs, including DPM[3], contribute to a host of respiratory impacts and may lead to the development of various cancers. Failing to quantify the carcinogenic and other health risk impacts places the community at risk for unwanted adverse health impacts. *Even brief exposures to the TACs could lead to the development of adverse health impacts over the life of an individual*.

[3] Because DPM is a TAC, it is a different air pollutant than criteria particulate matter (PM) emissions such as PM10, PM2.5, and fugitive dust. DPM exposure causes acute health effects that are different from the effects of exposure to PM alone.

Diesel exhaust has been linked to a range of serious health problems including an increase in respiratory disease, lung damage, cancer, and premature death.[4,5,6] Fine DPM is deposited deep in the lungs in the smallest airways and can result in increased respiratory symptoms and disease; decreased lung function, particularly in children and individuals with asthma; alterations in lung tissue and respiratory tract defense mechanisms; and premature death.[7] Exposure to DPM increases the risk of lung cancer. It also causes non-cancer effects including chronic bronchitis, inflammation of lung tissue, thickening of the alveolar walls, immunological allergic reactions, and airway constriction.[8] DPM is a TAC that is recognized by state and federal agencies as causing severe health risk because it contains toxic materials, unlike $PM_{2.5}$ and PM_{10}.[9]

The inherent toxicity of TACs requires the City to first accurately quantify the concentration released into the environment from all sources and asses at each of the sensitive receptor locations through air dispersion modeling the ground-level concentration, calculate the dose of each TAC at that location, and quantify the cancer risk and hazard index for each of the chemicals of concern. Following that analysis, then the City can make a determination of the relative significance of the emissions.

4. CARE-31: Exposure Of Prisoners and Workers At The West Valley Detention Center

T&B's response to the question of impacts from the Project to a previously unidentified population source, the San Bernardino County West Valley Detention Center (WVDC), located

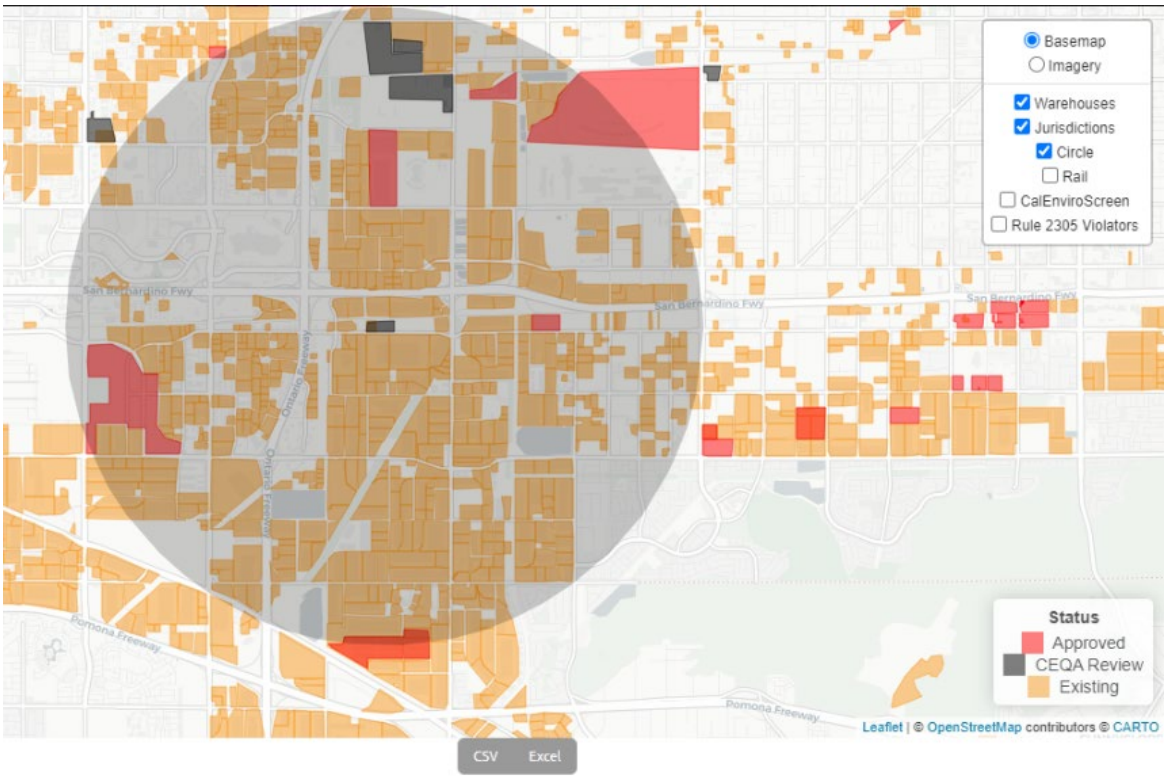
[7] California Air Resources Board, Initial Statement of Reasons for Rulemaking, Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Staff Report, June 1998.

[8] Findings of the Scientific Review Panel on The Report on Diesel Exhaust as adopted at the Panel's April 22, 1998 Meeting.



[9] Health & Safety Code § 39655(a) (defining "toxic air contaminant" as air pollutants "which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. Sec. 7412 (b)) is a toxic air contaminant.")

approximately 5,600 feet north northeast of the Project Site, was to dismiss the population as a non-long term residential population. While prisoners may be held at the WVDC for up to a year, there is no opportunity for the prisoners to get away from emissions associated with the Project. Workers at the WVDC should also be included in the evaluation of health impacts. The analyses presented in the EIRs and Staff Report did not address this unique population until we raised a concern.

The Detention Center is nearly 3,000 feet closer to the Project Site than the residential property selected in the EIR. Health risks from exposure are a function of the concentration of the contaminant and the duration of exposure. Until an actual attempt is made to calculate the exposure concentration at the WVDC determinations of relative risk (from either chronic or acute exposures) are speculative at best. The City must assess the impacts of the Project emissions on this receptor center.

5. CARE 32/CARE 10: Additional Cumulative Impacts From Existing/Pending Warehouse Projects

T&B's response that comments on the cumulative impacts did not raise new information is not supportable. The EIR's flaws have not been resolved regarding the cumulative impacts on air quality based on the number of existing and new projects in the area. As was pointed out in the last letter, based on the current analysis of warehouse projects within a 5-kilometer radius (3.1 miles) of the Project Site, there are 595 current warehouses, totaling 126,400,000 square feet of floor space.

Those projects account for 85,000 truck trips per day, which emit 117.6 lbs of DPM and 13, 243 lbs of NOx per day. There is an additional 7,400,000 square feet of warehousing that is either approved or undergoing CEQA review (includes the Airport Site). Clearly the City has not included the relevant emissions of all the new projects in its analysis of the Project.

6. CARE 27: Building Downwash

T&B's response to comments on the incorporation of building downwash into the dispersion model are to claim that "The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of building downwash. No additions, revisions, or corrections are necessary and no further response is required." This response fails to address the significant issue raised by the comment.

Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[10] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect

[10] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

underestimates the exposure point concentrations for receptors near the building(s).

In a recent review of Draft Environmental Impact Report (Draft EIR) for the Proposed West Campus Upper Plateau Project (Proposed Project) (SCH Number: 2021110304), SCAQMD[11] specifically calls out the need for inclusion of downwash analysis for this Project which included a business park, industrial, mixed-use, public facility, parks, recreation and open space, and infrastructure improvements, totaling 369.60 acres. SCAQMD staff reviewing the project outlined that building downwash should be considered for the Proposed Project operation in order to predict more accurate ground-level concentrations. In addition, the truck idling emissions would need to be estimated separately and included in the dispersion modeling analysis and HRA as point sources. The City should address the impact of this issue in a revised EIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised environmental impact report should be prepared to address these substantial concerns.

Sincerely,

[11] SCAQMD. 2023. Draft Environmental Impact Report (Draft EIR) for the Proposed West Campus Upper Plateau Project (Proposed Project) (SCH Number: 2021110304) Dated March 9, 2023, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/march-2023/RVC230111-04.pdf?sfvrsn=8.

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

In October 2023, I reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). In April 2024, I addressed additional analysis contained in the Project's Final EIR ("FEIR"). The Planning Commission Agenda Report dated August 27, 2024 fails to adequately address the outstanding issues identified in my October 2023 and April 2024 comments.

In October 2023, I made the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

In April 2024, I reviewed the responses to these comments made in the project's Final Environmental Impact Review ("FEIR") dated February 2024 and made additional comments on these same points.

My April 2024 comments and the August Report responses follow:

Truck trip lengths – The FEIR repeats the false assertion that the truck trip lengths follow SCAQMD's recommendations (FEIR, A-18, p. 2-43). In my October 2023 comments, I addressed this, writing:

> The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[1] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[2] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

To prove that this is not a general SCAQMD recommendation for all warehouses, I attach SCAQMD's November 22, 2023 comments on the Hemlock Warehouse Development Project Draft SEIR in the City of Fontana. That Draft SEIR applied the same truck trip lengths as used in the 5355 East Airport Drive DEIR and FEIR. SCAQMD's comments state:

> However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project. (p. 2)

SCAQMD is making the same point I made in my October 2023 comments where I wrote:

> it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

[1] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf
[2] https://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/sclc_warehouse-presentation-final.pdf

The FEIR does not use SCAQMD- recommended truck trip lengths. SCAQMD instead recommends: "**Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project**."

The Report states only:

> *The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required. (Report, PDF p. 2609 of 3993)*

This response fails to address my comments reproduced above.

VMT mitigation – The FEIR continues to state that the proposed project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.

However, the FEIR states that these impacts cannot be mitigated because "measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant." (FEIR A-24, p. 2-44)

My October 2023 comments recommended requiring CAPCOA T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – that can provide up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

A smaller mandatory reduction may be appropriate for this project, with this requirement passed on to the tenant, but it is not sufficient to claim that no significant mitigation is possible.

In addition, the attached SCAQMD comments on the Hemlock Warehouse Development Project recommends several mitigation measures targeting truck emissions, including:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks,
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the final CEQA document, and
- Provide electric vehicle (EV) charging stations and electrical hookups for truckers. (p.3)

The Report states only:

> *Contrary to the commenter's assertion, this memorandum, RTC, and Final EIR demonstrates that the Project's impacts have been adequately analyzed and mitigated.*

> *Thus, no additions, revisions, or corrections are necessary are necessary.. (Report, CARE 22 p. PDF 2620-2621 of 3993)*

This response fails to address my comments reproduced above.

Trip generation

In my October 2023 comments, I provided data on different types of warehouses that have significantly higher trip generation rates than the 1.75 trips per 1000 sq. ft. assumed in the DEIR and FEIR. These include:

> The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

The FEIR argues that the highest generators that I discussed in my October 2023 comments could not be accommodated because ". . . the layout of the site with 251 parking spaces would not reasonable accommodate the on-site parking required to support these uses."

This point about parking may be valid for the highest generators per 1000 sq. ft. but not for the intermediate generators. The DEIR and FEIR estimate only 270 passenger car trips per day (DEIR Appendix K, p. 5), i.e., 135 vehicles in and 135 cars out. Therefore, if all cars were employees and they all worked the same single shift, the parking lot utilization would never exceed 54%. With multiple shifts and non-employee passenger car trips, the parking lot utilization would be much lower. Therefore, the parking lot is designed to support many more trips than assumed in the DEIR and FEIR.

The 251 parking spaces are consistent with ITE Land Use 156: High Cube Parcel Hub Warehouse. This use is described:

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. A high-cube warehouse can be free-standing or located in an industrial park. A high-cube parcel hub warehouse typically serves as a regional and local freight-forwarder facility for time sensitive shipments via airfreight and ground carriers. A site can also include truck maintenance, wash, or fueling facilities. Some limited assembly and repackaging may occur within the facility.

Given the uncertainty concerning the proposed project and its size, 270,377 sq. ft., it could foreseeably end up being a High-Cube-Parcel-Hub Warehouse as defined above.

The number of parking spaces provided also is consistent with this usage. The trip generation rate for this category is 4.63 trips per 1000 sq. ft., i.e. 2.6 times the rate used in the DEIR and FEIR. This rate includes 0.58 truck trips per 1000 sq. ft. Therefore, the passenger car rate is 4.05

trips per 1000 sq. ft. As a High-Cube-Parcel-Hub Warehouse, the proposed project would generate 1095 passenger car trips per day.

The DEIR states:

> For the purposes of this EIR, the Project is assumed to be operational 24 hours per day, seven days per week, with exterior loading and parking areas illuminated at night. (DEIR, p. 3-13)

This suggests multiple shifts each day.

Some of the passenger car trips would not be parking long term, including trips dropping off and picking up workers, and miscellaneous service trips, all of which include both and entering trip and an exiting trip. However, even if all passenger car trips involved parking long-term, all the trips could be accommodated with the planned 251 parking spaces if each space is occupied an average of 2.18 times per day.

As I stated in my October 2023 comment letter:

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

The Report states only:

> *The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project trip generation. No additions, revisions, or corrections are necessary and no further response is required... (Report, CARE 7 p. PDF 2607 of 3993)*

This response fails to address my comments reproduced above.

In summary, the August 2024 Report fails to adequately address any of my comments.

Sincerely,

Norman L. Marshall

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

DATE: September 13, 2024

RE: 5355 East Airport Drive (PDEV22-017) – Response to September 5, 2024 Appeal Letter from CARE CA

T&B Planning, Inc. is the environmental consulting firm that prepared the Environmental Impact Report (EIR; SCH No. 2022090006) for the 5355 East Airport Drive Project (hereafter "Project"). The Project Applicant, Prologis, Inc., proposes to demolish the existing buildings and structures on the Project site and redevelop the property with a 270,337 square foot (s.f.) warehouse building. The Project's design also includes the installation of associated site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detention facilities, exterior lighting, walls/fencing, and signage as well as site-adjacent improvements to East Airport Drive. The Draft EIR for the Project was published on August 22, 2023, for a 45 day review period, with the local review period and State review period ending on October 5, 2023.

On August 27, 2024, the City of Ontario Planning Commission certified the Final Environmental Impact Report (EIR), including the adoption of a Mitigation Monitoring and Reporting Program (MMRP) and a Statement of Overriding Considerations, and in conjunction with the approval of a Development Plan (File No. PDEV22-017) for the Project. Subsequently, an appeal letter was submitted to the City on September 5, 2024, requesting that the City Council appeal the Planning Commission's approval of the Project. In response, T&B Planning prepared this memorandum for the purpose of responding to the comments received alleging deficiencies in the Draft EIR and Final EIR and to the Appellant's reasons and grounds for appeal. The responses contained herein demonstrate that the Draft EIR's analyses and conclusions are correct and that the Final EIR has been appropriately prepared to satisfy CEQA compliance requirements. There are no CEQA compliance deficiencies as claimed by Adams Broadwell Joseph & Cardozo on behalf of the Californians Allied for a Responsible Economy (CARECA). For the reasons outlined in this memorandum, the comments provided by CARECA and the responses thereto contained in this memo do not present substantial new information, do not necessitate revisions to the Draft EIR or Final EIR, and do not trigger the need for recirculation of the Draft EIR or Final EIR, or the conduct of additional environmental review pursuant to CEQA Guidelines § 15088.5.

Commenter Letter: Adams Broadwell Joseph & Cardozo on behalf of Californians Allied for a Responsible Economy dated September 5, 2024.

CARECA-1 This comment contains introductory remarks and identifies that the comments in this letter are being provided by Adams Broadwell Joseph & Cardozo on behalf of the Californians Allied for a Responsible Economy (CARECA) and provides a summary of project's background, prior comments submitted concerning the Project during the Draft's EIR public review period, the Final EIR, and subsequent response to comment (RTC) memorandum. The commenter claims that the Planning Commission's approval of the Project and certification of the Final EIR violated CEQA and land use laws because the City has not complied with its duty to disclose and mitigate the Project's potentially significant environmental and land use impacts, and the Planning Commission's approval findings were not supported by substantial evidence. Response to the comments made are provided below in this memorandum.

CARECA-2 This comment cites to Section 2.04.010(B)(1) and 2.04.005 of the Ontario Development Code related to appeal filings and includes a statement of interest describing CARECA's organization, role, members, and purposes. The commenter's standing to appeal and statement of interest are noted. This comment does not raise any issues concerning the environmental analysis provided in the Draft EIR or Final EIR and thus no further response is required.

CARECA-3 The commenter reiterates previous statements and opinions that the Final EIR fails to analyze the full scope of the Project, in particular in relation to the Project's reasonably foreseeable use as a parcel hub (a use that generates 2.6 times more trips than analyzed). This comment is similar to Response to Comment A-6 in the Final EIR, 1-8 in the RTC dated May 20, 2024, and CARE-7 in the RTC dated August 8, 2024. Refer to Final EIR Response to Comment A-6 (Final EIR, pp. 2-38, 2-39), Response to Comment 1-8 (RTC, p. 3), and Response to Comment CARE-7 (RTC, p. 3). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project's trip generation. There is no reasonable possibility that the Project, as designed, could operate as a parcel hub. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-4 The commenter reiterates prior comments that the Final EIR fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach, which are longer than the trips analyzed in the Final EIR. This comment is similar to Response to Comment A-18, A-19, and A-28 in the Final EIR, 1-16 in the RTC dated May 20, CARE-14, CARE-15, and CARE-16 in the RTC dated August 8. Refer to Final EIR Response to Comment A-18, A-19, A-28 (Final EIR, pp. 2-43, 2-44, 2-45) and Response to Comment 1-16 (RTC, p. 7), and Response to Comment CARE-14, CARE-15, and CARE-16 (RTC, p. 5). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-5 The commenter reiterates prior comments that the Final EIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines. This comment is similar to Response to Comment 1-20 in the RTC dated May 20, CARE-17, CARE-18, and CARE-21 in the RTC dated August 8. Refer to Response to Comment 1-20 (RTC, pp. 8 to 10, and Response to Comment CARE-17, CARE-18, and CARE-21 (RTC, p. 6). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-6 The commenter reiterates prior comments that the Final EIR's analysis of cumulative air quality impacts is inadequate because it fails to consider the Project's impacts in the context of the numerous other warehouses existing and planned in the area. This comment is similar to Response to Comment A-14 in the Final EIR, 1-10 in the RTC dated May 20, CARE-9, CARE-10, and CARE-11 in the RTC dated August 8. Refer to Final EIR Response to Comment A-14 (Final EIR, pp. 2-41, 2-42), Response to Comment 1-8 (RTC, p. 4, 5), and Response to Comment CARE-9, CARE-10, and CARE-11 (RTC, pp. 3 to 4). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of cumulative air quality impacts. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-7 The commenter reiterates prior comments that the Final EIR's quantified health risk analysis underestimates impacts because it analyzed trucks travelling only east along Airport Drive, not accounting for building downwash and relying on unreliable input values. This comment is similar to Response to Comment 1-12, 1-13, 1-41 in the RTC dated May 20, CARE-13, CARE-27, and CARE-28 in the RTC dated August 8. Refer to Response to Comment 1-12, 1-13, and 1-41 (RTC, po. 5, 14 to 16), and Response to Comment CARE-13, CARE-27, CARE-28 (RTC, pp. 4,7). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of health risk impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

CARECA-8 The commenter reiterates prior comments that the Final EIR identifies significant vapor intrusion impacts due to tetrachloroethylene (PCE) contamination, but improperly defers formulation of mitigation measures. This comment is similar to Response to Comment CARE-4, CARE-5, and CARE-6 in the RTC dated August 8. Refer to Response to Comment CARE-4, CARE-5, and CARE-6 (RTC, pp. 2, 3). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of vapor intrusion impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

CARECA-9 The commenter states that the Final EIR is deficient as a matter of law and its conclusions are not supported by substantial evidence based on the previous comments made. The commenter asserts that the Planning Commission's approval decision must be vacated, and the EIR must be revised and recirculated in compliance with CEQA. Contrary to the commenter's assertion, this memorandum, RTCs (dated May 20 and August 8), and Final EIR demonstrates that the Project's impacts have been adequately analyzed and mitigated. Thus, no additions, revisions, or corrections are necessary are necessary.

CARECA-10 The commenter cites to Section 4.02.025(D) of the City's Municipal Code and assets that the Project would have significant and unavoidable VMT impact, potential health risk, air quality, GHG, energy, and soil contamination impacts that have been underestimated. The commenter asserts that the City cannot make the requisite findings to approve the Project and a revised EIR must be recirculated before the Project can be recommended for approval. Contrary to the commenter's assertion, this memorandum, prior RTCs (dated May 20 and August 8), and Final EIR demonstrates that the Project's impacts have been adequately analyzed and mitigated as feasible. Thus, no additions, revisions, or corrections are necessary are necessary.

CARECA-11 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

CARECA-12 The commenter provides previously submitted comment letters as Attachments A through D. Attachment A includes a comment letter dated October 5, 2023, which has been responded to in the Project's Final EIR. Attachment B includes a comment letter dated April 15, 2024, which has been response to in the RTC dated May 20, 2024. Attachment C is a comment letter dated May 28, 2024, which has been responded to in the RTC dated August 8, 2024. Response to Attachment D is provided below in Response to Comments CARECA-13 to CARECA-33 in this memorandum.

CARECA-13 This comment consists of introductory remarks, identifies that the comments in this letter are being provided by Adams Broadwell Joseph & Cardozo on behalf of CARECA, and provides a summary of prior comments submitted concerning the Project during the Draft's EIR public review period, and on the Final EIR. The commenter claims that the RTC, dated August 8, 2024, failed to resolve asserted flaws that CARE CA and its experts identified in the Draft EIR and that the Planning Commission should require the City to revised and recirculate the EIR before any further action is taken on the Project. Response to the comments made in this letter are provided below in Response to Comments CARECA-14 to CARECA-33. Thus, no further response is required.

CARECA-14 The commenter reiterates previous comments about the conclusions of the Project's Phase I and II Environmental Site Assessment (ESA; *Technical Appendix G* to the Draft EIR) regarding ethylbenzene concentration and opines the Final EIR improperly defers formulation of mitigation for PCE and ethylbenzene contamination. Refer to Response to Comment CARECA-8 above and Response to Comments CARE-4, CARE-5, and CARE-6 in the RTC dated August 8, 2024. Refer to Response to Comments CARE-4, CARE-5, and CARE-6 (RTC, pp. 2, 3). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position

regarding accuracy and adequacy of the EIR analysis of vapor intrusion impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

CARECA-15 The commenter reiterates previous comments regarding the Project's potential as a High Cube Parcel Hub Warehouse and that trip generated by the Project are not adequately analyzed. This comment is similar to Response to Comment A-6 in the Final EIR, 1-8 in the RTC dated May 20, 2024, and CARE-7 in the RTC dated August 8, 2024. Refer to Final EIR Response to Comment A-6 (Final EIR, pp. 2-38, 2-39), Response to Comment 1-8 (RTC, p. 3), and Response to Comment CARE-7 (RTC, p. 3). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project's trip generation. There is no reasonable possibility that the Project, as designed, could operate as a parcel hub. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-16 The commenter reiterates previous comments that the Final EIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. This comment is similar to Response to Comment A-14 in the Final EIR, 1-10 in the RTC dated May 20, CARE-9, CARE-10, and CARE-11 in the RTC dated August 8. Refer to Final EIR Response to Comment A-14 (Final EIR, pp. 2-41, 2-42), Response to Comment 1-8 (RTC, p. 4, 5), and Response to Comment CARE-9, CARE-10, and CARE-11 (RTC, pp. 3 to 4). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of cumulative air quality impacts. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-17 The commenter reiterates previous comments that the Project's Health Risk Assessment underestimates health risk impacts on sensitive receptors and failed to account for building downwash and relied on unreliable input values. This comment is similar to Response to Comment 1-12, 1-13, 1-41 in the RTC dated May 20, CARE-13, CARE-27, and CARE-28 in the RTC dated August 8. Refer to Response to Comment 1-12, 1-13, and 1-41 (RTC, po. 5, 14 to 16), and Response to Comment CARE-13, CARE-27, CARE-28 (RTC, pp. 4,7). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of health risk impacts. No additions, revisions, or corrections to the EIR are necessary and no further response is required.

CARECA-18 The commenter reiterates previous comments that Final EIR truck trip length is underestimated. This comment is similar to Response to Comment A-18, A-19, and A-28 in the Final EIR, 1-16 in the RTC dated May 20, CARE-14, CARE-15, and CARE-16 in the RTC dated August 8. Refer to Final EIR Response to Comment A-18, A-19, A-28 (Final EIR, pp. 2-43, 2-44, 2-45) and Response to Comment 1-16 (RTC, p. 7), and Response to Comment CARE-14, CARE-15, and CARE-16 (RTC, p. 5). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC,

and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-19 The commenter reiterates previous comments that the Project's energy analysis remains inadequate. This comment is similar to Response to Comment 1-20 in the RTC dated May 20, CARE-17, CARE-18, and CARE-21 in the RTC dated August 8. Refer to Response to Comment 1-20 (RTC, pp. 8 to 10, and Response to Comment CARE-17, CARE-18, and CARE-21 (RTC, p. 6). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-20 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

CARECA-21 This comment consists of introductory remarks from Clark and Associates and does not raise any issues concerning the environmental analysis provided in the Draft EIR. Thus no further response is required.

CARECA-22 The commenter asserts that the Project's Media Management Plan (*Attachment F* to the Final EIR) was never attached to the Final EIR that is posted at the City of Ontario's website. The City thanks the commenter for calling this to the City's attention and the City immediately posted the Media Management Plan to the website. All appendices to the Final EIR are posted on the City's website (https://www.ontarioca.gov/Planning/Reports/EnvironmentalImpact). Additionally, the Media Management Plan was provided in all agenda packages and staff reports for the Project's Development Advisory Board (DAB) meetings[1,2] and Planning Commission hearings[3,4]. The commenter also summarizes the procedures in the Media Management Plan in the event that an unanticipated subsurface structure is discovered and states a site-specific remedial action work (RAW) plan should be initiated to protect workers onsite. The Media Management Plan's implementation is sufficient for ensuring that potential environmental effects are reduced to below a level of significance. Refer to Section 4.3 of the Media Management Plan, which requires adherence to a Health and Safety Plan (HASP) including for constriction workers. The HASP will detail all planned construction activities and will describe standard safety precautions (e.g., protective gear for workers, proper soil handling techniques, etc). The Contractor or the Environmental Professional is responsible for ensuring that the safety precautions detailed in the HASP are implemented and monitored during

[1] See Page 2872 of the March 18, 2024 DAB Agenda Package: https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/20240318%20DAB%20Agenda%20Packet.pdf
[2] See Page 2761 of the April 15, 2024 DAB Agenda Package: https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/20240415%20DAB%20Agenda%20Packet.pdf
[3] See Page 3119 of the May 28, 2024 Planning Commission Agenda Package: https://granicus_production_attachments.s3.amazonaws.com/ontarioca/6af4a0bd3120834cb9a0da60382943e10.pdf
[4] See Page 3044 of the August 27, 2024 Planning Commission Agenda Package: https://granicus_production_attachments.s3.amazonaws.com/ontarioca/23a3c29303afd40b3c88ce6d3ae8da890.pdf

all activities at the site. The Contractor and the Environmental Professional also are required to abide by all applicable federal, state, and local regulations and codes relating to health and safety and are required by law to adhere to all California Occupational Safety and Health Administration regulations contained in Title 8 of the California Code of Regulations (8 CCR), as they apply to activities at the Project site.

CARECA-23 The commenter reiterates previous comments that Final EIR truck trip length is underestimated and that the "Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns" by the National Center for Sustainable Transportation (NCST) validates that the majority of facilities in the SCAG region receive goods from the Ports of Los Angeles and Long Beach. This comment is similar to Response to Comment A-18, A-19, and A-28 in the Final EIR, 1-16 in the RTC dated May 20, CARE-14, CARE-15, and CARE-16 in the RTC dated August 8. Refer to Final EIR Response to Comment A-18, A-19, A-28 (Final EIR, pp. 2-43, 2-44, 2-45) and Response to Comment 1-16 (RTC, p. 7), and Response to Comment CARE-14, CARE-15, and CARE-16 (RTC, p. 5). Specifically, refer to Response to Comment CARE-16 regarding the low sample size of the study and that the study is not an accurate representation of warehouse facilities in the region. The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-24 The commenter reiterates previous comments the use of a diesel generator was not accounted for in the Project's air quality analysis and that diesel generators is a source of diesel particulate matter (DPM), which is a primary toxic air contaminant (TAC) associated with the Project. Refer to Response to Comment A-10 in the Final EIR (Final EIR, pp. 2-40 to 2-41) that addresses the use of diesel generator and which provided a table of calculations of emissions that would be generated from a 197 horsepower (hp) diesel-powered emergency water pump and a 762 hp diesel-powered emergency backup generator. As shown, emissions would be negligible and the Project's total emissions would be less than the South Coast Air Quality Management District (SCAQMD) significance threshold. Thus, no further response is required.

CARECA-25 The commenter reiterates previous comments that the health risk impacts to the San Bernardino County West Valley Detention Center (WVDC) was not analyzed. Refer to Response to Comment CARE-31 in the RTC dated August 4 (RTC, p. 8). Thus, no further response is required.

CARECA-26 The commenter reiterates previous comments regarding the Project's cumulative impacts analysis. This comment is similar to Response to Comment A-14 in the Final EIR, 1-10 in the RTC dated May 20, CARE-9, CARE-10, and CARE-11 in the RTC dated August 8. Refer to Final EIR Response to Comment A-14 (Final EIR, pp. 2-41, 2-42), Response to Comment 1-8 (RTC, p. 4, 5), and Response to Comment CARE-9, CARE-10, and CARE-11 (RTC, pp. 3 to 4). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of

cumulative air quality impacts. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-27 The commenter reiterates previous comments related to building downwash. This comment is similar to Response to Comment 1-12 in the RTC dated May 20. Refer to Response to Comment 1-12 in the RTC (RTC, p. 5) for a full discussion on the reasoning why the Project would not be materially affected by downwash. Thus, no further response is required.

CARECA-28 The commenter provides a conclusionary statement, which does not present any additional information not covered in the previous comments. Thus, no additional response is required.

CARECA-29 This comment consists of introductory remarks from Smart Mobility and summarizes the findings of the commenter's letter in October 2023, stating that the Draft EIR acknowledges a significant and unavoidable VMT impact, asserting that the proposed VMT mitigation measure is not fully specified or quantified, and claiming that the Project's trip generation and GHG emissions could be much higher than assumed. As described in the following responses, the commenter's assertions are incorrect. Refer to Response to Comments CARECA-30 to CARECA-33. Thus, no further response is required

CARECA-30 The commenter reiterates previous comments and responses made regarding the Project's truck trip length. This comment is similar to Response to Comments A-18, A-19, and A-28 in the Final EIR, 1- 16 in the RTC dated May 20, CARE-14, CARE-15, and CARE-16 in the RTC dated August 8. Refer to Final EIR Response to Comment A-18, A-19, A-28 (Final EIR, pp. 2-43, 2-44, 2-45) and Response to Comment 1-16 (RTC, p. 7), and Response to Comment CARE-14, CARE-15, and CARE-16 (RTC, p. 5). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required.

CARECA-31 The commenter reiterates previous comments and responses made regarding the Project's significant and unavoidable VMT impacts. The commenter's statements have been previously addressed at Final EIR Response to Comment A-24, which included a calculation of feasible VMT mitigation measures. As stated, measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant (Final EIR pp. 2-44 to 2-45). Additionally, the commenter reiterated suggestions on requiring zero emission trucks, limiting daily number of trucks allowed at the Project site, and providing electric vehicle (EV) charging stations and electrical hookups for truckers. Refer to Response to Comment B-53 and B-60 in the Final EIR (Final EIR, pp. 2-97 to 2-100) regarding the infeasibility of using zero-emission vehicles and EV charging stations for trucks and 1-33 in the RTC dated May 20 (RTC, p. 13) for limiting daily number of trucks allowed at the Project site. Thus, no further response is required.

CARECA-32 The commenter reiterates previous comments and responses made related to the Project's trip generation assumptions. This comment is similar to Response to Comment A-18, A-19, and A-28 in the Final EIR, 1- 16 in the RTC dated May 20, CARE-14, CARE-15, and CARE-16 in the RTC dated August 8. Refer to Final EIR Response to Comment A-18, A-19, A-28 (Final EIR, pp. 2-43, 2-44, 2-45) and Response to Comment 1-16 (RTC, p. 7), and Response to Comment CARE-14, CARE-15, and CARE-16 (RTC, p. 5). The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required.

Re: Appeal to City Council of Planning Commission Approval of the 5355 East Airport Drive Project (File No. PDEV22-017; SCH No. 2022090006)

Dear Mayor Leon, Mayor pro tem Porada, City Council Members, Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit this appeal to the City Council of the Planning Commission's ("Commission") August 27, 2024 approvals of the 5355 East Airport Drive Project (File No. PDEV22-017; SCH No. 2022090006) ("Project"), proposed by Prologis Inc. ("Applicant").

The scope of the Commission's determination for File No. PDEV22-017 includes certification of a Final Environmental Impact Report (State Clearinghouse No. 202209006) ("FEIR"), including the adoption of a Mitigation Monitoring and Reporting Program and a Statement of Overriding Considerations, in conjunction with approval of a Development Plan to construct a 270,337-square-foot industrial building on 13.08 acres of land located at 5355 East Airport Drive, and related findings.

CARECA-1

CARE CA submitted comments on the Project's Draft EIR ("DEIR") on October 5, 2023 during the public review period required by Section 15087 of the California Environmental Quality Act ("CEQA") Guidelines.[1] CARE CA's comments on the DEIR demonstrated that the DEIR failed to comply with CEQA by failing to accurately disclose potentially significant health risk, air quality, GHG, energy, and soil contamination impacts, failing to support its significance findings with substantial evidence, and failing to mitigate the Project's significant impacts to the greatest extent feasible, in violation of CEQA.

The City subsequently prepared the FEIR, which the City claims fully resolves the issues identified in CARE CA's comments and by other commenters. But CARE CA submitted comments demonstrating that the FEIR fails to meet CEQA's requirements. Staff reports prepared for the Planning Commission erroneously claim that that the FEIR has adequately addressed CARE CA's comments. This is incorrect. The staff reports mainly reiterate the flawed reasoning and conclusions of the FEIR. As such, although the City has prepared several documents which purport to respond to CARE CA's comments, the City has not resolved the issues raised in CARE CA's comments and the FEIR remains in violation of CEQA. The Planning Commission's approval of the Project and certification of the FEIR violated CEQA and land use laws because the City has not complied with its duty to disclose and mitigate the Project's potentially significant environmental and land use impacts, and the Planning Commission's approval findings were not supported by substantial evidence.

CARE CA hereby appeals all actions taken by the Commission with regard to the Project under File No. PDEV22-017. This appeal is timely filed in compliance with the Ontario Development Code.[2] The reasons for this appeal are set forth herein and in the attachments, which include CARE CA's comments on the DEIR,[3] FEIR,[4] and two letters to the Planning Commission responding to staff reports

CARECA-1 (CONT.)

[1] 14 Cal. Code Regs. §§ 15000 et seq.; *see* Cal. Pub. Res. Code §§ 21000 et seq.
[2] Section 2.04.010(B)(1).
[3] **Attachment A**: Letter from Adams Broadwell Joseph & Cardozo ("ABJC") to City re: Comments on the Draft Environmental Impact Report for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) (October 5, 2023).
[4] **Attachment B**: Letter from ABJC to City re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006) (April 15, 2024).

prepared for the Project.[5] We incorporate by reference the attached comments and exhibits, which are in the City's record of proceedings for the Project.[6]

The Commission abused its discretion and failed to proceed in the manner required by law by approving the Project in reliance on a deficient CEQA document and without substantial evidence to support the approval findings.[7] CARE CA respectfully requests that the City Council vacate the Commission's approval of the Project.

CARECA-1 (CONT.)

A. Standing to Appeal and Statement of Interest

Section 2.04.010(B)(1) of the Ontario Development Code provides that the decision of the Approving Authority may be appealed within 10 days of the action or decision. Because the Planning Commission approved the Project on August 27, the final day to submit an appeal is September 6. Thus, this appeal is timely filed.

Section 2.04.005 of the Code provides that "[a]ny person having legal standing, including but not limited to an applicant, resident, business owner, or any person owning real property within the City, that is aggrieved by an interpretation, action or decision made pursuant to this Development Code by any City agency or department, or by an Approving Authority, may appeal such action to the Appeal Authority in accordance with the provisions of this Division."

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County. CARE CA's comments on the DEIR, FEIR, to the Planning Commission, and this appeal, detail the specific issues over which CARE CA is aggrieved by the Planning Commission's decision.

CARECA-2

[5] **Attachment C**: Letter from ABJC to City Re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006) (May 28, 2024); **Attachment D**: Letter from ABJC to City Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006) (August 27, 2024).

[6] We reserve the right to supplement these comments at later hearings and proceedings on the Project. Gov. Code § 65009(b); PRC § 21177(a); *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal. App. 4th 1184, 1199-1203; *see Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109, 1121,

[7] Code Civ. Proc § 1094.5(b); *Topanga Assn. for a Scenic Community v. County of Los Angeles* (1974) 11 Cal.3d 506, 515.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

CARECA-2 (CONT.)

B. The Commission's Certification of the FEIR Was Contrary to Law and Unsupported by the Record

As summarized below, and demonstrated fully in the attached comments, the FEIR fails to adequately analyze and mitigate the project's potentially significant impacts.

The FEIR fails to analyze the full scope of the Project – CEQA requires that an EIR analyze the reasonably foreseeable consequences of the Project, but the Project's FEIR fails to analyze the Project's reasonably foreseeable use as a parcel hub (a use that generates 2.6 times more trips than analyzed). The City has argued that the Project is not envisioned as a parcel hub and its design would not support use as a parcel hub, but the Project plainly meets the description of a potential high cube parcel hub in Institute of Transportation Engineers ("ITE") land use code 156 (the Project would have adequate parking, square footage, and ceiling height). Any claim that the Project is not envisioned as a parcel hub is not supported by substantial evidence because the City has acknowledged that the Project is proposed as a speculative development and the user(s) of the building is not known at this time. Thus, the FEIR must be revised to analyze the heightened environmental impacts from the Project's potential use as a parcel hub.

CARECA-3

Similarly, the FEIR fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach, which are longer than the trips analyzed in the FEIR. Longer truck trips are associated with greater emissions of criteria air pollutants and GHG emissions. CARE CA presented numerous comment letters from the South Coast Air Quality Management District ("SCAQMD") recommending that warehouses just like this one analyze trips to the Ports, and presented studies showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario.

CARECA-4

The FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines. CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[8] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[9] Here, the FEIR fails to analyze the feasibility and effectiveness of measures including onsite solar facilities, electric vehicle charging, and others discussed in CARE CA's comments. The City maintains that discussion of energy consumption measures is not required for this Project because its energy impacts are less than significant, but makes the same error as the lead agency in *CCEC* because the EIR in that case also identified a less-than-significant energy impact.[10]

CARECA-5

The FEIR's analysis of cumulative air quality impacts is inadequate because it fails to consider the Project's impacts in the context of the numerous other warehouses existing and planned in the area. The City's approach to cumulative impacts, relying on SCAQMD guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable. CARE CA's comments demonstrated that this approach fails to meet CEQA's standards in light of the controlling caselaw,[11] the Attorney General's recent litigation on this issue in *People of the State of California v. City of Fontana*,[12] and pending updates to the SCAQMD significance thresholds for cumulative impacts in response to this litigation. At no point have the City's responses meaningfully addressed the caselaw proscribing the City's invalid approach to cumulative impacts. The responses primarily reiterate that the City is complying with current SCAQMD guidance (as opposed to the pending updates to

CARECA-6

[12] San Bernardino Superior Court, Case No. CIVSB2121829; SCAQMD Working Group Meeting # 4, Cumulative Impacts from Air Toxics for CEQA Projects (June 6, 2023) pg. 6;

the guidance). The FEIR must be revised to include a legally adequate discussion of cumulative impacts.

CARECA-6 (CONT.)

Regarding the Project's individual health risk impacts, CARE CA's air quality expert presented substantial evidence demonstrating that the FEIR's quantified health risk analysis underestimates impacts. For example, the HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. CARE CA's air quality expert also demonstrated that the HRA failed to account for building downwash and relied on unreliable input values. The City has not revised its HRA to address these flaws and others identified in Dr. Clark's comments.

CARECA-7

Regarding hazards, the FEIR identifies significant vapor intrusion impacts due to PCE contamination, but improperly defers formulation of mitigation measures. The FEIR fails to specify whether passive/engineered vapor intrusion mitigation may be employed as opposed to removal of all impacted soil, does not quantify the impacts associated with each form of mitigation (e.g. construction impacts associated with excavation, removal and backfilling contaminated soil versus impacts of installing vapor intrusion barriers), and does not commit the City or the Applicant to specific binding mitigation. The body of the FEIR also fails to disclose potentially significant impacts resulting from ethylbenzene concentrations in excess of the commercial/industrial screening level of 163 micrograms per cubic meter.

CARECA-8

As a result of these issues and others raised in CARE CA's prior comments, the FEIR is deficient as a matter of law and its conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR. As such, the Commission's certification of the FEIR was contrary to law and unsupported by the record. The Planning Commission's approval decision must be vacated, and the EIR must be revised and recirculated in compliance with CEQA.

CARECA-9

C. The Commission's Approval of the Development Plan Was Contrary to Law and Unsupported by the Record

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the

CARECA-10

minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[13]

The Project would have a significant and unavoidable VMT impact. And the Project has potentially health risk, air quality, GHG, energy, and soil contamination impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City lacked substantial evidence to make the requisite findings to approve the Project. A revised EIR must be recirculated before the Project can be approved.

CARECA-10 (CONT.)

D. CONCLUSION

CARE CA respectfully requests that the City set a hearing on this appeal, and that the City Council uphold this appeal, vacate the Planning Commission's approval of the Project, and direct staff to revise and recirculate the EIR to comply with CEQA before the Project can be reconsidered for approval.

CARECA-11

Sincerely,

Aidan P. Marshall

Re: Comments on the Draft Environmental Impact Report for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017)

Dear Mr. Grahn and Mr. Zeledon:

We are writing on behalf of Californians Allied for a Responsible Economy ("CARE CA") to provide comments on the Draft Environmental Impact Report ("DEIR") prepared by the City of Ontario ("City") for 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant").

The Project site is located on 13.08 acres at 5355 East Airport Drive in the City of Ontario, in San Bernardino County, California (Assessor Parcel Numbers: 0238-052-29 and 0238- 052-20). The Project proposes to demolish all existing on-site structures and redevelop the site as a warehouse distribution facility with approximately 270,337 square feet (sf") of building area and 54 south-facing loading dock doors. Of the total building square footage, the Project design allocates 255,337 sf for ground floor space and 15,000 sf for mezzanine space. Development of the Project site would require demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The proposed building would be a one-story, 49-foot-tall speculative warehouse/distribution facility with ancillary office space.

CARECA-12 (CONT.)

The Project design includes surface parking with 251 parking spaces including 126 standard automobile parking stalls, 7 accessible parking stalls, 25 electric vehicle parking stalls, 93 additional standard stalls within the truck court, and 48 truck trailer parking spaces.

Based on our review of the DEIR and supporting documentation, we conclude that the DEIR fails to comply with the requirements of the California Environmental Quality Act ("CEQA")[1]. The DEIR fails to adequately analyze the Project's cumulative impacts in light of the community's existing pollution burden resulting from similar warehouse projects, and fails to propose feasible and enforceable mitigation measures to reduce those impacts to a less than significant level, as required by CEQA. The DEIR also underestimates potentially significant air quality, greenhouse gas ("GHG"), and energy impacts by failing to concretely describe the Project – which may have significantly greater cold storage uses, transport refrigeration units ("TRUs"), and backup generators than disclosed in the DEIR. The DEIR also impermissibly fails to identify specific and effective mitigation to reduce the Project's significant Vehicle Miles Traveled ("VMT") impact to the greatest extent feasible before declaring the impact significant and unavoidable.[2] The DEIR's transportation analysis also underestimates VMT and resultant GHG emissions. We reviewed the DEIR and its technical appendices with the assistance of transportation expert Norm Marshall.[3] We reserve the right to supplement these comments at a later date, and at any later proceedings related to this Project.[4]

CARECA-12 (CONT.)

As explained in these comments, the DEIR lacks substantial evidence to support its conclusions with regard to the Projects' impacts relating to air quality, health risks, greenhouse gases, energy, and transportation. The City may not approve the Project until the City revises and recirculates the Project's DEIR to adequately analyze the Project's significant direct, indirect and cumulative impacts, and incorporates all feasible mitigation measures to avoid or minimize these impacts to the greatest extent feasible.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Fontana and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

CARECA-12 (CONT.)

II. LEGAL BACKGROUND

CEQA requires public agencies to analyze the potential environmental impacts of their proposed actions in an EIR.[5] "The foremost principle under CEQA is that the Legislature intended the act to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language."[6]

[5] PRC § 21100.
[6] *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal ("Laurel Heights I")* (1988) 47 Cal.3d 376, 390 (internal quotations omitted).
6752-004j

CEQA has two primary purposes. First, CEQA is designed to inform decisionmakers and the public about the potential significant environmental effects of a project.[7] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'"[8] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return."[9] As the CEQA Guidelines explain, "[t]he EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected."[10]

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring consideration of environmentally superior alternatives and adoption of all feasible mitigation measures.[11] The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced."[12] If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[13]

While courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."[14] As the courts have explained, a

6752-004j

prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process."[15] "The ultimate inquiry, as case law and the CEQA guidelines make clear, is whether the EIR includes enough detail 'to enable who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'"[16]

III. THE PROJECT DESCRIPTION IS INADEQUATE

The DEIR does not meet CEQA's requirements because it fails to include an accurate and complete Project description, rendering the entire analysis inadequate. California courts have repeatedly held that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[17] CEQA requires that a project be described with enough particularity that its impacts can be assessed.[18] Without a complete project description, the environmental analysis under CEQA is impermissibly limited, thus minimizing the project's impacts and undermining meaningful public review.[19] Accordingly, a lead agency may not hide behind its failure to obtain a complete and accurate project description.[20]

CEQA Guidelines section 15378 defines "project" to mean "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[21] "The term "project" refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term project does not mean each separate governmental approval."[22]

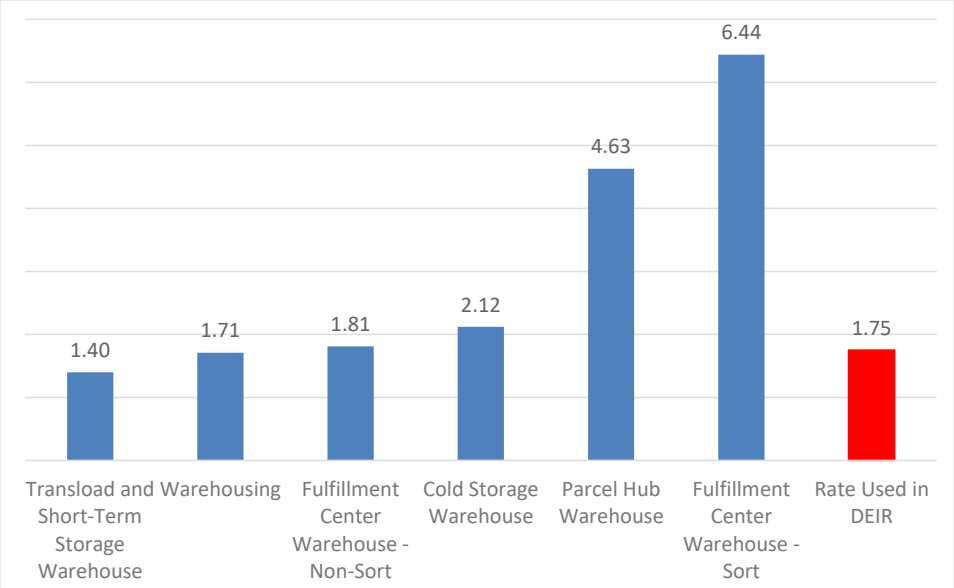
[22] *Id.*, § 15378(c).
6752-004j

Courts have explained that a complete description of a project must "address not only the immediate environmental consequences of going forward with the project, but also all "*reasonably foreseeable* consequence[s] of the initial project."[23] "If a[n]…EIR…does not adequately apprise all interested parties of the true scope of the project for intelligent weighing of the environmental consequences of the project, informed decisionmaking cannot occur under CEQA and the final EIR is inadequate as a matter of law."[24]



A. The DEIR Fails to Describe the Project's End Uses with Sufficient Particularity to Adequately Evaluate Trips Generated by the Project

CARECA-12 (CONT.)

The DEIR assumes that the Project would include approximately 27,034 sf of high-cube cold storage uses (10% of the building space), with remaining portions of the building consisting of warehouse uses.[25] The DEIR explains that the Project's end users are unknown.[26] In order to develop the traffic characteristics of the proposed Project, trip-generation statistics published in the Institute of Transportation Engineers ("ITE") Trip Generation Manual for the proposed Project's land uses was utilized.[27] For purposes of the trip generation assessment, the DEIR used ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse). Transportation expert Norm Marshall explains that these land use codes are just one of many land use codes potentially applicable to the Project.[28] The figure below shows other warehousing land use codes and compares trips generated by each land use.

[23] *Laurel Heights I,* 47 Cal. 3d 376, 398 (emphasis added); *see also Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 449-50.

[26] DEIR, pg. 4.7-17.
[27] DEIR, pg. 4.10-5.
[28] Marshall Comments, pg. 4.
6752-004j

Figure 1: Trip Generation Rates for Different Warehouse Categories (Trips Per 1000 Square Feet per Day)[29]

CARECA-12 (CONT.)

The DEIR fails to address why the other land use codes shown above are inapplicable to the Project. And the DEIR fails to provide sufficient information about the Project's expected uses and configuration for the public and decisionmakers to ascertain which of these end uses are possible for the Project. This informational defect affects the entire DEIR, as different types of warehousing have different environmental impacts.

Mr. Marshall explains that the land use code selected by the DEIR may drastically underestimate the Project's GHG and VMT impacts. Specifically, the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[30] A greater number of trips generated results in greater traffic impacts and greater emissions of GHGs. Given the large uncertainty in the trips generated by the Project, the DEIR fails to meet CEQA's requirement that a project be

[29] Marshall Comments, pg. 5.
[30] *Id.*

described with enough particularity that its impacts can be assessed.[31] Mr. Marshall recommends two approaches to resolve this issue: either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.[32] The City should revise and recirculate the DEIR to correct these deficiencies and to present a revised trip generation analysis which reflects reasonably foreseeable conditions at the Project site, or condition Project approval on the limitations assumed in the DEIR.

B. The DEIR Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

The DEIR assumes, without support, that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space), with remaining portions of the building consisting of warehouse uses.[33] The DEIR states that a limitation of 10% of the building for potential cold storage is based on the Project Applicant's understanding of the cold storage market demand.[34] However, this assumption, even if based on a reasonable interpretation of current market conditions, is subject to fluctuate during the life of the Project and is not otherwise reflected in any enforceable conditions related to Project use.

CARECA-12 (CONT.)

In order for the City to rely on the Applicant's 10% cold storage assumption in the CEQA document, the DEIR would need to include binding measures or conditions which limit warehouse use at the Project to no more than 10% cold storage. Absent such a restriction, the DEIR may substantially estimate the air quality, public health, and energy impacts of cold storage use at the Project site.

Cold storage warehouse generates greater environmental impacts than a high cube warehouse. Cold storage generates more trips per square foot and has higher energy impacts due to the low temperatures required by the facility's transport refrigeration units ("TRUs") and on-site storage. TRUs are refrigeration systems powered by integral diesel engines.[35] The refrigeration systems are used to control the environment of temperature-sensitive products transported in insulated

[34] *Id.*
[35] California Air Resources Board, 2022 TRU Technology Assessment, pg. 1, https://ww2.arb.ca.gov/sites/default/files/2022-10/CARB%202022%20TRU%20Technology%20Assessment%2010-14-22.pdf.
6752-004j

trucks, trailers, shipping containers, or railcars. The California Air Resources Board ("CARB") states that TRUs emit diesel particulate matter ("DPM"), fine particulate matter ("PM2.5"), oxides of nitrogen ("NOx"), and GHGs while in transit and during stationary operation at refrigerated warehouses or distribution centers, grocery stores, seaport facilities, intermodal railyards, and other locations of operation. CARB explains that communities near facilities where TRUs operate bear a disproportionate health burden:

> PM2.5 pollution contributes to more fatalities than other air pollutants and can lodge deep in the lungs or pass through the lungs to enter the blood stream and affect the heart, brain, and other organs. Adverse health effects from long-term exposure to PM2.5 pollution include increased risk of heart attacks and heart disease, impaired lung development in children, the development and exacerbation of asthma, and premature death. NOx is a precursor to ozone, which can cause irritation and damage lung tissue, worsen asthma and chronic illnesses including obstructive pulmonary disease and reduce lung function.[36]

CARB also explains that TRUs' emissions of GHGs contribute towards climate change,[37] and that TRUs generate noise impacts: "TRU operations produce noise that can be problematic when deliveries that often occur late evening or early morning are near residential neighborhoods, hotels, hospitals, and elder care facilities… One study conducted by LSA Associates found that a diesel-powered TRU operating at high idle produces an A-weighted decibel (dBA) noise rating of 104 dBA, while a diesel truck at idle produces a noise rating of 96 dBA."[38]

By assuming the Project will only include 10% cold storage, the DEIR may drastically underestimate the Project's impacts in each of these areas. The DEIR does not provide supporting evidence demonstrating that cold storage uses would be limited to 10% of the Project site for the duration of the Project's life. Due to ever-increasing population and market demands in Southern California, it is also reasonably foreseeable that the Project may attract end users, either now or in future years of the Project's life, which require more than 10% cold storage. As a result, the DEIR's assumption is not supported by substantial evidence.

CARECA-12
(CONT.)

[36] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[37] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[38] California Air Resources Board, 2022 TRU Technology Assessment, pg. 17-18.
6752-004j

In the California Attorney General's ("AG") guidance for warehouse projects, the AG recommends that, unless a developer adopts mitigation measures limiting cold storage impacts, the developer should record a covenant on the title of the underlying property to ensuring that the property cannot be used to provide refrigerated warehouse space.[39] The City should include such a title restriction for the Project unless the DEIR's 10% cold storage assumption is revised to analyze and mitigate impacts associated with a more conservative and fact-based cold-storage use percentage.

C. The Project Description Fails to Include Reasonably Foreseeable Backup Generators

The DEIR fails to disclose potential backup/emergency stationary generators for the Project's operations. The DEIR's project description does not address whether backup generators are a reasonably foreseeable component of the Project, and the DEIR's technical analyses assume no backup generators will be installed for operations. The DEIR does not disclose any conditions or mitigation measures that limit or prevent use of backup generators. Thus, the DEIR must disclose and analyze the potential use of backup generators because (1) they a reasonably foreseeable consequence of the Project, and (2) the use of backup generators will expand the Project's environmental effects.[40]

In *East Oakland Stadium Alliance v. City of Oakland*,[41] the Court of Appeal upheld an EIR's analysis of emissions from backup generators. The EIR's analysis assumed that generators would operate for 50 hours of testing and maintenance annually, while allocating no time for actual emergency use. In discussing the lead agency's duty to analyze backup generator emissions, the Court stated that "if the annual need for emergency generator use is reasonably foreseeable, the EIR was not entitled to disregard such use merely because it would occur at unpredictable times."[42] The Court explained that use of a generator was reasonably foreseeable because, "[a]s noted in the EIR, some parts of the Bay Area are subject to

predictable, sustained power outages undertaken to reduce the risk of fire."[43] Thus, "[t]he EIR was required to make neither a generally applicable nor a worst-case assumption; rather it was required to make a reasonable estimate of likely annual use of the generators at the project site."[44]

Here, as in *East Oakland Stadium Alliance*, back-up generators are a reasonably foreseeable consequence of the Project due to increasingly common Public Safety Power Shutoff ("PSPS") events and extreme heat events. Extreme heat events ("EHE") are defined as periods where in the temperatures throughout California exceed 100 degrees Fahrenheit.[45] From January 2019 through December 2019, Southern California Edison reported 158 of their circuits underwent a PSP event.[46] In Los Angeles County, two circuits had 4 PSPS events during that period, lasting an average of 35 to 38 hours. The total duration of the PSPS events lasted between 141 hours to 154 hours in 2019. According to the California Public Utilities Commission (CPUC) de-energization report[47] in October 2019, there were almost 806 PSPS events that impacted almost 973,000 customers (~7.5% of households in California) of which ~854,000 of them were residential customers. The California Air Resources Board estimates that with 973,000 customers impacted by PSPS events in October 2019, approximately 125,000 back-up generators were used by customers to provide electricity during power outage.[48] The widespread use of back-up generators to adapt to PSPS and EHE events suggests that back-up generators are a reasonably foreseeable consequence of the Project.

CARECA-12 (CONT.)

Further demonstrating that backup generators are reasonably foreseeable is that the DEIR assumes that 10% of the building (27,034 sf) would be cold storage.[49] A cold storage warehouse has the ability to keep temperature sensitive items in a

6752-004j

temperature-controlled environment, which requires a constant energy supply to power refrigeration. Cold storage warehouses thus commonly utilize backup generators.[50] Backup generators commonly rely on fuels such as natural gas or diesel,[51] and thus can significantly impact air quality, GHG emissions, and public health through toxic DPM emissions.[52] Since the Project may include cold storage, it is reasonably foreseeable that the Project would require on-site backup generators.

CARECA-12 (CONT.)

Generators can emit criteria air pollutants, greenhouse gases, and toxic air contaminants ("TACs"). Backup generators commonly rely on fuels such as natural gas or diesel,[53] and thus can significantly impact public health through DPM

Diesel particulate matter (DPM) has been identified as a toxic air contaminant, composed of carbon particles and numerous organic compounds, including over forty known cancer-causing organic substances. The majority of DPM is small enough to be inhaled deep into the lungs and make them more susceptible to injury. Much of the back-up power produced during PSPS events is expected to come from engines regulated by CARB and California's 35 air pollution control and air quality management districts (air districts)").

[53] SCAQMD, Fact Sheet on Emergency Backup Generators, http://www.aqmd.gov/home/permits/emergency-generators ("Most of the existing emergency backup generators use diesel as fuel").

emissions.[54] Diesel back-up generators emit significant amounts of Nitrogen Oxides ("NOx"), sulfur dioxides ("SO2"), particulate matter ("PM10"), carbon dioxide ("CO2"), carbon monoxide ("CO"), and volatile organic compounds ("VOC").[55] Omission of a generator system results in an underestimation of the Project's air quality, greenhouse gas, and health risk impacts.

In sum, omission of the Project's generator results in an underestimation of the Project's air quality, greenhouse gas, energy, and health risk impacts. The DEIR must be revised to resolve this project description inconsistency and correct the affected impacts analyses to accurately disclose the Project's potentially significant impacts.

CARECA-12 (CONT.)

IV. THE DEIR FAILS TO DISCLOSE, ANALYZE AND MITIGATE POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a Project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact

[54] California Air Resources Board, Emission Impact: Additional Generator Usage Associated with Power Outage (January 30, 2020), available at https://ww2.arb.ca.gov/resources/documents/emissions-impact-generator-usage-during-psps (showing that generators commonly rely on gasoline or diesel, and that use of generators during power outages results in excess emissions); California Air Resources Board, Use of Back-up Engines for Electricity Generation During Public Safety Power Shutoff Events (October 25, 2019), available at https://ww2.arb.ca.gov/resources/documents/use-back-engines-electricity-generation-during-public-safety-power-shutoff ("When electric utilities de-energize their electric lines, the demand for back-up power increases. 6752-004j

must be supported by accurate scientific and factual data.[56] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[57]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by CEQA.[58] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[59] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[60]

Additionally, CEQA requires agencies to commit to all feasible mitigation measures to reduce significant environmental impacts.[61] In particular, the lead agency may not make required CEQA findings, including finding that a project impact is significant and unavoidable, unless the administrative record demonstrates that it has adopted all feasible mitigation to reduce significant environmental impacts to the greatest extent feasible.[62]

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[63]

A. The DEIR Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

An EIR must evaluate a cumulative impact if the project's incremental effect combined with the effects of other projects is "cumulatively considerable."[64] This determination is based on an assessment of the project's incremental impacts "viewed in connection with the effects of past project, the effects of other current projects, and the effects of probable future projects."[65] Proper cumulative impact analysis is vital because "the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant when considered individually, but assume threatening dimensions when considered collectively with other sources with which they interact."[66]

1. The DEIR Fails to Provide a List of Cumulative Projects

CARECA-12 (CONT.)

The CEQA Guidelines set forth two methods for satisfying the cumulative impacts analysis requirement: the list of projects approach and the summary of projections approach.[67] Under the former, an adequate discussion of cumulative impacts requires "a list of past, present, and probable future projects producing related or cumulative impacts…"[68] Relevant factors when compiling a list of related projects include the environmental resource being examined and the location and type of the project.[69] The Guidelines expressly recognize that project type may be important "when the impact is specialized, such as a particular air pollutant or mode of traffic."[70]

Here, the DEIR states that it uses a combination of the two methods as appropriate for each impact analysis:

> The summary of projections approach is used in this EIR, except for the evaluation of cumulative transportation effects (for purposes of demonstrating General Plan policy compliance) and vehicular-related air

[64] CEQA Guidelines § 15130(a).

[68] *Id.*, § 15130(b)(1)(A).
[69] *Id.*, § 15130(b)(2).
[70] *Id.*

quality, greenhouse gas, and noise impacts, for which the analysis combines the summary of projections approach with the manual addition of past, present, and reasonably foreseeable projects ("combined approach"). The City determined the combined approach to be appropriate because long-range planning documents contain a sufficient amount of information to enable an analysis of cumulative effect for all subject areas, with the exception of transportation (and vehicular-related air quality, greenhouse gas, and noise effects), which requires a greater level of detailed study.[71]

However, the DEIR fails to provide a list of cumulative projects. And the appendices containing the air quality, greenhouse gas, and noise analyses do not consider past, present, and reasonably foreseeable projects. The air quality, greenhouse gas, and noise analyses should be revised to include consideration of cumulative projects, as recommended by the DEIR itself.

2. The DEIR's Cumulative Air Emissions Analysis Does Not Comply with CEQA or Attorney General Warehouse Guidance

CARECA-12 (CONT.)

The DEIR fails to adequately analyze the Project's cumulative air quality emissions. The DEIR asserts that, under South Coast Air Quality Management District ("SCAQMD") guidance, any exceedance of a regional or localized threshold for criteria pollutants also is considered to be a cumulatively-considerable effect, while air pollutant emissions that fall below applicable regional and/or localized thresholds are not considered cumulatively-considerable.[72]

The DEIR fails to note that SCAQMD's approach is outdated, as evidenced by its ongoing process to update its cumulative impacts guidance.[73] The DEIR's approach has been also rejected by the courts for failing to comply with CEQA's requirement that a project mitigate impacts that are "cumulatively considerable."[74] The City's failure to actually examine the Project's cumulative air quality impacts violates CEQA's requirement to analyze cumulative impacts.

[71] DEIR, pg. 4-2.
[72] DEIR, Appendix B, pg. 53.
[73] See e.g., http://www.aqmd.gov/docs/default-source/ceqa/documents/wgm-3_20230124.pdf?sfvrsn=6.
[74] PRC § 21083(b)(2); 14 CCR § 15130; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692, 719-21.
6752-004j

The leading case on this issue is *Kings County Farm Bureau v. City of Hanford*.[75] In *Kings County*, the city prepared an EIR for a 26.4-megawatt coal-fired cogeneration plant. Notwithstanding the fact that the EIR found that the project region was out of attainment for PM_{10} and ozone, the city failed to incorporate mitigation for the project's cumulative air quality impacts from project emissions because it concluded that the Project would contribute "less than one percent of area emissions for all criteria pollutants."[76] The city reasoned that, because the project's air emissions were small in ratio to existing air quality problems, that this necessarily rendered the project's "incremental contribution" minimal under CEQA. The court rejected this approach, finding it "contrary to the intent of CEQA." The court stated:

> We find the analysis used in the EIR and urged by GWF avoids analyzing the severity of the problem and allows the approval of projects which, when taken in isolation, appear insignificant, but when viewed together, appear startling. Under GWF's "ratio" theory, the greater the over-all problem, the less significance a project has in a cumulative impacts analysis. We conclude the standard for a cumulative impacts analysis is defined by the use of the term "collectively significant" in Guidelines section 15355 and the analysis must assess the collective or combined effect of energy development. The EIR improperly focused upon the individual project's relative effects and omitted facts relevant to an analysis of the collective effect this and other sources will have upon air quality.[77]

CARECA-12 (CONT.)

The DEIR's analysis is similarly flawed because while the DEIR admits that the Project region is out of attainment for ozone, PM_{10}, and $PM_{2.5}$, the City fails to analyze or mitigate the Project's emissions' cumulative air quality impacts.[78] Given that there are multiple existing large warehouses immediately adjacent to the proposed Project site,[79] as well as the proliferation of warehouse projects in the region and San Bernardino County, the DEIR is inadequate in its analysis of the Project's potentially significant cumulative air quality impacts.

[75] *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 692 ("Kings County"); *see also, Friends of Oroville v. City of Oroville* (2013) 219 Cal. App. 4th 832, 841-42.
[76] *Id.* at 719.
[77] *Id.* at 721.
[78] DEIR, pg. 5.2-17.
[79] DEIR, pg. 2-4, Figure 2-1.
6752-004j

The SCAQMD approach used in the DEIR also directly conflicts with the AG recent guidance document setting forth best practices for evaluating the environmental impacts of warehouse projects like this one under CEQA.[80] With respect to cumulative air quality and GHG emissions analysis, the Attorney General's guidance states that best practices include "[w]hen analyzing cumulative impacts, thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[81]

The DEIR's cumulative air quality impacts analysis does not comply with CEQA. The City must prepare a revised EIR that properly evaluates and mitigates such impacts.

3. The DEIR's Health Risk Analysis Fails to Consider the Health Impacts of Cumulative Emissions from Nearby Warehouses

CARECA-12 (CONT.)

The DEIR's analysis of cumulative health risks is flawed for the same reason as the air quality analysis. The DEIR points to guidance from SCAQMD to reason that emissions of TACs are considered significant if a quantified health risk analysis ("HRA") shows an increased risk of greater than 10 in 1 million.[82] And the DEIR provides that Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable, and vice versa.[83] This approach is inadequate because it fails to analyze the Project's cumulative effects with the existing and proposed warehouses surrounding the Project site.

CEQA provides that the incremental effects of an individual project are cumulatively considerable if the effects are significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."[84] Courts have held that where a community already

[80] *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act* (Updated September 2022), available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf .
[81] *Id.*, pg. 7.
[82] DEIR, Appendix B2, pg. 5.
[83] *Id.*
[84] CEQA requires a lead agency consider whether the combined effects from both the proposed project and other projects would be "cumulatively considerable." (CEQA Guidelines, § 15130, subd. (a).) The incremental effects of an individual project are cumulatively considerable if the effects are
6752-004j

bears a high pollution burden, a lead agency must consider "whether any additional amount" of pollution caused by the project "should be considered significant in light of the serious nature" of the existing problem.[85]

Here, the DEIR's approach of using a project-level analysis as a substitute for a cumulative impacts analysis fails to address that the Project would be impacting a community already bearing a high pollution burden. The DEIR's CalEEMod output sheets show the community' pollution burden as scoring 91.1 in AQ-Ozone, 95.7 in AQ-PM, and 96.6 in AQ-DPM.[86] A high score reflects a higher pollution burden compared to other census tracts in the state, with a maximum CalEnviroScreen score of 100.[87] Despite this high pollution burden, the DEIR concludes that the Project would not contribute to cumulative impacts because its own impacts would result in an increased risk of less than 10 in 1 million. This analysis violates principles of *Kings County Farm Bureau v. City of Hanford* and guidance from Attorney General. The City must revise and recirculate a DEIR that analyzes the Project's potentially significant cumulative health risk impacts.

CARECA-12 (CONT.)

B. The DEIR's Quantified Health Risk Analysis Underestimates Operational Mobile Source Impacts

The DEIR includes an HRA addressing the Project's construction and operational impacts. The operational HRA is flawed because it omits analysis of TRUs.[88]

As explained above, TRUs emit DPM, PM2.5, NOx, and GHGs while in transit and during stationary operation at refrigerated warehouses or distribution centers, grocery stores, seaport facilities, intermodal railyards, and other locations of operation.[89] CARB explains that communities near facilities where TRUs operate bear a disproportionate health burden:

significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." (Id., §§ 15065, subd. (a)(3), 15355, subd. (b).)
[85] *Kings County Farm Bureau*, *supra*, 221 Cal.App.3d at 718; *San Joaquin Raptor/Wildlife Rescue Ctr. v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 720.

6752-004j

> PM2.5 pollution contributes to more fatalities than other air pollutants and can lodge deep in the lungs or pass through the lungs to enter the blood stream and affect the heart, brain, and other organs. Adverse health effects from long-term exposure to PM2.5 pollution include increased risk of heart attacks and heart disease, impaired lung development in children, the development and exacerbation of asthma, and premature death. NOx is a precursor to ozone, which can cause irritation and damage lung tissue, worsen asthma and chronic illnesses including obstructive pulmonary disease and reduce lung function.[90]

Thus, the omission of TRUs in the DEIR's HRA results in an underestimate of the Project's health risk impacts. The DEIR's significance findings are thus not supported by substantial evidence. The DEIR must be revised to adequately disclose the health risk impacts from TRUs.

C. The DEIR Underestimates Project VMT and Mobile Source GHGs

Transportation expert Norm Marshall explains that the DEIR potentially underestimates average trip lengths for both trucks and passenger vehicles.[91] Longer trip lengths results in greater impacts (including air quality, GHGs, and VMT). As a result, the analyses that rely on these trip lengths lack the support of substantial evidence. The DEIR air quality analysis relies on the follow trip lengths:

> To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.[92]

The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explains that SCAQMD does not make a recommendation that these trip distances be used for warehouse project EIRs.[93] Rather, the AG's guidance document for warehouse projects states:

CARECA-12 (CONT.)

[90] California Air Resources Board, 2022 TRU Technology Assessment, pg. 10.
[91] Marshall Comments, pp. 6-7.
[92] DEIR, Appendix B1, pg. 37.
[93] Marshall Comments, pg. 6-7.
6752-004j

> CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur.[94]

In contrast to the approach recommended by the AG, the DEIR's estimated trip distances did not account for the Project's likely trip destinations. Mr. Marshall explains that, while it may be too early to determine specific truck trip origins and destinations, it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR.[95] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The DEIR's analysis thus likely underestimates trip distances.

The DEIR also underestimates lengths of passenger trips generated by the Project. Mr. Marshall observes that CalEEMod trip lengths were used for passenger trips.[96] But in the DEIR's VMT analysis, the DEIR acknowledges that the Project's VMT per service population, i.e., the VMT per worker, is significantly higher than the average for the City of Ontario, and therefore, also significantly higher than the regional average.[97] Mr. Marshall explains that the average auto trip lengths should be increased from the default values to account for the VMT-inefficient project location. Thus, the DEIR's analysis lacks the support of substantial evidence, and must be revised.

CARECA-12 (CONT.)

D. The DEIR Fails to Identify All Feasible VMT Mitigation Measures

The DEIR concludes that the Project would result in a significant and unavoidable VMT impact despite mitigation included in the DEIR. Specifically, the DEIR estimates that the Project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.[98] The DEIR identifies the following mitigation for this significant impact:

[94] Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act (Updated September 2022), pg. 7.
[95] Marshall Comments, pg. 7.
[96] *Id.*; DEIR, Appendix F, pg. 56
[97] Marshall Comments, pg. 7.
[98] Marshall Comments, pg. 1.
6752-004j

> MM 4.10-1: Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours).[99]

This measure fails to meet CEQA's standards for mitigation. CEQA provides that if the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[100] Further, EIRs must mitigate significant impacts through measures that are "fully enforceable through permit conditions, agreements, or other legally binding instruments."[101] Deferring formulation of mitigation measures is generally impermissible.[102] If identification of specific mitigation measures is impractical until a later stage in the Project, specific performance criteria must be articulated and further approvals must be made contingent upon meeting these performance criteria.[103] Mitigation that does no more than allow approval by a county department without setting enforceable standards is inadequate.[104]

CARECA-12 (CONT.)

Here, the measure improperly defers identification of specific VMT-reducing mitigation measures to a future date. MM 4.10-1 does not commit to any particular measures to reduce VMT. Nor does the DEIR articulate specific performance criteria to ensure that impacts would be mitigated to the greatest extent feasible. Mr. Marshall notes that, while MM 4.10-1 lists potential measures to reduce VMT,

there is no clear commitment or description of the measures.[105] Mr. Marshall explains that the measures listed in MM 4.10-1 can be formulated in a variety of ways that determine the magnitude of VMT reductions.[106] MM 4.10-1 is thus improperly deferred mitigation that does no more than allow approval by a county department without setting enforceable standards.[107]

As a result of this improper deferral of mitigation, the DEIR also fails to comply with CEQA's requirement to reduce all significant effects on the environment to the greatest extent feasible. MM 4.10-1 must be revised to clearly require the all feasible VMT-reducing measures be adopted until the expected 28.47% excess VMT is mitigated.

V. CONCLUSION

For the reasons discussed above, the DEIR for the Project is inadequate under CEQA. It must be revised to provide legally adequate analysis of, and mitigation for, all of the Project's potentially significant impacts. These revisions will necessarily require that the DEIR be recirculated for additional public review. Until the DEIR has been revised and recirculated, as described herein, the City may not lawfully approve the Project.

Thank you for your consideration of these comments. Please include them in the record of proceedings for the Project.

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

I have reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I make the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

CARECA-12 (CONT.)

1

Significant and Unavoidable VMT impact

The DEIR states that the project would have a "Significant and Unavoidable [VMT] Impact." (DEIR, p. S-24)

DEIR Appendix J, "IE Distribution Center #14 Vehicle Miles Traveled (VMT) Analysis," evaluates the project relative to the City of Ontario's VMT screens and concludes:

- TPA [Transit Priority Area] screening criteria is not met.
- Low VMT Area screening criteria is not met.
- Project Type screening criteria is not met.

As the project fails these screens, a full VMT analysis was performed using the San Bernardino Transportation Analysis Model (SBTAM). The table below copied from DEIR Appendix J, p. 9 summarizes the results of this analysis.

TABLE 10: PROJECT COMPARISON TO CITY OF ONTARIO VMT THRESHOLD

	Baseline	Buildout Year
Impact Threshold	27.61	27.61
Project	33.84	35.47
Percent Change	+22.56%	+28.47%
Potentially Significant?	Yes	Yes

As shown in the reproduced table, the proposed project would exceed the City's VMT threshold by 22.56% in the baseline year and by an even larger 28.47% in the buildout year (2050).

The VMT Mitigation Described in the VMT is Inadequate

The City of Ontario's VMT Resolution adopted June 16, 2020, reiterates General Plan Mobility Element M1-2: **"Mitigation of impacts. We require development to mitigate its traffic impacts."**

In the case of the proposed project, full mitigation would reduce VMT to below the threshold, i.e., the 28.47% excess VMT in the horizon year would be eliminated. The EIR should quantify the expected VMT reduction from mitigation. Unless the reduction is sufficient to achieve the VMT threshold, the EIR should justify why greater mitigation is infeasible.

The VMT mitigation described in the DEIR is:

> **MM 4.10-1** Prior to the issuance of a certificate of occupancy, the building operator shall prepare and submit for approval to the City of Ontario Community Development Department a Transportation Demand Management Program (TDMP). The TDMP shall specify measures that the building operator will commit to implementing in an effort to reduce vehicle miles traveled for its on-site employees. The TDMP shall include provisions, incentives, and programs for employee ridesharing programs, carpools, vanpools, transit use, bike travel, avoidance of peak periods of traffic congestion, and on-site parking preferences for zero-emission vehicles, among other items that have reasonable potential of reducing employee reliance on single-occupant gas-powered vehicles during peak time travel periods (rush hours). (DEIR, p. S-24)

CARECA-12 (CONT.)

The above wording is ambiguous. Is this a commitment to include all the measures listed, or only to a subset of the measures. For the included measures, what are the magnitudes of the different incentives. Are the included measures voluntary or mandatory? Is monitoring included? What is the total VMT reduction from the package, and is this reduction sufficient to adequately address the expected 28.47% excess VMT in the horizon year? If the planned reduction is not achieved, what are the consequences?

The California Air Pollution Control Officers Association (CAPCOA) provides on quantifying VMT mitigation measures in its publication *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity: Designed for Local Governments, Communities, and Project Developers (Final Draft, December 2021)*. It states:

> The Handbook builds on CAPCOA's previous efforts to provide accurate and reliable quantification measures. In 2010, CAPCOA published *Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emissions Reductions from Greenhouse Gas Mitigation Measures* (hereafter referred to as the "2010 Handbook"). Since that time, climate science has evolved and GHG reduction practices have advanced in sophistication. New priorities have also arisen, such as strengthening climate resilience and infusing health and equity into integrated planning efforts. Therefore, CAPCOA decided it was time to develop an updated and expanded resource to provide the latest data and methods to quantify GHG emissions reductions, climate change vulnerability reductions, and equity improvements in a single resource: The Handbook. (p. 2-3)

The Handbook makes a critical distinction between voluntary and mandatory Commuter Trip Reduction ("CTR") programs:

T-5 Implement Commute Trip Reduction Program (Voluntary) – up to 4% VMT reduction:

> Voluntary CTR programs must include the following elements to apply the VMT reductions reported in literature. ▪ Employer-provided services, infrastructure, and incentives for alternative modes such as ridesharing (Measure T-8), discounted transit (Measure T-9), bicycling (Measure T-10), vanpool (Measure T-11), and guaranteed ride home. ▪ Information, coordination, and marketing for said services, infrastructure, and incentives (Measure T-7). (*Handbook*, p. 83)

T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

CARECA-12 (CONT.)

A 26% reduction at this site may be impossible given the relatively poor transit , bicycle and walk accessibility plus long commute distances that making walking and biking impractical. The DEIR states:

> Public transit service in the region is provided by Omnitrans, a public transit agency that serves various jurisdictions within San Bernardino County. There are no public transit routes that run adjacent to the Project Site under existing conditions. The nearest transit routes to the Project Site are Route 61 which has a stop located along Fourth Street, approximately 0.9 mile north of the Project Site and Route 82 which has a stop located at South Etiwanda and Jurupa Avenue, approximately 1.2 miles southeast of the Project Site. There are no existing bicycle facilities within the vicinity of the Project Site. The closest bike route to the Project Site is a Class III bike route located along Ontario Mills Parkway, approximately 0.4 mile north of the Project Site. There are no sidewalks on either side of East Airport Drive, with the exception of a small portion along the adjacent development frontage directly to the west at 5351 East Airport Drive. (DEIR, p. 2-11)

Furthermore, ridesharing and vanpooling would be complicated by a geographically dispersed workforce and likely multiple shifts.

Joining with other employers would be beneficial. The more employers that support these VMT reduction programs, the stronger these programs will be, and the regional benefit of participating may be greater than just the onsite VMT reductions. For example, a vanpool could include multiple employers IE Commuter, a program of the San Bernardino County Transportation Authority in partnership with the Riverside County Transportation Commission, offers a full range of services to help employers set up and manage VMT reduction programs.[1]

Achieving significant VMT mitigation for this project may be impossible – but mitigation must be fully specified and quantified for the project to be properly evaluated.

CARECA-12 (CONT.)

Project Trip Generation Could Be Much Higher Than Assumed

The project is comprised of a 270,377 square feet warehouse building. (DEIR, Appendix K, p. 1) The tenants have not been identified, and the nature of the operations are unknown at this time. For the purpose of estimating project trip generation, the DEIR assumes a mix of 90% warehousing and 10% high-cube cold storage. (DEIR, Appendix K, p. 1) This mix is highly speculative, and the project may not even include either of the assumed trip generation categories.

The DEIR estimates trip generation based on the rates in the Institute of Transportation Engineers ("ITE") *Trip Generation* manual. *Trip Generation* includes other categories of warehouses. As shown in the figure below, the trip generation rates applied in the DEIR are much lower than rates for some other warehouse categories.

[1] https://www.iecommufter.org/rp2/home/EmployerSupport

Trip Generation Rates for Different Warehouse Categories (Trips Per 1000 Square Feet per Day)

CARECA-12 (CONT.)

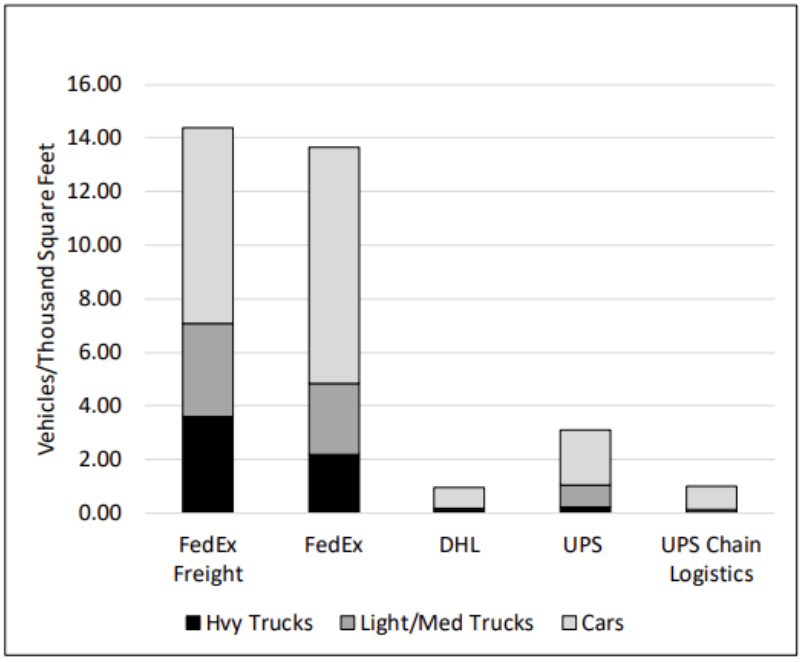
The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.



A 2019 study of warehouse trip generation done by WSP for the Western Riverside COG documented even higher trip generation rates.[2] This study was based on counts at 16 warehouses, segmented between 11 fulfillment centers and 5 parcel hubs.

The observed trip generation rates at two of the parcel hub sites are even higher than the rates shown in the figure above.. As shown in the figure below, the highest trip generation rates were observed at two of the parcel hubs, with rates of about 14 trips per 1000 square feet per day, i.e., 8 times the rate used in the DEIR.

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

Exhibit 11: Daily Trip Generation Rates at Parcel Hubs

CARECA-12 (CONT.)

Project VMT and GHG Emissions Could Be Much Higher Than Assumed

Any underestimate of trip generation translates into underestimated GHG emissions. It is likely that the DEIR also underestimates average trip lengths.

The DEIR air quality analysis (Appendix B1) states:

> To determine emissions from trucks for the proposed industrial uses, the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages. (DEIR, Appendix B1, p. 37)

The DEIR misstates that these truck trip distances are "recommended" by SCAQMD. The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[3] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any

[3] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf

use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[4] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

The Attorney General's September 2022 guidance: *Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act*[5] states:

> CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin, local jurisdiction, or other truncated endpoint. All air pollution associated with the project must be considered, regardless of where those impacts occur. (p. 7)

While it is too early to determine truck trip origins and destinations, it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The DEIR states that CalEEMod trip lengths were used for passenger trips:

> In order to determine emissions from passenger car vehicles, CalEEMod defaults for trip length and trip purpose were utilized. (DEIR, Appendix F, p. 56)

In the VMT analysis, the DEIR documents that the project's VMT per service population, i.e., the VMT per worker, is significantly higher than the average for the City of Ontario, and therefore, also significantly higher than the regional average. Therefore, the average auto trip lengths should be increased from the default values to account for the VMT-inefficient project location.

Underestimating truck and passenger vehicle VMT translates to underestimating GHG as well.

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

CARECA-12
(CONT.)

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

CARECA-12
(CONT.)

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Mr. Ochoa, Development Advisory Board Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant"), including the Final Environmental Impact Report ("FEIR") prepared by the City of Ontario ("City"). The FEIR and development plan will be considered at the April 15, 2024 Development Advisory Board meeting as Agenda Item B. The Board will make a recommendation to the Planning Commission regarding certification of the EIR and approval of the Development Plan application.[1]

CARE CA submitted comments on the Draft EIR ("DEIR") on October 5, 2023, accompanied by expert comments, showing that the DEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant cumulative impacts, air quality and public health impacts,

CARECA-12 (CONT.)

[1] Staff Report, pg. 1. The Staff Report incorrectly states that the Board recommendation to the Planning Commission is to "adopt the draft EIR." (pg. 8). However, the operative CEQA document for the Project is currently the FEIR, which includes both the Draft EIR and the City's responses to comments on the Draft EIR.

6752-007acp

greenhouse gas ("GHG") emissions, energy and transportation impacts. We reviewed the Board Staff Report, the FEIR, and its technical appendices with the assistance of transportation expert Norm Marshall[2] and air quality expert Dr. James Clark.[3] The FEIR contains responses to CARE CA's comments. However, it fails to meaningfully address or correct major flaws CARE CA and its experts identified in the DEIR.

As explained herein, the FEIR still underestimates the number of trips generated by the Project and the distance of Project-related truck trips, thus continuing to underestimate the severity of the Project's public health, air quality, GHG, and transportation impacts. The FEIR also continues to assume that cold storage uses would be limited to 10% of the Project, reasoning that a condition of approval will limit cold storage to 10% of the Project's square footage, but no such condition of approval is included in the conditions of approval attached to the Staff Report. The FEIR still fails to provide an adequate cumulative impacts analysis that considers the Project's combined impacts with other existing and proposed industrial developments near the Project, in violation of CEQA. And the FEIR's quantified health risk analysis still underestimates impacts. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

CARECA-12 (CONT.)

The Staff Report incorrectly concludes that the "draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[4] The Staff Report recommends that the Planning Commission adopt the draft EIR[5] and approve the Project's Development Plan Application.[6] These recommendations are unsupported due to the major flaws in the Project's environmental review.

CARE CA urges the Board to recommend that the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

[2] Mr. Marshall's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit B**.

certified WBENC

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

CARECA-12 (CONT.)

A. CARE CA Has a Direct Interest in Enforcing Compliance with CEQA and Land Use Laws

The City, in FEIR Response A-3, claims that CARE CA's "primary interest is securing jobs through a project labor agreement."[7] This statement is an improper ad hominem attack on members of the public who submitted comments on the Draft EIR. It is also incorrect, unsupported by any facts in the record, and contrary to the purpose of an FEIR's responses to comments, which is to "describe the disposition of each significant environmental issue that is raised by commenters,"[8] not to attack the commenter.

The FEIR's statement appears intended solely to influence City decisionmakers to disregard the valid environmental concerns raised in CARE CA's

[7] FEIR, pg. 2-37.
[8] Pub Res. Code §21091(d); 14 Cal Code Regs §§15088(c), 15132(d), 15204(a); *City of Long Beach v Los Angeles Unified Sch. Dist.* (2009) 176 Cal. App. 4th 889, 904.

printed on recycled paper

www.tbplanning.com

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

comments, and distract from the substantial evidence presented by CARE CA's experts regarding the Project's unmitigated environmental and public health impacts. This is an improper use of an FEIR, which is intended to ensure that "public participation in the environmental review process is meaningful."[9] It is also irrelevant, because community groups, labor organizations, and other members of the public have standing under CEQA to participate in the public comment period required by law, and California courts have explained that ad hominem responses are irrelevant.[10]

The FEIR's statement is also factually incorrect. For decades, labor organizations like the union members of CARE CA have relied on the CEQA process to enforce environmental and public health protections – *including worker health protections* – for new development projects as a means of ensuring a safe working and living environment for the public, including themselves and their families. CEQA is especially important to union members who construct projects because they are the first in line to be exposed to health and safety impacts that exist onsite – impacts like soil contamination, air pollution from construction equipment, and excess noise. For many, CEQA has become the only place where communities of color, which includes workers represented by labor unions, have a voice in the process of developing projects in their communities.

California unions regularly participate as interested members of the public in the CEQA process. Their participation has led to decades of stronger air quality and toxic material controls at construction sites and housing developments, lowered emissions at industrial sites, increased electrification and renewable gas and fuels, reductions in GHG emissions, reduced construction noise and traffic in residential areas, improved water quality, water conservation, and protections for natural landscapes and sensitive biological resources. Union participation in the CEQA process has resulted in improved analysis and mitigation in agencies' CEQA documents, and, in some cases, successful litigation requiring agencies to comply with CEQA where the issues unions raised were not resolved during the administrative process. In short, ***union participation in the CEQA process leads to cleaner, safer, and more sustainable development in the State***. This is exactly what CEQA is designed to accomplish – protecting people and the environment through active public engagement in the environmental process.

[9] *City of Long Beach*, 176 Cal. App. 4th at 904.
[10] *Bakersfield Citizens for Local Control v. City of Bakersfield* (Cal. Ct. App. 2004) 124 Cal.App.4th 1184, 1196 ("[W]e will not dignify with extended comment [developer]'s complaint that BCLC is just a 'front' for a grocery worker's union whose disgruntled members feel threatened by nonunionized Wal-Mart's entry into the grocery business. As will be explained, BCLC has standing to pursue this litigation and it exhausted its administrative remedies. This is sufficient.")

printed on recycled paper

Public agencies have also acknowledged unions for their valuable contribution to the environmental review process. For example, when approving the Elk Hills project, the California Energy Commission Presiding Commissioner Michal Moore praised and thanked union coalition California Unions for Reliable Energy ("CURE") for its participation in the proceeding: **"We never would've gotten to some of the places that we did, and the resolution that we did, if it hadn't been for the – the dogged efforts of [CURE]…we came to a good place, and probably couldn't have gotten to that good place without some of the tension and – and rigor that was applied. So, thank you very much**."[11] During the evidentiary hearings, a Commissioner "**thank[ed] CURE for the technical help that Phyllis Fox [CURE expert] offered us, and certainly offered me an education that I wasn't going to get any other place**."[12]

Some unions work on constructing and operating projects after they participate in the environmental permitting process. Some developers and critics allege this means that unions are using CEQA to induce developers to enter into project labor agreements, then abandon the environmental issues – just as the FEIR does here. These allegations are not only false, they demonstrate a fundamental misunderstanding of union participation. When the unions work on projects they have challenged, ***they do not walk away from the environmental and public health issues they raise. They enforce them through binding mitigation and environmental settlement agreements***. This is consistent with CEQA's environmental purpose, and with the historic values of organized labor to solve problems, engage in civic discourse and activism, advocate for safe working conditions, and effect changes that improve their members' lives and communities.[13]

CARE CA asks that the City revise the EIR to remove this inaccurate and improper statement about CARE CA, and any other unsupported statements of dislike made about other members of the public who commented on the DEIR.

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[14] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[15]

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by law.[16] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[17] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[18]

CARECA-12 (CONT.)

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[19]

CEQA requires that a lead agency evaluate and prepare written responses to comments in an FEIR.[20] Agencies are required to provide "detailed written response to comments . . . to ensure that the lead agency will fully consider the environmental consequences of a decision before it is made, that the decision is well informed and open to public scrutiny, and the public participation in the environmental review process is meaningful."[21] When a comment raises a "significant environmental issue," the written responses must describe the

certified WBENC

disposition of each such issue raised by commentators.[22] Specifically, the lead agency must address the comment "in detail giving reasons why" the comment was "not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice."[23]

A. The FEIR Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the DEIR showed that the DEIR underestimated trips generated by the Project by relying on inappropriate Institute of Transportation Engineers ("ITE") land use codes, thus underestimating the Project's GHG and VMT impacts. Specifically, the DEIR relied on ITE land use code 150 (Warehousing) and ITE land use code 157 (High-Cube Cold Storage Warehouse), when other land use codes are applicable to the Project that have much higher trip generation rates. In particular, Mr. Marshall explained that the Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.[24]

CARECA-12 (CONT.)

The FEIR responds that the Project's design would not support a high-cube (sort) fulfillment center or high-cube parcel hub, pointing to the Project's square footage and number of parking spaces.[25] The FEIR states that the Project's anticipated use and size (270,377 sf) most closely aligns with the ITE Warehousing land use category. But Mr. Marshall explains that the Project's size equally aligns with ITE Land Use 156: High Cube Parcel Hub Warehouse, which accounts for warehouses with at least 200,000 gross square feet of floor area.[26] Mr. Marshall also explains that the Project's proposed number of parking spaces would further enable the Project to function as a High Cube Parcel Hub Warehouse.

In sum, the FEIR offers no support for is continued reliance on low trip generation rates. As a result, the City continues to rely on potentially underestimated trip generation rates which do not accurately reflect the Project's operational impacts. To the contrary, substantial evidence shows that trip generation rates could be 2.6 times greater than analyzed. To ensure adequate analysis and mitigation of this impact, Mr. Marshall recommends either applying a

certified WBENC

significantly more conservative trip generation rate, or implementing a condition of approval that trip generation will not exceed the number assumed in the EIR.[27] The EIR must be revised and recirculated to provide an accurate analysis of trip generation.

B. The FEIR Still Fails to Substantiate Its Estimate that Just 10% Percent of the Project Will be Used for Cold Storage

CARE CA's comments on the DEIR showed that the City lacked substantial evidence to assume that the Project would only include approximately 27,034 sf of high-cube cold storage uses (10% of the building space).[28] In Response A-7, the FEIR states that the City has added a condition of approval to the Project limiting cold storage to 27,034 sf (10% of the total sf).[29] But there is currently no indication any such condition of approval will be required. The April 15, 2024 Development Advisory Board agenda packet contains a Draft Development Advisory Board decision,[30] Land Development Division conditions of approval,[31] Landscape Planning Division conditions of approval,[32] Engineering Division conditions of approval,[33] and City of Ontario memoranda containing conditions of approval.[34] None of these documents contain a condition limiting the Project's cold storage uses. The FEIR's conclusion that the environmental impacts associated with cold storage would be limited to just 10% of the Project site therefore remains unsupported.

As explained in CARE CA's comments on the DEIR, cold storage warehouses generate greater environmental impacts than other types of warehouse.[35] CARE CA urges the City to revise and recirculate the EIR to analyze the impacts of additional cold storage use at the Project site, or to add a mitigation measure with a title restriction limiting cold storage to 10%.

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the DEIR fails to consider the cumulative impacts of past, present, and probable future projects producing related or cumulative

certified WBENC

impacts. The DEIR's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[36] CARE CA's comments explained that rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and information requirements of CEQA, per caselaw such as *Kings County Farm Bureau v. City of Hanford*.[37] CARE CA also explained that SCAQMD's cumulative impacts significance thresholds, adopted in 2003, are being revised to reflect current conditions. The updated cumulative impacts significance thresholds will reflect projects' existing background MATES cancer risk and additional criteria such as whether the project would generate a high volume of diesel-fueled trucks.[38] CARE CA also discussed the Attorney General's guidance on cumulative impacts, which states that best practices include "thoroughly considering the project's incremental impact in combination with past, present, and reasonably foreseeable future projects, *even if the project's individual impacts alone do not exceed the applicable significance threshold* [emphasis added]."[39]

CARECA-12 (CONT.)

In Responses 14, 15, and 16, the FEIR responds that "The Draft EIR and underlying technical studies were prepared in a matter consistent to the SCAQMD recommendation for determining cumulative impacts." The FEIR's response is non-responsive because it does not address the City's failure to comply with CEQA's legal standards for evaluating cumulative impacts that were discussed in CARE CA's comments. The FEIR also does not address the pending updates to SCAQMD's cumulative impacts methodology, which are statedly prepared in response to recent CEQA cases such as *People of the State of California v. City of Fontana*.[40]

In *People of the State of California v. City of Fontana,* the Attorney General's petition for writ of mandate challenged a Mitigated Negative Declaration ("MND")

certified WBENC

that erroneously applied SCAQMD guidance in the same way as the instant EIR. The petition explained:

> [T]he MND's cumulative air quality impact analysis does not account for—or even acknowledge—the multitude of other warehouses near the Project. Rather than consider the environmental setting within which the Project will be situated, the MND simply states that the Project will not result in a cumulatively considerable increase in emissions because the Project's individual air quality impacts will be less than significant. The MND even applies this reasoning to its analysis of health impacts from localized emissions, despite making no attempt to determine or disclose the severity of the existing health impacts from localized emissions in the community.[41]

The petition further explained that merely citing to SCAQMD guidance does not justify a failure to analyze a Project's cumulative impacts:

> The MND cites Appendix D of an August 2003 white paper published by the South Coast Air Quality Management District ("SCAQMD") entitled "White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution" ("2003 SCAQMD White Paper"). **To the extent that the 2003 SCAQMD White Paper asserts that any project with less than significant individual air quality impacts also necessarily has less than significant cumulative air quality impacts, it is inconsistent with CEQA** for at least the reasons stated above. Moreover, the 2003 SCAQMD White Paper lacks substantial evidence to support such a contention, and thus the MND's reliance on it violates CEQA. (Cal. Code Regs., tit. 14, § 15064.7, subd. (c).) The MND further violated CEQA by failing to provide substantial evidence to support its reliance on the 2003 SCAQMD White Paper, Appendix D as "guidance." (Ibid.) Finally, even if the MND's reliance on the 2003 SCAQMD White Paper were proper and supported by substantial evidence, the MND did not consider other evidence—such as public comments and the existence of many other sources of pollution near the Project site—showing that the Project could have a significant cumulative air quality impact. (See Cal. Code Regs., tit. 14, § 15064, subd. (b).) [emphasis added][42]

certified WBENC

The Attorney General's litigation resulted in a settlement which requires compliance with an ordinance adopted on April 12, 2022 that establishes sustainability standards for warehouses in Fontana, including standards intended to address cumulative air quality impacts. For example, the standards include requirements that rooftop solar panels supply 100% of power for non-refrigerated portions of facilities with buildings over 400,000 square feet, trees in automobile parking areas, zero emission motorized operational equipment, other equipment electrification requirements, and solar-ready buildings roofs.[43] These are just a few examples of feasible mitigation available to reduce cumulative air quality impacts, in compliance with CEQA.

The FEIR for the instant Project suffers from the same lack of analysis and legal errors as the MND in the Attorney General's Fontana litigation. As a result of its refusal to analyze cumulative impacts, the FEIR fails to disclose or mitigate potentially significant local and regional cumulative impacts. In sum, the FEIR has not responded to CARE CA's comments on this issue and fails to remedy the City's inadequate cumulative impacts analysis. The Project cannot be approved until the City revises and recirculates an EIR that analyzes the Project's potentially significant cumulative impacts.

CARECA-12 (CONT.)

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

The City prepared a Mobile Source Health Risk Assessment ("HRA") to analyze health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project.[44]

The HRA underestimates the Project's operational health risk impacts on residential receptors and workers by failing to account for building downwash in the AERMOD analysis.[45] Dr. Clark explains that building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution.[46] This downwash effect leads to higher ground-level concentration of chemicals emitted from sources.[47]

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

The HRA also underestimates the Project's health risk impacts by relying on non-standard daily breathing rates for sensitive receptors. Dr. Clark explains that the HRA unjustifiably relies on breathing rates lower than recommended by the Office of Environmental Health Hazard Assessment's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.[48]

CEQA requires an accurate analysis of human health impacts. CEQA Guidelines Section 15065(a)(4) provides that the City is required to find a project will have a significant impact on the environment and require an EIR if the environmental effects of a project will cause a substantial adverse effect on human beings. The Supreme Court has also explained that CEQA requires the lead agency to disclose the health consequences that result from exposure to a project's air emissions.[49] Courts have held that an environmental review document must disclose a project's potential health risks to a degree of specificity that would allow the public to make the correlation between the project's impacts and adverse effects to human health.[50]

Because the City's analysis underestimates the Project's health risk impacts, the City fails to meet CEQA's requirement to accurately disclose the Project's impacts on public health and support its conclusions with substantial evidence. A revised HRA must be included in a recirculated EIR.

CARECA-12 (CONT.)

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the DEIR underestimates truck trip lengths by applying a truck trip length of 15.3 miles for 2-axle trucks, 14.2 miles for 3-axle trucks, and 40 miles for 4+-axle trucks. The DEIR states that these truck trip distances are recommended by SCAQMD, but Mr. Marshall explained that the City must consider the reasonably foreseeable distance to the Project's likely trip destinations.[51] These include the Ports of Los Angeles and Long Beach – approximately 60 miles away. The FEIR responds in Response A-18:

> The commenter fails to provide any evidentiary basis for the arbitrary number of 60 miles it suggests using… In fact, these recommendations are in direct opposition of the SCAQMD's recommended truck travel distance for warehousing projects within its jurisdiction (based on SCAG regional travel

certified WBENC

> demand data)… The commenter's recommended trip lengths are not supported by any substantial evidence provided by the SCAQMD and contradicts published material from SCAQMD that was utilized in the underlying analysis.[52]

The FEIR misinterprets the SCAQMD guidance. SCAQMD itself regularly comments on warehouse projects that it is essential to analyze the distance from warehouse projects to likely destinations and has emphasized that agencies should not rely solely on the 40-mile average trip length identified in its guidance. For example, SCAQMD recently commented on a warehouse project proposed for a location at a similar distance from the Ports as the instant Project:

> South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan. However, it is essential to note that **the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way**. Thus, **South Coast AQMD staff is concerned about underestimating truck emissions** due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the **more conservative trip length between 40 to 70 miles**, of which 40 miles could be used for local and **70 miles for Port trips** and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.[53]

CARECA-12 (CONT.)

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

In sum, the FEIR is incorrect when it states that CARE CA's recommendation to use a 60-mile truck trip length for trips to Ports of Los Angeles and Long Beach is not supported by substantial evidence. Rather, it is the FEIR's truck trip length assumptions which are not supported by substantial evidence – SCAQMD does not recommend blind reliance on truck trip lengths of 15.3 miles, 14.2 miles, and 40 miles for warehouse projects such as the instant Project for which longer trips to and from the ports are reasonably foreseeable.

Dr. Clark's comments also discuss the relationship between the ports and warehouses like this Project. Dr. Clark discusses the large percentage of goods passing through the ports, the number of truck trips generated by the ports, and observes that the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.[54] Substantial evidence therefore demonstrates that the Project's truck trip lengths are underestimated, resulting in underestimation of transportation, air quality, and GHG impacts. The Project cannot be approved until this error is corrected in a revised and recirculated EIR.

CARECA-12 (CONT.)

F. The FEIR Fails to Include Sufficient Investigation into Energy Conservation Measures

The DEIR and FEIR do not include sufficient investigation into energy conservation measures that might be available or appropriate for the Project. In the DEIR, the City concludes that energy impacts of the Project would be less than significant because the Project's construction and operations would comply with state regulations.[55] But as discussed below, the Project's environmental review does not sufficiently consider energy conservation measures like solar facilities, use of alternate fuel sources, and passive energy efficiency measures to ensure the Project's energy consumption would not be wasteful, inefficient, or unnecessary. The FEIR briefly addresses some energy conservation measures in Responses B-59, B-56, and B-53, but only to explain that none are required because air quality impacts are less than significant. This analysis fails to meet CEQA's requirements.

CEQA requires an environmental document to discuss mitigation measures for significant environmental impacts, including "measures to reduce the wasteful,

described in the DEIR."); SCAQMD, Comments on Draft Environmental Impact Report (DEIR) for the Proposed Westgate Specific Plan (SCH No. 1995052002) (March 5, 2015), pg. 5, available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/march/deirwestgate.pdf?sfvrsn=4; SCAQMD, Comments on Draft Mitigated Negative Declaration (Draft MND) for the Proposed Colton – DEXUS Project (February 1, 2013), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2013/february/colton-dexus.pdf.

certified WBENC

inefficient, and unnecessary consumption of energy."[56] The CEQA Guidelines require discussion of energy conservation measures when relevant, and provide examples in Appendix F:[57]

1) Potential measures to reduce wasteful, inefficient and unnecessary consumption of energy during construction, operation, maintenance and/or removal. The discussion should explain why certain measures were incorporated in the project and why other measures were dismissed.
2) The potential of siting, orientation, and design to minimize energy consumption, including transportation energy, increase water conservation and reduce solid waste.
3) The potential for reducing peak energy demand.
4) Alternate fuels (particularly renewable ones) or energy systems.
5) Energy conservation which could result from recycling efforts.

Courts have rejected EIRs that fail to include adequate analysis investigation into energy conservation measures that might be available or appropriate for a project.[58] In *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[59] the Court of Appeal reviewed an EIR for a shopping center on undeveloped agricultural land. The EIR concluded that, due to the proposed project's compliance with Title 24 guidelines and regulations, the project would be expected to have a less-than-significant impact regarding the wasteful, inefficient, or unnecessary consumption of energy. But the lead agency's EIR did not include discussion regarding the different renewable energy options that might be available or appropriate for the project. The Court held "the City's EIRs failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options."[60] The lead agency argued that compliance with the Building Code sufficed to address energy impact concerns for the project.[61] But the Court explained:

> Although the Building Code addresses energy savings for components of a new commercial construction, it does not address many of the considerations required under Appendix F of the CEQA Guidelines… These considerations include whether a building should be constructed at all, how large it should

> be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope. Here, a requirement that Gateway II comply with the Building Code does not, by itself, constitute an adequate assessment of mitigation measures that can be taken to address the energy impacts during construction and operation of the project.[62]

Here, the FEIR lacks analysis of common energy consumption measures in violation of CEQA Guidelines Appendix F. The FEIR fails to analyze the feasibility of onsite solar facilities, such as rooftop, parking lot, or ground-level solar photovoltaics. This analysis must address considerations such as the technical and economic feasibility of installing solar facilities on the Project site, the potential size of the Project's solar zone, and the potential magnitude of mitigation provided by installing solar facilities. The FEIR also fails to evaluate the extent to which mobile source energy consumption could be reduced during Project operations through electric vehicle charging infrastructure (above what is required by existing regulations).

CARECA-12 (CONT.)

The FEIR acknowledges that a diesel backup generator may be required for Project operations,[63] but fails to evaluate measures to reduce this source of energy consumption, such as use of alternative fuel sources.

The FEIR also fails to evaluate the feasibility of more stringent idling requirements over existing requirements.[64]

The FEIR's discussion of construction energy conservation measures also violates CEQA Guidelines Appendix F. The City's energy analysis fails to evaluate the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators.[65]

The FEIR contains responses briefly addressing the measures discussed above.[66] But the responses simply state: "[a]s concluded in Section 4.2, Air Quality, of the Draft EIR, Project operation-source emissions would not exceed the SCAQMD regional thresholds of significance for any criteria pollutants even when not taking

[62] *CECC* (2014) 225 CA4th 173, 213.

certified WBENC

into account of existing development emissions (Refer to Draft EIR pp. 4.2-31 to 4.2-32)… Thus, the City determines that additional mitigation is not warranted."[67] This type of response does not evaluate the feasibility or effectiveness of energy-conservation measures, and thus does not provide the analysis required by CEQA Guidelines Appendix F.

In sum, the FEIR's energy analysis fails adequately analyze measures to reduce the wasteful, inefficient, and unnecessary consumption of energy, and fails to meaningfully address Appendix F's considerations of whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope.[68] This analysis must be provided in a revised and recirculated EIR.

III. THE BOARD CANNOT MAKE THE REQUISITE FINDINGS TO RECOMMEND APPROVAL OF THE PROJECT

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[69]

The Staff Report states that the Project meets this requirement, but this finding lacks support.[70] The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project.

CARECA-12 (CONT.)

[67] FEIR, Response B-57.
[68] *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 CA4th 256, 264.
[69] Section 4.02.025(D)(3).
[70] Staff Report, PDEV22-017, Part 3, Section 4.

6752-007acp

For the same reason, the Staff Report lacks support to make the following finding in recommending adoption of the FEIR: "[t]he draft EIR contains a complete and accurate reporting of the environmental impacts associated with the Project."[71]

A revised EIR must be recirculated before the Project can be recommended for approval.

IV. CONCLUSION

As is explained herein, the FEIR's air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to recommend certification of the FEIR or under the City of Ontario Municipal Code to approve the Project's development plan. CARE CA urges the Board to recommend that the City revise and recirculate the EIR before any further action is taken on the Project.

CARECA-12 (CONT.)

Sincerely,

Aidan P. Marshall

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

In October 2023, I reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). I made the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.
4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

Now, I have reviewed the responses to these comments made in the project's Final Environmental Impact Review ("FEIR") dated February 2024.

CARECA-12 (CONT.)

1

Truck trip lengths – The FEIR repeats the false assertion that the truck trip lengths follow SCAQMD's recommendations (FEIR, A-18, p. 2-43). In my October 2023 comments, I addressed this, writing:

> The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[1] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[2] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

To prove that this is not a general SCAQMD recommendation for all warehouses, I attach SCAQMD's November 22, 2023 comments on the Hemlock Warehouse Development Project Draft SEIR in the City of Fontana. That Draft SEIR applied the same truck trip lengths as used in the 5355 East Airport Drive DEIR and FEIR. SCAQMD's comments state:

> However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project. (p. 2)

SCAQMD is making the same point I made in my October 2023 comments where I wrote:

> it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

The FEIR does not use SCAQMD- recommended truck trip lengths. SCAQMD instead recommends: "**Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project**."

[2] https://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/sclc_warehouse-presentation-final.pdf

VMT mitigation – The FEIR continues to state that the proposed project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.

However, the FEIR states that these impacts cannot be mitigated because "measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant." (FEIR A-24, p. 2-44)

My October 2023 comments recommended requiring CAPCOA T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – that can provide up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

A smaller mandatory reduction may be appropriate for this project, with this requirement passed on to the tenant, but it is not sufficient to claim that no significant mitigation is possible.

In addition, the attached SCAQMD comments on the Hemlock Warehouse Development Project recommends several mitigation measures targeting truck emissions, including:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks,
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the final CEQA document, and
- Provide electric vehicle (EV) charging stations and electrical hookups for truckers. (p.3)

CARECA-12 (CONT.)

Trip generation

In my October 2023 comments, I provided data on different types of warehouses that have significantly higher trip generation rates than the 1.75 trips per 1000 sq. ft. assumed in the DEIR and FEIR. These include:

> The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

The FEIR argues that the highest generators that I discussed in my October 2023 comments could not be accommodated because ". . . the layout of the site with 251 parking spaces would not reasonable accommodate the on-site parking required to support these uses."

This point about parking may be valid for the highest generators per 1000 sq. ft. but not for the intermediate generators. The DEIR and FEIR estimate only 270 passenger car trips per day (DEIR Appendix K, p. 5), i.e., 135 vehicles in and 135 cars out. Therefore, if all cars were employees and they all worked the same single shift, the parking lot utilization would never exceed 54%. With multiple shifts and non-employee passenger car trips, the parking lot utilization would be much

lower. Therefore, the parking lot is designed to support many more trips than assumed in the DEIR and FEIR.

The 251 parking spaces are consistent with ITE Land Use 156: High Cube Parcel Hub Warehouse. This use is described:

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. A high-cube warehouse can be free-standing or located in an industrial park. A high-cube parcel hub warehouse typically serves as a regional and local freight-forwarder facility for time sensitive shipments via airfreight and ground carriers. A site can also include truck maintenance, wash, or fueling facilities. Some limited assembly and repackaging may occur within the facility.

Given the uncertainty concerning the proposed project and its size, 270,377 sq. ft., it could foreseeably end up being a High-Cube-Parcel-Hub Warehouse as defined above.

The number of parking spaces provided also is consistent with this usage. The trip generation rate for this category is 4.63 trips per 1000 sq. ft., i.e. 2.6 times the rate used in the DEIR and FEIR. This rate includes 0.58 truck trips per 1000 sq. ft. Therefore, the passenger car rate is 4.05 trips per 1000 sq. ft. As a High-Cube-Parcel-Hub Warehouse, the proposed project would generate 1095 passenger car trips per day.

The DEIR states:

> For the purposes of this EIR, the Project is assumed to be operational 24 hours per day, seven days per week, with exterior loading and parking areas illuminated at night. (DEIR, p. 3-13)

This suggests multiple shifts each day.

Some of the passenger car trips would not be parking long term, including trips dropping off and picking up workers, and miscellaneous service trips, all of which include both and entering trip and an exiting trip. However, even if all passenger car trips involved parking long-term, all the trips could be accommodated with the planned 251 parking spaces if each space is occupied an average of 2.18 times per day.

CARECA-12 (CONT.)

As I stated in my October 2023 comment letter:

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

CARECA-12 (CONT.)

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

CARECA-12 (CONT.)

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Aidan Marshall

Subject: Comments On Final Environmental Impact Report (FEIR) 5355 East Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the City of Ontario (the City) FEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the Project consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

CARECA-12 (CONT.)

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

CARECA-12 (CONT.)

Specific Comments

1. The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.

A review of the AQ Analysis and the Mobile Source Health Risk Assessment show that building downwash was not incorporated into the AERMOD analysis of the Project. Building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from nearby stacks. A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity. This downwash effect leads to higher ground-level concentration of chemicals emitted from sources. The downwash effect increases as the relative difference between the release height and top of the building increases.[1] Using a lower height for the building will underestimate the potential ground level concentrations of pollutants associated with the Project operation.

For the closest receptors to the site, this difference will create an additional air quality impact that is not accounted for in the City's analysis. In addition to incorporating the building downwash impacts of the Project buildings, the AERMOD model should also incorporate the building downwash for receptors near the Project. Receptors farther away will still be subject to the downwash effect given the assumed emission height release incorporated into the model. Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[2] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). The City should address the impact of this issue in a revised DEIR.

CARECA-12 (CONT.)

[1] The so-called good engineering practice height (GEP) of the source. The GEP is defined in Section 123 of the Clean Air Act as "the height necessary to ensure that emissions from a stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies or wakes which may be created by the source itself, nearby structures or nearby terrain obstacles."

[2] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

2. The Air Quality Analysis Relies On An Input Value From AP-42 That Is Rated As Poor And May Be Unreliable

The CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42. According to the AP-42 FAQ - E = Poor. Factor is developed from C and D rated test data from a very few number of facilities, and there may be reason to suspect that the facilities tested do not represent a random sample of the industry. There also may be evidence of variability within the source category population. This means that there is a lot of uncertainty in the AQ analysis regarding the amount of particulate matter that will be emitted from the construction phase of the Project. The City should assess the impacts of this variable in a revised DEIR.

3. The Health Risk Analysis Incorporates Non-Standard Daily Breathing Rates For Sensitive Receptors Analyzed In The HRA

According to the FEIR, a health risk assessment was prepared in accordance with SCAQMD's guidance. For purposes of this Health Risk Assessment, receptors include both residential and non-residential (worker) land uses in the vicinity of the Project. These receptors are included in the Health Risk Assessment since residents and workers may be exposed at these locations over a long-term duration of 30 and 25 years, respectively.[3]

The input values utilized in the HRA analysis included a variety of daily breathing rates that are favorable to reducing the potential health impacts. The HRA states that "Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the 2015 OEHHA Guidelines."[4] The values listed in Table 2-7 include both the 95 percent upper confidence limit (95% UCL) values (for age *in utero* exposure and age 0 to 2) and the 80th percentile values for the remaining age groups (age 2 to 16 and age 16 to 30).

95th Percentile	361	1090	861	745	335	290

[a] 3rd trimester **breathing rates** based on breathing rates of pregnant women using the assumption that the dose to the fetus during the 3rd trimester is the same as that to the mother.

The City's analysis is therefore incomplete, is not consistent with the guidance from OEHHA, and must be corrected in a revised final environmental impact report for the Project.

CARECA-12 (CONT.)

4. The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to the operations air quality analysis of Project,[6] the analysis incorporated the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2), 14.2 miles for

[5] Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, http://oehha.ca.gov/air/hot_spots/hotspots2015.html

[6] Urban Crossroads. 2022. 5355 East Airport Drive Air Quality Impact Analysis. August 30. 2022. Pg 37

3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages.

This statement does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately 700 million square feet, an increase of 20 percent over the last five years"),[7] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[8] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[9] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

CARECA-12 (CONT.)

Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the Regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised final environmental impact report should be prepared to address these substantial concerns.

Sincerely,

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling
Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995
M.S., Environmental Health Science, University of California, 1993
B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well recognized toxicologist, air modeler, and health scientist. He has 20 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

Significant projects performed by Dr. Clark include the following:

LITIGATION SUPPORT

Case: James Harold Caygle, et al, v. Drummond Company, Inc. Circuit Court for the Tenth Judicial Circuit, Jefferson County, Alabama. Civil Action. CV-2009

Client: Environmental Litgation Group, Birmingham, Alabama

Dr. Clark performed an air quality assessment of emissions from a coke factory located in Tarrant, Alabama. The assessment reviewed include a comprehensive review of air quality standards, measured concentrations of pollutants from factory, an inspection of the facility and detailed assessment of the impacts on the community. The results of the assessment and literature have been provided in a declaration to the court.

CARECA-12
(CONT.)

Case Result: Settlement in favor of plaintiff.

Case: Rose Roper V. Nissan North America, et al. Superior Court of the State Of California for the County Of Los Angeles – Central Civil West. Civil Action. NC041739

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to multiple chemicals, including benzene, who later developed a respiratory distress. A review of the individual's medical and occupational history was performed to prepare an exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to respiratory irritants. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: O'Neil V. Sherwin Williams, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to petroleum distillates who later developed a bladder cancer. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Summary judgment for defendants.

Case: Moore V., Shell Oil Company, et al. Superior Court of the State Of California for the County Of Los Angeles

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to chemicals while benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

CARECA-12 (CONT.)

Case Result: Settlement in favor of plaintiff.

Case: Raymond Saltonstall V. Fuller O'Brien, KILZ, and Zinsser, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Richard Boyer and Elizabeth Boyer, husband and wife, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-7G.

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

CARECA-12

Case: JoAnne R. Cook, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-9R

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of an individual exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Patrick Allen And Susan Allen, husband and wife, and Andrew Allen, a minor, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-W

CARECA-12
(CONT.)

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Michael Fahey, Susan Fahey V. Atlantic Richfield Company, et al. United States District Court Central District of California Civil Action Number CV-06 7109 JCL.

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Constance Acevedo, et al., V. California Spray-Chemical Company, et al., Superior Court of the State Of California, County Of Santa Cruz. Case No. CV 146344

Dr. Clark performed a comprehensive exposure assessment of community members exposed to toxic metals from a former lead arsenate manufacturing facility. The former manufacturing site had undergone a DTSC mandated removal action/remediation for the presence of the toxic metals at the site. Opinions were presented regarding the elevated levels of arsenic and lead (in attic dust and soils) found throughout the community and the potential for harm to the plaintiffs in question.

Case Result: Settlement in favor of defendant.

Case: Michael Nawrocki V. The Coastal Corporation, Kurk Fuel Company, Pautler Oil Service, State of New York Supreme Court, County of Erie, Index Number I2001-11247

Client: Richard G. Berger Attorney At Law, Buffalo, New York

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the

CARECA-12
(CONT.)

known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Judgement in favor of defendant.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model will be used to estimate acute and chronic exposure concentrations to multiple contaminants and will be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

Client – Los Angeles Alliance for a New Economy (LAANE), Los Angeles, California

Dr. Clark is advising the LAANE on air quality issues related to current flight operations at the Los Angeles International Airport (LAX) operated by the Los Angeles World Airport (LAWA) Authority. He is working with the LAANE and LAX staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

CARECA-12 (CONT.)

Client – City of Santa Monica, Santa Monica, California

Dr. Clark is advising the City of Santa Monica on air quality issues related to current flight operations at the facility. He is working with the City staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client: Omnitrans, San Bernardino, California

Dr. Clark managed a public health survey of three communities near transit fueling facilities in San Bernardino and Montclair California in compliance with California Senate Bill 1927. The survey included an epidemiological survey of the effected communities, emission surveys of local businesses, dispersion modeling to determine potential emission concentrations within the communities, and a comprehensive risk assessment of each community. The results of the study were presented to the Governor as mandated by Senate Bill 1927.

Client: Confidential, San Francisco, California

Summarized cancer types associated with exposure to metals and smoking. Researched the specific types of cancers associated with exposure to metals and smoking. Provided causation analysis of the association between cancer types and exposure for use by non-public health professionals.

Client: Confidential, Minneapolis, Minnesota

Prepared human health risk assessment of workers exposed to VOCs from neighboring petroleum storage/transport facility. Reviewed the systems in place for distribution of petroleum hydrocarbons to identify chemicals of concern (COCs), prepared comprehensive toxicological summaries of COCs, and quantified potential risks from carcinogens and non-carcinogens to receptors at or adjacent to site. This evaluation was used in the support of litigation.

Client – United Kingdom Environmental Agency

Dr. Clark is part of team that performed comprehensive evaluation of soil vapor intrusion of VOCs from former landfill adjacent residences for the United Kingdom's Environment

CARECA-12
(CONT.)

Agency. The evaluation included collection of liquid and soil vapor samples at site, modeling of vapor migration using the Johnson Ettinger Vapor Intrusion model, and calculation of site-specific health based vapor thresholds for chlorinated solvents, aromatic hydrocarbons, and semi-volatile organic compounds. The evaluation also included a detailed evaluation of the use, chemical characteristics, fate and transport, and toxicology of chemicals of concern (COC). The results of the evaluation have been used as a briefing tool for public health professionals.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: Ameren Services, St. Louis, Missouri

Managed the preparation of a comprehensive human health risk assessment of workers and residents at or near an NPL site in Missouri. The former operations at the Property included the servicing and repair of electrical transformers, which resulted in soils and groundwater beneath the Property and adjacent land becoming impacted with PCB and chlorinated solvent compounds. The results were submitted to U.S. EPA for evaluation and will be used in the final ROD.

CARECA-12
(CONT.)

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark is managing the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark is assisting the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of perchlorate in environment. Dr. Clark evaluated the production, use, chemical characteristics, fate and transport, toxicology, and remediation of perchlorate. Perchlorates form the basis of solid rocket fuels and have recently been detected in water supplies in the United States. The results of this research

were presented to the USEPA, National GroundWater, and ultimately published in a recent book entitled *Perchlorate in the Environment*.

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

CARECA-12
(CONT.)

Client: Confidential, San Francisco, California

Identified and analyzed fifty years of epidemiological literature on workplace exposures to heavy metals. This research resulted in a summary of the types of cancer and non-cancer diseases associated with occupational exposure to chromium as well as the mortality and morbidity rates.

Client: Confidential, San Francisco, California

Summarized major public health research in United States. Identified major public health research efforts within United States over last twenty years. Results were used as a briefing tool for non-public health professionals.

Client: Confidential, San Francisco, California

Quantified the potential multi-pathway dose received by humans from a pesticide applied indoors. Part of team that developed exposure model and evaluated exposure concentrations in a comprehensive report on the plausible range of doses received by a specific person. This evaluation was used in the support of litigation.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client – United Kingdom Environmental Agency

Oversaw a comprehensive toxicological evaluation of methyl-*tertiary* butyl ether (M*t*BE) for the United Kingdom's Environment Agency. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of M*t*BE. The results of the evaluation have been used as a briefing tool for public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of *tertiary* butyl alcohol (TBA) in municipal drinking water system. TBA is the primary breakdown product of M*t*BE, and is suspected to be the primary cause of M*t*BE toxicity. This evaluation will include available information on the production, use, chemical characteristics, fate and transport in the environment, absorption, distribution, routes of detoxification, metabolites, carcinogenic potential, and remediation of TBA. The results of the evaluation were used as a briefing tool for non-public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of methyl *tertiary* butyl ether (MTBE) in municipal drinking water system. MTBE is a chemical added to gasoline to increase the octane

CARECA-12
(CONT.)

rating and to meet Federally mandated emission criteria. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of MTBE. The results of the evaluation have been were used as a briefing tool for non-public health professionals.

Client – Ministry of Environment, Lands & Parks, British Columbia

Dr. Clark assisted in the development of water quality guidelines for methyl tertiary-butyl ether (MTBE) to protect water uses in British Columbia (BC). The water uses to be considered includes freshwater and marine life, wildlife, industrial, and agricultural (e.g., irrigation and livestock watering) water uses. Guidelines from other jurisdictions for the protection of drinking water, recreation and aesthetics were to be identified.

Client: Confidential, Los Angeles, California

Prepared physiologically based pharmacokinetic (PBPK) assessment of lead risk of receptors at middle school built over former industrial facility. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

CARECA-12
(CONT.)

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Client: Confidential, Atlanta, Georgia

Researched potential exposure and health risks to community members potentially exposed to creosote, polycyclic aromatic hydrocarbons, pentachlorophenol, and dioxin compounds used at a former wood treatment facility. Prepared a comprehensive toxicological summary of the chemicals of concern, including the chemical characteristics, absorption, distribution, and carcinogenic potential. Prepared risk characterization of the carcinogenic and non-carcinogenic chemicals based on the exposure assessment to quantify the potential risk to members of the surrounding community. This evaluation was used to help settle class-action tort.

Client: Confidential, Escondido, California

Prepared comprehensive Preliminary Endangerment Assessment (PEA) of dense non-aqueous liquid phase hydrocarbon (chlorinated solvents) contamination at a former printed circuit board manufacturing facility. This evaluation was used for litigation support and may be used as the basis for reaching closure of the site with the lead regulatory agency.

Client: Confidential, San Francisco, California

Summarized epidemiological evidence for connective tissue and autoimmune diseases for product liability litigation. Identified epidemiological research efforts on the health effects of medical prostheses. This research was used in a meta-analysis of the health effects and as a briefing tool for non-public health professionals.

Client: Confidential, Bogotá, Columbia

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of a 13.7 hectares plastic manufacturing facility in Bogotá, Colombia The risk assessment was used as the basis for the remedial goals and closure of the site.

CARECA-12 (CONT.)

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally cadmium) and VOCs from soil and soil vapor at 12-acre former crude oilfield and municipal landfill. The site is currently used as a middle school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and was used as the basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Managed remedial investigation (RI) of heavy metals and volatile organic chemicals (VOCs) for a 15-acre former manufacturing facility. The RI investigation of the site included over 800 different sampling locations and the collection of soil, soil gas, and groundwater samples. The site is currently used as a year round school housing approximately 3,000 children. The Remedial Investigation was performed in a manner

that did not interrupt school activities and met the time restrictions placed on the project by the overseeing regulatory agency. The RI Report identified the off-site source of metals that impacted groundwater beneath the site and the sources of VOCs in soil gas and groundwater. The RI included a numerical model of vapor intrusion into the buildings at the site from the vadose zone to determine exposure concentrations and an air dispersion model of VOCs from the proposed soil vapor treatment system. The Feasibility Study for the Site is currently being drafted and may be used as the basis for granting closure of the site by DTSC.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally lead), VOCs, SVOCs, and PCBs from soil, soil vapor, and groundwater at 15-acre former manufacturing facility. The site is currently used as a year round school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and will be basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of VOC vapor intrusion into classrooms of middle school that was former 15-acre industrial facility. Using the Johnson-Ettinger Vapor Intrusion model, the evaluation determined acceptable soil gas concentrations at the site that did not pose health threat to students, staff, and residents. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client –Dominguez Energy, Carson, California

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of 6-acre portion of a 500-acre oil and natural gas production facility in Carson, California. The risk assessment was used as the basis for closure of the site.

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

CARECA-12
(CONT.)

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

CARECA-12
(CONT.)

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Draft Subsequent Environmental Impact Report (Draft SEIR) for the Hemlock Warehouse Development Project (Proposed Project) (SCH No.: 2009091089)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The City of Fontana is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Draft SEIR

Based on the Draft SEIR, the Lead Agency proposes demolishing the existing development to construct and operate a warehouse facility for 882,000 square feet on the 40.01-acre site at 11115 Hemlock Avenue, Fontana.[1] A portion of the warehouse facility would be used for cold storage, approximately 220,500 square feet or 25 percent of the warehouse.[2] The Proposed Project would have 114 dock doors on the east and west sides of the building[3] associated with 562 truck trips per day.[4] Regional access to the Proposed Project site via Interstate 10, State Route 60, and Interstate 15, and local access via Santa Ana Avenue and Jurupa Avenue. [5] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (e.g., residential units) is approximately 900 feet southeast and southwest of the Proposed Project site. Construction of the Proposed Project is anticipated to take approximately 15 months.[6]

CARECA-12 (CONT.)

South Coast AQMD Staff's Comments on the Draft SEIR

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

In the Draft SEIR, the Lead Agency discusses the determination of truck emissions for the Proposed Project and states that "…*CalEEMod defaults were utilized for trip length and the SCAQMD recommended truck trip length of 15.3 miles for 2-axle (LHDT1, LHDT2) trucks, 14.2*

[1] Draft SEIR. Page 3-1 and 3-2.
[2] *Ibid*. Page 3-9.
[3] *Ibid*.
[4] *Ibid*. Appendix F- Traffic Impact Analysis. Page 40.
[5] *Ibid*. Page 3-1.
[6] *Ibid*. Page 3-10.

miles for 3-axle (MHDT) trucks, and 40 miles for 4+-axle (HHDT) trucks and weighting the average trip lengths using traffic trip percentages from the Traffic Impact Analysis prepared for the Project (Appendix F), which resulted in an overall truck trip length of 29.9 miles with an assumption of 100% primary trips for the proposed warehouse.[7]"

South Coast AQMD recommended 15.3 miles, 14.2 miles, and 40 miles of truck trip lengths derived from the Southern California Association of Government's (SCAG) estimation of average truck trip length in its 2016 Regional Transportation Plan.[8] However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

User-Defined Land Use Subtype in the California Emissions Estimator Model (CalEEMod) Analysis

In the operational CalEEMod output files, besides the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes, "user-defined industrial" is added.[9] According to the CalEEMod User Guide, the "user-defined" may be selected to characterize project land use subtypes not included in CalEEMod. If selected, all data on the Land Use screen will need to be input manually. [10] However, lot acreage and the floor square area use are all set to zero under the "user-defined industrial" land use subtype.

In addition, the truck information (e.g., truck trips) is input under the "user-defined industrial" but not in the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtypes for the Proposed Project. This possibly leads to underestimating the heavy-duty truck emissions for warehouse activities since no data is filled under this "user-defined industrial" land use subtype. Therefore, it is recommended that the Lead Agency explain why the land use is separated in the CalEEMod analysis and why the truck information is not under the "unrefrigerated warehouse-no rail" and "refrigerated warehouse-no rail" land use subtype and revise the analysis as necessary in the final CEQA document.

Additional Recommended Air Quality and Greenhouse Gases Mitigation Measures

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse air quality impacts. To further reduce the Proposed Project's air quality impacts, and in addition to SWIP SP FEIR Mitigation Measures

CARECA-12 (CONT.)

[7] *Ibid*. Page 5.1-22
[8] South Coast Air Quality Management District, Preliminary Draft Staff Report: Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce.
[9] *Ibid*. Appendix B - Air Quality Impact Analysis. CalEEMod Operational and LST Output Files.
[10] California Emissions Estimator Model (CalEEMod) Version 2022.1 User Guide. Access at: https://www.caleemod.com/documents/user-guide/CalEEMod_User_Guide_v2022.1.pdf

MM 4.2-1a to MM 4.2-1f, MM 4.2-2a to MM4.2-2l, and MM 4.2-5a, South Coast AQMD staff recommends that the Lead Agency incorporate the following mitigation measures in the Final EIR.

Mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft SEIR may include the following:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks, such as heavy-duty trucks with natural gas engines that meet the CARB's adopted optional NOx emissions standard at 0.02 grams per brake horsepower-hour (g/bhp-hr), if and when feasible. Given the state's clean truck rules and regulations aiming to accelerate the utilization and market penetration of ZE and NZE trucks, such as the Advanced Clean Trucks Rule[11] and the Heavy-duty Low NOx Omnibus Regulation,[12] ZE and NZE trucks will become increasingly more available to use. The Lead Agency should require a phase-in schedule to incentivize the use of these cleaner operating trucks to reduce any significant adverse air quality impacts. South Coast AQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency. At a minimum, require the use of a 2010 model year[13] that meets CARB's 2010 engine emissions standards at 0.01 g/bhp-hr of particulate matter (PM) and 0.20 g/bhp-hr of NOx emissions or newer, cleaner trucks. All heavy-duty haul trucks should meet CARB's lowest optional low-NO_x standard starting in 2022.[14] Where appropriate, include environmental analyses to evaluate and identify sufficient electricity and supportive infrastructures in the Energy and Utilities and Service Systems Sections in the CEQA document. Include the requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with project construction to document that each truck used meets these emission standards and make the records available for inspection. The Lead Agency should conduct regular inspections to the maximum extent feasible to ensure compliance.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the Final CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this higher activity level.
- Provide electric vehicle (EV) charging stations or, at a minimum, provide electrical infrastructure, and electrical panels should be appropriately sized. Electrical hookups should be provided for truckers to plug in any onboard auxiliary equipment.

CARECA-12 (CONT.)

Mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft SEIR may include the following:

[11] CARB. June 25, 2020. Advanced Clean Trucks Rule. Accessed at: https://ww2.arb.ca.gov/our-work/programs/advanced-cleantrucks.
[12] CARB has recently passed a variety of new regulations that require new, cleaner heavy-duty truck technology to be sold and used in the state. For example, on August 27, 2020, CARB approved the Heavy-Duty Low NOx Omnibus Regulation, which will require all trucks to meet the adopted emission standard of 0.05 g/hp-hr starting with engine model year 2024. Accessed at: https://ww2.arb.ca.gov/rulemaking/2020/hdomnibuslownox.
[13] CARB adopted the statewide Truck and Bus Regulation in 2010. The Regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. More information on the CARB's Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.
[14] CARB's optional low-NOx emission standard is available at: https://ww2.arb.ca.gov/our-work/programs/optional-reduced-nox-standards.

- Maximize the use of solar energy by installing solar energy arrays.
- Use light-colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices and appliances.

Design considerations for the Proposed Project that the Lead Agency should consider reducing air quality and health risk further impacts include the following:

- Clearly mark truck routes with trailblazer signs so that trucks will not travel next to or near sensitive land uses (e.g., residences, schools, daycare centers, etc.).
- Design the Proposed Project such that truck entrances and exits are not facing sensitive receptors and trucks will not travel past sensitive land uses to enter or leave the Proposed Project site.
- Design the Proposed Project such that any truck check-in point is inside the Proposed Project site to ensure no trucks are queuing outside.
- Design the Proposed Project to ensure that truck traffic inside the Proposed Project site is as far away as feasible from sensitive receptors.
- Restrict overnight truck parking in sensitive land uses by providing overnight truck parking inside the Proposed Project site.

The South Coast AQMD staff also suggests the Lead Agency review the references (listed below) and consider including the additional recommended mitigation measures in the final CEQA document:

- State of California – Department of Justice: Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act[15]
- South Coast AQMD 2022 South Coast Air Quality Management Plan,[16] specifically:
  - Appendix IV-A – South Coast AQMD's Stationary and Mobile Source Control Measures
  - Appendix IV-B – CARB's Strategy for South Coast
  - Appendix IV-C – SCAG's Regional Transportation Strategy and Control Measures
- United States Environmental Protection Agency (U.S. EPA): Mobile Source Pollution - Environmental Justice and Transportation[17]

CARECA-12 (CONT.)

South Coast AQMD Air Permits and Role as a Responsible Agency

The Draft SEIR assumes in the analysis that an emergency diesel-powered fire pump and emergency diesel-powered generator would be used for the Proposed Project.[18] Hence, air permits from South Coast AQMD would be required, and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead

Rina Leung November 22, 2023

Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to review the above-mentioned document. The City of Jurupa Valley is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments which are organized by topic of concern.

South Coast AQMD Staff's Summary of Project Information in the Recirculated Draft EIR

Based on the Recirculated Draft EIR, the Proposed Project is comprised of the development of the 80.8-acre property with five industrial buildings ("Building 1," "Building 2," "Building 3," "Building 4," and "Building 5") totaling 1,118,102 square feet (s.f.). Building 1 would include 309,870 s.f. of building area, Building 2 would include 388,222 s.f. of building area, Building 3 would include 174,364 s.f. of building area, Building 4 would include 275,958 s.f. of building area, and Building 5 would include 35,688 s.f. of building area. The Recirculated Draft EIR states that although the future tenant(s) of the building is not known, industrial uses would allow for high-cube fulfillment, manufacturing, and general light industrial services.[1] Based on a review of aerial photographs, South Coast AQMD staff found that the nearest sensitive receptor (residential development) is located adjacent to the Proposed Project site, approximately 240 feet southeast of the Proposed Project. Construction of the Proposed Project is anticipated to occur in a single phase, commence in January 2023, and be completed in June 2024.[2] The Proposed Project is located on the southeast corner of Montana Avenue and 25th Street.[3]

South Coast AQMD Staff's Comments

> *The CalEEMod Land Use(s) Subtype Assumptions (Combining Manufacturing and General Light Industrial) in the Appendix B- Air Quality Impact Analysis May Have Underestimated the Worst-Case Operational Air Quality Impacts*

In accordance with the project description outlined in the Recirculated Draft EIR, the construction of five industrial buildings totaling 1,194,170 square feet is proposed on 80.8 acres

CARECA-12 (CONT.)

[1] Recirculated Draft EIR Page 26.
[2] Appendix B, Air Quality Impact Analysis. Page 146.
[3] Recirculated Draft EIR Page 26.

of land. It is important to note that the document does not currently specify the future tenants for these five buildings.[4] However, based on the footnote in Appendix B- Air Quality Impact Analysis of the Recirculated Draft EIR, the analysis assumes that the project site will be divided into two equal parts for analytical purposes. Specifically, half of the site, totaling 597,085 square feet, is designated for manufacturing land uses, while the remaining half, also 597,085 square feet, is allocated for general light industrial land uses.[5]

According to the CalEEMod User Guide - Version 2022.1, it explicitly states the characteristics of "Light Industrial Land Use Subtype: *"Light industrial use facilities are free-standing facilities devoted to a single use, the facilities that have an emphasis on activities other than manufacturing and typically have minimal office space. Typical light industrial activities include printing, material testing, and assembly of data processing equipment. This land use subtype must be less than 50,000 square feet".*[6] Therefore, the allocation of 597,085 square feet for this purpose contradicts the guidelines provided in the CalEEMod User Guide. Moreover, the general light industrial activities are expected to generate less emissions and involve fewer total daily truck trips[7] compared to the manufacturing or other industrial land uses. The current assumption has led to an underestimation of emissions. South Coast AQMD staff recommends that the Lead Agency conduct a more conservative analysis using the "worst-case" scenario in CalEEMod modeling and correct the land use sub-type used in CalEEMod to ensure accuracy and compliance with guidelines.

Potential Underestimation of Emissions Due to Inaccurate On-site Distance for the Trucks and Passenger Vehicles During Project Operation

The Recirculated Draft EIR notes that CalEEMod Version 2022 lacks the capacity to distinguish between On-site and Off-site emissions during operation. Consequently, the analysis relies on the assumption that 0.5 mile is the maximum allowable On-site distance for both trucks and passenger vehicles. However, the aerial map of the On-site vehicle route (truck movements) as identified in Exhibit 2-B in Appendix C of the Recirculated Draft EIR indicates that the actual On-site distance of the route exceed 0.7 mile, which is greater than the 0.5-mile assumption upon which the emission estimates are based. Therefore, the On-site emissions appear to have been underestimated. For this reason, T the Lead Agency is recommended to either revise the calculations to reflect an On-site route distance of 0.7 mile or provide a comprehensive explanation and justification of the methodology employed in relying on the 0.5-mile On-site assumption parameter.

Potential Underestimation of Emissions Due to Imprecise Assumptions for Truck Trip Lengths and Trip Rates in Emissions Analysis

Appendix B of the Recirculated Draft EIR, explains that air quality impact analysis was based on the assumption that the average truck trip length is 30.34 miles for general light industrial and manufacturing uses. However, the project site is located 70 to 80 miles away from the Ports of Los Angeles and Long Beach which means that the air quality analysis underestimated the

CARECA-12 (CONT.)

[4] Recirculated Draft EIR Page 26.
[5] Appendix B, Air Quality Impact Analysis. Page 14 in PDF.
[6] *CalEEMod User Guide - Version 2022.1.
[7] Appendix Q, VMT Analysis. Page 12.

emissions from trucks traveling from the Ports to the project site. For this reason, the Lead Agency is recommended to revise the calculations in the Final EIR by taking a project-specific approach to the vehicle trip length and trip rates by applying more conservative trip lengths such as designating 40 miles for local trips and 80 miles for Port-related trips. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project.

Warehouse Cold Storage Land Use and the Associated Emissions from Transport Refrigeration Units (TRU)

The project description in the Recirculated Draft EIR does not explain whether the Proposed Project intends to allocate a portion of the warehouse land use for cold storage. Cold storage warehouses utilize more trucks and trailers equipped with TRUs than warehouses without cold storage. As a result, the Lead Agency is recommended to revise the project description in the Final EIR to explain whether cold storage would be a part of the Proposed Project and provide an estimate for the number of TRU trucks and trailers associated with the operation of the warehouses with cold storage. If there are potential uses for TRUs, the Lead Agency is recommended to revise the calculations in the Final EIR to quantify the emissions from the TRUs in addition to the operational truck emissions.

CARECA-12 (CONT.)

Incorrect Pollutant Averaging Time and Underestimation of Ground-Level Pollutants Near Buildings in Health Risk Assessment (HRA),

South Coast AQMD staff's review of the construction and operational HRA modeling files noted that the ANNUAL[8] keyword was selected for the pollutant averaging time in the control pathway in the AERMOD model. However, according to the South Coast AQMD Risk Assessment Procedures v8.1 and South Coast AQMD Modeling Guidance for AERMOD,[9] a detailed HRA utilizing AERMOD should be run using the pollutant averaging time PERIOD and 1-hour.

In addition, South Coast AQMD staff's review of the modeling files noted that industrial buildings were not included in the building downwash option in the AERMOD dispersion model during operation which resulted in an underestimation of the ground-level pollutant concentrations near the buildings.

Thus, the Lead Agency is recommended to: 1) re-run the construction and operational HRAs to utilize PERIOD and 1-hour averaging time to determine the health risk impacts to the sensitive receptors and off-site workers and include the industrial buildings in the building downwash to analyze more accurate ground-level concentrations; and 2) include the results in the Final EIR.

Inconsistent Emission Rates (lb/day) Calculated from CalEEMod vs. AERMOD

[8] South Coast AQMD Risk Assessment Procedures v8.1. Access at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf
[9] South Coast AQMD Modeling Guidance for AERMOD. Access at: South Coast AQMD Modeling Guidance for AERMOD

Jim Pechous October 9, 2023

South Coast AQMD staff's review of the AERMOD files noted that the diesel particulate matter (DPM) emission rates do not match the data reported in Table 13: Localized Significant Summary of Operations (Onsite Emissions) in Appendix B of the Recirculated Draft EIR which were estimated using CalEEMod. For example, the operational PM10 emission rates presented in Table 13 d are 0.88 pounds per day (lb/day) but the PM10 emissions calculated via AERMOD modeling (including Idling and Onsite emissions) are 0.014 lb/day. This lack of continuity in the emission estimates raises questions about the accuracy of the calculations and warrants a more comprehensive and careful examination of the underlying factors and route causes contributing to this disparity. The Lead Agency is recommended to re-review these calculations and update the Final EIR accordingly with the appropriate corrections.

South Coast AQMD Air Permits and Role as a Responsible Agency

If the implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, spray booths, and etc., air permits from South Coast AQMD will be required and the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections15086, the Lead Agency is required to consult with South Coast AQMD. In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the Final EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project.

The Final EIR should also include calculations and analyses for construction and operation emissions for the new stationary and portable sources, as this information will also be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits.

Conclusion

As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final EIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final EIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency's position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this

Draft Environmental Impact Report (DEIR) for the Optimus Logistics Center 2

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the lead agency and should be incorporated into the Final CEQA document.

In the project description, the lead agency proposes the construction of two buildings for warehouse distribution and office space uses totaling approximately 1,037,811 square feet on a 48.4 acre site. The lead agency has projected 1,744 total daily vehicle trips including at least 357 daily truck trips operating at the site. In the Air Quality Section, the lead agency quantified the project's construction and operation air quality impacts and has compared those impacts with the SCAQMD's recommended regional and localized daily significance thresholds. Based on its analyses, the Lead Agency has determined that operational air quality impacts will exceed the recommended regional daily significance threshold for NOx.

The SCAQMD staff has concerns regarding the assumptions used in the air quality analysis, specifically the operational portion of the CalEEMod land use model. Since the proposed project will result in significant NOx impacts, all feasible mitigation measures should be included in the Final CEQA document to further reduce the significant impacts. Details are included in the attachment.

CARECA-12 (CONT.)

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the lead agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. Further, staff is available to work with the lead agency to address these issues and any other questions that may arise. Please contact Jack Cheng, Air Quality Specialist, at (909) 396-2448, if you have any questions regarding the enclosed comments.

Sincerely,

Jillian Wong

Siting of an Incompatible Land Use

1. Based on information in the DEIR (air quality analyses, the project truck distribution, and by aerial map inspection), the lead agency shows a minimum distance of 15 meters to the nearest sensitive receptor; a residence located southeast of the project site. The SCAQMD staff is concerned that the existing sensitive receptors will be exposed to significant regional and localized operational impacts, mostly from the daily truck activities that will likely operate using diesel fuel.

   As a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land-use decision making process, the California Air Resources Board (CARB) has provided the CARB Air Quality and Land Use Handbook (CARB Land Use Handbook). Based on guidance from thin e CARB Land Use Handbook, CARB recommends a buffer of at least 1,000 feet between land uses that will have 100 or more trucks per day. [1]

   In accordance with the state CEQA Guidelines §15126.4 (a)(1)(D), the lead agency should discuss the proposed siting of this land use and any potential impacts resulting from any proposed mitigation related to the CARB Land Use Handbook guidance in the Final EIR.

Air Quality Analysis

Daily Truck Trip Rate

2. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars and trucks totaling approximately 1,744 daily vehicles) for the proposed Project, but does not use the 0.64 (38.1%) daily truck trip rate from this same reference. Rather, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 (20.43%) daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) to estimate project air quality operational impacts in the CalEEMod modeling. By using the 0.343 Fontana Study daily truck trip rate, trucks are estimated at 357 daily truck trips in the DEIR instead of approximately 664 daily truck trips using the ITE 0.64 daily truck trip rate.

   Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and Final EIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

   Absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

CARECA-12 (CONT.)

[1] CARB Air Quality and Land Use Handbook: http://www.arb.ca.gov/ch/handbook.pdf

On-Road Truck Trip Length

3. In the CalEEMod output sheets provided in Appendix E of the DEIR appendices, the modeling used a 60 mile one-way trip distance and a 20% trip percentage for trucks moving goods for perspective tenants (C-W) and a 6.9 one-way trip distance and an 80% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). In electronic file "LOG 2 4.03 Air Quality – 7-15 Table 4.3-E Operational Vehicle Trip Assumption", the table indicates a 16.6 mile one-way trip distance and an 80% trip percentage for trucks moving goods for perspective tenants (C-W) and a 60 mile one-way trip distance and a 20% trip percentage for trucks supporting the operation of the perspective tenants (C-NW). The Air Quality Analysis is inconsistent and under estimates air quality impacts. A 60 mile one-way trip distance and 80% trip percentage should be used to model trucks moving goods for the perspective tenants (C-W) and a 6.9 – 16.6 one-way trip distance and 20 % trip percentage should be used by trucks supporting the operations of the proposed facility(C-NW).

   On page 3.0-8 in the project description, the lead agency describes potential truck activities that involve the proposed warehouse trucks. "Goods imported from the Ports of Long Beach and Los Angeles as well as other locations will be delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations." Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR.

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

4. Based on a review of the project's emissions calculations in Appendix E – RK Revised AQ, GHG, HRA: Air Quality Analysis[2] (CalEEMod Output Sheets), the lead agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM Air-12 to reduce operational emissions, the lead agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the lead agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the lead agency chooses to include refrigerated warehouses in the air quality analysis then MM Air-12 should be incorporated into the project and remain in the Final EIR.

<u>LST and Health Risk Assessment (HRA) Modeling</u>

5. The lead agency used AERMOD (version 12345) to prepare the dispersion modeling for the HRA even though AERMOD (version 14134) was available for at the time of analysis (10/20/2014). Therefore, SCAQMD staff recommends using AERMOD (version 15181), the most recent available version, to revise the dispersion modeling for this project.

6. The HRA analysis involved the use of separate discrete receptors placed randomly for the sensitive receptors. SCAQMD staff recommends that the lead agency revise the HRA using a receptor grid over the existing residences and areas zoned or planned for residential development, in order to ensure that the maximum impacts to a residential receptor are properly analyzed.

CARECA-12 (CONT.)

[2] Appendix A: CalEEMod Emissions Model Output.

7. SLINE1, SLINE2, and SLINE3 onsite travel line volume sources do not span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a series of volume sources that spans the entire docking area to ensure that impacts are properly analyzed.

8. STCK1, STCK2, and STCK3 onsite idling point sources should span the entire docking area. SCAQMD staff recommends that the lead agency revise the HRA using a line volume that spans the entire docking area to ensure that impacts are properly analyzed.

9. Based on the site plan in the project description, there are two driveways that access Webster Street where residences are located across from the proposed project site. Traffic exiting the site from Webster Street can then access Ramona Expressway to get on the freeway. Although the project description in the Notice of Availability, the site plan and the computer modeling show truck traffic using only Patterson Avenue north towards Harvey Knox Boulevard to access the 215 Freeway, there is nothing, however, to preclude trucks from using the driveways on Webster Street, passing by existing residences and then accessing Ramona Expressway to get on the freeway. The SCAQMD staff recommends that the Final EIR include a discussion of how the project will stop trucks from using Webster Avenue or include a restriction that would formally restrict Webster Street to passenger vehicles only. If trucks are not formally restricted, then project impacts from truck movement on Webster Street and beyond (i.e., north on Webster Street, or south to Ramona Expressway to access the 215 Freeway) would have been underestimated in the DEIR. These potential impacts should therefore be analyzed in the HRA and included in the Final EIR.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

10. Because the California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic and during project operations, the lead agency has determined that project operation emissions are significant for Oxides of Nitrogen (NOx), primarily from truck activity emissions, the SCAQMD staff therefore recommends the following changes and additional measures that should be incorporated in the Final EIR to reduce exposure to sensitive receptors and reduce potential significant project air quality impacts:

Recommended Changes

MM AQ 4.3H

- Prior to issuance of a building permit, the Project proponent shall provide the City with project specifications, drawings, and calculations that demonstrate that main electrical supply lines and panels have been sized to support heavy truck charging facilities. ~~when these trucks become available. The calculations shall be based on reasonable predictions from currently available truck manufacturer's data. Electrical system upgrades that exceed reasonable costs shall not be required. In addition, the Project will incorporate 2 electric vehicle charging stations for light duty vehicles.~~ Electrical lines shall be designed and sized to add additional charging stations when a demand is demonstrated. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations.[3] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

CARECA-12 (CONT.)

[3] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Additional Mitigation Measures

- Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.
- Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors.
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.
- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Should the proposed Project generate significant regional emissions, the lead agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the lead agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the lead agency and project applicant.

CARECA-12 (CONT.)

Mitigation Measures for Operational Air Quality Impacts (Other)

11. In addition to the mobile source mitigation measures identified above the Lead Agency should incorporate the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from NOx emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

8353 Sierra Avenue
Fontana, CA 92335

Draft Environmental Impact Report (DEIR)
for the Proposed Westgate Specific Plan (SCH No. 1995052002)

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document.

The Lead Agency proposes construction within four village areas that will be divided into 68 total planning development areas on an approximately 964-acre site. Included are up to 6,410 residential units, 50.9 acres of commercial/retail uses, 179.9 acres of business park and professional office uses, 71.6 acres and up to 1.2 million square feet of warehouse/distribution uses, open space/public and private parks, two elementary schools, a high school, landscaping and infrastructure. The four project areas are located by the Interstate 15 (I-15) and State Route 210 (SR-15) Freeways. The air quality analysis assumes a construction period starting in July 2015 showing Phase 1 construction completed as early as 2016, but based on market conditions, overall construction will continue over an approximately 20-year period until project buildout planned for year 2035.

The Lead Agency has determined that estimated construction, operation emissions and cancer risks substantially exceed the SCAQMD recommended thresholds of significance during construction (NOx), operations (VOC, NOx, CO, PM10 and PM2.5, mostly from vehicle operations) and for Toxic Air Contaminants (potential cancer risk from sensitive receptors being sited near diesel particulate emissions (DPM) from vehicles operating on the two freeways). The unmitigated cancer risk of up to 47 in one million from the DPM freeway vehicle would remain 33 in one million with mitigation, which is still substantially above the SCAQMD's recommended CEQA significance threshold for Maximum Incremental Cancer Risk (MICR): 10 in one million or greater lifetime probability of contracting cancer.

CARECA-12
(CONT.)

Based on its review, the SCAQMD staff has concerns about the assumptions made in the health risk assessment and air quality analyses. The SCAQMD also notes that localized significant emission impacts from on-site project uses were not estimated in the DEIR although emissions from on-site mobile sources at proposed the warehouse/distribution, light industry, commercial/retail and other land uses potentially impact nearby sensitive receptors (i.e., residents, students, school staff, etc.). Therefore, these impacts should be analyzed, compared with appropriate significance thresholds and incorporated into the Project and applicable analyses in the Final EIR to demonstrate the Lead Agency's findings. Finally, since the Lead Agency has determined that project air quality impacts from construction, operations and cancer risk are significant and unavoidable, the SCAQMD staff is concerned that all feasible mitigation pursuant to Section 15126.4 of the CEQA Guidelines has not been incorporated into the project and should be included in the Final CEQA document. Further details are included in the attached pages.

Pursuant to Public Resources Code Section 21092.5, SCAQMD staff requests that the Lead Agency provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. The SCAQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist CEQA Section, at (909) 396-3302, if you have any questions regarding the enclosed comments.

Health Risk Assessment

1. As of December 9, 2006, AERMOD is fully promulgated as a replacement to ISC3, in accordance with Appendix W (http://www.epa.gov/ttn/scram/dispersion_prefrec.htm). AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. AERMOD-ready meteorological data for various meteorological stations within the South Coast Air Basin (SCAB) are available for download free of charge at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/data-for-aermod. The Lead Agency used AERMOD (version 13350) to prepare the dispersion modeling for the Warehouse Health Risk Assessment (HRA) but used AERMOD (version 12060) for the Freeway HRA analysis. Furthermore, while the meteorological data from the SCAQMD Fontana meteorological station was used for both HRA analyses, two different versions of the meteorological data were used. Font2.pfl and Font2.sfc (meteorological data for 2005-2007) and Font7.sfc and Font7.pfl (meteorological data for 2008-2012) are for different years. Given the advancements and bug fixes that occurred in AERMOD between version 12060 and 13350 and 14134 (today's current version), SCAQMD staff recommends that the Lead Agency revise the HRA analyses for both warehouse and freeway using the latest version of AERMOD (version 14134) without the use of Lakes AERMOD-MPI. SCAQMD's modeling guidance for AERMOD can be found at http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/modeling-guidance. Please note that when using AERMOD, the regulatory default option should be used (i.e. without the use of the "FASTALL" or "FLAT" options) and the Lakes MPI should not be used without prior SCAQMD or EPA Region 9 approval.

2. The electronic files for the HRA analyses provided by the Lead Agency to SCAQMD staff were incomplete and did not include the receptor file. Therefore, SCAQMD staff was unable to verify the placement of receptors in the HRA analyses. In the event that receptors were not placed in the correct location using a receptor grid of no more than 100-meter spacing over the existing residences and areas zoned or planned for residential development, the health risks reported in the HRA analyses and DEIR could be underestimated. Therefore, SCAQMD staff recommends that the Lead Agency provide a graphic showing the receptor grid placement in the Final EIR.

3. The proposed project includes both two elementary schools and one high school. However, in the analysis, no receptors were placed in those locations to estimate the health risks to the students, teachers and administrative staff at those locations. SCAQMD staff recommends the Lead Agency update the HRA analyses to include the schools as receptors and estimate the health risks at those locations.

4. In the Warehouse HRA analysis, the Lead Agency assumed only 10 minutes of idling for each truck. Since trucks may idle several times on-site, the SCAQMD staff

CARECA-12 (CONT.)

recommends assuming 15-minutes idling per truck in the HRA analysis, e.g., five minutes entering, five minutes on-site and five minutes exiting, etc.

5. In the DEIR, the Lead Agency analyzed health risk impacts for residential exposure separately from TAC emissions coming from vehicles operating on the I-15 and State SR-15 Freeways. Since residents will be exposed to adverse health impacts from both the freeways (diesel-fueled vehicles operating on the freeways) and project warehouse distribution uses (diesel-fueled trucks operating at the sites), the combined risk from both sources should be totaled and disclosed in the Final EIR, in addition to the separate Maximum Incremental Cancer Risk (MICR) estimates for both sources already included in the DEIR. Otherwise, the potential combined risk is underestimated.

Air Quality Analysis - Operations

Daily Truck Trip Rate

6. In the Air Quality Impact Analysis, the Lead Agency uses the Institute of Transportation Engineers Trip Generation Manual, 9th Edition, 2012 (ITE Manual) 1.68 overall trip generation rate (for cars + trucks totally approximately 2,046 daily vehicles) for the proposed Project, but does not use the 0.64 daily truck trip rate from this same reference.[1] Rather, the Trip Generation Rates use a passenger car daily trip rate of 1.337 vehicles per day and a daily truck trip rate of 0.343 truck trips per day.[2] By using the 0.343 daily truck trip rate, trucks are estimated at 418 daily truck trips in the DEIR instead of approximately 780 daily truck trips using the ITE 0.64 daily truck trip rate. Therefore, absent from a specific traffic study of known tenants, the Final EIR should be consistent using the associated ITE truck trip rate to estimate project daily truck trips so that project trips and associated emission and health effect impacts are not underestimated.

Vehicle Fleet Mixture Percentages

7. In the DEIR, the air quality analysis used a 0.343 daily truck trip rate (ITE 1.68 total daily trip rate minus 1.337 passenger vehicle trip rate = 0.343 daily truck trip rate) and truck vehicle fleet mixture percentages from the City of Fontana Truck Trip Generation Study (Fontana Study) [3] to estimate project air quality operational impacts in the CalEEMod modeling. Specifically, the Fontana Study fleet mixture percentages include: 3.46 percent of the total fleet for 2-axle Trucks; 4.64 percent for 3-axle trucks; and 12.33 percent for 4-axle and larger trucks with truck categories totaling 20.43 percent of the total vehicle fleet. Passenger Vehicles would therefore comprise 79.57 percent of total vehicles during operations. However, the 0.343 daily

CARECA-12 (CONT.)

[1] ITE Manual, High Cube Warehouse Distribution Center (ITE Land Use – 152), 0.64 weighted average Truck Trip Generation Rate (trip ends per 1,000 square feet of gross floor area), Page 267.
[2] 1.337 + 0.343 = 1.68.
[3] DEIR, Traffic Impact Analysis, Project Trip Generation, Pages 31 and 37 Project (High Cube Warehouse Distribution Center) Trip Generation (Table 5, (3 of 3).

truck trip rate resulted in fleet percentages for the CalEEMod truck subcategories that were not proportionally adjusted consistent with the percentage of trucks estimated using the ITE 0.64 daily truck trip rate. Specifically, the number of daily trucks using the ITE 0.64 trip rate results in a greater number of daily truck trips: approximately 780 with the ITE 0.64 rate compared with approximately 418 daily trucks using the 0.343 daily truck trip rate based on the trip generation rates used in the Traffic and Circulation Section. Therefore, based on the increase numbers of trucks, the CalEEMod fleet mixture truck subcategories should be proportionally adjusted with the higher numbers of trucks after using the recommended ITE 0.64 daily truck trip rate. In the modeling inputs, however, the individual vehicle category percentages totaled 6.74 percent, which is lower than the percentage of trucks in the Traffic Study. In order to avoid underestimating project operational and related air quality and health effect impacts, the Air Quality Analysis, HRA and FEIR should be revised using the following truck percentages: LHD2 = 0.0645, MHD = 0.0865, HHD = 0.2300.

On-Road Truck Trip Lengths

8. In the DEIR, the Lead Agency does not describe potential truck activities that involve the proposed warehouse trucks. Since goods can be brought from the Ports of Long Beach and Los Angeles as well as other locations and delivered via truck to the proposed distribution centers and distributed via truck to both in- and out-of-state locations, the Final EIR should include more detailed discussion to justify the trip lengths used in the air quality and health risk affect analyses. In the CalEEMod output sheets provided in Appendix B of the DEIR appendices, the modeling used a 16.6 mile one-way trip distance was used by trucks employed by perspective tenants and an 8.4 one-way trip distance was used by trucks not employed by perspective tenants was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Since the port areas are over 70 miles away from the project site and that trucks will be serving other destinations within the basin and out of state, the SCAQMD staff recommends, absent a tenant-specific analysis with trip length information, that all applicable analyses be revised in the Final EIR using a one-way trip length that more accurately estimates air quality emission and related impacts based on the anticipated activities and distances described in the DEIR. If the Lead Agency is uncertain of the types of tenants or the trip lengths, the Lead Agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

CARECA-12 (CONT.)

Use of an Un-Refrigerated Warehouse Land Use CalEEMod Model Input

9. Based on a review of the project's emissions calculations in Appendix B: Air Quality Technical Appendix [4] (CalEEMod Output Sheets), the Lead Agency determined the proposed Project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, in mitigation measure MM C-12 to reduce

[4] Appendix B: Air Quality Technical Appendix.

Operational Emissions starting on Page 4.C-69, the Lead Agency refers to the use of Transportation Refrigeration Units (TRUs) at the project site. The SCAQMD staff therefore recommends that the Lead Agency include a mitigation measure that precludes the use of refrigerated warehousing at the Project site or revise the air quality analysis to account for emissions from refrigerated warehouse uses. Further, if the Lead Agency chooses to include refrigerated warehouses in the air quality analysis then MM C-12 should be incorporated into the project and remain in the Final EIR.

Mitigation During Operations (MERV Filters and HVAC Systems)

10. Starting on page 4.C-54, the Lead Agency discusses Health Risk results concluding that during occupancy, adverse air quality impacts from vehicles traveling on the existing I-10 and SR-210 freeways would expose sensitive receptors to substantially significant levels of Toxic Air Contaminants (TACs) even with mitigation due to existing ambient air pollution in the vicinity. The SCAQMD staff recognizes the many factors lead agencies must consider when siting new housing. On page 4.C-70, the Lead Agency is proposing mitigation to reduce the proposed project's significant health impacts. Further, many mitigation measures should be considered in the Final CEQA document that have been proposed for other projects as well to reduce exposure, including building filtration systems, placing the residential units furthest from the freeway, making any windows facing the freeway inoperable, building sound walls, planting vegetation barriers, etc. However, because of the potentially significant health risks involved, it is critical that any proposed mitigation must be carefully evaluated prior to determining if those health risks would be brought below recognized significance thresholds.

Limits to Enhanced Filtration Units

11. The Lead Agency should consider the limitations of the proposed enhanced filtration mitigation (Measure C-16) on page for this project on the housing residents. For example, in a study that SCAQMD conducted to investigate filters[5] similar to those proposed for this project, costs were expected to range from $120 to $240 per year to replace each filter. In addition, because the filters would not have any effectiveness unless there is a HVAC system that draws enough air to support eh filter system and that the HVAC system is fully operable throughout the life of the project. In addition, there may be increased energy costs to the resident. The proposed mitigation also assumes that the filters operate 100 percent of the time while residents are indoors to reduce significant TAC impacts up to 33 in one million compared with the SCAQMD

CARECA-12 (CONT.)

[5] http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf?sfvrsn=0 . This study evaluated filters rated MERV 13+ while the proposed mitigation calls for less effective MERV 12 or better filters. See also CARB link for the "Status of Research on Potential Mitigation Concepts to Reduce Exposure to Nearby Traffic Pollution" (August 23, 2012): http://www.arb.ca.gov/db/search/search_result.htm?q=Potentiaal+Mitigation+Concepts+to+Reduce+Exposure+to+Nearby+Traffic+Polltion&which=arb_google&cx=006180681887686055858%3Abew1c4wl8hc&srch_words=&cof=FORID%3A11 .

threshold of 10 in one million. It should be noted that these filters have no ability to filter out any toxic gasses from vehicle exhaust and would not reduce exposure when residents are outside of their homes, e.g. children playing outdoors, being around a pool area, residents relaxing or walking outside, working outside on a balcony, cleaning a vehicle, etc. In the Final CEQA document, the presumed effectiveness and feasibility of this mitigation should therefore be evaluated in more detail prior to assuming that it will sufficiently alleviate near truck exhaust exposures. Otherwise, impacts to residents from exposure to TACs will remain substantially significant and unavoidable.

Mitigation Measures for Operational Air Quality Impacts (Mobile Sources)

12. The California Air Resources Board has classified the particulate portion of diesel exhaust emissions as carcinogenic. During project operations, the Lead Agency has determined that project operation emissions are significant for Volatile Organic Compounds (VOC) and Oxides of Nitrogen (NOx), Carbon Monoxide (CO), Particulate Matter (PM10) and PM2.5, primarily from on-road mobile sources including truck activity emissions. The SCAQMD staff therefore recommends the following change and additional measures that should be incorporated into the Final EIR to reduce exposure to sensitive receptors and reduce project air quality impacts:

    Recommended Change:

    MM C-13

    - The City shall require future commercial and industrial projects (to) promote the expanded use of renewable fuel and low-emission vehicles by including ~~one or both of~~ the following project components: provide preferential parking for ultra-low emission, zero-emission, and alternative-fuel vehicle; and provide electric vehicle charging stations within the development.

    Additional Mitigation Measures:

    - Require the use of 2010 compliant diesel trucks, or alternatively fueled, delivery trucks (e.g., food, retail and vendor supply delivery trucks) at commercial/retail sites upon project build-out. If this isn't feasible, consider other measures such as incentives, phase-in schedules for clean trucks, etc.
    - Provide minimum buffer zone of 300 meters (approximately 1,000 feet) between truck traffic and sensitive receptors based on guidance from the California Air Resource Board (CARB) guidance.[6]
    - Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site,

CARECA-12 (CONT.)

[6] CARB: Air Quality and Land Use Handbook: A Community Health Perspective, April 2005, Page4 for Distribution Centers.

the Lead Agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.

- Design the site such that any check-in point for trucks is well inside the facility to ensure that there are no trucks queuing outside of the facility.
- On-site equipment should be alternative fueled.
- Provide food options, fueling, truck repair and or convenience stores on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Because the proposed Project generates significant regional emissions, the Lead Agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the Lead Agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency and project applicant.

  At a minimum, require upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the occupant should also be required to accept and use them.

CARECA-12 (CONT.)

Electric Vehicle (EV) Charging Stations

13. Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2012 Regional Transportation Plan. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, the SCAQMD staff recommends the Lead Agency require the proposed facility and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include

EV charging stations.[7] Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should appropriately sized to allow for future expanded use.

CNG Fueling Station and Convenience Site

14. Because proposed project generate significant regional NOx operational impacts, the SCAQMD staff recommends that the project pro-actively take measures that could reduce emissions sooner rather than later. The SCAQMD staff therefore recommends that the Lead Agency ensure the availability of alternative fueling facility (e.g., natural gas) to serve the project site prior to operation of any large truck operation uses within the project area.

Mitigation Measures for Operational Air Quality Impacts (Other)

15. In addition to the mobile source mitigation measures identified above, the SCAQMD staff recommends the following on-site area source mitigation measures below to reduce the project's regional air quality impacts from VOC, CO, NOx, PM10 and PM2.5 emissions during operation. These mitigation measure should be incorporated pursuant to CEQA Guidelines §15126.4, §15369.5.

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Limit the use of outdoor lighting to only that needed for safety and security purposes.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

Transportation

- Make a commitment to install electric car charging stations (not just wiring infrastructure) for both non-residential and residential uses at the project site.
- Create local "light vehicle" networks, such as neighborhood electric vehicle (NEV) systems.

CARECA-12 (CONT.)

[7] http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

Energy

- Make a commitment that the project site will include a solar photovoltaic or an alternate system with means of generating renewable electricity.

Other

- Provide outlets for electric and propane barbecues in residential areas.

Mitigation Measures for Construction Air Quality Impacts

16. Based on a review of the DEIR the Lead Agency determined that the proposed project will result in significant air quality impacts during construction. Specifically, the air quality analysis demonstrated that the proposed project will exceed the SCAQMD's CEQA regional construction significance thresholds for NOx. Therefore, the SCAQMD staff recommends the following changes and additional measures be incorporated into the proposed project and FEIR to reduce significant project impacts in addition to the measures included in the Draft EIR starting on page 4.C-67.

Recommended Change:

MM C-2 During project construction, the City shall require internal combustion engines/construction equipment operating on all future project sites ~~greater than five acres~~ to meet the following:

- ~~At least 50 percent of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 3 emissions standards or better and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

- Consistent with measures that other lead agencies in the region (including Port of Los Angeles, Port of Long Beach, Metro and City of Los Angeles)[8] have enacted, require all on-site construction equipment to meet EPA Tier 3 or higher emissions standards according to the following:

- Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

CARECA-12 (CONT.)

[8] For example see the Metro Green Construction Policy at: http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

- ~~Post-January 1, 2016, in addition to the Tier 3 standards specified above, an additional 20 percent or more of construction equipment greater than 250 hp, which are on-site for 6 or more consecutive days, shall meet Tier 4 emissions standards or better and be outfitted with BACT devices (e.g., and be outfitted with BACT devices (e.g., Level 3 diesel emissions control devices) certified by CARB.~~

Recommended Additions

- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NOx emissions requirements.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

- Encourage construction contractors to apply for SCAQMD "SOON" funds. Incentives could be provided for those construction contractors who apply for SCAQMD "SOON" funds. The "SOON" program provides funds to accelerate clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website: http://www.aqmd.gov/home/programs/business/business-detail?title=vehicle-engine-upgrades

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies .

(909) 396-2000 • www.aqmd.gov

E-MAILED: FEBRUARY 1, 2013 February 1, 2013

Mr. Mark Tomich, Director, MTomich@ci.colton.ca.us
Development Services, Planning Division
City of Colton
659 N. La Cadena Drive
Colton, CA 92324

**Draft Mitigated Negative Declaration (Draft MND)
for the Proposed Colton – DEXUS Project**

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final CEQA document. In the project description, the lead agency proposes demolition of the existing 28,000 square foot truck terminal and 18,000 square foot office building. Building construction would include a high-cube warehouse building on the 34.36 acre site. The proposed facility would have 600,046 square feet of building area (12,000 square feet of office area and 588,048 square feet of warehouse/distribution space). The proposed project would include 116 dock doors with parking for 425 standard and handicap spaces, and 42 trailer spaces. Construction is expected to last approximately 10 months and 2014 is the proposed opening year. Although basically zoned for industrial uses, there is a single-family residence located less than a quarter mile northwest of the project site along Agua Mansa Road.

The AQMD staff requests that the lead agency provide additional information regarding the fate of the existing facility. The CEQA analysis assumes it will cease its operations within the boundaries of the South Coast Air Basin (SCAB) by applying the emissions from the current operation to the baseline thus offsetting the projected emissions from the proposed high-cube warehouse use. In addition, the baseline itself may be overestimated by using generalized trip generation estimates instead of the on-site traffic count data to account for vehicle activity and the resulting air quality impacts for the existing operation. Because the determination of significance under CEQA is based on the difference between existing baseline and future project impacts, we recommend that the lead agency provide further substantial evidence for, and re-evaluate where necessary, the baseline and future impacts of this project. If impacts are found to be significant, then additional mitigation may be required to reduce these impacts to a less than significant level. Details regarding these comments and others follow in the attachment.

CARECA-12

Mr. Mark Tomich, Director 2 February 1, 2013
Development Services

Please provide the AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. The AQMD staff is available to work with the Lead Agency to address these issues and any other air quality questions that may arise. Please contact Gordon Mize, Air Quality Specialist – CEQA Section, at (909) 396-3302, if you have any questions regarding these comments.

Sincerely,

Ian MacMillan
Program Supervisor, Inter-Governmental Review
Planning, Rule Development & Area Sources

CARECA-12
(CONT.)

Baseline Emissions and the Status of the Existing Use

1. In a telephone conversation staff on or about January 15, 2013, the lead agency staff expressed uncertainty to AQMD staff whether the existing truck terminal business would cease operations completely within the SCAB boundaries or continue its current operations at the site but at a lower level of activity. The lead agency's operational air quality analysis uses the emissions from the existing use as a baseline to offset the estimated long-term air quality impacts from the proposed warehouse use. It is unclear to AQMD staff if the incremental emissions benefit derived from the existing use would actually be realized. Unless there is assurance that the previous facility activities will cease and not move to another location within the SCAB, the lead agency should not include these emissions as a baseline when calculating regional impacts. AQMD staff requests that the lead agency provide additional discussion of the fate of the existing operations and revise the air quality and greenhouse gas analyses, if necessary.

Potential Overestimation of the Existing Facility Baseline Emissions

2. The lead agency has estimated project emissions for the existing truck terminal building activity using the California Emissions Estimator Model (CalEEMod) and using trip rates based on land uses shown in the Institute of Traffic Engineers (ITE) Trip Generation, 8th Edition (2008) and the Truck Trip Generation Study (City of Fontana, August 2003). In addition to these sources, the lead agency included traffic count worksheets in the Revised Traffic Impact Analysis (Kunzman Associates, Inc., October 2012). It is not clear to the AQMD staff why available project-specific traffic count data included in the Draft MND that could be used to analyze vehicle activity and associated emissions for the existing facility were not used to estimate baseline emissions.

   The AQMD staff believes that using the ITE trip rate to calculate baseline vehicle activity may substantially overestimate project vehicle activity and related on-road mobile source emissions compared with the data supplied in the traffic analysis. This is demonstrated, for example, by looking at the volumes supplied in the Traffic Impact Analysis (TIA) for vehicles entering the facility during the AM peak hour shown on page 11 (Figure 5, Existing Morning Peak Hour Intersection Turning Movement Volumes). For Intersection Six (the main entrance into the facility) in Figure 5, the number of vehicles entering and exiting the facility totals 70. From Table 3 of the TIA (Current Development {Truck Maintenance Facility}), the lead agency has estimated, using the ITE trip rate for the General Light Industrial (110) land use, 259 vehicles per hour. This is more than three times the 70 vehicles per hour found from actual traffic counts. Using the ITE trip rate instead of the vehicle data shown from the traffic counts appears to significantly overestimate the existing project baseline emissions. This results in the incremental emissions, i.e., the difference between the existing facility emissions and the emissions for the proposed warehouse facility being

CARECA-12 (CONT.)

underestimated. The AQMD staff therefore recommends that applicable analyses be revised in the Final MND using the project-specific traffic count data. Alternatively, the lead agency could explain why the project-specific traffic counts should be ignored.

On-Road Truck Trip Length

3. In the CalEEMod input files provided to AQMD staff by the lead agency, an average one-way trip length of 8.3 miles was used to estimate operational air quality impacts for trucks moving goods for the proposed facility. Trucks operating from these kinds of facilities often handle goods coming directly from the port areas over 70 miles away as well as potentially serving out of state destinations. Absent tenant-specific trip length information, the AQMD staff recommends a one-way trip length from the project site to the port areas as more appropriate trip length for on-road truck emissions and that applicable analyses in the Final MND be revised. If the lead agency is uncertain of the types of tenants or the trip lengths, the lead agency could alternatively limit activities, as a condition of a tenant's occupancy, to levels described in the analysis. Otherwise, long-term project air quality impacts for operations and other relative analyses will be substantially underestimated.

Use of Non-Default Truck Trip Rate

4. In the air quality and health effect analyses, the lead agency based its estimates on trip generation rates from the 8th Edition of the Institute of Transportation Engineers (ITE) Report using a non-default trip rate of 1.44 per thousand square of gross floor area (Land Use Code 152 – High-Cube Warehouse). Based on guidance from the California CalEEMod User's Guide, the AQMD staff recommends using a more conservative trip rate of 2.59 per 1,000 square feet. AQMD staff believes a more conservative trip rate is appropriate as the tenant is unknown, and there are no conditions on the project limiting activity to what is analyzed in the MND.

CalEEMod Fleet Mixture Percentage

5. On page 28 of the Draft IS/MND, the lead agency's narration lists the fleet mixture percentages used in the CalEEMod land use model to estimate operational emissions. The narration states that the estimated fleet mixture is approximately 37 percent truck traffic for the proposed warehouse use including 17 percent heavy-heavy duty (HHD); 8 percent medium-heavy duty (MND); and 12 percent light-heavy duty 1 (LHD1). The CalEEMod inputs, however, also include the 3.4 percent Light-Heavy Duty 2 (LHD2) category that was omitted in the narration total. The 3.4 percent LHD2 percentage would therefore increase the overall truck percentage from 37 to 40 percent. In the Final MND, the narration should be revised to be consistent with the CalEEMod fleet percentages shown in the actual modeling.

CARECA-12
(CONT.)

Localized Significance Thresholds Analysis: Construction and Operations

6. Under Sensitive receptors on page 13 of the Air Quality & Climate Change Assessment and upon an aerial map inspection, a single-family residential property appears to be located within one-quarter mile of the proposed warehouse. We therefore recommend that the lead agency evaluate localized air quality impacts. The AQMD staff requests this evaluation to ensure that any nearby sensitive receptors are not adversely affected by the construction and operational activities that are occurring in close proximity. AQMD guidance for performing a localized air quality analysis can be found at the following web address: http://www.aqmd.gov/ceqa/handbook/LST/LST.html .

Operational Mitigation Measures

7. In the event the lead agency determines that project air quality impacts (regional or localized) for operations will exceed recommended significance thresholds (mostly attributed to mobile source tailpipe emissions from vehicles operating at the proposed facility), the AQMD staff encourages the lead agency to develop a common set of enforceable mitigation measures to reduce those emissions to the maximum extent feasible. As the lead agency is aware, heavy-duty trucks are the largest source of NOx emissions in our basin and NOx emissions must be reduced by approximately two thirds beyond existing rules and regulations in order to meet air quality standards as required by 2023. Without meeting air quality standards, our region faces federally mandated sanctions, including possible loss of transportation funding. AQMD staff therefore recommends that the lead agency consider the feasibility of the following measures to reduce project impacts. Other lead agencies that have imposed these and similar measures include the City of Banning[1], Riverside County[2], City of San Bernardino[3], and the San Pedro Bay Ports[4], among others.

   Recommended additional measures:

   - Lease/purchase documents shall identify that tenants required to implement the following:
   - At project start, all heavy duty trucks entering the property must meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.
   - If the above clean truck requirements are infeasible, a phase-in schedule should be put forth that will feasibly achieve emission reductions as soon as possible, and faster than existing regulations. Should an alternative

[3] Palm/Industrial Distribution Center http://www.ci.san-bernardino.ca.us/civica/filebank/blobdload.asp?BlobID=11793
[4] Clean Trucks Program http://www.cleanairactionplan.org/cleantrucks/ .

schedule be found necessary, the AQMD staff should be consulted prior to approving the schedule.

- Provide a phase-in schedule and goals for the introduction of zero or near-zero technology trucks (e.g., 10% by 2020, 20% by 2025, etc.) that visit warehouses.

The facility operator will maintain a log of all trucks entering the facility to ensure that on average, the daily truck fleet meets the quantities and emission standards listed in the Draft MND. This log should be available for inspection by city staff at any time.

- The facility operator will ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies [for example, by requiring attendance at CARB approved courses (such as the free, one-day Course #512)].
- Limit the daily number of trucks allowed at each facility to levels analyzed in the Final MND. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the project through CEQA prior to allowing this higher activity level.
- Require at least a portion of the fleet to utilize alternative fueled technologies.
- The 2012 Regional Transportation Plan includes a zero-near-zero emissions truck corridor along the SR-60 freeway west of I-15. Because at least a portion of the trucks serving this project may be expected to travel along this route, the project should consider providing onsite alternative fueling infrastructure, such as electric charging stations or natural gas fueling that will help facilitate these low-emitting trucks. This could include ensuring electrical panels and wiring are sufficiently sized to accommodate future needs.
- At a minimum, require tenants upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the tenant should also be required to accept and use them.
- Restrict overnight parking in residential areas. Establish overnight parking within the warehouse/distribution center where trucks can rest overnight.
- Establish area(s) within the facility for repair needs.
- Post signs outside of the facility providing a phone number where neighbors can call if there is a specific issue.
- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.

CARECA-12 (CONT.)

- Have truck routes clearly marked with trailblazer signs, so trucks will not enter residential areas.
- Identify or develop secure locations outside of residential neighborhoods where truckers that live in the community can park their truck, such as a Park & Ride.
- Provide food options, fueling, truck repair and or convenience store on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Requiring all on-site vehicles (hostlers, forklifts, etc.) to utilize zero or near-zero emission technology.
- Use street sweepers that comply with SCAQMD Rules 1186 and 1186.1.
- Install solar panels on all available roof space. If this isn't feasible, then at a minimum all buildings and electrical infrastructure should be designed to accommodate potential future solar panel upgrades.

Off-Road Construction Equipment Reduced Load Factors

8. In Appendix B (CalEEMod Output) in the air quality assessment, the lead agency estimated project construction impacts using the CalEEMod land use emissions computer model. This model uses default and user-defined settings to estimate emissions based on the land use settings. In the CalEEMod inputs under User Entered Comments, the lead agency has reduced the Construction Phase Off-Road Equipment load factors by 33 percent citing the California Air Resources Board (CARB) as authority for the changes. For example, the default load factor in the CalEEMod model for rubber tired loaders of 54 percent was reduced to 36 percent.

   Based on communication with ARB staff[5] regarding this issue, the AQMD staff confirmed that CARB staff does not recommend reducing the default settings in the current OFFROAD2007 without considering all parameters besides the load factor. Other parameters such as activity level, horsepower, and population all contribute to the emission factor estimate, and selectively changing only one parameter will lead to inaccurate estimates at a project level. For some equipment types, OFFROAD2007 may underestimate emissions while others may be overestimated. Because of these revisions (and others), CARB developed the new OFFROAD2011. The AQMD staff therefore recommends that the lead agency either use existing OFFROAD2007 defaults until OFFROAD2011 is incorporated into CalEEMod later this year or run OFFROAD2011 outside CalEEMod and use those results to modify the CalEEMod construction calculations. Therefore, even though the reductions might not change the lead agency's determination of significance for construction air quality impacts, these reductions related to

CARECA-12 (CONT.)

[5] Personal communication with Nicole Dolney, June 1, 2012.

reduced off-road equipment load factors are not recommended by the AQMD staff without further substantial evidence to support those emission reductions resulting from their use. Otherwise, the lead agency should commit to enforcing the assumed lower non-substantiated emission factors.

Construction Mitigation Measures

9. Should the lead agency determine that project localized construction air quality impacts will exceed the AQMD recommended daily significance thresholds, the AQMD staff therefore recommends the following mitigation measures during the projected 10 month construction period to reduce adverse air quality impacts from on-site construction emission sources, if applicable and feasible.

   Recommended additions:

   - Limit the amounts of daily soil disturbance to the amounts analyzed in the Draft MND.
   - All clearing, grading, earth-moving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.
   - Apply non-toxic soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for ten days or more).
   - All trucks hauling dirt, sand, soil, or other loose materials are to be covered.
   - Sweep streets at the end of the day if visible soil is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water).

   Further, other lead agencies in the region including LA County Metro, the Port of Los Angeles, and the Port of Long Beach have also enacted the following mitigation measures. AQMD staff recommends the following measures to further reduce air quality impacts from construction equipment exhaust:

   - Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
   - Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by

CARECA-12 (CONT.)

the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

- A copy of each unit's certified tier specification, BACT documentation, and CARB or AQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html .

Re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Planning Commission Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant") in the City of Ontario ("City"). The Project's Final Environmental Impact Report ("FEIR") and development plan will be considered at the May 28, 2024 Planning Commission meeting as Agenda Item D. The Commission will consider certification of the FEIR and approval of the Development Plan application.

CARE CA submitted comments on the DEIR and subsequently on the FEIR, accompanied by expert comments, showing that the FEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant air quality, public health, greenhouse gas ("GHG"), energy, transportation, and cumulative impacts. The Staff Report contains responses[1] to CARE CA's comments on the FEIR. However, the responses fail to resolve the major flaws CARE CA and its experts identified in the DEIR.

CARECA-12 (CONT.)

[1] Letter from T&B Planning Inc. to City, re: 5355 East Airport Drive (PDEV22-017) – Response to April 15, 2024 Comment Letter from CARE CA (May 20, 2024).

6752-008acp

printed on recycled paper

We reviewed the Planning Commission Staff Report with the assistance of air quality expert Dr. James Clark.[2]

The Staff Report fails to meaningfully address the flaws in the Project's environmental review. Regarding hazards, the FEIR identifies significant vapor intrusion impacts due to PCE contamination, but improperly defers formulation of mitigation measures. The FEIR also fails to analyze the full scope of the Project – CEQA requires that an EIR analyze the reasonably foreseeable consequences of the Project, but the Project's FEIR fails to analyze the Project's reasonably foreseeable use as a parcel hub (a use that generates more trips than analyzed), and fails to analyze reasonably foreseeable truck trips to the Ports of Los Angeles and Long Beach. Regarding cumulative impacts, the Staff Report still fails to meaningfully respond to the legal authority requiring analysis of the Project's impacts in the context of the numerous other warehouses existing and planned in the area. The Staff Report also fails to resolve flaws in the Project's health risk assessment, which still underestimates impacts on sensitive receptors. Regarding energy, the Staff Report provides an analysis of factors in Appendix F the CEQA Guidelines. But the analysis is wholly inadequate because it fails to address applicable energy consumption measures and renewable energy options. As a result, the FEIR's conclusions are not supported by substantial evidence. Rather, substantial evidence demonstrates that the Project's significant impacts are greater than analyzed in the FEIR.

CARECA-12
(CONT.)

The Staff Report incorrectly concludes that the "final EIR contains a complete and accurate reporting of the environmental impacts associated with the Project" and complies with CEQA.[3] The Staff Report recommends that the Planning Commission adopt the final EIR and approve the Project's Development Plan Application.[4] These recommendations are unsupported by evidence in the record due to the major flaws in the Project's environmental review.

CARE CA urges the Planning Commission to require the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker

[2] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit A**.
[3] Staff Report, Item D - 2573 of 3296.
[4] Staff Report, Item D - 1 of 3296.

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

health and safety hazards, and the environmental impacts of the Project. The coalition includes Ontario residents Daniel Brewer, David Audelo, Carlos Mendez, Rober Rubio, the District Council of Ironworkers and Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in Ontario and in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in the City of Ontario and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

CARECA-12
(CONT.)

II. THE FEIR FAILS TO ADEQUATELY ANALYZE, QUANTIFY, AND MITIGATE THE PROJECT'S POTENTIALLY SIGNIFICANT IMPACTS

A. The FEIR Improperly Defers Formulation of Mitigation Measures for Hazardous Materials

The FEIR's Phase I/II Environmental Site Assessment ("ESA") identifies levels of tetrachloroethene ("PCE") in soil vapor samples in excess of current commercial/industrial calculated soil gas screening levels ("SGSLs").[5] The ESA concludes that "PCE impacts potentially associated with the use and storage of hazardous materials at Building B could contribute to vapor intrusion conditions on the Site."[6] The FEIR identifies this contamination as a potentially significant impact.[7] Additionally, the ethylbenzene concentration in one soil vapor sample

[5] FEIR, Phase I/II Environmental Site Assessment, pg. vii.

[7] DEIR, pg. S-17.

printed on recycled paper

www.tbplanning.com

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.[8] The FEIR fails to disclose this significant impact in the body of the FEIR, in violation of CEQA.

The FEIR states that the potentially significant vapor intrusion impacts would be mitigated through imposition of Mitigation Measure ("MM") 4.7-1. This measure requires future preparation of a Soil Management Plan ("SMP"). he SMP will include instructions for handling, storage, and disposal of any known or potentially impacted soil during soil moving activities. But MM 4.7-1 fails to explain how the PCE contamination at the Project site will actually be addressed – whether it will be remediated, capped in place, etc. – and the FEIR lacks a quantitative analysis of the construction impacts associated with that process. The measure states that contaminated soils will be monitored and provides guidance for proper soil handling, but does not specifically state that PCE-contaminated soil will be removed. Under MM 4.7-1, it is unclear if the City will remove PCE-contaminated soil or adopt passive/engineered vapor intrusion mitigation such as installing a vapor barrier or venting. Without clear performance standards and a quantitative analysis of the impacts of the PCE cleanup phase of construction, MM 4.7-1 remains incomplete and ineffective, and the FEIR's construction impact analysis remains incomplete.

CARECA-12
(CONT.)

MM 4.7-1 improperly defers formulation of mitigation measures related to PCE contamination to a future date.

CEQA Guidelines Section 15126.4 states that formulation of mitigation measures shall not be deferred until some future time. The Guidelines permit an agency to develop the "specific details of a mitigation measure" after project approval "when it is impractical or infeasible to include those details during the project's environmental review."[9] In such circumstances, deferral of mitigation details is permitted if the agency "(1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will [be] considered, analyzed, and potentially incorporated in the mitigation measure."[10] Compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on

[8] FEIR, Phase I/II Environmental Site Assessment, pg. viii.
[9] Guidelines, § 15126.4, subd. (a)(1)(B) (Section 15126.4).
[10] Section 15126.4, subd. (a)(1)(B); *see Save Our Capitol! v. Department of General Services* (2022) 85 Cal.App.5th 1101, 1134 (*Save Our Capitol!*).)

6752-008acp

substantial evidence in the record, to reduce the significant impact to the specified performance standards.[11]

Here, the FEIR defers formulation of the PCE mitigation until after Project approval. But the City fails to present any evidence that it would be impractical or infeasible to do so during the Project's environmental review. Based on the evidence before the City, it should be feasible to require and formulate vapor intrusion mitigation. Even if deferral of formulation of mitigation were reasonable in this case, MM 4.7-1 fails to adopt specific performance standards for remediating PCE contamination and the associated vapor intrusion risks. MM 4.7-1 also fails to clearly identify the types of potential actions that may be taken to mitigate the vapor intrusion risk. Thus, the City improperly defers formulation of PCE contamination and vapor intrusion mitigation.

The City also improperly defers formulation of mitigation for the ethylbenzene contamination. As with the PCE contamination, MM 4.7-1 fails to substantiate how this contaminant will be addressed. The FEIR contains no evidence that formulation of mitigation for ethylbenzene contamination is impractical or infeasible, identifies no performance standards, and fails to identify potential mitigation measures. Mitigation for this impact is thus improperly deferred.

CARECA-12
(CONT.)

B. The City Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the FEIR showed that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse, which has a trip generation rate 2.6 times the rate used in the FEIR. In Response 1-8, the City reiterates its position that analyzing the Project as a combination of the "Warehousing" and "High-Cube Cold Storage Warehouse" land uses is reasonable due to the Project's anticipated use and size.[12]

The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[13] Here, the Project proposes a 270,337-square-foot industrial

[11] *Id.*

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

building with a proposed height of 46 feet on 13.08 acres of land. A high-cube parcel hub warehouse is a reasonably foreseeable use of this project because "high-cube parcel hub warehouse" is defined in Institute of Transportation Engineers ("ITE") land use code 156 as a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods prior to their distribution to retail locations or other warehouses. And Mr. Marshall's comments on the FEIR demonstrate that the Project site includes adequate parking to support this use. Even if less-intensive warehouse uses are possible for this Project (such as the FEIR's combination of "Warehousing" and "High-Cube Cold Storage Warehouse"), use as a high-cube parcel hub warehouse is a reasonably foreseeable outcome that must be analyzed.

The City's claim that the Project's "anticipated use" does not include a high-cube parcel hub warehouse is irrelevant to the analysis. Courts have held that in this situation, "the identity of a tenant is irrelevant to CEQA review."[14] The court in *Maintain Our Desert Environment v. Town of Apple Valley* explained that "land use entitlements such as conditional use permits and development approvals run with the land and do not belong to the permittee…. had [the developer] developed the Project and then held it out for sale to any interested buyer, no additional CEQA review would have been necessary for the new owner so long as the use was consistent with that that had already been approved."[15] Here, the project that is the subject of the FEIR is a Development Plan to develop an industrial building totaling 270,337 square feet of gross floor area on 13.08 acres and having a FAR of 0.47. This building could be used as a high-cube parcel hub warehouse, so this level of use must be analyzed in the FEIR.

CARECA-12 (CONT.)

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the FEIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. The City's approach to cumulative impacts, relying on South Coast Air Quality Management District ("SCAQMD") guidance, is that emissions of criteria air pollutants or toxic air contaminants that do not exceed individual project thresholds are also not cumulatively considerable.[16] CARE CA's

[14] *Am. Canyon Cmty. United for Responsible Growth v. City of Am. Canyon* (2006) 145 Cal. App. 4th 1062, 1074 (citing *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 443–449)).

printed on recycled paper

comments provided a discussion of the controlling caselaw,[17] the Attorney General's recent litigation on this issue in *People of the State of California v. City of Fontana*,[18] and pending updates to the SCAQMD significance thresholds for cumulative impacts in response to this litigation. These authorities explain that the City's "drop in the bucket" approach to cumulative impacts does not comply with CEQA.

In Responses 1-10 and 1-11, the Staff Report states: "[t]he commenter is again advised that the SCAQMD is the regulatory authority on air quality charged with the responsibility of ensuring the improvement of air quality in the South Coast Air Basin… The commenter speculates on 'updated thresholds' for air quality impacts. Absent these 'updated thresholds' the EIR properly evaluates air quality impacts in the context of existing thresholds, protocols, and methodologies."[19]

The Staff Report and the FEIR continue to fail to address any of the controlling legal authority on this issue raised in CARE CA's comments. The court in *Environmental Protection Information Center v. California Dept. of Forestry Fire Protection* stated: "[w]e review an agency's decision regarding the inclusion of information in the cumulative impacts analysis under an abuse of discretion standard. 'The primary determination is whether it was reasonable and practical to include the projects and whether, without their inclusion, the severity and significance of the cumulative impacts were reflected adequately.'"[20] CARE CA's comments demonstrate that the SCAQMD individual project significance threshold fail to reflect the significance of cumulative air quality and public health impacts in areas burdened by extensive warehouse development – this Project would add a substantial number of diesel truck trips to routes in an area with a high existing background MATES cancer risk, combining with the emissions of trucks from numerous other warehouses. Analysis of cumulative impacts from past, present, and probable future warehouse projects is feasible. As an example, Dr. Clark's comments present data from Pitzer College's Warehouse CITY tool, which maps existing and proposed warehouses in Los Angeles, Riverside, and San Bernardino Counties.[21] The tool measures metrics including acreage, square footage, and diesel particulate matter and carbon emissions.[22]

The Staff Report's statement that CARE CA speculates as to "updated thresholds" is erroneous because CARE CA's comments link directly to the materials for SCAQMD's working group meetings – these materials discuss updates to the thresholds.[23] The Staff Report's failure to discuss SCAQMD's pending updates is inconsistent with the Staff Report's statement that SCAQMD is the regulatory authority on air quality. In sum, the City's rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and informational requirements of CEQA.

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

CARE CA's comments on the FEIR identify flaws in the City's Mobile Source Health Risk Assessment ("HRA") that underestimate health risk impacts on residential and non-residential (worker) receptors in the vicinity of the Project. In Responses 1-12 and 1-13, the Staff Report disputes these flaws. The Staff Report maintains that "[a]ny variant in interpretation of OEHHA guidance such as is suggested by the commenter would not materially affect the EIR health risk significance conclusions" because "the Project site is surrounded by industrial uses and the nearest sensitive receptor locations are short-term stay hotels located on the opposite side of freeways with the closest being approximately 3/4-mile from the Project site."[24]

CARECA-12 (CONT.)

The Staff Report's statement regarding distance from sensitive receptors ignores that the Project would generate truck trips impacting sensitive receptors along the City's designated truck routes.[25] The Project's primary truck routes would depend on the Project's future uses. Despite uncertainty regarding the Project's future tenants, the HRA makes an unsubstantiated assumption regarding the Project's primary truck route, shown in the exhibit below.[26]

certified WBENC

EXHIBIT 2-C: MODELED OFF-SITE EMISSION SOURCES

CARECA-12 (CONT.)

The HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. Trucks could easily travel west on Airport Drive and north along Milliken Avenue, which are both City-designated truck routes.[27] Sensitive receptors including Receptor R6 are located off Milliken Avenue, and could thus be impacted by cumulative truck trips from this Project and other warehouses. The HRA's assumption that trucks would not travel west along Airport Drive underestimates impacts. A revised HRA must be prepared.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the FEIR underestimates truck trip lengths by failing to account for the Project's distance to the Ports of Los Angeles and Long Beach. CARE CA presented numerous comment letters from SCAQMD

[27] The Ontario Plan, Mobility Element, Figure M-04, https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/The%20Ontario%20Plann/Mobility/FIgure%20M-04%20Truck%20Routes.pdf; Clark Comments, pg. 5.

printed on recycled paper

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

recommending analysis of trips to the Ports, and presented evidence showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario. In Response 1-16, the Staff Report states:

> The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, Project Description, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages.

CARECA-12 (CONT.)

The Staff Report apparently dismisses the SCAQMD comments as inapplicable without providing any evidence demonstrating that the Project's truck trips would be limited to the local 40-mile average trip lengths analyzed in the FEIR, and without considering the additional guidance from SCAQMD contained in the letters which explains that truck trips to and from the ports should be analyzed. Many of the SCAQMD letters recommending consideration of the distance to the Ports were in regard to "spec" warehouses with unknown tenants, just like the Project.[28] The Staff Report and the FEIR's responses fail to respond to this guidance with good faith, reasoned analysis,[29] and still fail to provide any evidence demonstrating that goods brought in and out of the Project's warehouses would primarily come from short-distance truck trips.

The Staff Report's statement that it is speculative to assume trucks may travel to the Ports of Los Angeles and Long Beach also misstates the applicable legal standard. The City's response ignores that an EIR must analyze reasonably foreseeable consequences of a Project. Public Resources Code Section 21065 provides, in part: "'Project' means an activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical

[28] SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf ("the future tenant(s) of the building is not known").

printed on recycled paper

change in the environment."[30] Here, the Project proposes a 270,337-square-foot industrial building with a proposed height of 46 feet on 13.08 acres of land. CARE CA's comments contain evidence showing that trips to the Ports are a reasonably foreseeable outcome of a warehouse like this (citing to the massive volume of goods moving to and from the Ports, and recommendations from SCAQMD).[31] In light of this evidence, the City's assumption that trucks would not travel to the Ports is speculative, unsupported by substantial evidence, and is a failure to analyze a reasonably foreseeable use permitted by the Development Plan.

This letter contains additional substantial evidence showing that trips to the Ports are reasonably foreseeable. The National Center for Sustainable Transportation ("NCST"), sponsored by the California Department of Transportation, prepared a research report titled "Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns" in 2017.[32] The report analyzed Southern California Association of Governments ("SCAG") data on warehouses in the six counties that comprise the SCAG region (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura). The report finds that **56% of the facilities in the SCAG region receive goods from the Port of Los Angeles and Long Beach**, and around 50% deliver to Southern California warehouses, retail stores or manufacturing plants.[33] This data suggests that trips to the Ports are reasonably foreseeable, and that it would be speculative not to account for distance to the Ports.

CARECA-12 (CONT.)

In June 2014, SCAQMD staff conducted a business survey of warehouse operators in the SCAQMD region.[34] The survey found that **42% of goods going to high-cube warehouses in the SCAQMD region originated from the Ports**, per the figure below.[35]

Origin and Destination of Goods

22 of 34 high cube warehouse respondents provided the origins and destinations of goods flowing to and from their facility. Major trends seen in the charts below include:

- The ports of Los Angeles and Long Beach make up a large share of imported goods yet only a minor component of exported goods
- Approximately 1 in 5 truck trips occurs between warehouses
- Approximately 1 in 7 truck trips involves an out of state location
- Approximately 1 in 10 truck trips involves a rail yard

During discussion at the April 15, 2024 Development Advisory Board hearing, a City consultant suggested that if the Project only makes truck trips to other warehouses, it would not be necessary to evaluate distance to the Ports. The figure above shows that only a small percentage of goods come from other warehouses and that the lion's share of goods are from the Ports. Thus, it would be speculative to disregard the Project's distance from the Ports in analyzing its impacts.

CARE CA's prior comments discussed the volume of goods passing through the Ports. 32 percent of all containers in the U.S. move through the Ports.[36]

CARECA-12 (CONT.)

[36] SCAG, ConnectSocal, Technical Report re Goods Movement (Adopted September 3, 2020), pg. 9, available at https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_goods-movement.pdf?1606001690.

6752-008acp

Approximately 40 percent of the total U.S.-Asia trade is served by the Ports, and 40 percent of the imports entering the Ports are transloaded or cross-docked.[37]

Substantial evidence also demonstrates the demand for port-related warehouse space is expected to expand. SCAG's 2012-2035 Regional Transportation Plan forecasts that "Demand for port-related warehouse space is projected to grow at a faster pace than demand for domestic warehousing… As space near the San Pedro Bay Ports reaches capacity, port warehousing will push out to the Inland Empire…. By 2035, the region may experience a shortfall of more than 228 million square feet in warehouse space relative to demand."[38] The table below reflects SCAG's forecasts for growth in demand for port-related warehouse space. The growth in the port-related market is expected to be much higher than the domestic market.[39]

Table 2.4 2014-2040 Minimum and Maximum Growth in Unconstrained Occupied Warehouse Space by Cargo Market across Alternate Scenarios

	Growth Percentage Range		Annualized Growth Rate Range	
Cargo Market	**Min.**	**Max.**	**Min.**	**Max.**
Port-related market	56%	83%	1.7%	2.4%
Border Crossing-related market	75%	165%	2.2%	3.8%
Domestic market	26%	39%	0.9%	1.3%
Total	**31%**	**45%**	**1.1%**	**1.4%**

Source: SCAG Warehouse Space Forecasting Model, Version 1.0, developed in June 30, 2016.

In sum, substantial evidence demonstrates that trips to the Ports are reasonably foreseeable for a spec warehouse proposed in the SCAG region, like this one. The lack of a specific tenant identified for the Project does not justify omission

of this analysis. As a result of this omission, the FEIR underestimates transportation, air quality, and GHG impacts.

F. The FEIR Still Fails to Include Sufficient Investigation into Energy Conservation Measures

CARE CA commented that the FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines.[40] CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[41] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[42]

In Response 1-20, the Staff Report suggests that discussion of energy consumption measures is not required for this Project because its energy impacts are less than significant.[43] The City continues to make the same error as the lead agency in *CCEC* because the EIR in that case also identified a less-than-significant energy impact.[44] The court held that the EIR must nonetheless analyze energy consumption measures.[45]

Response 1-20 provides a "CEQA Guidelines Appendix F Energy Analysis" in Table 1-1.[46] Table 1-1 addresses factors listed in Appendix F, subdv. II(C), but fails to include any discussion of renewable energy options. As explained in *CCEC*, an EIR fails to comply with the requirements of Appendix F by not discussing or analyzing renewable energy options.[47] And as explained in CARE CA's prior comments, this FEIR must analyze the feasibility and effectiveness of measures including onsite solar facilities, electric vehicle charging, alternative fuel sources for the backup generators, more stringent idling requirements, and use of existing power sources during construction rather than generators.

The Staff Report contains additional responses regarding energy in Responses 1-21 to 1-25, but none address the feasibility of reducing energy

certified WBENC

consumption through onsite solar facilities. Response 1-21 states that the City need not evaluate using alternative fuel sources for backup generators because their emissions would be less-than-significant.[48] Again, the Staff Report makes the same mistake proscribed in *CCEC* by assuming no analysis of energy consumption measures is required if the Project's energy impact is less-than-significant.[49]

In Response 1-22, the City states that it would be infeasible to set more stringent idling requirements over existing requirements because there is no enforcement mechanism that the City can assure to enforce adherence.[50] But the City is authorized under Development Code Section 4.02.025(E) to impose conditions of approval to protect public health and mitigate environmental impacts. Section 4.02.025(E)(3) states that "All conditions of approval or requirements authorized by this Section are enforceable in the same manner and to the same extent as any other applicable requirement of this Development Code." Unenforceability is thus not a valid reason not to consider a more stringent idling requirement.

In Response 1-23, the Staff Report states that the FEIR adequately evaluated the feasibility of utilizing existing power sources (e.g., power poles) or alternative fuel generators rather than temporary power generators during construction. The Response seems to misunderstand the nature of CARE CA's comment by discussing how "new dry utility infrastructure would be installed underground."[51] Instead, the FEIR should have included a discussion on the feasibility of a measuring limiting use of diesel generators during construction.

In Response 1-25, the Staff Report states that it meaningfully addresses Appendix F's considerations of "whether a building should be constructed at all, how large it should be, where it should be located, whether it should incorporate renewable energy resources, or anything else external to the building's envelope."[52] But neither the Staff Report nor the FEIR contain this analysis.

In sum, the FEIR's energy analysis remains wholly inadequate. The Staff Report and the FEIR make no attempt to evaluate the feasibility of onsite renewable energy generation and storage, and fail to consider the feasibility of electric vehicle charging beyond existing requirements. And the Staff Report's

responses to proposed energy consumption measures in Responses 1-21 to 1-25 are generally nonresponsive and fail to meet CEQA's requirements.

III. THE COMMISSION CANNOT MAKE THE REQUISITE FINDINGS TO APPROVE THE PROJECT

Section 4.02.025(D) of the City of Ontario Municipal Code sets forth findings necessary to approve a development plan. The Code provides that an application for a development plan shall be denied if the following finding (among others) cannot be clearly established: "The proposed development will complement and/or improve upon the quality of existing development in the vicinity of the project and the minimum safeguards necessary to protect the public health, safety and general welfare have been required of the proposed project."[53]

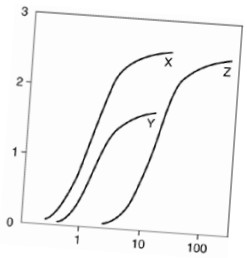
The Project would have a significant and unavoidable VMT impact. And the Project has potentially significant vapor intrusion, health risk, air quality, GHG, and energy impacts which have been underestimated in the FEIR. Because the Project's impacts on public health, safety and general welfare have not been adequately analyzed and mitigated, the City cannot make the requisite findings to approve the Project. A revised EIR must be recirculated before the Project can be recommended for approval.

CARECA-12 (CONT.)

IV. CONCLUSION

As is explained herein, the FEIR's hazards, air quality, health risk, energy, and transportation analyses remain substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the FEIR still fails to adequately disclose and mitigate the Project's significant impacts. As a consequence of these impacts, the City cannot make the requisite findings under CEQA to certify the FEIR or under the City of Ontario Municipal Code to approve the Project's Development Plan. CARE CA urges the Commission to require the City revise and recirculate the EIR before any further action is taken on the Project.

Sincerely,



Aidan P. Marshall

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Aidan Marshall

Subject: Comments On Staff Report For Final Environmental Impact Report (DEIR) 5355 Esat Airport Drive, City of Ontario, CA SCH No. 202209006

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the August 2023 City of Ontario's (the City) DEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the City of Ontario's Development Advisory Board Decision File No. PDEV22-017 – Draft EIR (dated March 18, 2024), the draft EIR consists of a Development Plan application to construct a 270,337 square-foot industrial building on the 13.08 acres of the Project site. The Project would require the demolition of the existing buildings and structures, on-site landscaping, and on-site parking. The design would also include the installation of site improvements, including drive aisles, landscaping, utility infrastructure, underground storm drain detection facilities, exterior lighting, walls/fencing, and signage along with improvements to East Airport Drive.

CARECA-12
(CONT.)

Figure 1: Site Location Map

Under existing conditions, the Project Site is developed with a grain processing company and a corn storage and distribution facility. The eastern portion of the Project Site contains grain storage silos, grain mill area, and five buildings that are used for maintenance and repair, grain storage, and service shop. The western portion of the Project Site contains enclosed grain storage, with an office trailer. A vehicle wash-down area is also present on the northeastern portion of the Site. Several subsurface septic systems are located beneath the Site to serve the existing uses.

CARECA-12 (CONT.)

In the Meeting Agenda for the May 28th, 2024 City of Ontario Planning Commission/Historic Preservation Meeting Agenda, the City included responses from T&B Planning (T&B) to comments on the Final EIR for the Project provided by CARE CA. The responses from T&B for the City in total claim that no new information has been provided within the comments. This assertion is not supported by the information provided within the responses from CARE.

Specific Comments

1. **Comment 1-12: The City's Air Quality Analysis Did Not Incorporate Building Downwash In The AERMOD Analysis.**

T& B claims that building downwash is not appropriate for volume or area sources. This is incorrect. The choice to model the idling trucks, which are movable discrete point sources onsite below the line of the building roof, is a controllable feature in the AERMOD model. Volume sources are defined in the AERMOD Users Guide as included a variety of industrial sources, such as building roof monitors, multiple vents, and conveyor belts.[1] Volume sources are characterized as having a defined specific release height above the ground, an initial lateral dimension of the volume, and an initial vertical dimension. While the assumption that roadways and idling trucks in the Health Risk Assessment can be modeled as a line of volume sources, it must be pointed out that emissions from idling trucks and moving trucks will come from the exhaust pipe(s) to the engine, releasing diesel particulate matter (DPM) from a raised pipe at a specific rate (a point source). Therefore, the use of building downwash in the model to ensure that the modeled concentrations are not underestimated is appropriate. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). T&B, in Response 1-12, states that the Project's Air Quality Impact Analysis experts (Technical Appendix B1 of the Draft EIR) have concluded that truck idling emissions sources resulting from the Project would not be materially affected by downwash, but it is important to note that the HRA does not quantify the effects of downwash. The City should address the impact of this issue in a Revised DEIR.

2. **Comment 1-41: The Air Quality Analysis Relies On An Input Value From AP-42 That**

CARECA-12 (CONT.)

[1] U.S. EPA. 2023. User's Guide for the AMS/EPA Regulatory Model (AERMOD). Pg 3-68

Is Rated As Poor And Maybe Unreliable

T&B's response that the impact from a poorly rated AP-42 value is incorporated into the analysis is not new evidence is not supported by the evidence in the FEIR. As was noted in my prior comments, the CalEEMOD analysis of the construction emissions incorporates various factors from U.S. EPA's Emission Factors Handbook (AP-42). The AP-42 emission factor for crushing stones used in the CalEEMOD analysis is rated E. This is the worst rating in AP-42, which according to U.S. EPA may not represent a random sample of the industry. The City's response to the questioning of the rating of the emission factor was qualitative at best, failing to show any quantitative analysis of the potential impacts. The City should assess the impacts of this variable in a Revised DEIR.

3. Comment 1-16: The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to T&B's response, the Project is proposed as a speculative development and the user(s) of the building. T&B goes on to state that it is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. This line of reasoning clearly conflicts with the goals of CEQA to analyze the foreseeable and reasonable emissions from the Project.

This statement also does not comport with the reality of where warehoused materials will ship from in the region. The 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. These Ports are the largest source(s) of containerized products, and therefore the primary sources of heavy-duty truck traffic, on the West Coast of the United States are the Ports of Los Angeles and Long Beach. "In 2020, the Ports of Los Angeles, Long Beach, and Oakland collectively accounted for over 34% of all United States international container trade. The Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day. Accordingly, the South Coast Air Basin now contains approximately 3,000 warehouses of over 100,000 square feet each, with a total warehouse capacity of approximately

CARECA-12 (CONT.)

700 million square feet, an increase of 20 percent over the last five years"),[2] citing data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units)[3] from 2020, the Ports of Los Angeles, Long Beach, and Oakland combined for 14.157 million TEUs, 34% of 41.24 million TEUs total nationwide.[4] The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710.

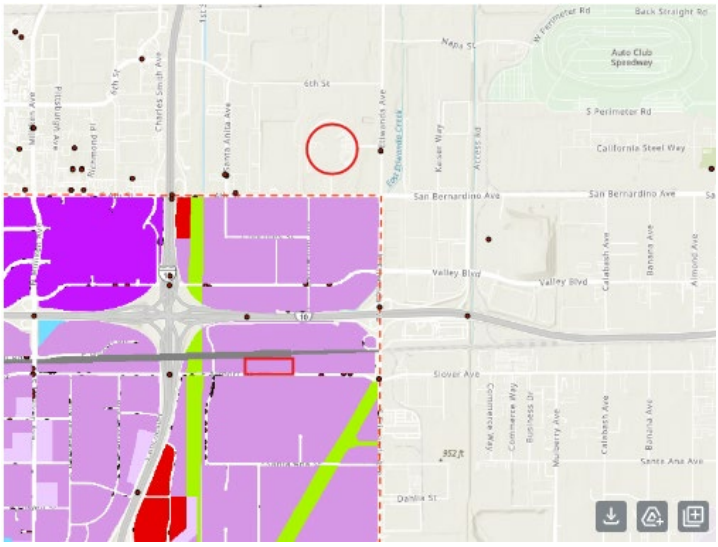
Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the regional burden and resulting in a potentially significant impact. The City must address the impact of this issue in a R-FEIR.

4. Additional Comments On The FEIR

a. The Truck Route Assumed For The Project Site Ignores The Traffic Constraints Of The Project Site

The truck route assumed in the FEIR assumes traffic will only exit the Project Site and turn left on East Airport Drive to S. Etiwanda Avenue. This route requires the trucks using the Project Site to cross (turn left out of the Project Site) Airport drive and to cross South Etiwanda Drive (turn left onto S. Etiwanda Avenue). The assumed distance to the 10 freeway is approximately 0.8 mile. An alternate route for traffic was not assessed in the FEIR which is longer than the primary route, but would have fewer traffic challenges for the drivers. Assuming trucks exit the Project Site and turn right (avoiding the delay getting across Airport Drive) then turn right on South Milliken Avenue, the vehicles will also be able to reach the 10 Freeway. The distance for this route is approximately 1.6 miles and is closer to the residential properties identified in the FEIR. The City must consider this alternate route and the air quality impacts in a R-FEIR.

b. The HRA And Air Quality Analysis Failed To Assess A Receptor Closer To The Project Site Than The Residential Properties To The Northwest – The San Bernardino County West Valley Detention Center



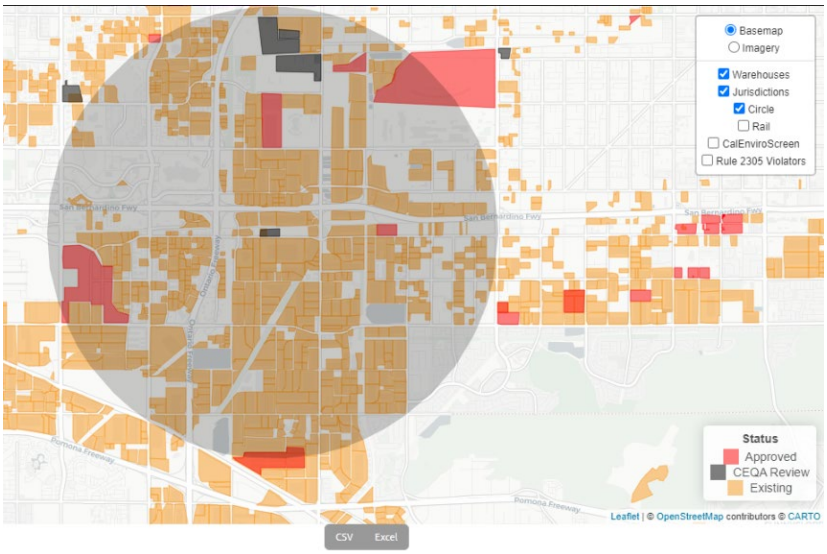
CARECA-12 (CONT.)

[2] Available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf

[3] https://data.bts.gov/stories/s/Container-TEU/x3fb-aeda/

[4] U.S. Dept. of Transportation, Federal Highway Administration, FHWA Operations Support – Port Peak Pricing Program Evaluation (2020), available at https://ops.fhwa.dot.gov/publications/fhwahop09014/sect2.htm

The HRA and Air Quality Analysis failed to consider a significant receptor near the Project Site. The San Bernardino County West Valley Detention Center is located approximately 5,600 feet north northeast of the Project Site at 9500 Etiwanda Ave in Rancho Cucamonga. The Detention Center houses approximately 3,347 inmates and 600 workers.



The Detention Center is nearly 3,000 feet closer to the Project Site, and is nearer the proposed truck route, than the residential property identified in the HRA. The City must assess the impacts of the Project emissions on this receptor center in a revised DEIR.

c. The Cumulative Analysis Of The Project Failed To Consider The Significant Number Of Existing Warehouse Projects In The Vicinity

Based on the current analysis of warehouse projects within a 5-kilometer radius (3.1 miles) of the Project Site, there are 595 current warehouses, totaling 126,400,000 square feet of floor space.

CARECA-12 (CONT.)

CARECA-12 (CONT.)

Those projects account for 85,000 truck trips per day, which emit 117.6 lbs of DPM and 13, 243 lbs of NOx per day. There is an additional 7,400,000 square feet of warehousing that is either approved or undergoing CEQA review (includes the Airport Site). The cumulative impacts must be considered in a revised DEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised draft environmental impact report should be prepared to address these substantial concerns.

Sincerely,

Re: Agenda Item B – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006)

Dear Planning Commission Members and Mr. Grahn:

On behalf of Californians Allied for a Responsible Economy ("CARE CA"), we submit these comments on the 5355 East Airport Drive Project (SCH No. 2022090006; File No. PDEV22-017) ("Project"), proposed by Prologis. Inc ("Applicant") in the City of Ontario ("City"). The Project's Final Environmental Impact Report ("FEIR") and development plan will be considered at the August 27, 2024 Planning Commission meeting as Agenda Item B. The Commission will consider certification of the FEIR and approval of the Development Plan application.

On May 28, 2024, the Planning Commission conducted a hearing to consider the Project and continued the Project for further consideration. In advance of the hearing, CARE CA submitted comments on the FEIR showing that the FEIR failed to comply with the requirements of CEQA by failing to accurately disclose and mitigate potentially significant air quality, public health, greenhouse gas ("GHG"), energy, transportation, and cumulative impacts. The Staff Report contains responses[1] to CARE CA's comments on the FEIR. However, the responses fail to resolve the major flaws CARE CA and its experts identified in the FEIR. The

CARECA-13

[1] Letter from T&B Planning Inc. to City, re: 5355 East Airport Drive (PDEV22-017) – Response to May 28, 2024 Comment Letter from CARE CA (August 8, 2024).

6752-010acp

printed on recycled paper

responses primarily claim that any issues raised by CARE CA have already been addressed in the FEIR and prior responses. This is incorrect. As shown herein, the City's responses fail to resolve the legal deficiencies identified in CARE CA's comments, and do not bring the FEIR into compliance with CEQA. The Project's environmental review remains inadequate.

We reviewed the Planning Commission Staff Report with the assistance of air quality expert Dr. James Clark[2] and transportation expert Norm Marshall.[3]

CARE CA urges the Planning Commission to require the City revise and recirculate the EIR to comply with CEQA before any further action is taken on the Project.

CARECA-13 (CONT.)

A. The FEIR Improperly Defers Formulation of Mitigation Measures for Hazardous Materials

The Project's Phase I/II Environmental Site Assessment shows that ethylbenzene concentration in one soil vapor sample exceeded the calculated soil gas commercial/industrial screening level of 163 micrograms per cubic meter.[4] CARE CA commented that the FEIR fails to disclose this impact in the body of the FEIR or analyze the resultant health impacts on people, in violation of CEQA.[5] The Court in *Banning Ranch Conservancy v. City of Newport Beach* explained:

> The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. "[I]nformation 'scattered here and there in EIR appendices,' or a report 'buried in an appendix,' is not a substitute for "a good faith reasoned analysis...."[6]

In Responses CARE-5 and CARE-6, the Staff Report still fails to address this critical informational defect. The responses simply state that the Media Management Plan explains the mitigation procedures that will be undertaken for all earthwork that involves chemically impacted soil.[7] But the Media Management Plan provides only general guidance on how impacted soil would generally be

CARECA-14

[2] Dr. Clark's technical comments and curricula vitae are attached hereto as **Exhibit A**.

[7] Staff Report, Letter from T&B Planning Inc., pg. 2-3.

printed on recycled paper

www.tbplanning.com

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

addressed – it does not address the FEIR's informational flaw of failing to disclose whether ethylbenzene contamination is a significant impact requiring mitigation.

CARE CA also commented that the FEIR improperly defers formulation of mitigation for PCE and ethylbenzene contamination. It is unclear whether the City will remove PCE and ethylbenzene contaminated soil or adopt passive/engineered vapor intrusion mitigation such as installing a vapor barrier or venting. Responses CARE-5 and CARE-6 state that the Media Management Plan explains the mitigation procedures that will be undertaken for all earthwork that involves chemically impacted soil.[8] But the Media Management Plan simply describes best practices for any required earthwork activities at the Project site. The Plan does not specify whether passive/engineered vapor intrusion mitigation may be employed as opposed to removal of all impacted soil, does not quantify the impacts associated with each form of mitigation (e.g. construction impacts associated with excavation, removal and backfilling contaminated soil versus impacts of installing vapor intrusion barriers), and does not commit the City of the Applicant to specific binding mitigation. As such, the Staff Report fails to address CARE CA's comments regarding the Project's significant soil contamination issues.

CARECA-14 (CONT.)

B. The City Still Fails to Adequately Evaluate Trips Generated by the Project

CARE CA's comments on the FEIR demonstrated that the Project's size and number of parking spots would enable it to be used as a High Cube Parcel Hub Warehouse, which has a trip generation rate 2.6 times the rate used in the FEIR. Responses CARE-7 and CARE-8 state that "the Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates" and "no further response is required."[9] Response CARE-8 further states that "[b]ased on the Project's design, there is no reasonable possibility that the Project could be used as a parcel hub."[10]

CARECA-15

The City has not provided substantial evidence in support of this claim. Conversely, transportation expert Mr. Marshall discusses the Project's features in detail, demonstrating that it could be used as a parcel hub.[11] Mr. Marshall and CARE CA's comments demonstrate that the proposed structure has adequate square feet to support use as a parcel hub (at least 200,000 sf), has a ceiling height

[8] Staff Report, Letter from T&B Planning Inc., pg. 2-3.
[9] Staff Report, Letter from T&B Planning Inc., pg. 3.
[10] *Id.*
[11] Marshall Comments, pg. 4-5.

printed on recycled paper

of 24 feet or more, and has adequate parking.[12] The City fails to rebut this evidence with any evidence.

CARECA-15 (CONT.)

C. The FEIR Still Fails to Adequately Disclose, Analyze and Mitigate the Project's Cumulative Impacts

CARE CA commented that the FEIR's analysis of cumulative impacts is inadequate because it fails to consider the cumulative impacts of past, present, and probable future projects. In summary, the City's approach to cumulative impacts is that emissions of criteria air pollutants or toxic air contaminants that do not exceed *individual* project thresholds set by South Coast Air Quality Management District ("SCAQMD") are also not *cumulatively* considerable.[13] CARE CA's comments explained that rote application of SCAQMD significance thresholds without analysis of the context in which the Project is being proposed fails to satisfy the analytical and information requirements of CEQA, per caselaw such as *Kings County Farm Bureau v. City of Hanford.*[14]

Responses CARE-9 and CARE-10 state that the FEIR and prior responses to comments already adequately responded to these comments, and no further response is necessary.[15] But at no point have the City's responses meaningfully addressed the caselaw proscribing the City's invalid approach to cumulative impacts. Response CARE-11 reiterates that the City is complying with current South Coast Air Quality Management District ("SCAQMD") guidance, as opposed to pending updates to the cumulative impacts guidance. Again, this response ignores the underlying legal mandates for these updates, which include recent CEQA cases such as *People of the State of California v. City of Fontana.*[16]

CARECA-16

D. The FEIR's Quantified Health Risk Analysis Underestimates Impacts

CARE CA commented that the City's Mobile Source Health Risk Assessment ("HRA") underestimates health risk impacts on sensitive receptors. One issue is that the HRA only analyzes trucks travelling east along Airport Drive, away from sensitive receptors located west of the Project. Trucks could easily travel west on

CARECA-17

[12] *Id.*; CARE CA letter to City re: Agenda Item D – File No. PDEV22-017: 5355 East Airport Drive Project (SCH No. 2022090006) (May 28, 2024), pg. 6.
[13] DEIR, Appendix B, pg. 53.

[15] Staff Report, Letter from T&B Planning Inc., pg. 3-4.
[16] San Bernardino Superior Court, Case No. CIVSB2121829; SCAQMD Working Group Meeting # 4, Cumulative Impacts from Air Toxics for CEQA Projects (June 6, 2023) pg. 6;

printed on recycled paper

Airport Drive and north along Milliken Avenue, which are both City-designated truck routes. Response CARE-13 states that "[e]ven if trucks travel to and from the Project site along the route as the commenter suggested, it would not materially affect the EIR health risk significance conclusions, as the risks are well below the significance threshold."[17] This statement is not supported by any quantitative analysis. Further, the claim that risks are well below the significance threshold is based on calculations that assume trucks would travel east, away from sensitive receptors. Thus, the City's response is not supported by substantial evidence.

CARECA-17 (CONT.)

CARE CA's air quality expert also demonstrated that the HRA failed to account for building downwash and relied on unreliable input values. Responses CARE-27 and CARE-28 state that no additional response is required regarding these issues. Dr. Clark's comments, attached, demonstrate that the HRA's methodological flaws and unsupported conclusions have not been resolved.

E. The FEIR Still Underestimates Truck Trip Lengths and Resultant Impacts

CARE CA commented that the FEIR underestimates truck trip lengths by failing to account for the Project's distance to the Ports of Los Angeles and Long Beach. CARE CA presented numerous comment letters from SCAQMD recommending that warehouse project's analyze trips to the Ports, and presented evidence showing that trips to the Ports are a reasonably foreseeable consequence for a warehouse in the City of Ontario. Responses CARE-14 and CARE-15 respond that "[t]he commenter raises no new or additional environmental issues" and "no further response is required."[18]

CARECA-18

Further response is necessary because the City's previous response (Response 1-16) in the May 28, 2024 Staff Report erroneously stated that the SCAQMD guidance is inapplicable to this Project because this Project would be a speculative warehouse.[19] But as explained in CARE CA's prior comments, SCAQMD advises

[17] Staff Report, Letter from T&B Planning Inc., pg. 4.
[18] Staff Report, Letter from T&B Planning Inc., pg. 5.
[19] "The commenter states that the Final EIR misinterprets the SCAQMD's guidance and provides examples of previous SCAQMD comments on other, unrelated warehouse projects alleging that the Project's truck trip length assumptions are not supported by substantial evidence. As discussed in Draft EIR Section 3.0, Project Description, the Project is proposed as a speculative development and the user(s) of the building is not known at this time (refer to Draft EIR p. 3-13). It is unknown and speculative at this time whether trucks serving the Project would travel to the Ports of Los Angeles and Long Beach as a trip origin or designation, given the complexities of supply chain routing and transportation geography. As stated in Response to Comment A-18 in the Final EIR, the trip lengths were derived by weighting the average trip lengths using traffic trip percentages."

printed on recycled paper

www.tbplanning.com

PLANNING • DESIGN • ENVIRONMENTAL • GRAPHICS

certified WBENC

speculative warehouses to analyze trips to the Ports.[20] The City has not corrected this omission or meaningfully addressed this issue.

In response to the studies presented in CARE CA's comments showing that trips to the Ports are reasonably foreseeable, Response CARE-16 argues that the studies show that it is more likely that the Project will not service the Ports.[21] But as explained in CARE CA's prior comments, an EIR must analyze reasonably foreseeable consequences of a project.[22] Here, the Project proposes a 270,337-square-foot industrial building with a proposed height of 46 feet on 13.08 acres of land. CARE CA's comments contain evidence showing that trips to the Ports are a reasonably foreseeable outcome of a warehouse like this (citing to quantitative evidence regarding the massive volume of goods moving to and from the Ports, as well as specific recommendations from SCAQMD).[23] In light of this evidence, the City's assumption that trucks would not travel to the Ports is unsupported by substantial evidence and is a failure to analyze a reasonably foreseeable use permitted by the Development Plan, as required by CEQA.

CARECA-18 (CONT.)

F. The FEIR Still Fails to Include Sufficient Investigation into Energy Conservation Measures

CARE CA commented that the FEIR fails to include sufficient investigation into energy conservation measures that might be available or appropriate for the Project, as required by the CEQA Guidelines.[24] CARE CA's comments discussed the decision in *California Clean Energy Commission v. City of Woodland* ("*CCEC*"),[25] in which the Court of Appeal held that an EIR failed to comply with the requirements of Appendix F to the Guidelines by not discussing or analyzing renewable energy options.[26] Response CARE-17 states "[t]his comment does not raise any new issues concerning the environmental analysis provided in the Draft EIR and thus no further response is required."[27]

CARECA-19

[20] SCAQMD, Comments on Notice of Availability of a Recirculated Draft Environmental Impact Report (EIR) for Rubidoux Commerce Park Project (Proposed Project) (SCH No. 2020110449) (October 9, 2023), available at https://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2023/october-2023/RVC230901-01.pdf ("the future tenant(s) of the building is not known").

Further response is necessary because the City has not yet analyzed the feasibility and effectiveness of measures including onsite solar facilities, such as rooftop, parking lot, or ground-level solar photovoltaics. The City has not addressed considerations such as the technical and economic feasibility of installing solar facilities on the Project site, the potential size of the Project's solar zone, and the potential magnitude of mitigation provided by installing solar facilities. The City has not evaluated the extent to which mobile source energy consumption could be reduced during Project operations through electric vehicle charging infrastructure (above what is required by existing regulations).

Response CARE-18 simply states that the Project would be solar ready, but this information does not meet CEQA's requirements discussed herein and in CARE CA's prior comments. As such, the Project's energy analysis remains inadequate.

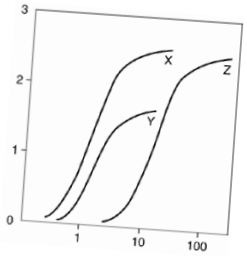
CARECA-19 (CONT.)

II. CONCLUSION

As is explained herein, the Staff Report does not correct major flaws in the FEIR's hazards, air quality, health risk, energy, and transportation analyses. The Project's environmental review remains substantially inaccurate and incomplete, failing to comply with the requirements of CEQA. As a result, the City cannot make the requisite findings under CEQA to certify the FEIR or under the City of Ontario Municipal Code to approve the Project's Development Plan.

CARE CA urges the Commission to comply with CEQA and require the City revise and recirculate the EIR before any further action is taken on the Project.

CARECA-20



Sincerely,

Aidan P. Marshall

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Mr. Aidan Marshall

Subject: Response To Comments Prepared By T&B Planning for City of Ontario Regarding 5355 East Airport Drive, City of Ontario, CA PDEV22-017

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed the August 8, 2024 Memorandum from T&B Planning regarding the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

CARECA-21

Specific Comments

1. **CARE-4/CARE-5: Failure To Disclose Impacts Of Ethylbenzene Concentrations In The Subsurface Soils At The Site And Development of Mitigation Measures For Worker Safety.**

T&B's response refers us to the Media Management Plan (Attachment F to the Final EIR). Despite the statement from T&B. that attachment F to the Final EIR is the Media Management Plan from Farallon, it is clear that the file was never attached to the FEIR that is posted at the City of Ontario's website. The Plan is attached to Item B starting on

CARECA-22

page 3039 of the 3379 included in the pdf. According to the Media Management Plan the subject property will be redeveloped as an approximately 250,000 square foot (footprint) warehouse. This is different from the 270,337 square foot industrial building description of the project listed in the Planning Commission Agenda Report.

This comment was specifically to address concerns over the presence of at least two known carcinogens (PCE and ethylbenzene) that were measured onsite in the soil and or soil vapor at the site. Mitigation of the carcinogens prior to initiating redevelopment of the property would ensure workers safety onsite. The Media Management Plan states that "if Contractor encounters an unanticipated condition, the Contractor will stop work, secure the work area, and notify Prologis within 24 hours of discovery of the condition. Prologis will identify and contact the appropriate entity to respond to the unanticipated condition. The procedures that will be followed in the event that an unanticipated subsurface structure is discovered are summarized below:

- A licensed Contractor or an Environmental Professional will remove and containerize any observed residual liquid, sludge, or sediment in the subsurface structure, and will characterize the residual material(s) as required by the waste-receiving facility(ies);
- The Contractor will remove the subsurface structure in compliance with applicable laws and regulations, and under permit from and oversight by the applicable regulatory agency, if required;
- Soil removal actions will be performed in accordance with the procedures outlined in this MMP; and
- The area will be cleared after any required regulatory authorization has been obtained from the permitting agency, so work may proceed."

This approach relies upon the construction workers onsite being able to identify environmental hazards that may not necessarily include visible staining of soils or visible emissions. Prior to any demolition of the site, preparation of a site-specific remedial action work (RAW) plan should be initiated to protect workers onsite. The purpose of the RAW would be to: 1) present and evaluate existing Site conditions; 2) establish appropriate removal action objectives (RAOs) for protection of human health and the environment; and 3) evaluate alternatives and

CARECA-22
(CONT.)

identify a final recommendation for a removal action at the Site that is protective of human health and the environment.

CARECA-22 (CONT.)

2. CARE-14, CARE-15, CARE-16, and CARE-29: The Average Truck Trip Length Of 40 Miles Used In The Air Quality Analysis Does Not Match The Length(s) Used To Support Other Warehouse Projects.

According to T&B's response no new or additional environmental issues have been raised with these comments. The EIR's flaws have not been resolved regarding the average trip length in the air quality analysis. T&B quotes from the National Center for Sustainable Transportation (NCST) report on Southern California Warehouse and Distribution Center Facilities noting that "the study also stated that "around 62% of the facilities in the SCAG region (approximately 4,900 buildings) are facilities larger than 50,000 sf mainly serving non-port related services. Most of the flow of goods by truck (85% of trips) found in the area is associated with local or intra-regional trips while international shippers have a higher use share of rail and air networks. Activities at port-related warehouses which locate in the Gateway cities focus mainly in transloading, deconsolidation and some value added services. National and international distribution centers are found mainly in the Inland Empire region."[1]

CARECA-23

T&B fails to include the next paragraph which notes[2] "Among the six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) that comprise the SCAG region, Los Angeles (31.2%), Riverside (21.2%) and San Bernardino (30.2%) account for the largest share of total miles of primary freight network (SCAG, 2016). Consequently, the majority of the facilities (larger than 50,000 sq. ft.) are located in these counties. In terms of the available land for new warehouses, the Inland Empire shows the highest availability (Figure 2) (SCAG, 2009). *56% of the facilities receive goods from the Port of Los Angeles and Long Beach, and around 50% deliver to Southern California warehouses, retail stores or manufacturing plants." (Emphasis added)*. Clearly the NCST report

[1] NCST. 2017. Warehousing and Distribution Center Facilities in Southern California: The Use of the Commodity Flow Survey Data to Identify Logistics Sprawl and Freight Generation Patterns: A Research Report from the National Center for Sustainable Transportation. Prepared by Miguel Jaller and Leticia Pineda. Dated July 2017. Pg. 6

[2] Ibid Pg. 6-7.

validates that the majority of facilities in the SCAG region receive goods from the Ports of Los Angeles and Long Beach.

As I previously stated in comments on the Project, the 40-mile distance is insufficient to allow vehicles to travel to the major ports in the Southern California region – Los Angeles and Long Beach. The distance from the Port of LA to the Project site is approximately 62 miles via Interstate 15 to Route 91 to Interstate 710. Using the 62-mile daily truck trip will nearly double the daily emissions of pollutants associated with the Project, increasing the Regional burden and resulting in a potentially significant impact.

CARECA-23 (CONT.)

3. CARE 20: Emissions From Diesel Generators.

T&B states that "The intermittent use of a backup generator during either construction or operation would not result in a substantial or measurable amount of emissions, since by the very nature of the activity, it would be short-term, intermittent, and infrequent. Thus, contrary to the commenter's assertion, measures to reduce this source of temporary and intermittent use of energy is not required. The City's experts disagree with the commenter and no further response is required" This comment ignores the essence of the comment, which is that the site will have an additional stationary source of diesel particulate matter (DPM) onsite that was not accounted for in the air quality analysis.

As was noted in the EIRs, the primary toxic air contaminant (TAC) associated with the project will be DPM. Diesel exhaust, in particular DPM, is classified by the State of California as a TAC. TACs, including DPM[3], contribute to a host of respiratory impacts and may lead to the development of various cancers. Failing to quantify the carcinogenic and other health risk impacts places the community at risk for unwanted adverse health impacts. *Even brief exposures to the TACs could lead to the development of adverse health impacts over the life of an individual*.

CARECA-24

[3] Because DPM is a TAC, it is a different air pollutant than criteria particulate matter (PM) emissions such as PM10, PM2.5, and fugitive dust. DPM exposure causes acute health effects that are different from the effects of exposure to PM alone.

Diesel exhaust has been linked to a range of serious health problems including an increase in respiratory disease, lung damage, cancer, and premature death.[4,5,6] Fine DPM is deposited deep in the lungs in the smallest airways and can result in increased respiratory symptoms and disease; decreased lung function, particularly in children and individuals with asthma; alterations in lung tissue and respiratory tract defense mechanisms; and premature death.[7] Exposure to DPM increases the risk of lung cancer. It also causes non-cancer effects including chronic bronchitis, inflammation of lung tissue, thickening of the alveolar walls, immunological allergic reactions, and airway constriction.[8] DPM is a TAC that is recognized by state and federal agencies as causing severe health risk because it contains toxic materials, unlike $PM_{2.5}$ and PM_{10}.[9]

The inherent toxicity of TACs requires the City to first accurately quantify the concentration released into the environment from all sources and asses at each of the sensitive receptor locations through air dispersion modeling the ground-level concentration, calculate the dose of each TAC at that location, and quantify the cancer risk and hazard index for each of the chemicals of concern. Following that analysis, then the City can make a determination of the relative significance of the emissions.

CARECA-24 (CONT.)

4. CARE-31: Exposure Of Prisoners and Workers At The West Valley Detention Center

T&B's response to the question of impacts from the Project to a previously unidentified population source, the San Bernardino County West Valley Detention Center (WVDC), located

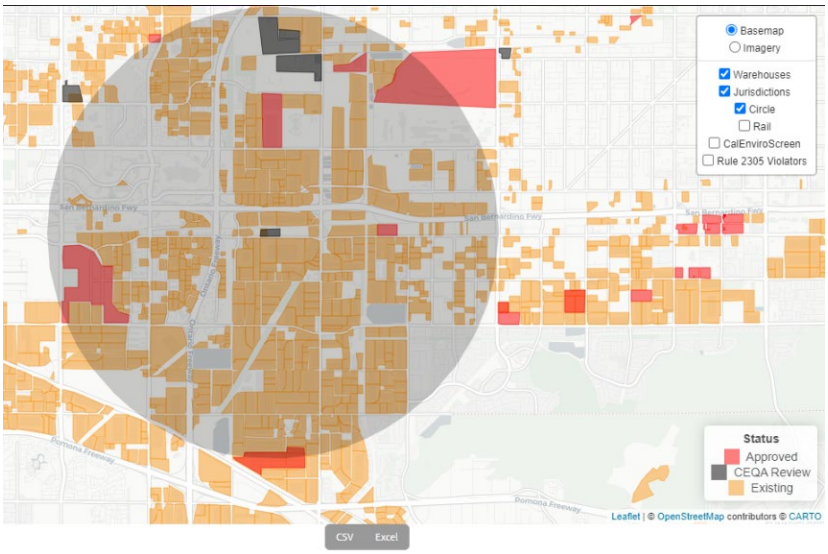
[7] California Air Resources Board, Initial Statement of Reasons for Rulemaking, Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Staff Report, June 1998.

[8] Findings of the Scientific Review Panel on The Report on Diesel Exhaust as adopted at the Panel's April 22, 1998 Meeting.

[9] Health & Safety Code § 39655(a) (defining "toxic air contaminant" as air pollutants "which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. Sec. 7412 (b)) is a toxic air contaminant.")

approximately 5,600 feet north northeast of the Project Site, was to dismiss the population as a non-long term residential population. While prisoners may be held at the WVDC for up to a year, there is no opportunity for the prisoners to get away from emissions associated with the Project. Workers at the WVDC should also be included in the evaluation of health impacts. The analyses presented in the EIRs and Staff Report did not address this unique population until we raised a concern.



The Detention Center is nearly 3,000 feet closer to the Project Site than the residential property selected in the EIR. Health risks from exposure are a function of the concentration of the contaminant and the duration of exposure. Until an actual attempt is made to calculate the exposure concentration at the WVDC determinations of relative risk (from either chronic or acute exposures) are speculative at best. The City must assess the impacts of the Project emissions on this receptor center.

CARECA-25 (CONT.)

5. CARE 32/CARE 10: Additional Cumulative Impacts From Existing/Pending Warehouse Projects

T&B's response that comments on the cumulative impacts did not raise new information is not supportable. The EIR's flaws have not been resolved regarding the cumulative impacts on air quality based on the number of existing and new projects in the area. As was pointed out in the last letter, based on the current analysis of warehouse projects within a 5-kilometer radius (3.1 miles) of the Project Site, there are 595 current warehouses, totaling 126,400,000 square feet of floor space.

CARECA-26

Those projects account for 85,000 truck trips per day, which emit 117.6 lbs of DPM and 13, 243 lbs of NOx per day. There is an additional 7,400,000 square feet of warehousing that is either approved or undergoing CEQA review (includes the Airport Site). Clearly the City has not included the relevant emissions of all the new projects in its analysis of the Project.

CARECA-26 (CONT.)

6. CARE 27: Building Downwash

T&B's response to comments on the incorporation of building downwash into the dispersion model are to claim that "The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of air quality impacts including analysis of building downwash. No additions, revisions, or corrections are necessary and no further response is required." This response fails to address the significant issue raised by the comment.

Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[10] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect

CARECA-27

[10] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

underestimates the exposure point concentrations for receptors near the building(s).

In a recent review of Draft Environmental Impact Report (Draft EIR) for the Proposed West Campus Upper Plateau Project (Proposed Project) (SCH Number: 2021110304), SCAQMD[11] specifically calls out the need for inclusion of downwash analysis for this Project which included a business park, industrial, mixed-use, public facility, parks, recreation and open space, and infrastructure improvements, totaling 369.60 acres. SCAQMD staff reviewing the project outlined that building downwash should be considered for the Proposed Project operation in order to predict more accurate ground-level concentrations. In addition, the truck idling emissions would need to be estimated separately and included in the dispersion modeling analysis and HRA as point sources. The City should address the impact of this issue in a revised EIR.

CARECA-27 (CONT.)

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant impacts if allowed to proceed. A revised environmental impact report should be prepared to address these substantial concerns.

CARECA-28

Sincerely,

Subject: 5355 East Airport Drive Project

Dear Mr. Marshall,

In October 2023, I reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Ontario Draft Environmental Impact Report for a proposed warehouse project at 5355 East Airport Drive ("DEIR"). In April 2024, I addressed additional analysis contained in the Project's Final EIR ("FEIR"). The Planning Commission Agenda Report dated August 27, 2024 fails to adequately address the outstanding issues identified in my October 2023 and April 2024 comments.

In October 2023, I made the following findings:

1) The DEIR acknowledges significant and unavoidable VMT impact. Furthermore, the DEIR documents that the project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.
2) The proposed VMT mitigation is not fully specified or quantified in the DEIR and appears to fall far short of what would be required to reduce project VMT below the City's threshold. Achieving significant VMT mitigation for this project may be impossible – but mitigation must be specified and quantified for the project to be properly evaluated.
3) Project trip generation could be much higher than assumed. Given the large uncertainty in the project's trip generation, the applicant should take one of two paths -either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

CARECA-29

1

4) Project GHG emissions could be much higher than assumed. In addition to trip generation possibly being underestimated, average trip lengths for both trucks and passenger vehicles are likely to be underestimated in the DEIR.

CARECA-29 (CONT.)

In April 2024, I reviewed the responses to these comments made in the project's Final Environmental Impact Review ("FEIR") dated February 2024 and made additional comments on these same points.

My April 2024 comments and the August Report responses follow:

Truck trip lengths – The FEIR repeats the false assertion that the truck trip lengths follow SCAQMD's recommendations (FEIR, A-18, p. 2-43). In my October 2023 comments, I addressed this, writing:

> The truck trip lengths are used in calculations of possible mitigation in *Second Draft Staff Report Proposed Rule 2305 – Warehouse Indirect Source Rule – Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program. And Proposed Rule 316 -Fees for Rule 2305*.[1] The reference for these numbers is the 2016 SCAG travel demand model (p. 117) and there is no indication that these numbers are intended for any use beyond this single document. The 40-mile heavy truck trip length also appears in a 2014 slide presentation.[2] In neither case, are these numbers presented as general recommendations for warehouse EIRs.

To prove that this is not a general SCAQMD recommendation for all warehouses, I attach SCAQMD's November 22, 2023 comments on the Hemlock Warehouse Development Project Draft SEIR in the City of Fontana. That Draft SEIR applied the same truck trip lengths as used in the 5355 East Airport Drive DEIR and FEIR. SCAQMD's comments state:

> However, it is essential to note that the distance from the Proposed Project site to the Port of Los Angeles or Long Beach is approximately 70 miles one-way. Thus, South Coast AQMD staff is concerned about underestimating truck emissions due to the shorter distance that HHDT is analyzed in the Draft SEIR. Hence, it is recommended that the Lead Agency revise the truck emissions analysis using the more conservative trip length between 40 to 70 miles, of which 40 miles could be used for local and 70 miles for Port trips and include the revision in the final CEQA document. Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project. (p. 2)

CARECA-30

SCAQMD is making the same point I made in my October 2023 comments where I wrote:

> it is notable that important major freight origins and destinations are considerably further away than the trip lengths assumed in the DEIR. These include the Ports of Los Angeles and Long Beach that are approximately 60 miles away. It would be more conservative to assume longer average truck distances in the air quality and GHG analyses.

[1] www.aqmd.gov/docs/default-source/planning/fbmsm-docs/pr-2305_sr_2nd-draft_4-7-21_clean.pdf
[2] https://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/sclc_warehouse-presentation-final.pdf

The FEIR does not use SCAQMD- recommended truck trip lengths. SCAQMD instead recommends: "**Tailoring these parameters and assumptions to be based on project-specific data will ensure a more accurate assessment of emissions, accounting for the unique circumstances and logistical realities of the Proposed Project**."

The Report states only:

> *The commenter raises no new or additional environmental issues not previously addressed in the Draft EIR, Final EIR, RTC, and the Responses provided herein, and the whole record before the Lead Agency. The Lead Agency maintains its position regarding accuracy and adequacy of the EIR analysis of the Project's truck trips assumptions. No additions, revisions, or corrections are necessary and no further response is required. (Report, PDF p. 2609 of 3993)*

This response fails to address my comments reproduced above.

CARECA-30 (CONT.)

VMT mitigation – The FEIR continues to state that the proposed project would exceed the VMT screening thresholds by a wide margin: 22.56% in the baseline year and 28.47% in the horizon year.

However, the FEIR states that these impacts cannot be mitigated because "measures associated with commute trip reduction (CTR) programs and their related commute trip reduction strategies have been excluded as they are not quantifiable, nor can their implementation be guaranteed and enforced since the Project is proposed to be developed as a speculative building without a known tenant." (FEIR A-24, p. 2-44)

My October 2023 comments recommended requiring CAPCOA T-5 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring) – that can provide up to 26% VMT reduction:

> The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction). (*Handbook*, p. 86)

A smaller mandatory reduction may be appropriate for this project, with this requirement passed on to the tenant, but it is not sufficient to claim that no significant mitigation is possible.

In addition, the attached SCAQMD comments on the Hemlock Warehouse Development Project recommends several mitigation measures targeting truck emissions, including:

- Require zero-emissions (ZE) or near-zero emission (NZE) on-road haul trucks,
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the final CEQA document, and
- Provide electric vehicle (EV) charging stations and electrical hookups for truckers. (p.3)

The Report states only:

> *Contrary to the commenter's assertion, this memorandum, RTC, and Final EIR demonstrates that the Project's impacts have been adequately analyzed and mitigated.*

CARECA-31

Thus, no additions, revisions, or corrections are necessary are necessary.. (Report, CARE 22 p. PDF 2620-2621 of 3993)

CARECA-31 (CONT.)

This response fails to address my comments reproduced above.

Trip generation

In my October 2023 comments, I provided data on different types of warehouses that have significantly higher trip generation rates than the 1.75 trips per 1000 sq. ft. assumed in the DEIR and FEIR. These include:

> The Parcel Hub Warehouse trip generation rate is 2.6 times the rate used in the DEIR, and the Fulfillment Center Warehouse with Sorting rate is 5.2 times the rate used in the DEIR.

The FEIR argues that the highest generators that I discussed in my October 2023 comments could not be accommodated because ". . . the layout of the site with 251 parking spaces would not reasonable accommodate the on-site parking required to support these uses."

This point about parking may be valid for the highest generators per 1000 sq. ft. but not for the intermediate generators. The DEIR and FEIR estimate only 270 passenger car trips per day (DEIR Appendix K, p. 5), i.e., 135 vehicles in and 135 cars out. Therefore, if all cars were employees and they all worked the same single shift, the parking lot utilization would never exceed 54%. With multiple shifts and non-employee passenger car trips, the parking lot utilization would be much lower. Therefore, the parking lot is designed to support many more trips than assumed in the DEIR and FEIR.

The 251 parking spaces are consistent with ITE Land Use 156: High Cube Parcel Hub Warehouse. This use is described:

CARECA-32

> A high-cube warehouse (HCW) is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/ or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. A high-cube warehouse can be free-standing or located in an industrial park. A high-cube parcel hub warehouse typically serves as a regional and local freight-forwarder facility for time sensitive shipments via airfreight and ground carriers. A site can also include truck maintenance, wash, or fueling facilities. Some limited assembly and repackaging may occur within the facility.

Given the uncertainty concerning the proposed project and its size, 270,377 sq. ft., it could foreseeably end up being a High-Cube-Parcel-Hub Warehouse as defined above.

The number of parking spaces provided also is consistent with this usage. The trip generation rate for this category is 4.63 trips per 1000 sq. ft., i.e. 2.6 times the rate used in the DEIR and FEIR. This rate includes 0.58 truck trips per 1000 sq. ft. Therefore, the passenger car rate is 4.05

trips per 1000 sq. ft. As a High-Cube-Parcel-Hub Warehouse, the proposed project would generate 1095 passenger car trips per day.

The DEIR states:

> For the purposes of this EIR, the Project is assumed to be operational 24 hours per day, seven days per week, with exterior loading and parking areas illuminated at night. (DEIR, p. 3-13)

This suggests multiple shifts each day.

Some of the passenger car trips would not be parking long term, including trips dropping off and picking up workers, and miscellaneous service trips, all of which include both and entering trip and an exiting trip. However, even if all passenger car trips involved parking long-term, all the trips could be accommodated with the planned 251 parking spaces if each space is occupied an average of 2.18 times per day.

As I stated in my October 2023 comment letter:

Given the large uncertainty in the project's trip generation, the applicant should take one of two paths - either a) applying a significantly higher and more conservative trip generation rate, or b) requesting as a condition of approval that trip generation will not exceed the number assumed in the EIR, and this be certified prior to beginning construction.

The Report states only:

> *The Lead Agency maintains its position regarding accuracy and adequacy of the EIR trip generation estimates and all environmental impacts related to or attributable to Project trip generation. No additions, revisions, or corrections are necessary and no further response is required... (Report, CARE 7 p. PDF 2607 of 3993)*

This response fails to address my comments reproduced above.

In summary, the August 2024 Report fails to adequately address any of my comments.

CARECA-32

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

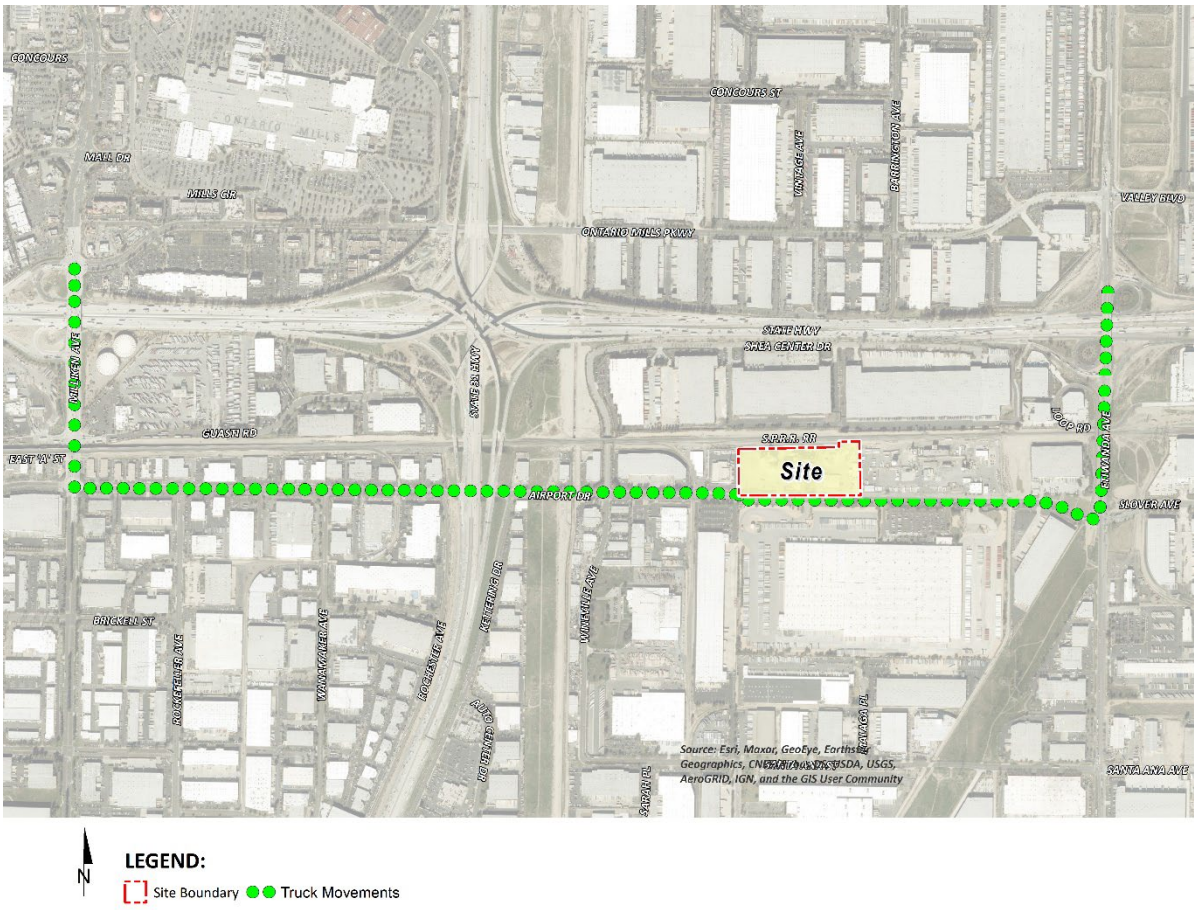
5355 EAST AIRPORT DRIVE SUPPLEMENTAL HEALTH RISK ASSESSMENT

Tracy Chu,



Urban Crossroads, Inc. is pleased to provide the following Supplemental Health Risk Assessment for the 5355 East Airport Drive (**Project**), which is located in the City of Ontario. This letter has been prepared in order to present the potential health risk resulting from the construction and operation of the proposed Project to the West Valley Detention Center, as well as to evaluate the potential health risk to sensitive receptors should a portion of Project trucks travel west on Airport Drive.

POTENTIAL AIRPORT DRIVE/S. MILLIKEN AVENUE TRUCK TRAVEL

Consistent with the Project traffic study, the *5355 East Airport Drive Mobile Source Health Risk Assessment* assumed that all trucks accessing the Project site would travel east on Airport drive and access I-10 via S. Etiwanda Avenue. However, in this supplemental health risk assessment evaluates a scenario in which half of Project trucks would travel this path, while the remaining half would access the Project site by traveling west on Airport Drive and accessing I-10 via S. Milliken Avenue.

The results of the analysis indicate that with Project truck traffic split evenly between Airport Drive/S. Etiwanda Avenue and Airport Drive/S. Milliken Avenue, Location R6, located approximately 8,840 feet northwest of the Project site, would remain the location of the maximally exposed individual resident, and cancer risk would remain unchanged at <0.01. Further, non-cancer risk would also remain unchanged at <0.01. As such, the potential use of Airport Drive/S. Milliken Avenue by Project trucks would not significantly affect the results of the analysis, and cancer and non-cancer risk would remain less than significant. Exhibit 1 presents the location of modeled off-site truck routes.

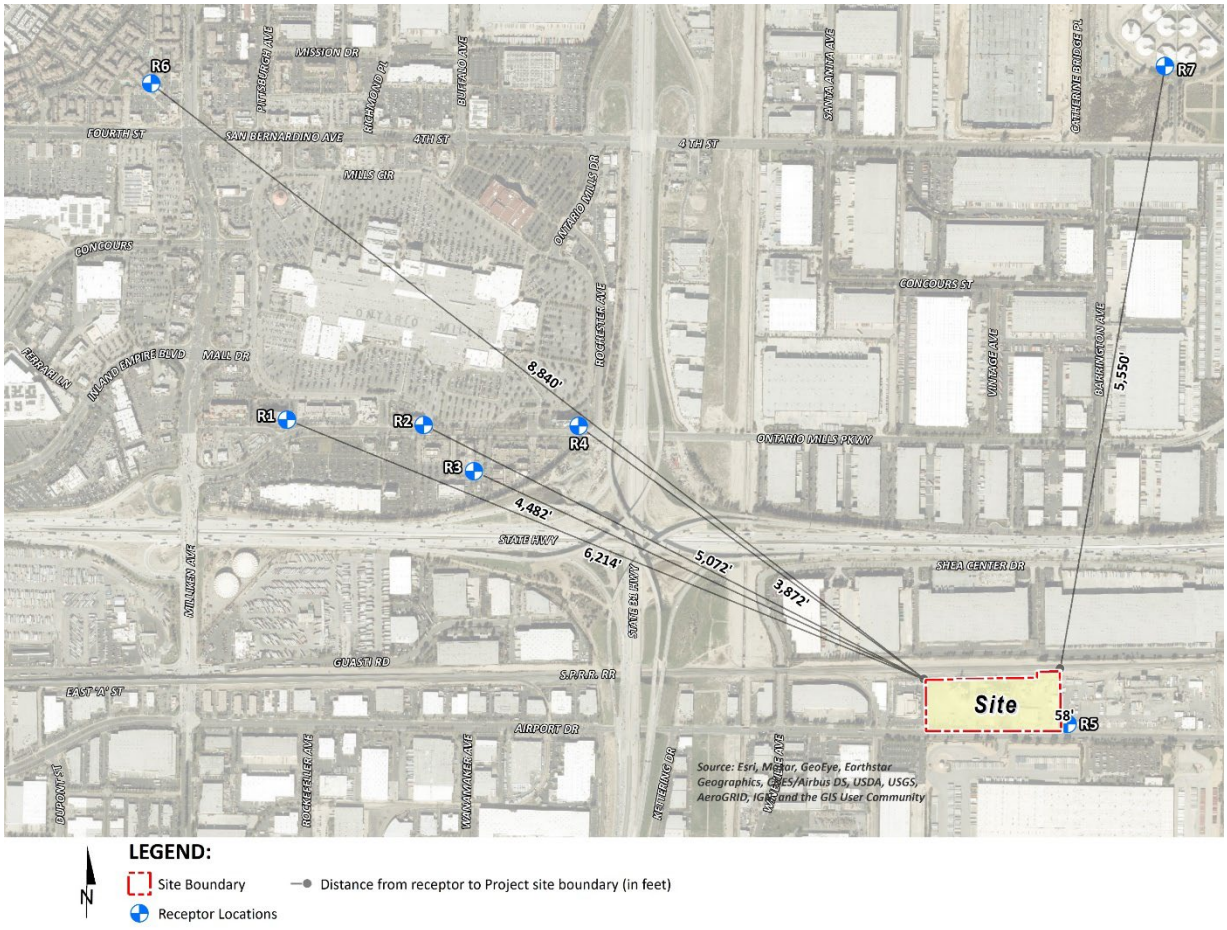
EXHIBIT 1: OFF-SITE TRUCK ROUTES

Detailed operational emission calculations are presented in Attachment A, and AERMOD model outputs are presented in Attachment B. Detailed health risk calculations are presented in Attachment C.

WEST VALLEY DETENTION CENTER HEALTH RISK

In order to account for potential cancer and non-cancer health risks to the San Bernardino County West Valley Detention Center, additional receptors were added in order to represent inmates who may be exposed to construction and operational emissions generated by the proposed Project. Construction and operational cancer risk was conservatively calculated using a residential exposure scenario, with exposure beginning at age 16. Further, a fraction of time at home value of 1.00 was conservatively assumed.

CONSTRUCTION



At the West Valley Detention Center, the maximum incremental cancer risk attributable to Project construction-source DPM emissions is estimated at <0.01 in one million, which is less

than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to inmates at the West Valley Detention Center as a result of Project construction activity.

OPERATION

At the West Valley Detention Center, the maximum incremental cancer risk attributable to Project operational-source DPM emissions is estimated at <0.01 in one million, which is less than the SCAQMD's significance threshold of 10 in one million. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable significance threshold of 1.0. As such, the Project will not cause a significant human health or cancer risk to inmates at the West Valley Detention Center. Exhibit 2 presents the locations of the nearest modeled receptors.

EXHIBIT 2: RECEPTOR LOCATIONS

[a] Vehicle miles traveled are for modeled truck route only.

[b] Emission rates determined using EMFAC 2021. Idle emission rates are expressed in grams per idle hour rather than grams per mile.

[c] This column includes the total truck travel and truck idle emissions. For idle emissions this column includes emissions based on the assumption that each truck idles for 15 minutes.

** Model Options Selected:
     * Model Uses Regulatory DEFAULT Options
     * Model Is Setup For Calculation of Average CONCentration Values.
     * NO GAS DEPOSITION Data Provided.
     * NO PARTICLE DEPOSITION Data Provided.
     * Model Uses NO DRY DEPLETION. DDPLETE  =  F
     * Model Uses NO WET DEPLETION. WETDPLT  =  F
     * Stack-tip Downwash.
     * Model Accounts for ELEVated Terrain Effects.
     * Use Calms Processing Routine.
     * Use Missing Data Processing Routine.
     * No Exponential Decay.
     * Model Uses URBAN Dispersion Algorithm for the SBL for   163 Source(s),
       for Total of    1 Urban Area(s):
  Urban Population =   2035210.0 ;  Urban Roughness Length =  1.000 m
     * Urban Roughness Length of 1.0 Meter Used.
     * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
     * CCVR_Sub - Meteorological data includes CCVR substitutions
     * TEMP_Sub - Meteorological data includes TEMP substitutions
     * Model Assumes No FLAGPOLE Receptor Heights.
     * The User Specified a Pollutant Type of: DPM

**Model Calculates PERIOD Averages Only

**This Run Includes:    163 Source(s);       1 Source Group(s); and      65 Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:    163 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                and:      0 SWPOINT source(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  16216

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing
                                                                Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   289.00 ;  Decay Coef. =
0.000     ;  Rot. Angle =     0.0
                Emission Units = GRAMS/SEC                                     ;  Emission Rate
                Unit Factor =   0.10000E+07
                Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      3.6 MB of RAM.

**Input Runstream File:
aermod.inp
**Output Print File:
aermod.out
