PPV	Peak Particle Velocity
Project	Rich-Haven Specific Plan-2022 Amendment
REMEL	Reference Energy Mean Emission Level
RMS	Root-mean-square
VdB	Vibration Decibels

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the potential noise impacts and the necessary noise mitigation measures, if any, for the proposed Rich-Haven Specific Plan-2022 Amendment development ("Project"). The proposed Project includes the development of a single 168,759 square foot warehouse building. This study has been prepared to satisfy applicable City of Ontario standards and thresholds of significance based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1)

The results of this Rich-Haven Specific Plan-2022 Amendment Noise and Vibration Analysis are summarized below based on the significance criteria in Section 4 of this report. Table ES-1 shows the findings of significance for each potential noise and/or vibration impact under CEQA before and after any required mitigation measures.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Off-Site Traffic Noise	7	*Less Than Significant*	-
On-Site Traffic Noise	8	*Less Than Significant*	-

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed Rich-Haven Specific Plan-2022 Amendment ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, sets out the local regulatory setting, presents the study methods and procedures for transportation related CNEL traffic noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term stationary-source operational noise and short-term construction noise and vibration impacts.

1.1 BACKGROUND AND PROJECT DESCRIPTION

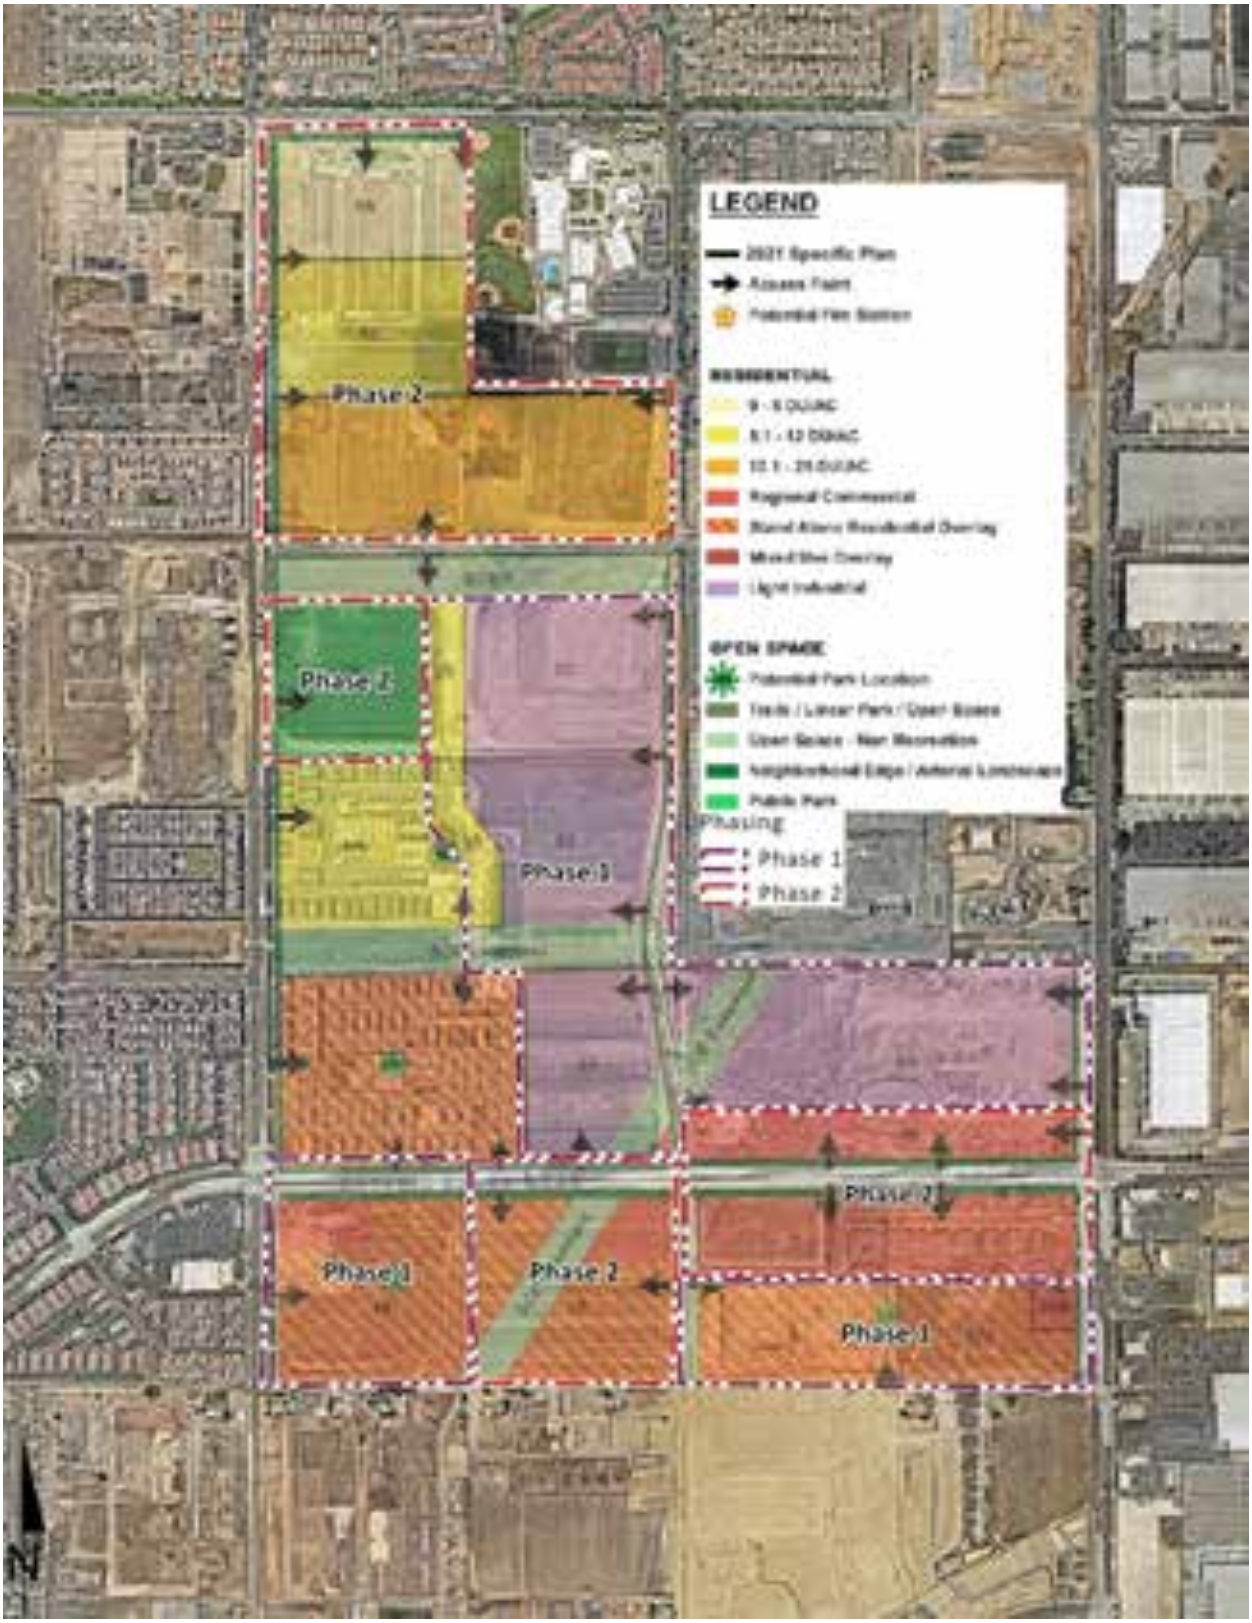
The Rich-Haven Specific Plan (RHSP) was approved by the City of Ontario in 2015, with subsequent Specific Plan Amendments approved in 2016, 2018, and 2021. The current (2021) Rich-Haven Specific Plan ("2021 Specific Plan") comprises approximately 584 acres located west of Interstate 15 (I-15), and south of State Route 60 (SR-60). The 2021 Specific Plan Area lies within the 8,200-acre Ontario Ranch area, bounded generally by Riverside Drive to the north, "Old" East Edison Avenue [alignment] to the south, Mill Creek Avenue and Hamner Avenue to the east, and Haven Avenue to the west. The location and boundaries of the 2022 RHSP Specific Plan Amendment evaluated herein coincide with the location and boundaries in the 2021 Specific Plan. Location of the Project is presented at Exhibit 1-A.

The 2021 Specific Plan entitlements allow for development of up to 7,194 dwelling units (all residential types), up to 990,902 square feet of commercial/office space, up to 1,183,525 square feet of light industrial uses, approximately 27 acres of public parkland, and approximately 20 acres of Southern California Edison (SCE) Parcel open space and SCE Easements. The 2022 RHSP Specific Plan Amendment (2022 Specific Plan Amendment, Project) evaluated in here proposes a new amendment of the RHSP as described herein.

Under the proposed 2022 RHSP Specific Plan Amendment, the Specific Plan Area would be developed with up to 7,194 dwelling units, up to 925,002 square feet of commercial space, and up to 2,767,148 square feet of light industrial uses. Other existing RHSP land uses, e.g., public parkland, Southern California Edison (SCE) Parcel open space and SCE Easements would not be substantively affected under the 2022 RHSP Specific Plan Amendment. This EIR evaluates potential environmental impacts of entire buildout of the Specific Plan Area that would result from the 2022 RHSP Specific Plan Amendment. In summary, the proposed 2022 Specific Plan Amendment would result in the following primary revisions to the 2021 Specific Plan:

- Total residential development within the Specific Plan Area would be maintained at 7,194 dwelling units. Residential units and residential densities would however be reassigned within the Specific Plan Area.
- Total commercial development would be reduced by approximately 65,900 square feet, an approximate 6.7 percent reduction in the 2021 Specific Plan commercial entitlements.

EXHIBIT 1-A: LOCATION MAP



- Total light industrial development would be increased by approximately 1,583,623 square feet, an approximate 134 percent increase from the 2021 Specific Plan Amendment.

Note that portions of Planning Areas 3A and 4A within the Project site have been developed. Planning Areas 2, 3, 4A, 5C, 6, 10, and portions of 7, 8, and 9 are anticipated to be developed as part of the first phase with an anticipated Opening Year of 2024. Project Buildout and of Phase 2 is anticipated in Year 2027. Project Planning Areas and Phases are illustrated at Exhibit 1-B.

The on-site Project-related noise sources are expected to include: loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, truck movements and park activities. This noise analysis is intended to describe noise level impacts associated with the expected typical operational activities at the Project site.

EXHIBIT 1-B: LAND USE PLAN

1.2 RECOMMENDED CONDITIONS OF APPROVAL

As substantiated in this analysis, all Project-source noise and vibration impacts would be less-than-significant. . The following measures would further reduce Project noise impacts. To ensure that Project noise impacts remain at levels that would be less-than-significant, it is recommended that the following noise abatement measures be incorporated as Project Conditions of Approval

1.2.1: Prior to Grading Permit issuance, the Applicant shall demonstrate that the project complies with the following:

- All construction equipment, fixed or mobile, shall be equipped with properly operating and maintained mufflers, to the satisfaction of the Noise Control Officer;
- During construction, stationary construction equipment shall be placed such that emitted noise is directed away from sensitive noise receivers to the satisfaction of the City Planner; and
- During construction and to the satisfaction of the City Planner, stockpiling and vehicle staging areas shall be located as far as practical from noise sensitive receptors during construction activities.

1.2.2: Operating or causing the operation of any tools or equipment used in construction, drilling, repair, alteration, or demolition work between the hours of 10:00 p.m. and 7:00 a.m. during is prohibited. The City Planner may approve additional hours when it can be found that such additional hours will not generate additional disturbance, or that mitigation measures will ensure compatibility with nearby residential areas.

1.2.3: Prior to the construction of residential development along Riverside Drive, Haven Avenue, Mill Creek Avenue, Edison Avenue, and Milliken Avenue, an acoustical noise analysis should be prepared prior to the submittal of final tentative tract maps to ensure that exterior and interior noise levels are met. The acoustical analysis shall demonstrate that the buildings have been designed to limit interior noise levels to 45 dBA CNEL and exterior noise (backyards and habitable balconies and patios) to less than 65 dBA CNEL. Individual developments shall, to the extent feasible, implement site-planning techniques.

1.2.4: Prior to final development plan approval, on a project-by-project basis and to the discretion of the Ontario Planning Department, subsequent noise studies shall be prepared, which demonstrates the site placement of stationary noise sources would not exceed criteria established in the City of Ontario Municipal Code. The analysis shall verify that loading dock facilities, rooftop equipment, trash compactors and other stationary noise sources are adequately shielded and/or located at an adequate distance from residential areas in order to comply with the City's noise standards.

1.2.5: Prior to Building Permit issuance and to the satisfaction of the Ontario Planning Department, the Project Applicants, on a project-by-project basis, shall demonstrate compliance with the following with respect to mechanical equipment:

- Mechanical equipment shall include specifications of quiet equipment;

- Mechanical equipment shall be properly selected and installed, and shall include sound attenuation packages;
- To the extent possible, mechanical equipment shall be oriented away from the nearest noise sensitive receptors; and
- The need for sound attenuation measures, and design of, such measures shall be determined as part of the final engineering design on a project-by-project basis.

1.2.6: Where a commercial zone abuts a residential zone or residential use, all deliveries of goods and supplies; trash pick-up, including the use of parking lot trash sweepers; and the operation of machinery or mechanical equipment which emits noise levels in excess of 65 dBA, as measured from the closest property line to the equipment, shall only be allowed between the hours of 7:00 a.m. and 10:00 p.m., unless otherwise specified in an approved conditional use permit or other discretionary approval.

1.2.7: Prior to final development plan approval, on a project-by-project basis, a subsequent noise analysis shall be prepared, to the satisfaction of the Ontario Planning Department, which demonstrates that all feasible sound attenuation has been incorporated into the parking areas (i.e., landscaping and brushed driving surfaces), such that noise from parking area has been minimized to the greatest extent practicable.

This page intentionally left blank

2 FUNDAMENTALS

Noise is simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140		
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100		
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70		
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50		
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		
QUIET SUBURBAN NIGHTTIME	LIBRARY	30		
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		
	BROADCAST/RECORDING STUDIO	10		
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (2) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 1,000 feet, which can cause serious discomfort. (3) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most used metric is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time-of-day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when noise can become more intrusive. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The City of Ontario relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (2)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually

sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (4)

2.3.3 ATMOSPHERIC EFFECTS

Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (2)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an "out of sight, out of mind" effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby residents. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of-sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The Federal Highway Administration (FHWA) does not consider the planting of vegetation to be a noise abatement measure. (5)

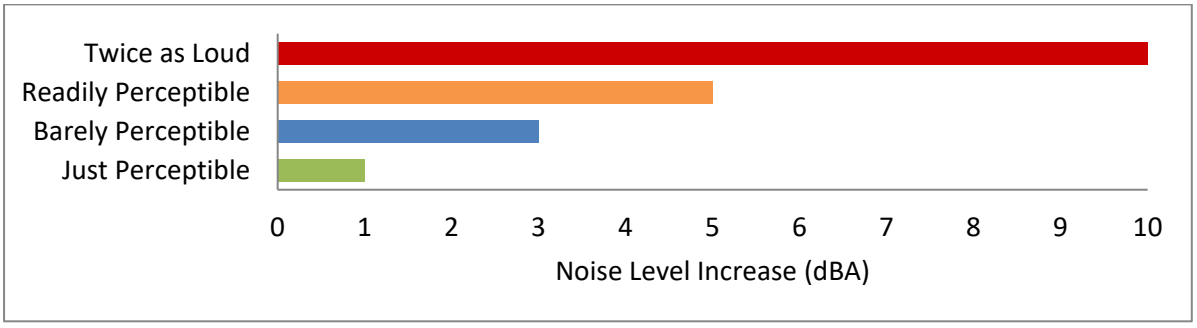
2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for an observation point or receiver by controlling the noise source, transmission path, receiver, or all three. This concept is known as the source-path-receiver concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receiver. Noise barriers, however, do have limitations. For a noise barrier to work, it must block the line-of-sight path of sound from the noise source.

2.6 LAND USE COMPATIBILITY WITH NOISE



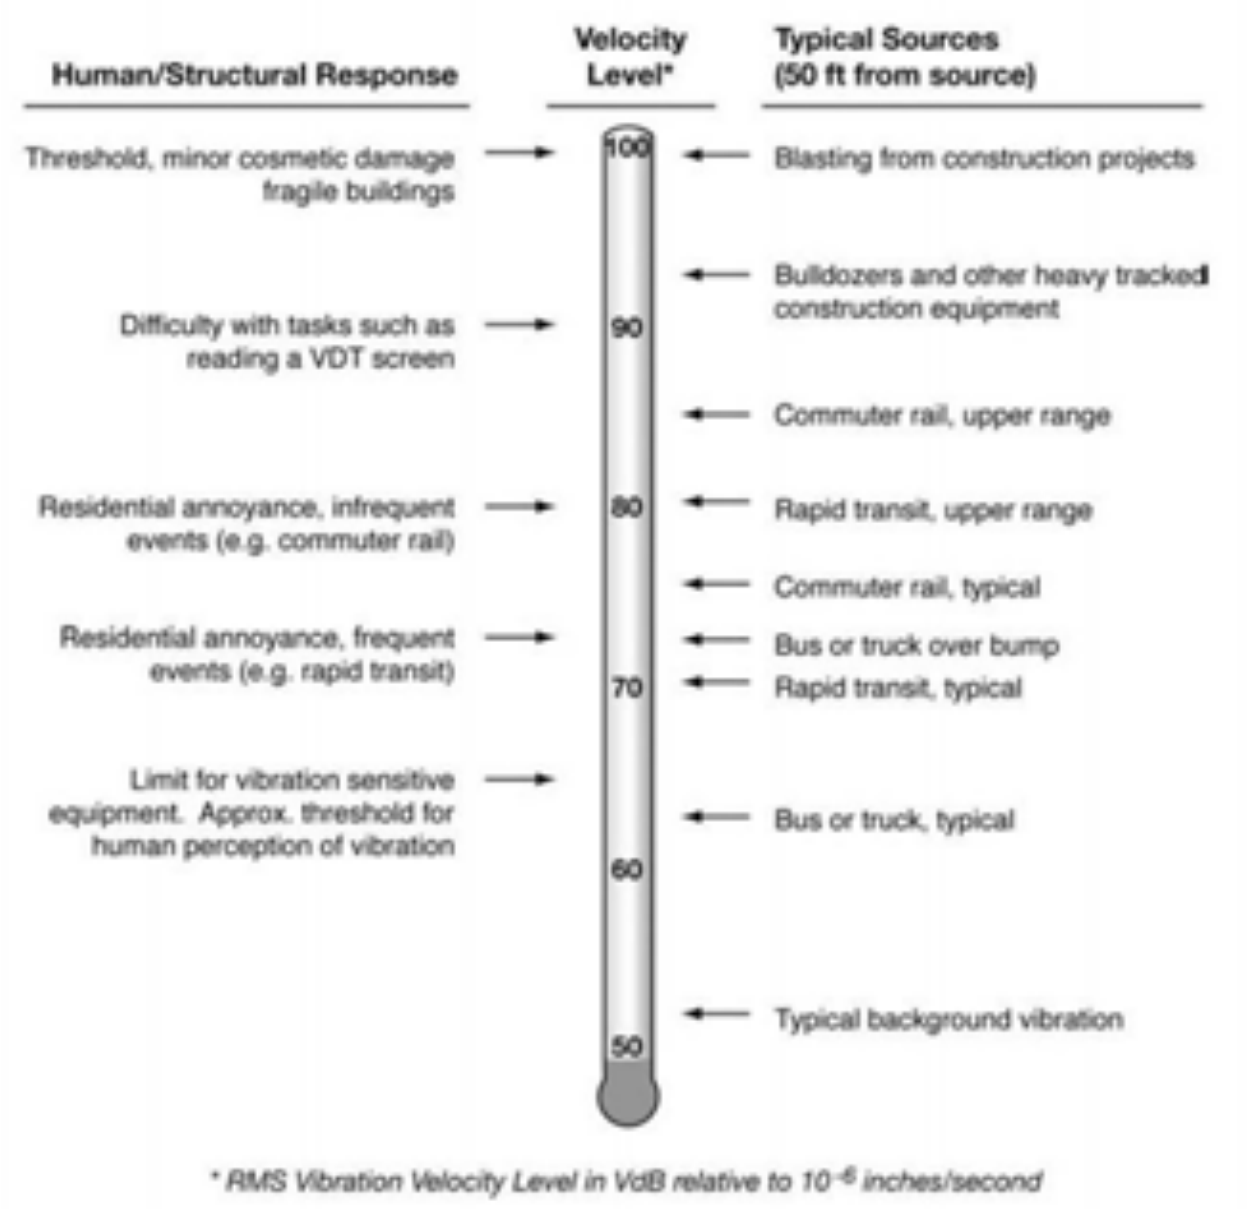
Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (6)

2.7 COMMUNITY RESPONSE TO NOISE

Approximately sixteen percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints may occur. Twenty to thirty percent of the population will not complain even in very severe noise environments. (7 pp. 8-6) Thus, a variety of reactions can be expected from people exposed to any given noise environment.

Surveys have shown that community response to noise varies from no reaction to vigorous action for newly introduced noises averaging from 10 dB below existing to 25 dB above existing. (8) According to research originally published in the Noise Effects Handbook (7), the percentage of high annoyance ranges from approximately 0 percent at 45 dB or less, 10 percent are highly annoyed around 60 dB, and increases rapidly to approximately 70 percent being highly annoyed at approximately 85 dB or greater. Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. A change of 3 dBA is considered barely perceptible, and changes of 5 dBA are considered readily perceptible. (4)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 VIBRATION

Per the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Impact Assessment Manual* (8), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment and/or activities.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

Source: Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual.

3 REGULATORY SETTING

The federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared per guidelines adopted by the Governor's Office of Planning and Research (OPR). (9) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

3.2 CITY OF ONTARIO GENERAL PLAN NOISE ELEMENT

The City of Ontario General Plan (Policy Plan) identifies several policies to minimize the impacts of excessive noise levels throughout the community. Policy Plan Section S4, Noise Hazards, establishes a goal of maintaining *an environment where noise does not adversely affect the public's health, safety, and welfare.* (10) To satisfy this goal, the Policy Plan identifies seven policies related to: noise mitigation; coordination with transportation authorities; noise mitigation; truck traffic; roadway design; airport noise compatibility and rail noise mitigation. The noise criteria identified on Table 5-13-3 of The Ontario Plan 2050 Final Supplemental Environmental Impact Report (FSEIR) (11) provide guidelines to evaluate land use compatibility within various noise environments. Table 5-13-3 is reproduced here as Exhibit 3-A *Ontario Noise Level Exposure and Land Use Compatibility Guidelines*.

Source: Ontario (2019).

[1] No special noise insulation required, assuming buildings of normal conventional construction.

[2] Acoustic reports will be required for major new residential construction. Conventional construction with closed windows and fresh air supply systems or air conditioning will normally suffice.

[3] New construction should be discouraged. Noise insulation requirements required for all new construction. If new construction does proceed, a detailed analysis of noise reduction requirements must be made, and necessary noise insulation features included.

[4] No new construction should be permitted.

Source: The Ontario Plan 2050 Draft SEIR (Table 5.13-3).

3.3 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the Rich-Haven Specific Plan-2022 Amendment, stationary-source (operational) noise levels are evaluated against standards established under a City's Municipal Code. The City of Ontario requires that noise from new stationary sources in the City comply with the City's Noise Ordinance, which limits the acceptable noise at the property line of the impacted property, to reduce nuisances to sensitive land uses. Compliance with the City's Noise Ordinance would result in noise levels that are acceptable to the City and would result in less than significant noise impacts from stationary sources. The City of Ontario Municipal Code, Title 5, Chapter 29 noise standards are included in Appendix 3.1.

Section 5-29.04(a) identifies the allowable daytime and nighttime ambient exterior noise standards for each land use type. For Manufacturing and Industrial land uses (Noise Zone V), such as the Project, ambient exterior noise levels may not exceed 70 dBA L_{eq}. For residential land uses (Noise Zone I), ambient exterior noise levels may not exceed 65 dBA L_{eq} during the daytime hours (7:00 a.m. to 10:00 p.m.) and may not exceed 45 dBA L_{eq} during the nighttime hours (10:00

p.m. to 7:00 a.m.) (12). The lower noise level standard shall apply on the boundary between two (2) different noise zones. If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard. The maximum acceptable Project-related operational noise levels received at off-site land uses in the City of Ontario are identified on Table 3-1.

TABLE 3-1: OPERATIONAL NOISE STANDARDS

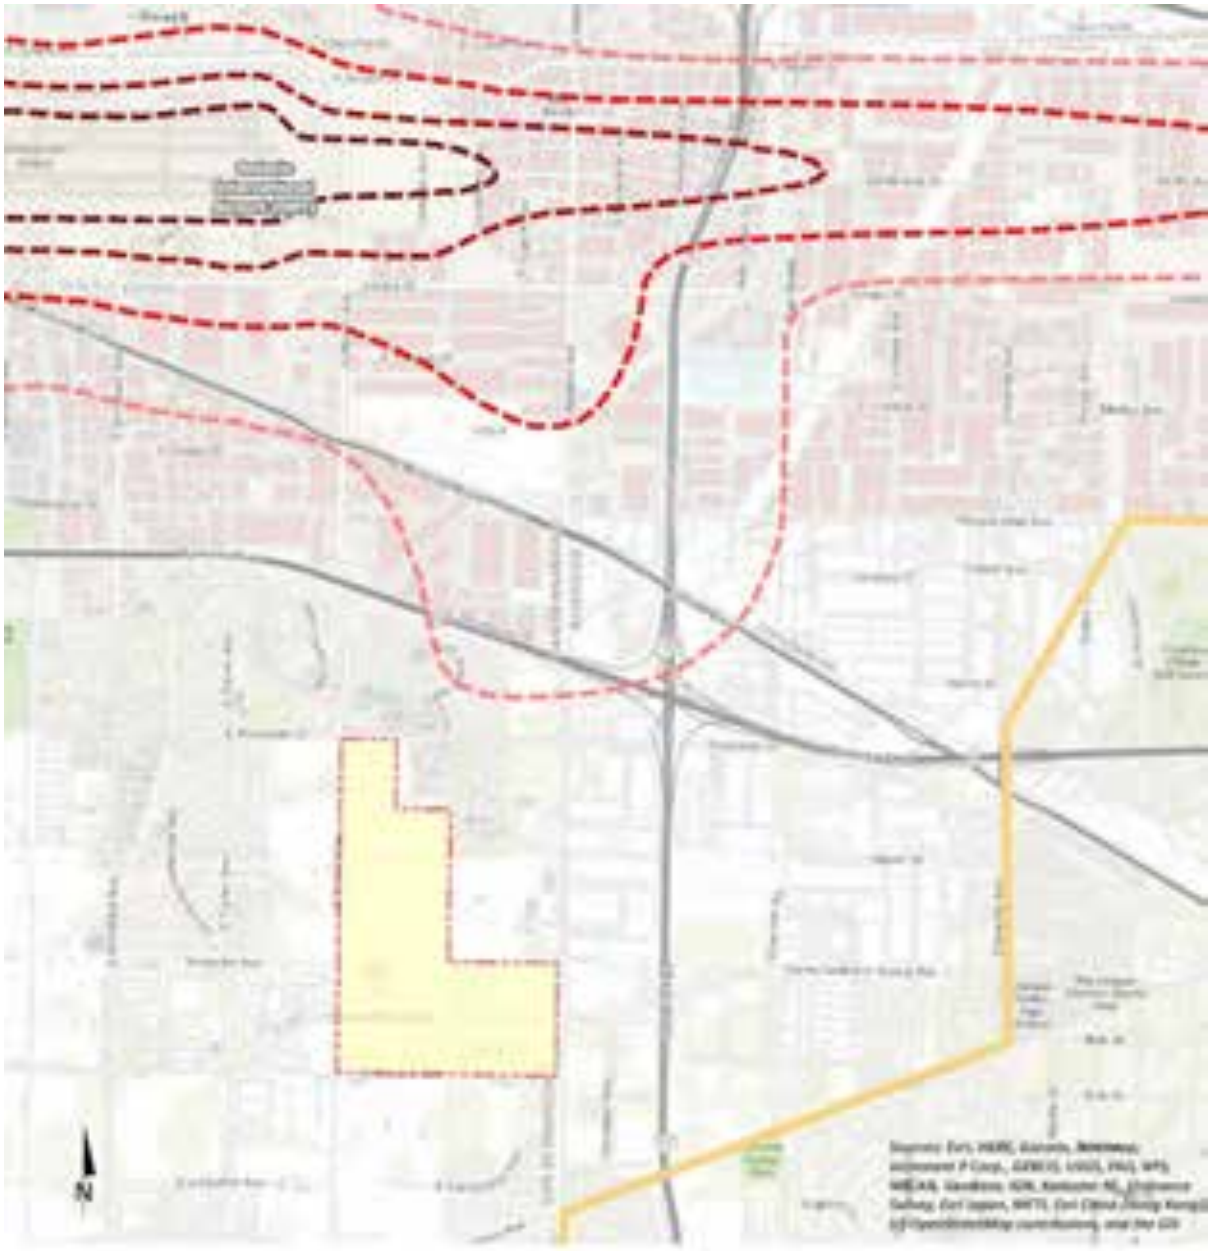
Noise Zone	Land Use	Exterior Noise Levels (dBA Leq)[2]	
		Daytime (7am-10pm)	Nighttime (10pm-7am)
I	Single-Family Residential	65	45
II	Multi-Family Residential	65	50
III	Commercial	65	60
IV	Residential Mixed-Use	70	70
V	Manufacturing and Industrial	70	70

[1] Source: Section 5-29.04 of the City of Ontario Municipal Code (Appendix 3.1).
[2] L_{eq} represents a steady state sound level containing the same total energy as a time varying signal over a given period.

3.4 CONSTRUCTION NOISE STANDARDS

The City of Ontario has set restrictions to control noise impacts associated with construction. Section 5-29.09 of the Municipal Code states: *No person, while engaged in construction, remodeling, digging, grading, demolition or any other related building activity, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, on any weekday except between the hours of 7:00 a.m. and 6:00 p.m. or on Saturday or Sunday between the hours of 9:00 a.m. and 6:00 p.m*. (12) While the City establishes limits to the hours during which construction activity may take place, it does not identify specific noise level limits for construction noise levels at potentially affected receiver locations for CEQA analysis purposes.

Construction noise would be considered significant if construction activities occurring outside of the hours specified (7:00 AM and 6:00 PM weekdays and 9:00 AM to 6:00 PM weekends, excluding federal holidays) or if construction activities substantially elevate the ambient noise environment at noise-sensitive uses for a substantial period. It is assumed that the Modified Project construction activities would comply with the City's hour of activity restrictions, thereby precluding construction activities during noise-sensitive time periods. However, neither the City of Ontario General Plan Noise Element or Municipal Codes establish numeric maximum acceptable construction source noise levels at potentially affected receivers, which would allow for a quantified determination of what CEQA constitutes a *substantial temporary or permanent increase in ambient noise levels*. Therefore, a numerical construction threshold based on Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual* is used for analysis of daytime construction impacts. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive land use. (8 p. 179)



3.5 VIBRATION STANDARDS

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. (8) To analyze vibration impacts originating from the operation and construction of Rich-Haven Specific Plan-2022 Amendment, vibration-generating activities are appropriately evaluated against standards established under a City's Municipal Code, if such standards exist. However, the City of Ontario does not identify specific vibration level limits. Therefore, for analysis purposes, the Caltrans *Transportation and Construction Vibration Guidance Manual*, (13 p. 38) Table 19, vibration damage are used in this noise study to assess potential temporary construction-related impacts at adjacent building locations. The nearest noise sensitive buildings adjacent to the Project site can best be described as "older residential structures" with a maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec).

3.6 AIRPORT LAND USE COMPATIBILITY

The Project site is located approximately 2.4 miles south of the Ontario International Airport (ONT). This places the Project site within the ONT Airport Influence Area according to Policy Map 2-1 of the *Ontario International Airport Land Use Compatibility Plan (ONT ALUCP).* The ONT ALUCP was amended July 2018 to promote compatibility between airport and the land uses that surround it (14). Since the Project site is located within the ONT Airport Influence Area, the Project is subject to the Noise Criteria established on Table 2-3 in the ONT ALUCP. As shown on Exhibit 3-B, the Project site is located within the ONT Airport Influence Area but outside the 60 dBA CNEL airport noise impact zone consistent with Policy Map 2-3. According to Table 2-3 of the ONT ALUCP, the Rich-Haven Specific Plan-2022 Amendment, residential, commercial, light industrial and community facilities land uses located outside the 60 dBA CNEL, are considered *normally compatible land use.* For *normally compatible land use,* either the activities associated with the land use are inherently noisy or standard construction methods will sufficiently attenuate exterior noise to an acceptable indoor community noise equivalent level (CNEL).

EXHIBIT 3-B: ONT FUTURE AIRPORT NOISE CONTOURS

This page intentionally left blank

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on currently adopted guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1) For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

B. Generation of excessive ground-borne vibration or ground-borne noise levels?

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

4.1 NOISE LEVEL INCREASES (THRESHOLD A)

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines described above at the closest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing baseline ambient noise levels, and the location of noise-sensitive receivers to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (16) This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged.

4.1.1 NOISE-SENSITIVE RECEIVERS

The Federal Interagency Committee on Noise (FICON) (17) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (CNEL) and equivalent continuous noise level (L_{eq}).

As previously stated, the approach used in this noise study recognizes *that there is no single noise increase that renders the noise impact significant*, based on a 2008 California Court of Appeal ruling on Gray v. County of Madera. (16) For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur if the noise criteria may be exceeded. Therefore, for this analysis, a *readily perceptible* 5 dBA or greater project-related noise level increase is considered a significant impact when the without project noise levels are below 60 dBA. Per the FICON, in areas where the without project noise levels

range from 60 to 65 dBA, a 3 dBA *barely perceptible* noise level increase appears to be appropriate for most people. When the without project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if the noise criteria for a given land use is exceeded, since it likely contributes to an existing noise exposure exceedance. The FICON guidance provides an established source of criteria to assess the impacts of substantial temporary or permanent increase in baseline ambient noise levels. Based on the FICON criteria, the amount to which a given noise level increase is considered acceptable is reduced when the without Project (baseline) noise levels are already shown to exceed certain land-use specific exterior noise level criteria. The specific levels are based on typical responses to noise level increases of 5 dBA or *readily perceptible*, 3 dBA or *barely perceptible*, and 1.5 dBA depending on the underlying without Project noise levels for noise-sensitive uses. These levels of increases and their perceived acceptance are consistent with guidance provided by both the Federal Highway Administration (4 p. 9) and Caltrans (18 p. 2_48).

4.1.2 NON-NOISE-SENSITIVE RECEIVERS

The *Ontario Noise Level Exposure and Land Use Compatibility Guidelines* were used to establish the satisfactory noise levels of significance for the non-noise-sensitive land uses in the Project study area. As previously shown on Exhibit 3-A, the *normally acceptable* exterior noise level for non-noise-sensitive general industrial land uses is 75 dBA CNEL. Noise levels greater than 75 dBA CNEL are considered *normally unacceptable.* (10)

To determine if Project-related traffic noise level increases are significant at off-site non-noise-sensitive general industrial land uses, a *barely perceptible* 3 dBA criteria is used. When the without Project noise levels are greater than the *normally acceptable* 75 dBA CNEL land use compatibility criteria, a *barely perceptible* 3 dBA or greater noise level increase is considered a significant impact since the noise level criteria is already exceeded. The noise level increases used to determine significant impacts for non-noise-sensitive land uses is generally consistent with the FICON noise level increase thresholds for noise-sensitive land uses but instead rely on *Ontario Noise Level Exposure and Land Use Compatibility Guidelines normally acceptable* 75 dBA CNEL exterior noise level criteria for non-noise sensitive general industrial land uses.

4.2 VIBRATION (THRESHOLD B)

As described in Section 3.5, the vibration impacts originating from the construction of the Rich-Haven Specific Plan-2022 Amendment, vibration-generating activities are appropriately evaluated using the Caltrans vibration damage thresholds to assess potential temporary construction-related impacts at adjacent building locations. The nearest noise sensitive buildings adjacent to the Project site can best be described as “older residential structures” with a maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec).

4.3 CEQA GUIDELINES NOT FURTHER ANALYZED (THRESHOLD C)

CEQA Noise Threshold C applies when there are nearby public and private airports and/or air strips and focuses on land use compatibility of the Project to nearby airports and airstrips. The closest airport which would require additional noise analysis under CEQA guideline C is the

Ontario International Airport. As previously indicated in Section 3.6, the Project site is located within the ONT Airport Influence Area but is located outside the 60 dBA CNEL airport noise impact zone. Therefore, airport noise impacts are considered *less than significant,* and no further noise analysis is provided under Guideline C.

4.4 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. Table 4-1 shows the significance criteria summary matrix that includes the allowable criteria used to identify potentially significant incremental noise level increases.

TABLE 4-1: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Land Use	Condition(s)	Significance Criteria	
			Daytime	Nighttime
Off-Site	Noise-Sensitive[1]	if ambient is < 60 dBA CNEL	≥ 5 dBA CNEL Project increase	
		if ambient is 60 - 65 dBA CNEL	≥ 3 dBA CNEL Project increase	
		if ambient is > 65 dBA CNEL	≥ 1.5 dBA CNEL Project increase	
	Non-Noise Sensitive[2]	if ambient is > 75 dBA CNEL	≥ 3 dBA CNEL Project increase	
Operational	Residential	Exterior Noise Level Limit[3]	55 dBA L_{eq}	45 dBA L_{eq}
	Noise-Sensitive[1]	if ambient is < 60 dBA L_{eq}	≥ 5 dBA L_{eq} Project increase	
		if ambient is 60 - 65 dBA L_{eq}	≥ 3 dBA L_{eq} Project increase	
		if ambient is > 65 dBA L_{eq}	≥ 1.5 dBA L_{eq} Project increase	
Construction	Noise-Sensitive	Noise Level Threshold[4]	80 dBA L_{eq}	70 dBA L_{eq}
		Vibration Level Threshold[5]	0.3 PPV (in/sec)	n/a

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, 24-hour noise level measurements were taken at eight locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Friday, September 30, 2022. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (19)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (2) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (8)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (8) In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels

and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location.

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Description	Energy Average Noise Level (dBA L_{eq})[2]	
		Daytime	Nighttime
L1	Located near the northwest corner of the Project Site near the Colony High School Football Field	56.0	55.6
L2	Located east of the Project Site just south of the existing residence at 3271 S Quincy Way.	48.9	48.4
L3	Located within the Rich Haven Specific Plan north of Ontario Ranch Road.	69.1	64.0
L4	Located south of the Project Site near the existing residence at 10823 Edison Avenue.	56.3	52.1
L5	Located within the Rich Haven Specific Plan near the existing residence at 3965 S Sunrise Avenue.	63.1	55.1
L6	Located west of the Project Site near the existing residence at 3860 S Oasis Paseo	68.8	62.4
L7	Located west of the Project Site near the existing residence at 3393 Clover Place	65.4	60.2
L8	Located north of the Project Site near the existing residence at 2943 S Alder Creek Drive.	68.5	64.3

[1] See Exhibit 5-A for the noise level measurement locations.
[2] Energy (logarithmic) average levels. The long-term 24-hour measurement worksheets are included in Appendix 5.2.
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

6 TRAFFIC NOISE METHODS AND PROCEDURES

The following section outlines the methods and procedures used to estimate and analyze the future traffic noise environment. Consistent with City of Ontario *Noise Level Exposure and Land Use Compatibility Guidelines* (see Exhibit 3-A), all transportation related noise levels are presented in terms of the 24-hour CNEL's.

6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The expected roadway noise level increases from vehicular traffic were calculated by Urban Crossroads, Inc. using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (20) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (21) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period. Research conducted by Caltrans has shown that the use of soft site conditions is appropriate for the application of the FHWA traffic noise prediction model used in this analysis. (22)

6.1.1 OFF-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

Table 6-1 presents the roadway parameters used to assess the Project's off-site transportation noise impacts. Table 6-1 identifies the 18 off-site study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications per the City of Ontario General Plan and Circulation Element, and the posted vehicle speeds. The ADT volumes used in this study area presented on Table 6-2 are based on *Rich-Haven Specific Plan-2022 Amendment Traffic Analysis*, prepared by Urban Crossroads, Inc. for the following traffic scenarios. (23)

- Existing 2022 Traffic Conditions
- Existing Plus Project 2022 Traffic Conditions
- Opening Year Cumulative (OYC) 2027 Without Project
- Opening Year Cumulative (OYC) 2027 With Project
- Horizon Year (HY) 2050 Without Project
- Horizon Year (HY) 2050 With Project

The ADT volumes vary for each roadway segment based on the existing traffic volumes and the combination of project traffic distributions. This analysis relies on a comparative evaluation of the off-site traffic noise impacts at the boundary of the right-of-way of the receiving adjacent land use, without and with project ADT traffic volumes from the Project traffic study.

TABLE 6-1: OFF-SITE ROADWAY PARAMETERS

ID	Roadway	Segment	Classification[1]	Receiving Land Use[2]	Distance from Centerline to Receiving Land Use (Feet)[3]	Vehicle Speed (mph)

18	Ontario Ranch Rd.	e/o Hamner Av.	Principal Arterial	Non-Sensitive	84'	55

[1] City of Ontario General Plan Circulation Element.
[2] Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.
[3] Distance to receiving land use is based upon the right-of-way distances.

To quantify the off-site noise levels, the Project related truck trips were added to the heavy truck category in the FHWA noise prediction model. The addition of the Project related truck trips increases the percentage of heavy trucks in the vehicle mix. This approach recognizes that the FHWA noise prediction model is significantly influenced by the number of heavy trucks in the vehicle mix.

TABLE 6-2: AVERAGE DAILY TRAFFIC VOLUMES

ID	Roadway	Segment	Average Daily Traffic Volumes[1]					
			Existing (2022)		OYC (2027)		HY (2050)	
			Without Project	With Project	Without Project	With Project	Without Project	With Project

[1] Rich Haven Specific Plan Traffic Analysis, Urban Crossroads, Inc.

Table 6-3 provides the time of day (daytime, evening, and nighttime) vehicle splits. The daily Project truck trip-ends were assigned to the individual off-site study area roadway segments based on the Project truck trip distribution percentages documented in the *Rich-Haven Specific Plan-2022 Amendment Traffic Analysis*.

TABLE 6-3: TIME OF DAY VEHICLE SPLITS

Vehicle Type	Time of Day Splits[1]			Total of Time of Day Splits
	Daytime	Evening	Nighttime	
Autos	70.72%	11.77%	17.51%	100.00%
Medium Trucks	82.20%	3.49%	14.31%	100.00%
Heavy Trucks	70.82%	6.23%	22.95%	100.00%

[1] Based on an existing vehicle count taken on Ontario Ranch Road west of Hamner Avenue (Rich Haven Specific Plan Traffic Analysis, Urban Crossroads, Inc.). Vehicle mix percentage values rounded to the nearest one-hundredth. "Daytime" = 7:00 a.m. to 7:00 p.m.; "Evening" = 7:00 p.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

Using the Project truck trips in combination with the Project trip distribution, Urban Crossroads, Inc. calculated the number of additional Project truck trips and vehicle mix percentages for each of the study area roadway segments. Table 6-4 shows the traffic flow by vehicle type (vehicle mix) used for all without Project traffic scenarios, and Tables 6-5 to 6-7 show the vehicle mixes used for the with Project traffic scenarios.

TABLE 6-4: WITHOUT PROJECT VEHICLE MIX

Classification	Total % Traffic Flow			Total
	Autos	Medium Trucks	Heavy Trucks	
All Segments	86.53%	2.42%	11.05%	100.00%

Based on an existing vehicle count taken on Ontario Ranch Road west of Hamner Avenue (Rich Haven Specific Plan Traffic Analysis, Urban Crossroads, Inc.) Vehicle mix percentage values rounded to the nearest one-hundredth.

Due to the added Project truck trips, the increase in Project traffic volumes and the distributions of trucks on the study area road segments, the percentage of autos, medium trucks and heavy trucks will vary for each of the traffic scenarios. This explains why the existing and future traffic volumes and vehicle mixes vary between seemingly identical study area roadway segments.

[1] Total of vehicle mix percentage values rounded to the nearest one-hundredth.

7 OFF-SITE TRAFFIC NOISE ANALYSIS

To assess the off-site transportation CNEL noise level impacts associated with development of the proposed Project, noise contours were developed based on the *Rich-Haven Specific Plan-2022 Amendment Traffic Analysis* prepared by Urban Crossroads, Inc. (23) Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway.

7.1 TRAFFIC NOISE CONTOURS

Noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not consider the effect of any existing noise barriers or topography that may attenuate ambient noise levels.

In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area. Tables 7-1 to 7-6 present a summary of the exterior traffic noise levels for each traffic condition. Appendix 7.1 includes the traffic noise level contours worksheets for each traffic condition.

"RW" = Location of the respective noise contour falls within the right-of-way of the road.

7.2 EXISTING (2022) PROJECT TRAFFIC NOISE LEVEL INCREASES

An analysis of existing traffic noise levels plus traffic noise generated by the proposed Project has been included in this report for informational purposes and to fully analyze all the existing traffic scenarios identified in the Traffic Analysis prepared by Urban Crossroads, Inc. However, the analysis of existing off-site traffic noise levels plus traffic noise generated by the proposed Project scenario will not actually occur since the Project would not be fully constructed and operational until Year 2027 conditions. Table 7-1 shows the Existing without Project conditions CNEL noise levels. The Existing without Project exterior noise levels range from 69.7 to 82.2 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-2 shows the Existing with Project conditions ranging from 71.1 to 83.5 dBA CNEL. Table 7-7 shows that the Project off-site traffic noise level increases range from 0.1 to 1.8 dBA CNEL on the study area roadway segments. Based on the significance criteria for off-site traffic noise presented in Table 4-1, land uses adjacent to the study area roadway segments would experience *less than significant* noise level increases on receiving land uses due to the Project-related traffic.

TABLE 7-7: EXISTING (2022) WITH PROJECT TRAFFIC NOISE LEVEL INCREASES

ID	Road	Segment	Receiving Land Use[1]	CNEL at Receiving Land Use (dBA)[2]			Incremental Noise Level Increase Threshold[3]

11	Riverside Dr.	w/o Milliken Av.	Sensitive	74.9	75.5	0.6	1.5	No
12	Chino Av.	e/o Archibald Av.	Sensitive	71.1	71.4	0.3	1.5	No
13	Ontario Ranch Rd.	w/o Archibald Av.	Sensitive	79.1	79.9	0.8	1.5	No
14	Ontario Ranch Rd.	e/o Archibald Av.	Sensitive	79.9	81.0	1.1	1.5	No
15	Ontario Ranch Rd.	w/o Haven Av.	Sensitive	80.4	81.5	1.1	1.5	No
16	Ontario Ranch Rd.	e/o Haven Av.	Sensitive	81.5	82.6	1.1	1.5	No
17	Ontario Ranch Rd.	w/o Hamner Av.	Non-Sensitive	81.3	83.1	1.8	3.0	No
18	Ontario Ranch Rd.	e/o Hamner Av.	Non-Sensitive	82.2	83.5	1.3	3.0	No

[1] Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.
[2] The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use.
[3] Does the Project create an incremental noise level increase exceeding the significance criteria (Table 4-1)?

7.3 OYC (2027) TRAFFIC NOISE LEVEL INCREASES

Table 7-3 presents the OYC without Project conditions CNEL noise levels. The OYC without Project exterior noise levels range from 70.1 to 83.7 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-4 shows that the OYC with Project conditions will range from 71.4 to 84.6 dBA CNEL. Table 7-8 shows that the Project off-site traffic noise level increases range from 0.1 to 1.3 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Table 4-1, land uses adjacent to the study area roadway segments would experience *less than significant* noise level increases on receiving land uses due to the Project-related traffic.

[1] Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.
[2] The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use.
[3] Does the Project create an incremental noise level increase exceeding the significance criteria (Table 4-1)?

7.4 HY (2050) TRAFFIC NOISE LEVEL INCREASES

Table 7-5 presents the HY without Project conditions CNEL noise levels. The HY without Project exterior noise levels range from 73.8 to 84.9 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-6 shows that the HY with Project conditions will range from 74.3 to 85.5 dBA CNEL. Table 7-8 shows that the Project off-site traffic noise level increases range from 0.0 to 1.0 dBA CNEL. Based on the significance criteria for off-site traffic noise presented in Table 4-1, land uses adjacent to the study area roadway segments would experience *less than significant* noise level increases on receiving land uses due to the Project-related traffic.

TABLE 7-9: HY (2050) WITH PROJECT TRAFFIC NOISE LEVEL INCREASES

[3] Does the Project create an incremental noise level increase exceeding the significance criteria (Table 4-1)?

8 ON-SITE TRAFFIC NOISE ANALYSIS

As outlined in Section 7, noise levels at the roadways bordering the proposed project along Haven Avenue, Mill Creek Avenue, Hamner Avenue, Riverside Drive, Chino Avenue and Ontario Ranch Road would have noise levels above 65 dBA. Therefore, on-site residential land uses located along these roadways would require additional noise attenuation to ensure that noise levels comply with the City's exterior and interior noise standards of 65 dBA CNEL and 45 dBA CNEL.

As the development phasing would be implemented through the approval of tentative tract maps and development permits, the proposed project would be required to implement noise abatement measure 1.2.4, which requires that an acoustical analysis be required for residential units upon submittal final site design plans. Noise abatement measure 1.2.4 includes providing attenuation measures such as soundwalls or increasing the distance between habitable spaces and roadways. With compliance with noise abatement measures, impacts from roadways noise to on-site residential homes would be *less than significant*.

This page intentionally left blank

9 RECEIVER LOCATIONS

To assess the potential for long-term operational and short-term construction noise impacts, the following sensitive receiver locations, as shown on Exhibit 9-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

To describe the potential off-site Project noise levels, eight receiver locations in the vicinity of the Project site were identified. The selection of receiver locations is based on FHWA guidelines and is consistent with additional guidance provided by Caltrans and the FTA, as previously described in Section 5.2. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Distance is measured in a straight line from the project boundary to each receiver location.

R1: Location R1 represents the Colony High School Football Stadium, approximately 76 feet north of the Project site. Receiver R1 is placed in the bleachers just north of Planning Area (PA) 1. A 24-hour noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R2: Location R2 represents the existing noise sensitive residence at 3271 S Quincy Way, approximately 219 feet east of the Project site. Receiver R2 is placed in the private outdoor living areas facing the Project site. A 24-hour noise measurement was taken near this location, L2, to describe the existing ambient noise environment.

R3: Location R3 represents an on-site receiver location within the planned PA7 residential mixed use overlay area. Receiver R3 is placed approximately 460 feet south of the light industrial use within PA 6A. A 24-hour noise measurement was taken near this location, L3, to describe the existing ambient noise environment.

R4: Location R4 represents the existing noise sensitive residence at 10823 Edison Avenue, approximately 94 feet south of the Project site. Since there are no private outdoor living areas (backyard) facing the Project site, receiver R4 is placed at the building's façade. A 24-hour noise measurement was taken near this location, L4, to describe the existing ambient noise environment.

EXHIBIT 9-A: RECEIVER LOCATIONS

R5: Location R5 represents the existing on-site noise sensitive residence at 3959 S Sunrise Avenue within the standalone residential overlay (PA4). Receiver R5 is placed in the private outdoor living areas facing the light industrial use within PA5A. A 24-hour noise measurement was taken near this location, L5, to describe the existing ambient noise environment.

R6: Location R6 represents the existing noise sensitive residence at 3455 Pine Ridge Loop, approximately 150 feet west of the Project site. Receiver R6 is placed in the private outdoor living areas facing the Project site. A 24-hour noise measurement was taken near this location, L6, to describe the existing ambient noise environment.

R7: Location R7 represents the existing noise sensitive residence at 3379 S Myrtle Drive, approximately 156 feet west of the Project site. Receiver R7 is placed in the private outdoor living areas facing the Project site. A 24-hour noise measurement was taken near this location, L7, to describe the existing ambient noise environment.

R8: Location R8 represents the existing noise sensitive residence at 2943 S Alder Creek Drive, approximately 189 feet north of the Project site. Receiver R8 is placed in the private outdoor living areas facing the Project site. A 24-hour noise measurement was taken near this location, L8, to describe the existing ambient noise environment.

This page intentionally left blank

10 OPERATIONAL NOISE ANALYSIS

This section analyzes the potential stationary-source operational noise impacts at the nearby receiver locations, identified in Section 9, resulting from the operation of the proposed Rich-Haven Specific Plan-2022 Amendment Project. It is expected that the primary noise source activities will be related to the light industrial and commercial land uses within planning areas 2C, 3C, 5A, 6A, 6B, 8 and 10B. The residential planning areas within the Rich-Haven Specific Plan-2022 Amendment are considered a noise-sensitive receiving land use. Therefore, no potential operational noise impacts for the residential land use are analyzed in the noise study. Exhibit 10-A identifies the noise source locations used to assess the operational noise levels.

10.1 OPERATIONAL NOISE SOURCES

This operational noise analysis is intended to describe noise level impacts associated with the expected typical of daytime and nighttime activities at the Project site. To present the potential worst-case noise conditions, this analysis assumes the Project would be operational 24 hours per day, seven days per week. The on-site Project-related noise sources are expected to include: loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, truck movements and park activities.

10.2 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 10-1 used to estimate the Project operational noise impacts. It is important to note that the following projected noise levels assume the worst-case noise environment with the loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, truck movements and park activities all operating at the same time. These sources of noise activity will likely vary throughout the day.

10.2.1 MEASUREMENT PROCEDURES

The reference noise level measurements presented in this section were collected using a Larson Davis LxT Type 1 precisions sound level meter (serial number 01146). The LxT sound level meter was calibrated using a Larson-Davis calibrator, Model CAL 200, was programmed in "slow" mode to record noise levels in "A" weighted form and was located at approximately five feet above the ground elevation for each measurement. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (19)

EXHIBIT 10-A: OPERATIONAL NOISE SOURCE LOCATIONS

TABLE 10-1: REFERENCE NOISE LEVEL MEASUREMENTS

Noise Source[1]	Noise Source Height (Feet)	Min./ Hour[2]		Reference Noise Level (dBA L_{eq}) @ 50 Feet	Sound Power Level (dBA)[3]
		Day	Night		
Loading Dock Activity	8'	60	60	62.8	103.4
Roof-Top Air Conditioning Units	5'	39	28	57.2	88.9
Trash Enclosure Activity	5'	60	30	57.3	89.0
Parking Lot Vehicle Movements	5'	60	60	52.6	81.1
Truck Movements	8'	60	60	59.8	93.2
Park Activities	5'	60'	0'	52.9	81.4

[1] As measured by Urban Crossroads, Inc.

[2] Anticipated duration (minutes within the hour) of noise activity during typical hourly conditions expected at the Project site. "Daytime" = 7:00 a.m. - 10:00 p.m.; "Nighttime" = 10:00 p.m. - 7:00 a.m.

[3] Sound power level represents the total amount of acoustical energy (noise level) produced by a sound source independent of distance or surroundings. Sound power levels calculated using the CadnaA noise model at the reference distance to the noise source. Numbers may vary due to size differences between point and area noise sources.

10.2.2 LOADING DOCK ACTIVITY

Noise sources at loading docks located with the Light Industrial may include maneuvering and idling trucks, truck refrigeration units, forklifts, banging and clanging of equipment (i.e., hand carts and roll-up doors), noise from public address systems, and voices of truck drivers and employees. The project proposes commercial uses, as described above that may contain loading docks. The reference loading dock activities are intended to describe the typical operational noise source levels associated with the Project. This includes truck idling, deliveries, backup alarms, unloading/loading, docking including a combination of tractor trailer semi-trucks, two-axle delivery trucks, and background forklift operations.

At a uniform reference distance of 50 feet, Urban Crossroads collected a reference noise level of 62.8 dBA L_{eq}. The loading dock activity noise level measurement was taken over a fifteen-minute period and represents multiple noise sources taken from the center of activity. The reference noise level measurement includes employees unloading a docked truck container included the squeaking of the truck's shocks when weight was removed from the truck, employees playing music over a radio, as well as a forklift horn and backup alarm. In addition, during the noise level measurement a truck entered the loading dock area and proceeded to reverse and dock in a nearby loading bay, adding truck engine, idling, air brakes noise, in addition to on-going idling of an already docked truck. Loading dock activity is estimated during all the daytime, evening, and nighttime hours.

Noise generated by loading docks could exceed the City's 65 dBA noise standard for residential and/or other sensitive noise receivers. Loading dock noise impacts are considered *less than significant* following compliance with the provisions of Ontario Municipal Code as specified in noise abatement measure 1.3.6, which would reduce noise impacts from loading docks to *less than significant* levels.

10.2.3 ROOF-TOP AIR CONDITIONING UNITS

Mechanical equipment, such as generators, trash compactors, heating, ventilation and air conditioning (HVAC) units would be included as part of the proposed improvements. Mechanical equipment would be utilized in commercial as well as institutional areas. The noise level measurements describe a single mechanical roof-top air conditioning unit. The reference noise level represents a Lennox SCA120 series 10-ton model packaged air conditioning unit. At the uniform reference distance of 50 feet, the reference noise levels are 57.2 dBA L_{eq}. Based on the typical operating conditions observed over a four-day measurement period, the roof-top air conditioning units are estimated to operate for and average 39 minutes per hour during the daytime hours, and 28 minutes per hour during the nighttime hours. These operating conditions reflect peak summer cooling requirements with measured temperatures approaching 96 degrees Fahrenheit (°F) with average daytime temperatures of 82°F. For this noise analysis, the air conditioning units are expected to be located on the roof of the Project buildings.

Noise generated from mechanical equipment could impact residential uses and other sensitive receivers within the project vicinity by exceeding the City's 65 dBA noise standard. However, the proposed project would be subject to the provisions of Ontario Municipal Code, which requires that noise levels emitted from such equipment not exceed 65 dBA at any property line within a residential zone, residential use, or other noise-sensitive use. Noise levels from mechanical equipment would be further minimized with implementation of mitigation requiring the orientation of equipment away from any sensitive receivers, proper selection of equipment, and installation of equipment with proper acoustical shielding; refer to noise abatement measure 1.2.5. With implementation of noise abatement measure 1.2.5 and compliance with Ontario Municipal Code provisions, potential impacts from mechanical equipment are considered *less than significant*.

10.2.5 TRASH ENCLOSURE ACTIVITY

To describe the noise levels associated with a trash enclosure activity, Urban Crossroads collected a reference noise level measurement at an existing trash enclosure containing two dumpster bins. The trash enclosure noise levels describe metal gates opening and closing, metal scraping against concrete floor sounds, dumpster movement on metal wheels, and trash dropping into the metal dumpster. The reference noise levels describe trash enclosure noise activities when trash is dropped into an empty metal dumpster, as would occur at the Project Site. The measured reference noise level at the uniform 50-foot reference distance is 57.3 dBA L_{eq} for the trash enclosure activity. The reference noise level describes the expected noise source activities associated with the trash enclosures for the Project's proposed building.

10.2.6 PARKING LOT ACTIVITY

The commercial and institutional uses proposed by the project would include designated parking areas. Traffic associated with parking lots is not of sufficient volume to exceed community noise standards that are based on a time averaged scale such as the CNEL scale. However, the instantaneous maximum sound levels generated by a car door slamming, an engine starting up, and car passing by may be an annoyance to adjacent sensitive receivers. Noise abatement

measure 1.2.7 has been recommended requiring that subsequent noise analyses be prepared for future uses, as determined necessary by the City of Ontario, which demonstrate that all feasible sound attenuation has been incorporated into proposed parking areas (i.e., landscaping and brushed driving surfaces), so that noise from the parking areas has been minimized to the greatest extent practicable. Following mitigation, noise generated by parking lots is not expected to exceed the 65 dBA noise standard and a *less than significant impact* would occur in this regard. Also, it should be noted that noise attenuation from existing walls and intervening vegetation and topography would further lessen potential impacts.

To describe the on-site parking lot activity, a long-term 29-hour reference noise level measurement was collected in the center of activity within the staff parking lot of an Amazon warehouse distribution center. At 50 feet from the center of activity, the parking lot produced a reference noise level of 52.6 dBA L_{eq}. Parking activities are expected to take place during the full hour (60 minutes) throughout the daytime and evening hours. The parking lot noise levels are mainly due cars pulling in and out of parking spaces in combination with car doors opening and closing.

10.2.7 TRUCK MOVEMENTS

It is anticipated that truck deliveries would occur at the proposed commercial uses and industrial land uses. Noise generated by delivery trucks on the project site could exceed the City's 65 dBA noise standard and a significant impact could occur unless mitigated. Delivery truck noise impacts would be minimized through compliance with the provisions of Ontario Municipal Code, as specified in noise abatement measure 1.2.6, which includes limitations on hours of operation when a commercial zone abuts a residential zone or residential use, would reduce noise impacts from trucks to less than significant levels.

The truck movements reference noise level measurement was collected over a period of 1 hour and 28 minutes and represents multiple heavy trucks entering and exiting the outdoor loading dock area producing a reference noise level of 59.8 dBA L_{eq} at 50 feet. The noise sources included at this measurement location account for trucks entering and existing the Project driveways and maneuvering in and out of the outdoor loading dock activity area.

10.2.8 PARK ACTIVITIES

The project proposes parks that would include both active and passive uses. The parks would include picnic areas, basketball courts, tot lots, football, soccer, or softball facilities. Activities at the park could expose surrounding receivers to noise impacts from events at these facilities. Since the residential land use would be located at a minimum of 50 feet from the proposed park facilities, noise generated from people utilizing the park would not exceed the City's 65 dBA noise standard. Furthermore, potential park activities would be limited to operation during daytime hours. Impacts in this regard are considered less than significant.

To represent the potential noise level impacts associated with the Project's Park activities, a reference noise level measurement was collected at the Founders Park in the unincorporated community of Ladera Ranch in the County of Orange. The reference noise levels collected at the

Founders Park are expected to reflect the noise level activities within the open space-recreation land use areas of the Project site, since the reference noise level measurement includes girls' youth soccer games, coaches shouting instructions, and parents speaking on cell phones at five feet from the noise level measurement location, and background noise levels from kids playing on swing sets and people cheering and clapping at 50 feet from the noise level measurement location. Using the uniform reference distance of 50 feet, the reference park activity noise level is 49.4 dBA L_{eq}. The playground activities are estimated to occur for 60 minutes during the peak hour conditions.

10.3 CADNAA NOISE PREDICTION MODEL

To fully describe the exterior operational noise levels from the Project, Urban Crossroads, Inc. developed a noise prediction model using the CadnaA (Computer Aided Noise Abatement) computer program. CadnaA can analyze multiple types of noise sources using the spatially accurate Project site plan, georeferenced Nearmap aerial imagery, topography, buildings, and barriers in its calculations to predict outdoor noise levels.

Using the ISO 9613-2 protocol, CadnaA will calculate the distance from each noise source to the noise receiver locations, using the ground absorption, distance, and barrier/building attenuation inputs to provide a summary of noise level at each receiver and the partial noise level contributions by noise source. Consistent with the ISO 9613-2 protocol, the CadnaA noise prediction model relies on the reference sound power level (L_w) to describe individual noise sources. While sound pressure levels (e.g., L_{eq}) quantify in decibels the intensity of given sound sources at a reference distance, sound power levels (L_w) are connected to the sound source and are independent of distance. Sound pressure levels vary substantially with distance from the source and diminish because of intervening obstacles and barriers, air absorption, wind, and other factors. Sound power is the acoustical energy emitted by the sound source and is an absolute value that is not affected by the environment.

The operational noise level calculations provided in this noise study account for the distance attenuation provided due to geometric spreading, when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. A default ground attenuation factor of 0.5 was used in the CadnaA noise analysis to account for mixed ground representing a combination of hard and soft surfaces. Appendix 10.1 includes the detailed noise model inputs used to estimate the Project operational noise levels presented in this section.

10.4 PROJECT OPERATIONAL NOISE LEVELS

Using the reference noise levels to represent the proposed Project operations that include loading dock activity, roof-top air conditioning units, trash enclosure activity, parking lot vehicle movements, truck movements and park activities, Urban Crossroads, Inc. calculated the operational source noise levels that are expected to be generated at the Project site and the Project-related noise level increases that would be experienced at each of the sensitive receiver locations. Table 10-2 shows the Project operational noise levels during the daytime hours of 7:00

a.m. to 10:00 p.m. The daytime hourly noise levels at the off-site receiver locations are expected to range from 33.1 to 45.8 dBA L_{eq}.

TABLE 10-2: DAYTIME PROJECT OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA Leq)							
	R1	R2	R3	R4	R5	R6	R7	R8
Loading Dock Activity	44.6	44.4	40.6	41.7	39.3	38.6	34.1	32.3
Roof-Top Air Conditioning Units	29.2	30.0	42.0	32.6	36.1	30.3	28.7	21.9
Trash Enclosure Activity	24.1	24.5	37.5	27.2	20.4	21.3	17.8	16.0
Parking Lot Vehicle Movements	27.3	29.2	36.8	29.2	37.4	26.7	25.9	19.8

Park Activities	24.6	22.6	26.1	23.5	28.5	28.8	31.5	20.5
Total (All Noise Sources)	**44.9**	**44.8**	**45.8**	**42.8**	**42.9**	**39.6**	**35.9**	**33.1**

[1] See Exhibit 10-A for the noise source locations. CadnaA noise model calculations are included in Appendix 10.1.

Table 10-3 shows the Project operational noise levels during the nighttime hours of 10:00 p.m. to 7:00 a.m. The nighttime hourly noise levels at the off-site receiver locations are expected to range from 32.9 to 44.8 dBA L_{eq}. The differences between the daytime and nighttime noise levels are largely related to the estimated duration of noise activity as outlined in Table 10-1 and Appendix 10.1.

TABLE 10-3: NIGHTTIME PROJECT OPERATIONAL NOISE LEVELS

Noise Source[1]	Operational Noise Levels by Receiver Location (dBA Leq)							
	R1	R2	R3	R4	R5	R6	R7	R8
Loading Dock Activity	44.6	44.4	40.6	41.7	39.3	38.6	34.1	32.3
Roof-Top Air Conditioning Units	26.8	27.5	39.6	30.2	33.7	27.9	26.3	19.5
Trash Enclosure Activity	20.1	20.5	33.5	23.2	16.4	17.3	13.9	12.1

Total (All Noise Sources)	**44.8**	**44.7**	**44.5**	**42.5**	**42.4**	**39.3**	**35.5**	**32.9**

[1] See Exhibit 10-A for the noise source locations. CadnaA noise model calculations are included in Appendix 10.1.

10.5 PROJECT OPERATIONAL NOISE LEVEL COMPLIANCE

To demonstrate compliance with local noise regulations, the Project-only operational noise levels are evaluated against exterior noise level thresholds based on the City of Ontario exterior noise level standards at nearby noise-sensitive receiver locations. Table 10-4 shows the operational noise levels associated with Rich-Haven Specific Plan-2022 Amendment Project will satisfy the City of Ontario 70 dBA L_{eq} daytime and 65 dBA L_{eq} nighttime exterior noise level standards at the

nearest receiver locations. Therefore, the operational noise impacts are considered *less than significant* at the nearby noise-sensitive receiver locations.

TABLE 10-4: OPERATIONAL NOISE LEVEL COMPLIANCE

Receiver Location[1]	Project Operational Noise Levels (dBA Leq)[2]		Noise Level Standards (dBA Leq)[3]		Noise Level Standards Exceeded?[4]	
	Daytime	Nighttime	Daytime	Nighttime	Daytime	Nighttime
R1	44.9	44.8	65.0	45.0	No	No
R2	44.8	44.7	65.0	45.0	No	No
R3	45.8	44.5	65.0	45.0	No	No

R5	42.9	42.4	65.0	45.0	No	No
R6	39.6	39.3	65.0	45.0	No	No
R7	35.9	35.5	65.0	45.0	No	No
R8	33.1	32.9	65.0	45.0	No	No

[1] See Exhibit 9-A for the receiver locations.
[2] Proposed Project operational noise level calculations are included in Appendix 10-1.
[3] Section 5-29.04 of the City of Ontario Municipal Code (Appendix 3.1).
[4] Do the estimated Project operational noise source activities exceed the noise level standards?
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

10.6 PROJECT OPERATIONAL NOISE LEVEL INCREASES

To describe the Project operational noise level increases, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearby receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (2) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describes the Project noise level increases to the existing ambient noise environment. As indicated on Table 10-5, the Project will generate a daytime noise level increase ranging from 0.0 to 1.4 dBA L_{eq} operational noise level increase at the nearest receiver locations. Table 10-6 shows that the Project will generate a nighttime operational noise level increase ranging from 0.0 to 1.6 dBA L_{eq} at the nearest receiver locations.

The Project-related operational noise level increases will satisfy the operational noise level increase significance criteria presented on Table 4-1. Therefore, the incremental Project operational noise level increase is considered *less than significant* at all receiver locations.

TABLE 10-5: DAYTIME PROJECT OPERATIONAL NOISE LEVEL INCREASES

Receiver Location[1]	Total Project Operational Noise Level[2]	Measurement Location[3]	Reference Ambient Noise Levels[4]	Combined Project and Ambient[5]	Project Increase[6]	Increase Criteria[7]	Increase Criteria Exceeded?

11 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project. Exhibit 11-A shows the construction noise source locations in relation to the nearest sensitive receiver locations previously described in Section 9. The Project Conditions of Approval identified at Section 1.3, would minimize or eliminate a construction-source noise impacts. It is recommended that the City consider these noise abatement measures in their deliberations regarding the Project i

While the City establishes limits to the hours during which construction activity may take place, it does not identify specific noise level limits for construction noise levels at potentially affected receiver locations for CEQA analysis purposes. In addition, since neither the City of Ontario General Plan or Municipal Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers for CEQA analysis purposes, a numerical construction threshold based on Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual is used for analysis of daytime construction impacts. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a reasonable threshold for noise sensitive residential land use (8 p. 179).

11.1 CONSTRUCTION NOISE LEVELS

The FTA *Transit Noise and Vibration Impact Assessment Manual* recognizes that construction projects are accomplished in several different stages and outlines the procedures for assessing noise impacts during construction. Each stage has a specific equipment mix, depending on the work to be completed during that stage. As a result of the equipment mix, each stage has its own noise characteristics; some stages have higher continuous noise levels than others, and some have higher impact noise levels than others. The Project construction activities are expected to occur in the following stages:

- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating

11.2 CONSTRUCTION REFERENCE NOISE LEVELS

To describe construction noise activities, this construction noise analysis was prepared using reference construction equipment noise levels from the Federal Highway Administration (FHWA) published the Roadway Construction Noise Model (RCNM), which includes a national database of construction equipment reference noise emission levels. (24) The RCNM equipment database, provides a comprehensive list of the noise generating characteristics for specific types of construction equipment. In addition, the database provides an acoustical usage factor to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation.

EXHIBIT 11-A: CONSTRUCTION NOISE SOURCE AND RECEIVER LOCATIONS

11.3 CONSTRUCTION NOISE ANALYSIS

Using the reference construction equipment noise levels and the CadnaA noise prediction model, calculations of the Project construction noise level impacts at the nearby sensitive receiver locations were completed. Consistent with FTA guidance for general construction noise assessment, Table 11-1 presents the combined noise levels for the loudest construction equipment, assuming they operate at the same time. As shown on Table 11-2, the construction noise levels are expected to range from 46.5 to 63.8 dBA L_{eq} at the nearby receiver locations. Appendix 11.1 includes the detailed CadnaA construction noise model inputs.

TABLE 11-1: CONSTRUCTION REFERENCE NOISE LEVELS

Construction Stage	Reference Construction Activity	Reference Noise Level @ 50 Feet (dBA L_{eq})[1]	Combined Noise Level (dBA L_{eq})[2]	Combined Sound Power Level (PWL)[3]
Demolition	Demolition Equipment	82	83	115
	Backhoes	74		
	Hauling Trucks	72		
Site Preparation	Crawler Tractors	78	80	112
	Hauling Trucks	72		
	Rubber Tired Dozers	75		
Grading	Graders	81	83	115
	Excavators	77		
	Compactors	76		
Building Construction	Cranes	73	81	113
	Tractors	80		
	Welders	70

R5	60.8	63.8	61.8	63.8	57.8	63.8
R6	52.1	55.1	53.1	55.1	49.1	55.1
R7	51.8	54.8	52.8	54.8	48.8	54.8
R8	49.5	52.5	50.5	52.5	46.5	52.5

[1] Noise receiver locations are shown on Exhibit 11-A.
[2] Construction noise level calculations based on distance from the construction activity, which is measured from the Project site boundary to the nearest receiver locations. CadnaA construction noise model inputs are included in Appendix 11.1.

11.4 CONSTRUCTION NOISE LEVEL COMPLIANCE

To evaluate whether the Project will generate potentially significant short-term noise levels at nearest receiver locations, a construction-related daytime noise level threshold of 80 dBA L_{eq} is used as a reasonable threshold to assess the daytime construction noise level impacts. The construction noise analysis shows that the nearest receiver locations will satisfy the reasonable daytime 80 dBA L_{eq} significance threshold during Project construction activities as shown on Table 11-3. With the implementation of mitigation measures N-1 and N-2, construction noise impacts would be *less than significant*.

TABLE 11-3: CONSTRUCTION NOISE LEVEL COMPLIANCE

Receiver Location[1]	Construction Noise Levels (dBA L_{eq})		
	Highest Construction Noise Levels[2]	Threshold[3]	Threshold Exceeded?[4]
R1	56.0	80	No
R2	53.3	80	No
R3	63.7	80	No
R4	55.8	80	No
R5	63.8	80	No
R6	55.1	80	No
R7	54.8	80	No
R8	52.5	80	No

[1] Noise receiver locations are shown on Exhibit 11-A.

[3] Construction noise level thresholds as shown on Table 4-1.
[4] Do the estimated Project construction noise levels exceed the construction noise level threshold?

11.6 CONSTRUCTION VIBRATION ANALYSIS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods employed. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Ground vibration levels associated with various types of construction equipment are summarized on Table 11-4. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the potential for human response (annoyance) and building damage using the following vibration assessment methods defined by the FTA. To describe the vibration impacts the FTA provides the following equation: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 11-4: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded Trucks	0.076
Large bulldozer	0.089
Vibratory Roller	0.210

Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual

Table 11-5 presents the expected Project related vibration levels at the nearby receiver locations. At distances ranging from 30 to 219 feet from Project construction activities, construction vibration velocity levels are estimated to range from 0.003 to 0.068 in/sec PPV. Based on maximum acceptable continuous vibration threshold of 0.3 PPV (in/sec), the typical Project construction vibration levels will fall below the building damage thresholds at all the noise sensitive receiver locations.

It is not anticipated that short-term construction operations or long-term operations for the proposed project would result in excessive groundborne vibration or ground borne noise levels. Vibration producing construction equipment such as pile drivers is not typically used for the type of residential homes and commercial buildings that would be developed as part of the Rich-Haven Specific Plan. Although the proposed project would include the use of heavy-duty construction equipment, vibration impacts that would be generated would not damage structures within the project vicinity. In addition, long-term operation at residential units typically would not produce excessive ground vibration. Therefore, the Project-related vibration impacts are considered *less than significant* during typical construction activities at the Project site.

TABLE 11-5: PROJECT CONSTRUCTION VIBRATION LEVELS

Receiver[1]	Distance to Const. Activity (Feet)[2]	Typical Construction Vibration Levels PPV (in/sec)[3]					Thresholds PPV (in/sec)[4]	Thresholds Exceeded?[5]
		Small bulldozer	Jackhammer	Loaded Trucks	Large bulldozer	Highest Vibration Level		
R1	76'	0.001	0.007	0.014	0.017	0.017	0.3	No
R2	219'	0.000	0.001	0.003	0.003	0.003	0.3	No
R3	30'	0.002	0.027	0.058	0.068	0.068	0.3	No

Sec. 5-29.01. Declaration of findings and policy.

It is hereby found and declared that:

(a) The making and creation of excessive, unnecessary or unusually loud noises within the limits of the City is a condition that has existed for some time, however, the extent and volume of such noises is increasing;

(b) The making, creation or maintenance of such excessive, unnecessary, unnatural or unusually loud noises that are prolonged, unusual and unnatural in their time, place and use affect and are a detriment to public health, comfort, convenience, safety, welfare and prosperity of the residents of the City; and

(c) The necessity in the public interest for the provisions and prohibitions hereinafter contained and enacted, is declared as a matter of legislative determination and public policy, and it is further declared that the provisions and prohibitions hereinafter contained and enacted are in pursuance of and for the purpose of securing and promoting the public health, comfort, convenience, safety, welfare and prosperity and the peace and quiet of the residents of the City.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.02. Definitions.

As used in this chapter, specific words and phrases are defined as follows:

(a) "Ambient noise level" shall mean the all-encompassing noise level associated with a given environment and is a composite of sounds from all sources, excluding the alleged offensive noise or excessive sound, at the location and approximate time at which a comparison with the alleged offensive noise is to be made.

(b) "Applicable (noise) zone" shall mean the noise zone category based on the actual use of the property, provided that the actual use is a legal use in the City.

(c) "A-weighted sound level" shall mean the sound pressure level in decibels (dBAs) as measured with a sound level meter using the A-weighted filter network (scale) at slow response and at a pressure of twenty (20) micropascals. The A-weighted filter de-emphasizes the very low and a very high frequency component of sound in a manner similar to the response of the human ear, and is a numerical method of rating human judgment of loudness.

(d) "Decibel (dBA)" shall mean a unit for measuring the amplitude of a sound, equal to twenty (20) times the logarithm to the base ten (10) of the ratio of pressure of the sound measured to the reference pressure of twenty (20) micropascals.

(e) "Equivalent sound or noise level (Leq)" shall mean the International Electrotechnical Commission (IEC) 60804 Standard for measurement, or the most recent revision thereof, for the sound level corresponding to a steady state noise level over a given sample period with the same amount of acoustic energy as the actual time varying noise level or the energy average noise level during the sample period. The measurement period for the purposes of this chapter is fifteen (15) minutes.

(f) "Impulsive noise" shall mean a noise of short duration usually less than one (1) second and of high intensity, with an abrupt onset and rapid decay. Such objectionable noises may also be repetitive.

(g) "Intrusive noise" shall mean that noise that intrudes over and above the ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, time of occurrence and tonal information content, as well as the prevailing ambient noise level.

(h) "Maintenance" shall mean the upkeep, repair or preservation of existing property or structures.

(i) "Noise" shall mean any unwanted sound or sound that is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing or is otherwise annoying.

(j) "Noise level (sound level)" shall mean the weighted sound pressure level obtained by use of a sound level meter having a standard frequency filter for attenuating part of the sound spectrum. For purposes of this chapter, all noise levels (sound levels) shall be A-weighted sound pressure level.

(k) "Noise (sound) level meter" shall mean an instrument, including a microphone, an amplifier, an output meter and frequency weighting networks for the measurement and determination of noise and sound levels. For the purposes of this chapter, the sound level meter must meet the International Electrotechnical Commission (IEC) 60651 and 60804 Standards, or the most recent revisions thereof, for Type 1 sound level meters or an instrument and the associated recording and analyzing equipment that will provide equivalent data.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.03. Designated noise zones.

The properties hereinafter described shall be assigned to the following noise zones:

Noise Zone I:	All single-family residential properties;
Noise Zone II:	All multi-family residential properties and mobile home parks;
Noise Zone III:	All commercial property;
Noise Zone IV:	The residential portion of mixed use properties;
Noise Zone V:	All manufacturing or industrial properties and all other uses.

The actual use of the property, and not necessarily its zoning designation, shall be the determining factor in establishing whether a property is in Noise Zone I, II, III, IV or V, provided that the actual use is a legal use within the applicable zone.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.04. Exterior noise standards.

(a) The following exterior noise standards, unless otherwise specifically indicated, shall apply to all properties within a designated noise zone.

Allowable Exterior Noise Level (1)		***Allowed Equivalent Noise Level, Leq. (2)***	
Noise Zone	***Type of Land Use***	***7 a.m. to 10 p.m.***	***10 p.m. to 7 a.m.***
I	Single-Family Residential	65 dBA	45 dBA
II	Multi-Family Residential, Mobile Home Parks	65 dBA	50 dBA
III	Commercial Property	65 dBA	60 dBA
IV	Residential Portion of Mixed Use	70 dBA	70 dBA
V	Manufacturing and Industrial, Other Uses	70 dBA	70 dBA

(1) If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard.

(2) Measurements for compliance are made on the affected property pursuant to §5-29.15.

(b) It is unlawful for any person at any location within the incorporated area of the City to create noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which noise causes the noise level, when measured at any location on any other property, to exceed either of the following:

(1) The noise standard for the applicable zone for any fifteen-minute (15) period; and

(2) A maximum instantaneous (single instance) noise level equal to the value of the noise standard plus twenty (20) dBA for any period of time (measured using A-weighted slow response).

(c) In the event the ambient noise level exceeds the noise standard, the maximum allowable noise level under such category shall be increased to reflect the maximum ambient noise level.

(d) The Noise Zone IV standard shall apply to that portion of residential property falling within one hundred (100) feet of a commercial property or use, if the noise originates from that commercial property or use.

(e) If the measurement location is on a boundary between two (2) different noise zones, the lower noise level standard applicable to the noise zone shall apply.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.05. Interior noise standards.

(a) The following interior noise standards, unless otherwise specifically indicated, shall apply to all properties within a designated noise zone.

Allowable Interior Noise Level (1)		**Allowed Equivalent Noise Level, Leq.** (2)	
Noise Zone	***Type of Land Use***	***7 a.m. to 10 p.m.***	***10 p.m. to 7 a.m.***
I	Single-Family Residential	45 dBA	40 dBA
II	Multi-Family Residential, Mobile Home Parks	45 dBA	40 dBA
IV	Residential Portion of Mixed Use	45 dBA	40 dBA

(1) If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard.

(2) Measurements for compliance are made on the affected property pursuant to §5-29.15.

(b) It is unlawful for any person at any location within the incorporated area of the City to create noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which noise causes the noise level, when measured at any location on any other property, to exceed either of the following:

(1) The noise standard for the applicable zone for any fifteen-minute (15) period;

(2) A maximum instantaneous (single instance) noise level equal to the value of the noise standard plus twenty (20) dBA for any period of time (measured using A-weighted slow response).

(c) In the event the ambient noise level exceeds the noise standard, the maximum allowable noise level under such category shall be increased to reflect the maximum ambient noise level.

(d) The Noise Zone IV standard shall apply to that portion of residential property falling within one hundred (100) feet of a commercial property or use, if the noise originates from that commercial property or use.

(e) If the measurement location is on a boundary between two (2) different noise zones, the lower noise level standard applicable to the noise zone shall apply.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.06. Exemptions.

The following activities shall be exempted from the provisions of this chapter:

(a) Any activity conducted on public property, or on private property with the consent of the owner, by any public entity or its officers, employees, representatives, agents, subcontractors, permittees, licensees or lessees that the public entity has authorized are exempt from the provisions of this chapter. This includes, without limitation, sporting and recreational activities that are sponsored, co-sponsored, permitted or allowed by the City or any school district within the City's jurisdictional boundaries. This also includes, without limitation, occasional outdoor gatherings, public dances, shows or sporting and entertainment events, provided such events are conducted pursuant to an approval, authorization, contract, lease, permit or sublease by the appropriate public entity, specifically the planning commission or City Council;

(b) Occasional outdoor gatherings, public dances, show, sporting and entertainment events, provided said events are

conducted pursuant to a permit or license issued by the appropriate jurisdiction relative to the staging of said events;

(c) Any mechanical device, apparatus or equipment used, related to or connected with emergency machinery, vehicle, work or warning alarm or bell, provided the sounding of any bell or alarm on any building or motor vehicle shall terminate its operation within forty-five (45) minutes in any hour of its being activated;

(d) Noise sources associated with construction, repair, remodeling, demolition or grading of any real property. Such activities shall instead be subject to the provisions of § 5-29.09;

(e) Noise sources associated with construction, repair, remodeling, demolition or grading of public rights-of-way or during authorized seismic surveys;

(f) All mechanical devices, apparatus or equipment associated with agriculture operations provided that:

(1) Operations do not take place between 8:00 p.m. and 7:00 a.m.;

(2) Such operations and equipment are utilized for the protection or salvage of agricultural crops during periods of potential or actual frost damage or other adverse weather conditions; or

(3) Such operations and equipment are associated with agricultural pest control through pesticide application, provided the application is made in accordance with permits issued by or regulations enforced by the California Department of Agriculture;

(g) Noise sources associated with the maintenance of real property. Such activities shall instead be subject to the provisions of § 5-29.08;

(h) Any activity to the extent regulation thereof has been preempted by state or federal law;

(i) Any noise sources associated with people and/or music associated with a party at a residential property. Such noise shall be subject to the provisions of OMC § 5-29.07;

(j) Any noise source emanating from an ice cream truck within the City. Such noise shall be subject to the provisions of OMC § 4-18.04;

(k) Any noise sources associated with barking dogs or other intermittent noises made by animals on any properly within the City. Such noise shall be subject to the provisions of OMC Chapter 1, Title 6;

(l) Noise sources related to uses approved by a permit or development agreement adopted prior to the date of adoption of this chapter and that contains acoustic or noise standard conditions of approval. This exemption shall only be applicable during the effective period of the City-approved permit or development agreement.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.07. Loud and disturbing noise.

(a) It is unlawful for any person or property owner within the City to make, cause or allow to be made any loud, excessive, impulsive or intrusive noise, disturbance or commotion that disturbs the peace or quiet of any area or that causes discomfort or annoyance to any reasonable person of normal sensitivities in the area, after a Police or Code Enforcement Officer has first requested that the person or property owner cease and desist from making such noise. The types of loud, disturbing, excessive, impulsive or intrusive noise may include, but shall not be limited to, yelling, shouting, hooting, whistling, singing, playing a musical instrument, or emitting or transmitting any loud music or noise from any mechanical or electrical sound making or sound-amplifying device.

(b) The factors, standards, and conditions that may be considered in determining whether a violation of the provisions of this section has been committed, included, but not limited to, the following:

(1) The level of the noise;

(2) The level and intensity of the background (ambient) noise, if any;

(3) The proximity of the noise to residential or commercial sleeping areas;

(4) The nature and zoning of the area within which the noise emanates;

(5) The density of inhabitation of the area within which the noise emanates;

(6) The time of day and night the noise occurs;

(7) The duration of the noise;

(8) Whether the noise is constant, recurrent or intermittent;

(9) Whether the noise is produced by a commercial or noncommercial activity; and

(10) Whether the use is lawful under the provisions of Title 5 of this Code and whether the noise is one that could reasonably be expected from the activity or allowed use.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.08. Real property maintenance noise regulations.

(a) No person, while engaged in maintenance of real property, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, except between the hours of 8:00 a.m. and 6:00 p.m.

(b) Trimming or pruning that requires the use of chainsaws or mulching machines shall only be allowed between the hours of 8:00 a.m. and 6:00 p.m. on a weekday and between the hours of 9:00 a.m. and 5:00 p.m. on Saturday or Sunday.

(c) The use of electrical or gasoline powered blowers, such as commonly used by gardeners or other persons for cleaning lawns, yards, driveways, gutters and other property shall only be allowed between the hours of 8:00 a.m. and 6:00 p.m. on a weekday and between the hours of 9:00 a.m. and 5:00 p.m. on Saturday or Sunday.

(d) No landowner, gardener, property maintenance service, contractor, subcontractor or employer shall permit or allow any person or persons working under his or her direction or control to operate any tool, equipment or machine in violation of the provisions of this section.

(e) Exceptions. The provisions of this section shall not apply to the following:

(1) Emergency property maintenance required by the building official;

(2) The maintenance, repair or improvement of any public work or facility by public employees, by any person or persons acting pursuant to a public works contract, or by any person or persons performing such work or pursuant to the direction of, or on behalf of, any public agency; provided, however, this exception shall not apply to the City, or its employees, contractors or agents, unless:

(i) The City Manager or department head determines that the maintenance, repair or improvement is immediately necessary to maintain public service,

(ii) The maintenance, repair or improvement is of a nature that cannot feasibly be conducted during normal business hours, or

(iii) The City Council has approved project specifications, contract provisions, or an environmental document that specifically authorizes maintenance during hours of the day that would otherwise be prohibited pursuant to this section; and

(3) Any maintenance that complies with the noise limits specified in §5-29.04.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.09. Construction activity noise regulations.

(a) No person, while engaged in construction, remodeling, digging, grading, demolition or any other related building activity, shall operate any tool, equipment or machine in a manner that produces loud noise that disturbs a person of normal sensitivity who works or resides in the vicinity, or a Police or Code Enforcement Officer, on any weekday except between the hours of 7:00 a.m. and 6:00 p.m. or on Saturday or Sunday between the hours of 9:00 a.m. and 6:00 p.m.

(b) No landowner, construction company owner, contractor, subcontractor, or employer shall permit or allow any person or persons working under their direction and control to operate any tool, equipment or machine in violation of the provisions of this section.

(c) Exceptions.

(1) The provisions of this section shall not apply to emergency construction work performed by a private party when authorized by the City Manager or his or her designee;

(2) The maintenance, repair or improvement of any public work or facility by public employees, by any person or persons acting pursuant to a public works contract, or by any person or persons performing such work or pursuant to the direction of, or on behalf of, any public agency; provided, however, this exception shall not apply to the City, or its employees, contractors or agents, unless:

(i) The City Manager or a department head determines that the maintenance, repair or improvement is immediately necessary to maintain public services,

(ii) The maintenance, repair or improvement is of a nature that cannot feasibly be conducted during normal business hours, or

(iii) The City Council has approved project specifications, contract provisions, or an environmental document that specifically authorizes construction during hours of the day that would otherwise be prohibited pursuant to this section; and

(3) Any construction that complies with the noise limits specified in §§5-29.04 or 5-29.05.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.10. Other public agency exceptions.

The provisions of this chapter shall not be construed to prohibit any work at different hours by or under the direction of any other public agency or public or private utility companies in cases of necessity or emergency.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.11. Schools, day care centers, churches, libraries, museums, health care institutions; Special provisions.

It is unlawful for any person to create any noise that causes the outdoor noise level at any school, day care center, hospital or similar health care institution, church, library or museum while the same is in use, to exceed the noise standards specified in § 5-29.04 prescribed for the assigned Noise Zone I.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.12. Sound amplifying equipment.

Loudspeakers, sound amplifiers, public address systems or similar devices used to amplify sounds shall be subject to the provisions of § 5-29.13. Such sound amplifying equipment shall not be construed to include electronic devices, including but not limited to, radios, tape players, tape recorders, compact disc players, MP3 players, electric keyboards, music synthesizers, record players or televisions, which are designed and operated for personal use, or used entirely within a building and are not designed or used to convey the human voice, music or any other sound to an audience outside such building, or which are used in vehicles and heard only by occupants of the vehicle in which installed.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.13. Amplified sound.

(a) The City Council enacts the following legislation for the sole purpose of securing and promoting the public health, comfort, safety and welfare for its citizenry. While recognizing that the use of sound amplifying equipment may be entitled to certain protection by the constitutional rights of freedom of speech and assembly, the City Council finds that in order to protect the public safety and the correlative rights of the citizens of this community to privacy and freedom from public nuisance of loud and unnecessary noise, reasonable regulation of the time, place and manner of the use of amplifying equipment is necessary. In no event shall approval or authorization required herein be withheld by reason of the constitutionally protected content of any material proposed to be broadcast through amplifying equipment.

(b) It is unlawful for any person, other than personnel of law enforcement or governmental agencies, to install, use or operate a loudspeaker or sound amplifying device in a fixed or movable position or mounted upon any vehicle within the City for the purpose of giving instructions, directions, talks, addresses or lectures to any persons or assemblages of persons in or upon any street, alley, sidewalk, park, place or public property without a permit to do so from the Police Chief or his or her designee. Notwithstanding any other provision of this chapter, the provisions of this section shall also apply to the use of sound amplifying equipment upon public or private property when used in connection with outdoor or indoor public or private events, whether or not admission is charged or food or beverages are sold, when such activity is to be attended by more than one hundred (100) persons and the noise emanating from the event will be audible at the property plane, or in the case of a street dance or concert on the nearest residential property. Those activities listed in § 5-29.06(a) are exempt from the requirements of this section.

(c) The Police Chief or his or her designee is authorized to approve and issue permits under this section.

(d) An application for a permit required by this section shall be filed with the Police Chief at least sixteen (16) days and no more than one hundred twenty (120) days prior to the date on which the sound amplifying equipment is intended to be used. Applications for events covered by the First Amendment of the United States Constitution are exempt from the time requirements of this section if it is shown that circumstances require a shorter filing period and the event will not constitute an unsafe condition. The application shall contain the following information:

(1) The name, address and telephone number of both the owner and the user of the sound amplifying equipment;

(2) The license number, if a sound truck is to be used;

(3) A general description of the sound amplifying equipment which is to be used;

(4) Whether sound amplifying equipment will be used for commercial or noncommercial purpose;

(5) The dates and times upon and within which, and the streets or property over or upon which, the equipment is proposed to be operated;

(6) The name or names of one (1) or more persons who will be present during the conduct of any activities for which registration is sought and who will have authority to reduce the volume of any sound amplifying equipment during the course of the activities if required pursuant to this chapter and, otherwise, to insure compliance with the provisions of this chapter;

(7) A statement by the applicant that he or she is willing and able to comply with the provisions of this chapter and the conditions of the permit; and

(8) A sketch of the area or facilities within which the activities are to be conducted, with approximate dimensions and illustration of the location and orientation of all sound-amplifying equipment.

(e) The Police Chief shall deny the permit application or revoke any permit if the chief finds any of the following:

(1) The application contains materially false or intentionally misleading information;

(2) The use of sound amplifying equipment at an event or activity proposed will be located in or upon a premises,

building or structure that is hazardous to the health or safety of the employees or patrons of the premises, business, activity, or event, or the general public, under the standards established by the Uniform Building or Fire Codes, or other applicable codes, as set forth in OMC Titles 4 and 8;

(3) The use of sound amplifying equipment at an event or activity proposed in or upon a premises, building or structure that lacks adequate on-site parking for participants attending the proposed event or activity under the applicable standards set forth in OMC Title 9;

(4) The conditions of any motor vehicle movement are such that, in his or her opinion, the use of the equipment would constitute an unreasonable interference with traffic safety;

(5) The conditions of pedestrian movement are such that the use of the equipment would constitute a detriment to traffic safety;

(6) The application submitted by the applicant reveals that the applicant would violate the provisions of this section or any other provision of federal, state and/or local law;

(7) The applicant is unwilling or unable to comply with the provisions of this chapter or any conditions imposed upon any permit issued;

(8) There had already been a permitted event at the intended location, or within a two hundred (200) yard radius of the intended location and the prior permitted event was located on residentially zoned property or on a street, alley, public parking lot or neighborhood park within three (3) months prior to the intended event. Community parks are exempt from this subsection (8); or

(9) The applicant or location has had previous violations within the past calendar year, and in the judgment of the Police Chief, issuance would be contrary to the intent of this section.

(f) In determining whether the use of the equipment would constitute an unreasonable interference with or detriment to traffic safety, the Police Chief shall consider, but shall not necessarily be limited to:

(1) The volumes, patterns and speed of vehicular and pedestrian traffic in the proposed area of use;

(2) The relationship of the proposed use of equipment and potential impacts upon traffic patterns;

(3) Availability of sufficient room for the operation of the equipment without significantly interfering with the traffic patterns;

(4) Proximity to schools, playgrounds and similar facilities where use of such equipment might attract children into traffic patterns; or

(5) Proximity to busy intersections or other potentially hazardous conditions where use of such equipment might constitute a hazard by reason of its tendency to distract drivers of vehicles or pedestrians.

(g) Issuance or denial.

(1) If the application is approved, the Police Chief shall return an approved copy of the application to the applicant and shall issue a permit. The permit shall constitute permission for the use of the sound amplifying equipment as requested.

(2) Any application filed shall be either approved or disapproved within five (5) days of the filing thereof.

(3) If the application is disapproved, the Police Chief shall return a disapproved copy forthwith to the applicant with a written statement on the reason for disapproval.

(i) Any person aggrieved by a decision of the Police Chief or his or her designee may file an appeal to the City Manager. A complete and proper appeal shall be filed with the City Clerk within ten (10) calendar days of the action that is the subject of the appeal. If the applicant fails to file an appeal within the ten (10) day filing period provided herein, denial shall take effect immediately upon expiration of such filing period. All appeals shall be in writing and shall contain the following information: (a) name(s) of the person filing the appeal, (b) a brief statement in ordinary and concise language of the relief sought, and (c) the signatures of all parties named as appellants and their mailing addresses. After receiving the appeal, the City Clerk shall immediately forward the matter to the City Manager for handling.

(ii) The City Manager shall, upon receipt of the appeal, set the matter for hearing before the City Manager or a hearing officer. Any hearing officer shall be a licensed attorney or recognized mediator designated by the City Manager. The hearing shall be set for not more than ten (10) calendar days after the receipt of the appeal unless a longer time is requested or consented to by the appellant. Notice of such hearing shall be given in writing and mailed at least five (5) calendar days prior to the date of the hearing, by U.S. mail, with a proof of service attached, addressed to the address listed on the permit application, or the written appeal if different from the permit application. The notice shall state the grounds of the complaint or reason for the denial and shall state the time and place where such hearing will be held.

(iii) The City Manager or hearing officer shall, within ten (10) calendar days following the conclusion of the hearing, make a written finding and decision, which shall be delivered to the City and the appellant by first class mail. Notwithstanding any provision in this Code, the decision of the City Manager or hearing officer shall be the final administrative decision of the City. Any party dissatisfied with the decision of the City Manager or hearing officer may seek review of such decision under the provisions of Code Civil Procedure, §§ 1094.5 and 1094.8, as amended from time to time.

(h) In addition to any other provisions of this Code, the use of sound-amplifying equipment and sound trucks in the City shall be subject to the following regulations:

(1) The only sounds permitted are music and human speech;

(2) Sound shall not be emitted within one hundred (100) yards of hospitals, churches, schools and City Hall;

(3) The volume of sound shall be controlled so that it will not be audible for a distance in excess of one hundred (100) feet from the sound amplifying equipment or sound truck, and so that the volume is not unreasonably loud, raucous, jarring, disturbing or a nuisance to persons within the range of allowed audibility; or

(4) The sound amplifying equipment or sound truck shall not be used between the hours of 8:00 p.m. and 8:00 a.m.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.14. Motor vehicles.

The use of any motor vehicle in such a condition as to create excessive, impulsive or intrusive noises is prohibited. The discharge into the open air of the exhaust of any internal combustion engine, stationary or mounted on wheels, motorboat or motor vehicle, including motor cycle, whether or not discharged through a muffler or other similar device, which discharge creates excessive, unusual, impulsive or intrusive noise is prohibited. Motor vehicles shall comply with the noise regulations of the California Vehicle Code.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.15. Noise level measurement.

(a) The location selected for measuring exterior noise levels in a residential area shall be at any part of a private yard, patio, deck or balcony normally used for human activity and identified by the owner or, if occupied by someone other than the owner, the occupant of the affected property as suspected of exceeding the noise level standard. This location may be the closest point in the private yard or patio, or on the deck or balcony, to the noise source, but should not be located in nonhuman activity areas such as trash container storage areas, planter beds, above or contacting a property line fence, or other areas not normally used as part of the yard, patio, deck or balcony. The location selected for measuring exterior noise levels in a nonresidential area shall be at the closest point to the noise source. The measurement microphone height shall be five (5) feet above finish elevation or, in the case of a deck or balcony, the measurement microphone height shall be five (5) feet above the finished floor level.

(b) The location selected for measuring interior noise levels shall be made within the affected residential unit. The measurements shall be made at a point at least four (4) feet from the wall, ceiling or floor, or within the frame of a window opening, nearest the noise source. The measurements shall be made with windows in an open position.

(c) Any decibel measurement made pursuant to the provisions of this chapter shall be measured in decibels (dBAs) as measured with a sound level meter using the A-weighted sound pressure level.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.16. Prima facie violation.

Any noise exceeding the noise level standard as specified in §§5-29.04 and 5-29.05, shall be deemed to be prima facie evidence of a violation of the provisions of this chapter.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.17. Penalty.

(a) Any person who negligently or knowingly violates any provision of this chapter shall be guilty of an infraction and upon conviction shall be punishable by a fine specified in OMC § 1-2.01. Each day a violation occurs shall constitute a separate offense and shall be punishable as such.

(b) Any person who negligently or knowingly violates any provision of this chapter may also be subject to fine(s) specified in the administrative citation schedule of fines set forth in OMC § 1-5.04. The manner of issuing administrative citations shall comply with all the procedures specified in OMC Chapter 5, Title 1.

(c) As an additional remedy, the operation or maintenance of any device, instrument, vehicle or machinery in violation of any provisions of this chapter, which operation or maintenance causes or creates sound levels exceeding the allowable standards as specified in this chapter, shall be deemed and is declared to be a public nuisance and may be subject to abatement by a restraining order or injunction issued by a court of competent jurisdiction.

(d) Any violation of this chapter is declared to be a public nuisance and may be abated in accordance with law. The expense of enforcing this chapter is declared to be public nuisance and may be by resolution of the City Council declared to be a lien and special assessment against the property on which such nuisance is maintained, and any such charge shall also be a personal obligation of the property owner.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.18. Enforcement and administration.

(a) It shall be the responsibility of Police or Code Enforcement Officers to enforce the provisions of this chapter and to perform all other functions required by this chapter. Such duties shall include, but not be limited to investigating potential violations, issuing warning notices and citations, and providing evidence to the City prosecutor for legal action.

(b) For violations of § 5-29.07, Police or Code Enforcement Officers shall obtain a declaration under penalty of perjury from two (2) declarants living in separate households within a sixty (60) day period stating in detail all of the following:

(1) That the declarant is a resident of a residential neighborhood located within two hundred (200) yards of the noise source; and

(2) Within the past month declarant has heard noise for substantially long periods to the extreme annoyance of the declarant.

(3) Declarations from two (2) declarants are required to prove a violation of §5-29.07, but are not required to prove that a person has violated any other provision of this chapter.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.19. City Manager waiver.

The City Manager is authorized to grant a temporary waiver to the provisions of this chapter for a period of time necessary to correct the violations of this chapter, if such temporary waiver would be in the public interest and there is no feasible and prudent alternative to the activity, or the method of conducting the activity, for which the temporary waiver is sought. This time period may include a commitment to a program that includes placing necessary orders and entering into necessary contracts within thirty (30) days for repair or installation.

(§ 2, Ord. 2888, eff. March 6, 2008)

Sec. 5-29.20. Noise abatement program.

(a) In circumstances where adopted community-wide noise standards and policies prove impractical in controlling noise generated from a specific source, the City Council may establish a noise abatement program that recognizes the characteristics of the noise source and affected property and that incorporates specialized mitigation measures.

(b) Noise abatement programs shall set forth in detail the approved terms, conditions and requirements for achieving maximum compliance with noise standards and policies. Said terms, conditions and requirements may include, but shall not be limited to, limitations, restrictions, or prohibitions on operating hours, location of operations, and the types of equipment.

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (9/12/2021)

Scenario: E
Road Name: Archibald Av.
Road Segment: n/o Ontario Ranch Rd.
Project Name: Rich Haven Specific Plan
Job Number: 14822

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	21,909 vehicles
Peak Hour Percentage:	7.91%
Peak Hour Volume:	1,733 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	80 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	60.0 feet
Centerline Dist. to Observer:	60.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	*Day*	*Evening*	*Night*	*Daily*
Autos:	70.7%	11.8%	17.5%	86.53%
Medium Trucks:	82.2%	3.5%	14.3%	2.42%
Heavy Trucks:	70.8%	6.2%	23.0%	11.05%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	*Grade Adjustment:*	0.0

Lane Equivalent Distance (in feet)

Autos:	45.000
Medium Trucks:	44.803
Heavy Trucks:	44.822

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (9/12/2021)

Scenario: E+P
Road Name: Ontario Ranch Rd.
Road Segment: w/o Haven Av.
Project Name: Rich Haven Specific Plan
Job Number: 14822

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	39,277 vehicles
Peak Hour Percentage:	7.91%
Peak Hour Volume:	3,107 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	154 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	84.0 feet
Centerline Dist. to Observer:	84.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	70.7%	11.8%	17.5%	93.29%
Medium Trucks:	82.2%	3.5%	14.3%	1.20%
Heavy Trucks:	70.8%	6.2%	23.0%	5.51%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	33.941
Medium Trucks:	33.679
Heavy Trucks:	33.705

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (9/12/2021)

Scenario: OY+P
Road Name: Ontario Ranch Rd.
Road Segment: e/o Haven Av.
Project Name: Rich Haven Specific Plan
Job Number: 14822

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	53,412 vehicles
Peak Hour Percentage:	7.91%
Peak Hour Volume:	4,225 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	154 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	84.0 feet
Centerline Dist. to Observer:	84.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	70.7%	11.8%	17.5%	92.79%
Medium Trucks:	82.2%	3.5%	14.3%	1.29%
Heavy Trucks:	70.8%	6.2%	23.0%	5.92%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	33.941
Medium Trucks:	33.679
Heavy Trucks:	33.705

5.5 - HAZARDS

5.5.1 - Introduction

Information in this section is derived from the following site-specific technical studies, other reference documents, and correspondence received.

- Phase I Environmental Site Assessment, Approximate 77-Acre Property, Rich Haven Specific Plan Mixed Use District, RBF Consulting, October 3, 2005.
- Phase I Environmental Site Assessment, Approximate 106-Acre Property, Rich Haven Specific Plan Mixed Use District, RBF Consulting, October 3, 2005.
- Phase I Environmental Site Assessment, Visser Property, GeoKinetics, February 1, 2003.
- Phase I Environmental Site Assessment, Randall Property, GeoKinetics, January 17, 2005.
- Phase I Environmental Site Assessment, Di Tommaso Property, GeoKinetics, February 18, 2004.
- Preliminary Subsurface Methane Gas Investigation, Randall Property, GeoKinetics, January 31, 2005.
- Subsurface Methane Gas Investigation, Scritsmier Property, GeoKinetics, January 26, 2004.
- Subsurface Methane Gas Investigation, Visser Property, GeoKinetics, February 1, 2003.
- Subsurface Methane Gas Investigation, Di Tommaso Property, GeoKinetics, February 18, 2004.
- Subsurface Methane Gas Investigation, Van Der Eyk Property, GeoKinetics, November 25, 2002.
- Letter from the California Department of Toxic Substances Control, June 12, 2006.
- NMC Final EIR, City of Ontario, October 1997.
- 1992 General Plan, City of Ontario, September 1992.

The NMC Final EIR identified that hazardous materials and hazardous waste generation are primarily associated with fuels such as gasoline, diesel, and heating oil, and pesticides, and identified a number of recorded sites. The NMC Final EIR concluded that potential impacts regarding hazardous waste sites within the NMC would become fully known when individual subareas are developed through the preparation of Phase I Environmental Site Assessments and, if applicable, the preparation of Phase II Environmental Site Investigations.

In addition, the NMC Final EIR referenced the likelihood that buildings located within the NMC would contain asbestos and lead-based paints, if constructed prior to 1979 and concluded that lead-based paint and asbestos surveys would be required prior to demolition.

Preparation of this section of the Draft EIR conforms to the recommendations contained in the NMC Final EIR and evaluates additional information specific to the project site that may not have been included in the broad, program-level evaluation of the NMC Final EIR.

5.5.2 - Existing Conditions

Phase I Environmental Site Assessments (ESA) and Subsurface Methane Gas Investigations were conducted for all properties on the site except for the following Assessor's Parcel Numbers, for which methane studies were not directly indicated:

- 0218-211-25
- 0218-211-12
- 0218-211-21
- 0218-211-15
- 0218-161-04
- 0218-161-05
- 0218-161-01
- 0218-161-11

Hazardous Materials and Risk of Upset

The presence of suspected or known hazardous waste contamination sites within the project site and immediate vicinity was determined through various Phase I ESAs performed by RBF Consulting and GeoKinetics in 2002, 2003, 2004, and 2005. These analyses included a computerized database search of various governmental agency lists. The CEQA Guidelines require a lead agency to consult the lists of hazardous waste sites compiled by various state agencies (Cal EPA, the Department of Health Services, the State Water Resources Control Board, and the California Integrated Waste Management Board) pursuant to Governmental Code Section 65962.5 (California Public Resources Section 21092.6). The database searches included review of all of the required state lists and a search of various federal (EPA) and local (San Bernardino County Fire Department) hazardous waste site lists.

The following environmental issues were discussed within the Phase I ESAs for the project site:

- The potential for asbestos in onsite structures built before the early 1970s.
- The potential for lead-based paint on structures that were built before 1978.
- Miscellaneous debris (e.g. trash, 55 gallon drums, paint cans, agriculture-related debris) that had been abandoned onsite.

- Utilities such as petroleum lines found onsite.
- Pole-mounted transformers that may contain polychlorinated biphenyls (PCBs).
- The potential for onsite septic systems.
- The potential for methane gas onsite in excess of 55,000 parts per million (ppm), which poses an explosion hazard, due to the project site's past use for dairy and hog farming.
- Storage tanks were noted on and near the project site, which may have contained agricultural-related chemicals.
- The project site was evaluated for the potential presence of radon gas.
- The potential for hazardous wastes, such as petroleum waste.

Historically, the project site was comprised of vacant land, onsite structures, agricultural uses, dairy farms, residences, wells, unimproved roads, and power transmission lines. Numerous local, state, and federal databases were searched in preparation for the Phase I ESAs. Databases included the Records of Decision database maintained by the EPA (ROD), CAL-SITES maintained by the California Department of Toxic Substance Control, and the Listing of Underground Tank Cleanup Sites maintained by the County of Riverside. Appendix D, Phase I ESAs and Phase II ESAs, contains the hazardous materials technical reports.

Information obtained by the data base search and contact with relevant governmental agencies indicated the following results:

- The nearby Heritage Dairy (target property) had a cleanup and abatement order issued for it by the California Waste Discharge System database (CAWDS) regarding the discharge of wastes associated with dairy farming operations. The facility is required to allow no waste discharge and water runoff onto surrounding properties. All dairy wastewater and stormwater must be contained and managed onsite. There is no indication as to whether or not the target property has violated the waste discharge requirements.
- The Aspen Dairy at 10241 Edison Avenue had a cleanup and abatement order issued for it that was identical to that issued for Heritage Dairy, per the CAWDS database. There is no indication as to whether or not the target property has violated the waste discharge requirements.
- Crossroad Classic Mustang at 12421 Riverside Avenue, Unit B, Mira Loma, California, was also issued a cleanup and abatement order, per the CAWDS database. There is no indication as to whether or not the target property has violated the waste discharge requirements.

- An unnamed facility located at 3176 Pony Drive reported a release of muratic acid on September 19, 2002. The release occurred as a result of a container being crushed inside a City trash truck. No other information regarding this site was identified in the listing.
- The Simon Koolhaas Dairy at 14717 Haven Avenue is permitted for Underground Storage Tanks (USTs) and as a Hazardous Material Handler, Underground Tank Only.
- The Martin Dairy at 10129 Edison Avenue is permitted as an Agricultural Hazardous Material Handler.
- The following sites appeared on the CORTESE database as having contaminated public drinking water wells, for which clean up and abatement orders were issued: Simon Koolhaas Dairy (14717 Haven Avenue), Martin Dairy (10129 Edison Avenue), Aspen Dairy (10241 Edison Avenue), Westra Dairy Farms (11009 Eucalyptus Avenue), Crossroad Classic Mustang (12421 Riverside Avenue, Unit B, Mira Loma, California).
- LUST: The Leaking Underground Storage Tank (LUST) Information System database listed the Westra Dairy Farms (11009 Eucalyptus Avenue) as a facility that had a known release from a UST.
- The Dykstra Bros. Dairy (11091 E. Edison Avenue) is known to have two historical USTs. This facility is also known to have obtained a San Bernardino County permit as a Hazardous Material Handler.
- The AG-J&J Cattle Co. (11250 E. Edison Avenue) has one reported UST location, and has a San Bernardino County permit as a Hazardous Material Handler.
- The Westra Dairy (11009 Eucalyptus Avenue) is reported as having a LUST, case closed April 24, 2000.
- The Department of Health Services conducted a California State Radon Survey, and found that radon gas is not an issue at the project site or in the project area.
- No federal National Priorities List (NPL), proposed NPL, Comprehensive Environmental Response and Cleanup Liability Information System (CERCLIS), Resource Conservation and Recovery (Act) Information System (RCRIS), or Emergency Response Notification System (ERNS) facilities are located within one mile of the dairy property.

The Phase I ESAs for the project site offered the following conclusions:

- Due to past use of the project site as a dairy farm and hog farm, the potential exists for elevated soil organic levels and the associated generation of subsurface methane gas.

- The potential for asbestos containing materials and lead-based paint on the project site exists because of some structures built before 1978.
- Based on the past and present agricultural usage of portions of the site, the potential exists for the presence of organic pesticides within the onsite soils. Soil samples should be collected and analyzed for organic pesticides in order to screen for their presence.
- Several homes present on the project site reportedly use onsite sewage disposal systems.
- The residences and other structures onsite may contain lead-based paint and asbestos-containing materials.
- Water supply wells were identified onsite, and it is necessary to verify that they have been properly abandoned.
- A 500-gallon diesel fuel aboveground storage tank (AST) is onsite, and should be deactivated and properly disposed of in conjunction with the site development activities.
- A debris pile with improperly disposed of waste oil was observed onsite.
- A concrete wastewater collection sump and associated underground water distribution piping, as well as an abandoned manufactured home are onsite.
- A Southern California Edison transmission line exists onsite with triple high-tension lines, which may impose some restrictions on development.

Based on the findings of the Phase I ESAs described previously, several methane studies were conducted for the properties that were used as dairies. Out of the 96 gas probes that were installed as a part of the methane studies, only 3 revealed elevated methane concentrations. These methane studies contained the following recommendations:

- Careful clearing, grubbing, segregation, and stockpiling or disposal of the near surface organic-rich soils at the site prior to the initiation of mass grading activities should occur.
- Identification and segregation/stockpiling or disposal of deeper soils which contain elevated levels of organic material should be conducted.
- Soils with organic contents in excess of 0.4 percent should not be placed as “deep” fill. Ideally, soils with significant levels of organic material should be placed in open areas within approximately two feet of the finished ground surface.
- Soils with organic contents in excess of 2 percent should typically not be placed as structural fill—even at shallow depths. The project geotechnical engineer should provide more specific recommendations in this regard.

No additional investigation of the project site was recommended.

Other Risk Management Issues

Additional hazards that potentially affect the project site include vector control issues associated with existing dairy operations, and electromagnetic fields associated with electrical lines crossing the project site. These conditions are discussed below.

Vector Control. The project site is contained within the historic San Bernardino Agricultural Preserve, which has been home to one of the largest dairy cattle populations in the world. The combined dairy operations in this area have resulted in the generation of millions of tons of manure each year. It is estimated that there are 2 million tons of manure stockpiled within that area. As a result of manure stockpiling, there has been an increase in the fly population. To control the increasing fly population, chemical treatments are typically used. The West Valley Mosquito and Vector Control District promotes the practice of routine application of adulticiding chemicals, in the absence of the ability to practice proper composting. However, the continued use of these chemicals has resulted in minor to severe resistance in the adult fly populations.

Activities that would increase the potential for standing water, especially during the summer months, have the potential to increase the mosquito population. As pesticides are used to control the increasing fly population, herbicides are also used by dairies to control plant and algae population in the numerous dairy manure ponds and water ponds.

Electrical Power Facilities/Transmission Lines and Electromagnetic Fields. Southern California Edison (SCE) provides electrical services to the City and the surrounding areas. The SCE Mira Loma substation is located immediately east of Mill Creek Avenue adjacent the project site. SCE high-voltage transmission line right-of-ways (SCE Corridor) appear at several locations onsite containing high Kv electrical transmission lines. Long-term direct exposure to electric and magnetic fields (electromagnetic fields [EMF]) has been identified as a possible risk to human health.

Electric fields are produced in electrical lines as a result of voltage applied to wiring, and are measured in volts per meter (V/m) or kilovolts per meter (Kv/m). Electric field strengths greatly diminish with distance from the source and many structures including trees and houses shield these fields. Most exposure to residential electric fields is the result of internal household appliance use. Magnetic fields are the result of the movement (current) of electricity. These fields are measured in Gauss; however, this measure is extremely large, and fields from electrical lines are generally referred to in milligaus (mg). As with electric fields, magnetic field strengths decrease dramatically with distance from the source; however,

structures such as trees or houses, unlike electrical fields, do not shield magnetic fields. Exposure to EMFs from power lines or electrical substations is typically in the extremely low frequency (ELF) range of the electromagnetic spectrum.

Within the project site, possible concern with EMFs resides with the major SCE power line corridor that traverses the site diagonally between Planning Areas 17 (a, b) and 20, the SCE substation immediately east of Mill Creek Avenue, and the types of uses planned within or directly adjacent to the corridor and/or substation. No U.S. federal agency has yet set ELF EMF standards. Presently, neither the State nor the County of San Bernardino has provisions or codes regulating development near major transmission lines or substations. The NMC Final EIR identifies setback requirements for educational facilities from high-voltage lines.

Ontario Airport Operations

The project site was originally estimated to be within two miles of Ontario International Airport (ONT), which is the criteria set forth in the CEQA Guidelines thresholds. This standard was used because an airport land use plan has not been adopted. Upon further investigation, the airport runways are more than two miles from the northern end of the project site along E. Riverside Drive. The 1992 General Plan discusses current and future operations at ONT. According to the 1992 General Plan, the project site does not directly lie within the flight path of ONT. Aircraft approach ONT from the east and depart to the west, and do not fly over the general project area. The Chino Airport is located approximately 4 miles southwest of the project site.

Existing Regulations and Standard Conditions:

The City of Ontario Municipal Code Section 9-1.3330 includes Environmental Performance Standards that require: "The use, handling, storage, and transportation of combustibles and explosives shall comply with applicable provisions of the Uniform Fire Code, the City of Ontario Hazardous Waste Ordinance and all other local, state and federal regulations."

5.5.3 - Thresholds of Significance

According to the Initial Study, the project could have a significant effect on the environment if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
- Create a hazard to the public or environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.
- If the area was located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport, result in a safety hazard for people that reside or work in the project area.

As previously referenced, the NMC Final EIR referenced distance setbacks developed by the State Department of Education for educational facilities from high-voltage transmission lines. Although these requirements apply only to educational facilities, the NMC Final EIR suggested that they could be applied to residential development. These setback distances are as follows: 100 feet from a 50-133 Kv line; 150 feet from a 220-230 Kv line; and 350 feet from a 500-550 Kv line. However, the State Department of Education revised policy in 2003 allows school districts to encroach within these setbacks based upon specific findings made in an EMF Management Plan.

5.5.4 - Project Impacts

The proposed project would have the potential to pose various hazards. Following is a discussion of the project impacts that correspond to the thresholds of significance previously identified in Section 5.5.3.

Hazardous Materials

Short-Term Construction Impacts

In the short term, the proposed project will involve storing limited quantities of petroleum products onsite during construction-related activities. With the mandatory compliance of the City's Environmental Performance Standards (City of Ontario 2000), the proposed project will not create a health hazard or use, produce, or dispose of materials that pose a hazard to human, animal, or plant populations within the project area. The Environmental Performance Standards are contained in the City's Municipal Code, Article 33, Section 9-1.3300. No impact from the temporary storage of hazardous materials during the construction phase is anticipated.

As previously referenced, potential impacts from exposure to lead-based paints and asbestos from demolition activities has the potential to occur. The Phase I ESA concluded that potential impacts related to asbestos exposure and lead-based paint exist, due to the existence of older residences and structures onsite. Because the construction dates for the dairy related structures are estimated and are close to the cut-off date as referenced in the NMC Final EIR, and because it is highly likely that some

structures were constructed prior to 1979, given the historic use of the property, it is assumed for the purposes of this analysis that all structures located on the project site were constructed prior to 1978.

Long-Term Operational Impacts

The proposed project introduces new land uses within the project area: residential, commercial, and recreation. Hazardous materials commonly associated with residential use include household cleaning and janitorial products, herbicides, insecticides, and solvents. Residential handling and disposal of hazardous materials is regulated at the federal, state, and local levels.

The proposed project provides for the development of regional commercial uses. Commercial uses that could be developed include large-scale retail commercial uses such as garden supply, furniture warehouses, discount centers, retailers, and other similar uses. Commercial development could also include professional offices, entertainment, dining, hotel, and conference facilities, supporting retail sales, product exhibition, art galleries, financial institutions, restaurants, health clubs, personal services, day-care, and professional offices. Use and storage of hazardous materials associated with allowed commercial uses will occur as a result of project implementation. In order to minimize risks to life and property, the proposed project will be required to demonstrate compliance with all applicable federal, state and local laws and regulations governing the handling, transport, treatment, generation and storage of hazardous materials.

Colony High School is adjacent to proposed single-family residential uses within Planning Areas 2, 3, 5 and 6 on the project site. Hazardous emissions or hazardous or acutely hazardous materials, substances, or waste will not intentionally be emitted. Use and storage of hazardous materials on the project site will adhere to all applicable regulations, as previously cited.

Generation and use of hazardous materials by residential, commercial, and light industrial usage within the project site is considered to have a less than significant impact due to the mandatory compliance with the City's Environmental Performance Standards (City of Ontario 2000). The Environmental Performance Standards are contained in the City's Municipal Code, Article 33, Section 9-1.3300.

Methane in Manure and Organic Soils

Surface organic residue (e.g., manure and other organic deposition) within the soils may remain after discontinuation of dairy operations and, in some instances, after clearing and grading. The potential for possible exposure of new development and human populations to explosive concentrations of methane released from such soils was investigated in the Phase I ESAs and methane studies. While

the incidence of methane gas was low, this is a potentially significant impact due to the explosion hazard in a soon-to-be highly populated area.

Vector Control

Development of the proposed project will systemically reduce the volume of standing water and other sources associated with the dairies, where mosquitoes can breed.

With the abundance of manure and the presence of stagnant water, these populations may continue to breed during the dairy transition to urban uses, and buildout of the Chino/Ontario areas. Control of these populations can be achieved with non-chemical methods (i.e. mechanical methods) and the use of pesticides. With proper vector control practices, health and safety impacts are not expected to be significant. Past and present uses of pesticides and herbicides in agricultural operations can leave measurable residues in soils. The Phase 1 ESAs for the project site addressed the possible presence of chemical residues in the soil and concluded that future uses of the project site would not be adversely affected by past agricultural use. Hazard impacts on the project site from vectors and past agricultural use are considered less than significant.

Electromagnetic Fields

Within the project site, possible concerns with EMFs are associated with the high-voltage electrical transmission lines that cross the project site. The NMC Final EIR identifies setbacks for educational facilities from high-voltage lines and indicates that could be applied to residential development. No U.S. federal agency has yet set Extremely Low Frequency EMF standards. Presently, no state, county, or City has provisions or codes regulating development near major transmission lines or substations. In addition, SCE does not have published standards regulating development adjacent to high-voltage transmission line rights-of-way (Southern California Edison 2005).

The proposed land use plan locates residential areas in Planning Areas 17 (a, b) and 20 adjacent to the major high-voltage line easement that diagonally traverses the project site. Because 1) the setback standards previously identified apply to educational facilities and are not required to be applied to residential development, 2) no definitive standards have been established by a federal agency, and 3) neither the City nor SCE have established setback requirements, potential impacts resulting from the proximity to the high-voltage transmission lines are considered less than significant.

Hazardous Materials

According to the Phase I ESAs prepared for the project, the various databases indicate that only one site lying near or within the project site boundaries exhibits the presence of hazardous materials. This

is the Martin Dairy at 10129 Edison Avenue that has a San Bernardino County Permit as an Agricultural Hazardous Material Handler. The site experienced an isolated spill event in July 1999. The Phase I ESAs concluded that the conditions associated with this individual site did not present a hazard for the project site.

No evidence of any significant soil and/or groundwater contamination has been identified within the overall project site, and the site is not identified as within the Border Zone of a Contaminated Property.

Ontario Airport Operations

As previously stated, ONT is not within 2 miles of the project site. The 1992 General Plan discusses current and future operations at ONT and describes impacts associated with those operations. Examination of this information reveals that the project site does not directly lie within the flight path of ONT and that no impacts are anticipated related to penetrations of air space, safety zones, or other protection areas. The only anticipated impact from ONT would be sporadic occurrences of aircraft flying over the general area in a southeasterly direction away from the Airport. At this distance, the maximum heights of the proposed structures would not penetrate any of the building height restrictions contained in the Federal Aviations Administration's Part 77 regulations.

5.5.5 - Cumulative Impacts

Implementation of the proposed plan will provide for a variety of residential, commercial, and open space related uses. In general, the types of uses allowed do not include those that would result in the generation of substantial quantities of hazardous wastes or toxic materials. Compliance with federal, state, and local regulations concerning the handling, transport, and disposal of hazardous materials and wastes would reduce impacts to less than significant levels. As related projects in the project vicinity will be required to mitigate their own hazardous materials impacts, no significant cumulative impacts related to hazardous materials are anticipated.

With cumulative development within the ONT vicinity, additional populations could be exposed to some level of risk associated with aircraft activities and hazards. However, safety zones have been established to protect future uses and reduce hazards to an acceptable level of risk, and future development could be subject to review by the Airport Comprehensive Land Use Plan (ACLUP) to assure compatibility, should an ACLUP for ONT be developed. No significant cumulative impact is anticipated.

5.5.6 - Mitigation Measures

The Risk of Upset Section of the NMC Final EIR identified mitigation measures related to hazardous materials (Mitigation measures HM-1 through HM-3) and a mitigation measure (EMF-1) related to electromagnetic fields. Mitigation measure HM-1 required the preparation of Phase 1 ESAs on all future developments in conformance with the American Society for Testing and Materials. Mitigation measure HM-2 required documentation that structures on the project site subject to renovation or demolition from a proposed project did not contain lead-based paints or asbestos or that if these materials were present, appropriate remedial actions for lead-based paints and asbestos would be used. Mitigation measure HM-3 required projects that proposed to handle, transport, process, or store hazardous materials to comply with the policies related to hazardous materials contained in the NMC General Plan. Mitigation measure EMF-1 required residential units and education facilities to be setback from high-voltage electrical transmission lines in accordance with the California Department of Education Guidelines.

Implementation of the NMC Final EIR mitigation measures and the following recommended mitigation measures would reduce potentially significant impacts to a less than significant level.

HM-1 Prior to the issuance of permits by the City of Ontario for any structural demolition activities on the project site, the project developer will be required to submit documentation to the City of Ontario Building Department that asbestos and lead-based paint issues are not applicable to their property or that appropriate remediation actions will be undertaken to correct any lead-based paint or asbestos issues, in conformance with the regulations of the South Coast Air Quality Management District and the State of California, Division of Occupational Health and Safety.

HM-2 Subsequent to grading activities, testing for the presence of methane in the soil shall be performed. This testing shall conform to applicable City of Ontario standards. If methane is detected, mitigation would include the installation of under-slab methane vents, methane barrier, and sealing utilities in locations where they enter a structure and penetrate the methane barrier.

HM-3 Post-grading methane gas investigation should take place near the former Scritsmier Hog Ranch (13571 Haven Avenue) where subsurface methane levels exceed 5,000 ppm. A passive vent system and gas membrane beneath the floor slab should be installed, along with utility trench dams and conduit seals.

HM-4 Careful clearing, grubbing, segregation, and stockpiling or proper disposal of the near surface organic-rich soils at the site prior to the initiation of mass grading activities should occur.

HM-5 Identification and segregation/stockpiling or proper disposal of deeper soils which contain elevated levels of organic material should be conducted.

HM-6 Prior to approval of a discretionary permit or approval for development of proposed residential uses on the Hillardis property, such as a parcel map or tentative tract map, a Phase 1 Environmental Site Assessment (ESA) shall be conducted and the results of that ESA implemented. The Phase 1 ESA shall be provided to the City of Ontario and shall be included in any CEQA analysis prepared in connection with the consideration of a discretionary approval for development of the eastern half of the project site.

5.5.7 - Level of Significance After Mitigation

Mitigation measure HM-1 requires implementation prior to permit issuance. This eliminates the potential for construction-related activities to commence without the benefit of the recommended mitigation measure and would prevent any building materials that may contain lead and/or asbestos from being released into the environment. Therefore, the effects will be less than significant.

Mitigation measures HM-2 through HM-5 should be implemented between the site preparation phase and the building construction phase and would prevent methane gas if present in the soil, from penetrating any of the structures built on the project site. The effects would be less than significant.

Mitigation measure HM-6 would require the preparation of a Phase 1 ESA on the Hillardis property that would determine the presence or absence of any hazardous materials on that portion of the project site prior to the approvals of any development permits. Because all necessary Phase I ESAs have been prepared, and mitigation measures developed, the effects would be less than significant.

With the incorporation of the recommended mitigation measures, implementation of the proposed project would result in less than significant impacts related to hazardous materials.

I. INTRODUCTION

The Rich-Haven Specific Plan includes approximately 584.2 gross acres of land in the southwestern portion of the City of Ontario, within the Ontario Ranch (formerly known as 'New Model Colony' or NMC). The project site, hereafter referred to as Rich-Haven, is bounded to the north by Riverside Drive, Colony High School, and SCE Mira Loma substation, to the east by Hamner Avenue, to the West by Haven Avenue, and to the south by Old Edison Road. Under the specific plan, Rich-Haven is to be developed as a cohesive community that incorporates diverse land uses that include residential of various densities, industrial, mixed-use, open space non recreation, and open space parkland (See *Figure 1* herein).

Figure 1. Rich-Haven Specific Plan Vicinity Map (Source: City Council Approved Specific Plan Amendment (File No. PSPA19-006): May 18, 2021 Resolution No's 2021-047)

The Rich-Haven Specific Plan was first approved by the City Council on December 4th, 2007, and has since been amended multiple times that oversaw changes in its planned land uses and coverage. The latest amendment was adopted on May 18th, 2021; notable changes of which

include an increase of 72.1 acres in the project's land coverage and changes in planned land uses that reflect the current market trend. These changes redefine the hydrologic patterns of the project site, which was previously evaluated in the 2012 City of Ontario's Master Plan of Drainage (hereafter, MPoD, unless stated otherwise) for sizing and planning of storm drain facilities. It is therefore important to validate the adequacy of the planned and constructed master-planned storm drain facilities in supporting developments within the amended Rich-Haven Specific Plan area. Consequently, the purpose of this study is to assess the hydrologic changes of the project and its implications on the planned storm drain facilities, using the MPoD study as comparison baseline (See *Exhibit 1* in **Appendix A**).

II. RICH-HAVEN WATERSHED

According to the 2012 MPoD, The Rich-Haven Specific Plan area is located within Drainage Area X, which covers approximately 4.5 square miles (2,880 acres). Drainage Area X is tributary to the County Line Channel, which is owned and maintained by the San Bernardino County Flood Control District and runs along the southerly edge of Ontario Ranch.

Rich-Haven is located within the northeastern portion of Drainage Area X, which is described as the following land area. The upstream or study area of drainage area X is bounded to the north by SR60, to the east by Milliken/Hamner Avenue, to the west by the approximate westerly edge of landscape buffer of Haven Avenue, and to the south by old Edison Avenue, covering a total of 1,062 acres (See *Exhibit 2* in **Appendix A**). Drainage among this sub watershed is further divided into three separate subareas, the drainage of each subarea will be intercepted and conveyed by the regional backbone drainage system as outlined below.

PROPOSED DRAINAGE FACILITIES

Drainage from the Rich-Haven project area will be conveyed by three main planned backbone storm drain lines, namely: 1**) Haven Avenue Storm Drain**, **2) Mill Creek Avenue Storm Drain**, and **3) Milliken Avenue Storm Drain**, all of which drain from north to south and connect to the County Line Channel (See *Exhibit 2* in **Appendix A**). Description of each backbone storm drain lines and its current implementation status are outlined as follows.

1. Haven Avenue Storm Drain

Haven Avenue Storm Drain (hereafter, Haven SD) is a network of storm drain lines 48" to 84"in size, with a mainline (HAVN-X-1) that runs north from Bellegrave Avenue to Riverside Drive along Haven Avenue and branches to storm drain line (HAVN-X-2, -X3, and -X4) and several unnamed laterals that extend from planned/future development within Rich-Haven (See *Figure 2* under Section C for Planning Area (PA) designation).

Storm Drain Line	Location	Construction status as of writing
HAVN-X-1	Runs north from Bellegrave Avenue to Riverside Drive along Haven Avenue	Partially constructed to southerly lot line of Rich-Haven Planning Area 3 (PA-3) (Public Park). See *Figure 2.*
HAVN-X-2	Branches westerly off HAVN-X-1 in Ontario Ranch Road	Constructed
HAVN-X-3 (Twinkle Storm Drain)	Branches from HAVN-X-1 through PA 5 and drains portions of PA 1, 2, 3, 4, and Colony High school	Constructed to north lot line of Rich-Haven PA 5, not constructed north of PA 5

Storm Drain Line	Location	Construction status as of writing
HAVN-X-4	Branches easterly off HAVN-X-1 in Chino Avenue and drains portion of PA 1	Not Constructed

2. Mill Creek Avenue Storm Drain

Mill Creek Avenue Storm Drain (hereafter, Mill Creek SD) is a network of storm drain pipes ranging in size from 48" to a 10' x 8' box , with a mainline (MLCR-X-1) that runs north from Bellegrave Avenue to Chino Avenue along Mill Creek Avenue, and extends to the east in Chino Avenue. MLCR-X-1 branches to MLCR-X-4, -5, and -6 and minor laterals that extend from planned/future development within Rich-Haven along Mill Creek Avenue (See *Figure 2* under Section C for Planning Area (PA) designation).

Storm Drain Line	Location	Construction status as of writing
MLCR-X-1	Runs north from Bellegrave Avenue to Chino Avenue along Mill Creek Avenue and turns east along Chino Avenue	Constructed north from Bellegrave Avenue to Eucalyptus (outside of Rich-Haven limit)
MLCR-X-4	Branches easterly off MLCR-X-1 in Ontario Ranch Road and drains PA 7	Constructed
MLCR-X-5	Branches westerly off MCLR-X-1 in Ontario Ranch Road and drains PA 6	Constructed
MLCR-X-6	Branches easterly off MLCR-X-1 in SCE access road and drains SCE Mira Loma Substation	Not Constructed

3. Milliken Avenue Storm Drain

Milliken Avenue Storm Drain (hereafter, Milliken Avenue SD) is a main line storm drain that varies in size from 36" to 54" that drains south from Ontario Ranch Road to Bellegrave Avenue along Hamner Avenue (also known as Milliken Avenue). Storm drain laterals extend from planned development within a minor portion of the southeastern area of Rich-Haven.

Storm Drain Line	Location	Construction status as of writing
MLKN-X-1	Runs north from Bellegrave Avenue to Riverside Drive along Milliken/Hamner Avenue	Constructed

STORM DRAIN FACILITIES DRAINAGE AREA

The tributary drainage area for each regional backbone drainage system per 2012 MPoD (Master Plan of Drainage) is summarized in the following table:

Drainage System	Tributary drainage area (MPoD 2012)
Haven Storm drain	352.2 acres
Mill Creek Storm drain	659.9 acres
Milliken Storm drain	50.0acres

LAND USE

The current designated land uses within the Rich-Haven area are outlined in the proposed Rich-Haven Specific Plan (See *Figure 2* herein). These updated land uses are compared to the land uses approved by the City Council under the 2010's City of Ontario's Revised Land Use Plan, which were used as the basis of hydrologic study for the 2012 MPoD.

Figure 2. Proposed Rich-Haven Specific Plan- Proposed land uses and Planning Area Designation

A summary of the land use change is shown as follows, with references to the planning areas within the Rich-Haven area (also See *Exhibit 1* in **Appendix A**).

PLANNING AREA/ PROJECT NAME	LAND USES	
	2010 CITY'S REVISED LAND USE PLAN	PROPOSED RICH-HAVEN SPECIFIC PLAN LAND USES
PA-1A	Residential (2.1-5DU/AC)	Residential (0-5 DU/AC)
PA-1B	Residential (2.1-5DU/AC)	Residential (5.1-12DU/AC)

III. HYDROLOGY AND HYDRAULICS

2012 MPOD STUDY

The ultimate condition hydrology of the Rich-Haven area was evaluated in the 2012 City's MPoD, with designated land uses that align with the Revised Land Use Plan adopted by the City Council in January 2010 (Refer to **Appendix A,** *Exhibit 1*).

However, the proposed land uses in some planning areas under the proposed Rich-Haven Specific Plan are generally denser or more impervious than the previously planned land use under the City's 2010 Revised Land Use Plan, such as the conversion of a low-density residential land use to high-density residential land use (See Section II.C- Land Use). Land use with more impervious areas typically generate higher peak flow with a shorter time of concentration. In addition, the tributary drainage areas of the master-planned regional backbone storm drainage systems have also changed since the MPoD study. Altogether, these changes present important implications in the planning and sizing of storm drain facilities, which necessitates a hydrology and hydraulic study.

STUDY OBJECTIVES

The overarching goal of this study is to ensure that there will be no significant adverse impacts to down stream storm drain facilities within the study area as a result of this project. Towards this goal, three objectives are further scoped, in order, as below:

1. *Hydrology analysis*
   - Reassess the hydrologic characteristics of the Rich-Haven area based on its latest proposed land uses and changes in the master-planned storm drain watersheds (Haven SD, Mill Creek SD, and Millken/Hamner SD watersheds).

2. *Peak flow mitigation analysis*
   - Determine the properties within Rich-Haven that may require peak flow mitigation.
   - Designate the allowable mainline peak flow within each storm drain mainline at storm drain connection point for each property.

3. *Hydraulic Analysis*
   - Based on the preceding analyses, identify the storm drain mainline(s) that requires further hydraulic analysis.
   - Analyze the proposed/existing storm drain for hydraulic capacity as needed

HYDROLOGY ANALYSIS

The following subsection outlines the hydrologic study components.

1. Hydrologic Study Approach

A main objective of this study is to update the 2012 MPoD hydrology analysis with updated inputs that reflect the latest Rich-Haven Specific Plan and any changes that may have occurred.

To ensure accurate comparison between this study and the 2012 MPoD study, a detailed review of the latter's hydrologic calculations was conducted to identify and preserve information that remains unchanged since the was completed. These include hydrologic data for existing development that were included as part of the 2012 MPoD study, planned storm drain facilities and its location.

Hydrologic parameters from planning areas and storm drains within Rich-Haven that were constructed, and changes in tributary area of the regional storm drains since the MPoD study are also incorporated into this study to reflect the latest conditions of the Rich-Haven to the maximum extent possible.

The following table summarizes the items in the 2012 MPoD that were reused in this study.

Item	Description
Hydrologic Node 5115	Confluenced Peak Flow rate, Max Loss Rate, and associated Tc from upstream-most drainage area of Rich-Haven Drainage Area
Hydrologic Node 5210	Confluenced Peak Flow rate, Max Loss Rate, and associated Tc from the Mira Loma SCE Substation Drainage Area
Hydrologic Nodes 5115, 5141, 5215, 5248, 5300, 5305, and 5330	Hydrologic nodes for the Mill Creek Storm Drain Drainage Area
Hydrologic Nodes 4070, 4080, 4075, 4120, 4170, 4171, and 4200	Hydrologic nodes for the Haven Storm Drain Drainage Area
Hydrologic Nodes 6050	Hydrologic node for the Milliken Storm Drain Drainage Area

The following table summarizes the parameters of projects within Rich-Haven area used in this study:

Item	Description
Hydrologic Nodes 4070 and 4080	Confluenced Peak Flow rate, Max Loss Rate, and associated Tc at referenced node per TTM 20526, PA 1 project (Node 508 and 312, respectively)
Hydrologic Node 416	Confluenced Peak Flow rate, Max Loss Rate, and associated Tc at referenced node per TM 20530, PA 5D (Vander Eyk) Project (Node 312)

Item	Description
Hydrologic Node 440	Hydrologic node at referenced node per TTM 20081, PA 6A (Regions North) project (Node 505)
Hydrologic Nodes 445, 450, and 4170	Pre-confluenced Peak Flow rate, Max Loss Rate, and associated Tc at referenced node per TTM 20081, PA 6A (Regions North) project (Node 5001, 5002, and 4170, respectively)
Hydrologic Nodes 455	Pre-confluenced Peak Flow rate, Max Loss Rate, and associated Tc at referenced node per PM19978, New Haven Commercial Development project (not part of Rich-Haven areas) (Node 37)
Hydrologic Nodes 465	Pre-confluenced Peak Flow rate, Max Loss Rate, and associated Tc at referenced node per TM20076, New Haven Residential Development project (not part of Rich-Haven areas) (Node 20)
Hydrologic Nodes 460 and 4171	Pre-confluenced Peak Flow rate, Max Loss Rate, and associated Tc at referenced node per TM 20449, PA 9A (Regions South) Project (Node 517 and 415, respectively)

2. *San Bernardino County Hydrology Methodology*

The hydrology methodologies accepted by the City of Ontario are documented in the San Bernardino County's Hydrology Manual (1986) and subsequent addenda. Two methods are primarily used:

a) Rational Method
b) Unit Hydrograph Method

Peak flow and time of concentration are typically the outcomes of interest from these methods. Selection of methodology is dependent on the drainage size to be studied. Rational method is typically used for drainage area that is approximately 1 square mile (640 acres) or less, beyond which the method may become less reliable due to the higher variation in point precipitation over a larger area. Unit hydrograph is then used for continuation of drainage study beyond 1 square mile, using the time of concentration estimated by Rational Method and area-averaged point rainfall over the entire drainage area as inputs.

The 2012 MDoP used both methods for its hydrology analysis, starting off with Rational Method for all drainage area studies, and switching to the Unit Hydrograph Method should the drainage area exceed 1 square mile.

This study adopts similar methodology basis as the MDoP, however, due to the relatively smaller drainage area of the Rich-Haven (i.e. ~644 acres for the largest sub drainage are), only Rational method is used.

3. *Implementation of Rational Method Analysis*

The Rational Method for this study is implemented using RSBC software, 2018 version, developed by Civil Design® Corporation and Joseph E. Bonadiman and Associates Inc. RSBC software is accepted by the County of San Bernardino for hydrologic study purposes. The software implements the various modeling approaches of the County's Rational Method as documented in the County's Hydrology Manual, which includes initial subarea time of concentration estimation, subarea addition, pipe and street flow time, and confluence analysis of adjoining streams.

4. *Hydrologic Study Criteria*

The parameters used for this study adhere to the 100-year storm study criteria used in MDoP and are summarized as follows.

Storm Return Frequency	100-yr
1-hour rainfall depth	1.2 in
Log-Log Slope for Rational Method Hydrology Studies	0.6
AMC Condition	II

PEAK FLOW RATE MITIGATION ANALYSIS

Peak flow mitigation is typically required if the peak flow rate as determined by this report's hydrology analysis exceeds the existing/proposed storm drain capacities. The individual developers of each planning area will be responsible for complying with mainline storm drain allowable flow rates as designated in this report or determining other methods of not adversely impacting the storm drain system capacity.

This study aims to determine an allowable peak flow Q for various planning areas, represented by the allowable peak flow at different points of the storm drain main line in relation to times of concentration, taking into account the existing and planned built-out conditions of the Rich-Haven area.

HYDRAULIC ANALYSIS

Hydraulic study of a drainage system acts as validation of the engineering design of the drainage system. This level of study typically is conducted with the availability of more detailed information, which include outputs from the preceding analyses.

Hydraulic parameters of the planned regional backbone storm drainage systems, such as the hydraulic grade line (HGL) and velocity, are shown on various approved storm drain improvement plans for the City of Ontario. The hydrologic data used for the hydraulic design of these storm drains are derived from different sources. For instance, the Haven Storm Drain hydraulic design is based upon the 2012 MPoD's hydrologic outputs. Whereas

the Mill Creek Storm Drain hydraulic design is based upon a combination of hydrologic outputs from 2007 MPoD's hydrologic outputs and approved final engineering studies from developed planning areas within Rich-Haven, and the Huitt-Zollars Mill Creek Hydraulic Study dated July 11th, 2022, which when looked at holisitically, allows for possible reconfiguration of storm drain to accommodate field conditions and updated design constraints.

The hydraulic parameters as shown approved storm drain plans may be utilized to assess the need for conducting a, updated hydraulic analysis of the proposed storm drain system. For example, if the peak flow along the mainline as estimated by the updated hydrology analysis remains consistently lower than the peak flow shown on the existing approved storm drain plans throughout all segments of the main lines, it can be inferred that the updated HGL will be lower than the existing HGL and any adverse impacts to the downstream storm drain(s) in the study area are not anticipated. Therefore, a hydraulic analysis of the subject storm drain is not provided in this study. However, if any of the storm drain segments is expected to convey a higher flow than shown on the existing storm drain plan, a detailed hydraulic analysis will be provided in this study to ensure that adequate capacity of the proposed storm drain to handle the updated hydrologic conditions.

The outcomes from this hydraulic analysis serve to determine the critical section along the storm drain mainline in terms of water surface elevation, which must not rise above 6" below finished surface or lip of catch basin for a 100-year storm, per the City of Ontario's storm drain design goals.

IV. FINDINGS/RECOMMENDATIONS

HYDROLOGY ANALYSIS

1. *Modeling approach*

This study's hydrology modeling approach varied slightly from that of the MPoD. The subarea addition approach, as used extensively in MPoD, is sensitive to the subarea size definition, which may either discount flow contribution of a subarea entirely or significantly amplify the estimated flow addition. This shortcoming is also acknowledged by the County's Hydrology Manual (Section D.11, Step 5). For example, an estimated 101 cfs from 53 acres of drainage area (out of a total of 660 acres) was not accounted in the MPoD's Mill Creek SD peak flow (within the study area) as a result of using the subarea addition approach (See Nodes 5116, 5117, 5141, 5215, 5248, 5300, and 5330 in MDoP Hydrology Calculations). While this modeling approach is generally accepted for planning level study such as Master Drainage Plan, it may not be suitable for storm drain design.

To circumvent this issue, this study used confluence analysis (County's Hydrology Manual, Section D.8) for any major subarea flow addition to the mainline, such as flow contribution from a Planning Area. Confluence analysis is a deliberate method that estimates the peak flow contribution of two or more streams joining at a physical location but at different times of concentration. This method allows for more specific understanding of the mainline flow contribution of a particular area, from which mitigation of peak flow can be determined . Peak flow estimated from confluence analysis is also generally higher than simple subarea

addition, as the former may partially discount peak flow based on time of concentration of the adjoining streams, but never the entire flow as the latter may discount as mentioned above.

The estimated peak flow from this study is presumed to be comparable to MPoD for further analysis of the planned storm drain system.

2. *Haven SD*

Although the drainage delineation for Haven SD (within Rich-Haven) has changed since the MPoD study, its tributary drainage area has remained the same (353 acres vs 352 acres at node 4200). However, the peak flow generated within the Haven SD has increased from 504 cfs to 603 cfs, a 101 cfs (20%) increase, at the downstream most point of the Haven SD watershed node 4200 (See **Appendix A-** *Exhibit 3* and **Appendix B**- Hydrology Calculations for more information). This increase in peak flow is attributed to the densification and increase of impervious area of PA-1B, -1C, and -4B as a result of their new proposed land uses (denser residential uses). Exceedance of MPoD's peak flow is observed at the confluence of HAVN-X-3 and the main line HAVN-X-1. HAVN-X-3 conveys a significant stormwater flow rate (121cfs) from PA-1—including runoff from the existing detention basin at the southwest corner of Colony High School—and all runoff from PA-4B before joining the mainline.

3. *Mill Creek SD*

Mill Creek SD (within Rich-Haven) shares a watershed boundary with Haven SD and Milliken SD. The tributary drainage area of Mill Creek SD is reduced slightly from 660 acres to 644 acres since the MPoD study. This reduction is presumably carried over from the neighborhood edge adjustment of properties within the adjacent Haven SD and Milliken SD watershed, and the redirection of flow from PA-4B and 5C from Mill Creek SD watershed to Haven SD watershed. In the context of the large scope of the study, this acreage change is negligible.

The peak flow generated within the Mill Creek SD increased from 1,021cfs per the MPoD to 1,160cfs in this study, a 139 cfs (14%) increase, at node 5330, the downstream most point of the Mill Creek SD watershed study area (See **Appendices A** and **B**). This increase in peak flow is due to the addition of flow contribution from a portion of PA-1 that was to be conveyed by Haven SD (in 2012 MPoD) and the increase of impervious area of PA-4A, -5B, 6B, -6D, -7A, and -7B, as a result of the new proposed land uses (Industrial and commercial use). The initial exceedance of MPoD's peak flow is observed at the joining of the storm drain lateral from PA-1 to the mainline node 5115, which propagates downstream and gradually add up with the addition of runoff from storm drain laterals from PA-4A, -5B, -6B, -7A, -7B, -8A, -8B, -9A and -9B (See **Appendix A-** *Exhibit 3* and **Appendix B**- Hydrology Calculations for more information).

4. Milliken SD

Milliken SD (within Rich-Haven) does not have any changes in land use, drainage area, or planned storm drain. A slightly larger area of 52 acres (vs. 50 acre in MPoD) as measured in this study's CAD file is due to adjustment for neighborhood edge and the linework precision between the CAD drawing and its MPoD counterpart. This difference is considered negligible for drainage study of this level. The peak flow at the downstream most point of the Milliken SD is estimated at 73.3 cfs per the MPoD study node 6050.

Since the input data remains the same, the Milliken SD watershed was not studied.

PEAK STORM FLOW RATE MITIGATION ANALYSIS

Based on the hydrology analysis result, the peak flow rate from certain planning areas withinin the Haven SD and Mill Creek drainage area needs to be mitigated to ensure adequate storm water conveyance and flood protection along the mainlines upstream of the County Line Channel. The acceptable flow rate is defined by the allowable peak flow rate, $\mathbf{Q_{allow}}$, along the mainline, which is determined by an iterative modeling approach of the preceding hydrology analysis by assigning a controlled flow rate contribution from the planning area(s) that would ultimately require peak flow mitigation to prevent significant adverse impacts to the downstream storm drain facilities.

The allowable flow rate along the mainline as designated by this report shall not be exceeded when flow is added from the planning areas requiring peak flow mitigation, as supported by a confluence analysis of the main line with the adjoining stream from each planning area. Planning area-specific studies may be performed to demonstrate that no adverse impact to the storm drain system is caused.

5. Haven SD

Peak flow mitigation solutions shall be ideally implemented within PA-1, which is the upstream-most portion of the Haven SD drainage area within Rich-Haven. PA-1 contributes significant flow to the Haven SD, both directly to HAVN-X-1 and indirectly through HAVN-X-3. The large land area of PA-1 also provides for flexible peak flow mitigation options, as compared to the planning areas downstream, which are either under construction or built-out. In addition, the existing detention basin at the southwest corner of Colony High School, is an ideal peak flow mitigation solution if remaining. Refer to *Exhibit 3* in **Appendix A** for locations of potential flow mitigation solutions and allowable flowrates along the Haven SD mainline.

6. Mill Creek SD

Peak flow rate shall be mitigated within PA-4A, -5B, -6B, -7B, -8A, -8B, -9A and -9B, which are deemed to be the main contributors to the increase in peak flow along the mainline.

Refer to *Exhibit 3* in **Appendix A** for location of potential peak flow mitigation facilities and allowable flow rates in the Mill Creek SD mainline.

7. *Milliken SD*

Peak flow mitigation is not required for Milliken SD, considering that the Milliken SD watershed remains unchanged since the MPoD study.

HYDRAULIC ANALYSIS

8. *Haven SD*

Based on the existing approved storm drain plans for Haven SD and the allowable flow rates from the preceding peak flow mitigation analysis, it is observed that the allowable flow rates are consistently lower than the flow rates shown on the existing approved storm drain plans throughout all segments of the Haven SD, as summarized in the following table (See *Exhibit 4* in **Appendix A**).

Stationing on SD	Node on Exhibit 3	Q in Storm Drain Plan	Allowable Q in Exhibit 3
114+75.39	4070	160 cfs	73 cfs
108+13.69	4075	189 cfs	100 cfs
98+15.73	4120	422 cfs	250 cfs
74+85.76	4170	504 cfs	411 cfs
62+13.65	4171	504 cfs	504 cfs
61+34.99	4200	553 cfs	504 cfs

Based upon the above allowable Q, the existing/proposed Haven SD will have capacity to adequately convey the updated flow.

9. *Mill Creek SD*

As certain segments of the Mill Creek SD will be experiencing higher peak flow as compared to the approved storm drain plans regardless of the implementation of peak flow mitigation (See *Exhibit 3* in **Appendix A**), a detailed updated hydraulic analysis is provided in this report for Mill Creek SD.

Hydraulic analysis of Mill Creek storm drain is an extension to the supporting study for the 2022 Mill Creek Storm Drain Delta 4 (M-1183) prepared by Huitt-Zollars Inc, for the construction of Mill Creek storm drain segment between Ontario Ranch Road and Chino Avenue to incorporate the whole Rich-Haven area. The input file for WSPGW—a commercial software package for analyzing hydraulic capacity of storm drains—from Huitt-Zollars Inc's study was utilized and modified with peak flow output as yielded by this study's hydrology analysis.

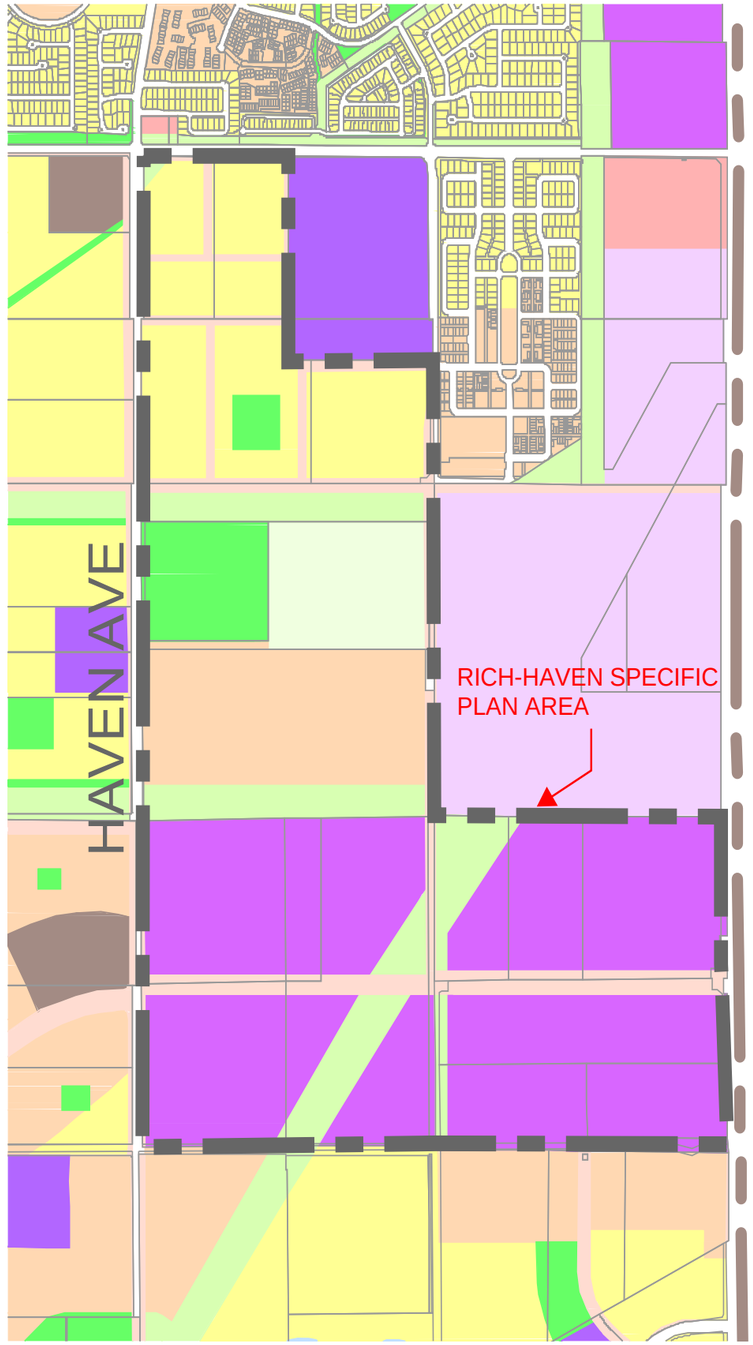
The hydraulic analysis of the Mill Creek SD was conducted using the $\mathbf{Q_{allow}}$ as determined in the preceding peak flow mitigation analysis. Peak flow contribution from each planning

area requiring mitigation is determined as the difference between the peak flow immediately upstream of the point of confluence and the **Q_{allow}** at the point of confluence.

The hydraulic grade line (HGL) analysis indicates that the **Q_{allow}** is adequate in ensuring the adequate flood protection within the mainline upstream of County Line Channel (See **Appendix A**- *Exhibit 5* and **Appendix C**-Hydraulic Calcs). Any deviation that causes exceedance of the **Q_{allow}** shall be supported by a similar analysis that ensure less than significant impacts to the storm drain facilities.

10. Milliken SD

Since peak flow mitigation is not required for Milliken SD, a hydraulic analysis of the storm drain is not conducted.



V. CONCLUSION

This report has determined where peak storm flow rates in mainline storm drain systems have increased with the updated Rich-Haven Specific Plan land uses and watersheds. Furthermore, it has also be determined where the existing/proposed storm drain facilities will have capacity deficiencies due to the proposed project. To reduce storm flows to a level that will be adequately conveyed by the mainline storm drain system, an allowable flow rate has been provided for each applicable property within the study area. The designated property owners shall mitigate their storm water discharges to not exceed their allowable mainline flow rates as provided herein, to prevent any significant adverse impacts to the downstream storm drain facilities in the study area. Any increase to the allowable flow rate may require additional planning area-specific analysis to ensure adequate flood control protection is provided.

MILL CREEK STORM DRAIN PLAN
SHEET 4 OF 4- MID OF MIRALOMA SUBSTATION TO CHINO AVENUE

APPENDIX B
HYDROLGY CALCULATIONS

San Bernardino County Rational Hydrology Program

(Hydrology Manual Date - August 1986)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1989-2018 Version 9.0
Rational Hydrology Study Date: 09/08/22

Rich-Haven Specific Plan
Hydrology Study
100-yr Storm
Haven Storm Drain

Program License Serial Number 6440

********* Hydrology Study Control Information **********

Rational hydrology study storm event year is 100.0
Computed rainfall intensity:
Storm year = 100.00 1 hour rainfall = 1.200 (In.)
Slope used for rainfall intensity curve b = 0.6000
Soil antecedent moisture condition (AMC) = 2

++

Process from Point/Station 4070.000 to Point/Station 4070.000
**** USER DEFINED FLOW INFORMATION AT A POINT ****

Soil classification AP and SCS values input by user
USER INPUT of soil data for subarea
SCS curve number for soil(AMC 2) = 32.46
Pervious ratio(Ap) = 0.3620 Max loss rate(Fm)= 0.353(In/Hr)
Rainfall intensity = 2.348(In/Hr) for a 100.0 year storm
User specified values are as follows:
TC = 19.60 min. Rain intensity = 2.35(In/Hr)
Total area this stream = 67.70(Ac.)
Total Study Area (Main Stream No. 1) = 67.70(Ac.)
Total runoff = 121.60(CFS)

++

Process from Point/Station 4070.000 to Point/Station 4075.000
**** PIPEFLOW TRAVEL TIME (User specified size) ****

Upstream point/station elevation = 744.000(Ft.)
Downstream point/station elevation = 740.000(Ft.)
Pipe length = 660.00(Ft.) Manning's N = 0.013
No. of pipes = 1 Required pipe flow = 121.600(CFS)
Given pipe size = 54.00(In.)
Calculated individual pipe flow = 121.600(CFS)
Normal flow depth in pipe = 36.33(In.)

```
Flow top width inside pipe =   50.67(In.)
Critical Depth =   38.94(In.)
Pipe flow velocity =     10.68(Ft/s)
Travel time through pipe =    1.03 min.
Time of concentration (TC) =    20.63 min.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station     4070.000 to Point/Station     4075.000
**** CONFLUENCE OF MAIN STREAMS ****
________________________________________________________________________
The following data inside Main Stream is listed:
In Main Stream number: 1
Stream flow area =     67.700(Ac.)
Runoff from this stream =    121.600(CFS)
Time of concentration =   20.63 min.
Rainfall intensity =     2.277(In/Hr)
Area averaged loss rate (Fm) =    0.3530(In/Hr)
Area averaged Pervious ratio (Ap) = 0.3620
Program is now starting with Main Stream No. 2

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station      401.000 to Point/Station      402.000
**** INITIAL AREA EVALUATION ****
________________________________________________________________________
PARK subarea
Decimal fraction soil group A = 1.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.000
Decimal fraction soil group D = 0.000
SCS curve number for soil(AMC 2)  = 32.00
Pervious ratio(Ap) = 0.8500     Max loss rate(Fm)=     0.831(In/Hr)
Initial subarea data:
Initial area flow distance =   640.000(Ft.)
Top (of initial area) elevation =   765.000(Ft.)
Bottom (of initial area) elevation =   761.000(Ft.)
Difference in elevation =     4.000(Ft.)
Slope =    0.00625  s(%)=       0.63
TC = k(0.483)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration =   17.670 min.
Rainfall intensity =      2.499(In/Hr) for a   100.0 year storm
Effective runoff coefficient used for area (Q=KCIA) is C = 0.601
Subarea runoff =      7.264(CFS)
Total initial stream area =        4.840(Ac.)
Pervious area fraction = 0.850
Initial area Fm value =    0.831(In/Hr)

           1.000 *    1.000 *    79.291) + =    1086.782

Total of 3 main streams to confluence:
Flow rates before confluence point:
    1018.123     106.211      80.291
Maximum flow rates at confluence using above data:
     1159.475     1035.863     1086.782
Area of streams before confluence:
      507.878       39.140       33.360
Effective area values after confluence:
      580.378      378.931      446.325

Results of confluence:
Total flow rate =   1159.475(CFS)
Time of concentration =    19.739 min.
Effective stream area after confluence  =    580.378(Ac.)
Study area average Pervious fraction(Ap) =  0.199
Study area average soil loss rate(Fm) =    0.191(In/Hr)
Study area total =     580.38(Ac.)
End of computations, Total Study Area =          644.37 (Ac.)
```

The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 0.199
Area averaged SCS curve number =   1.$

San Bernardino County Rational Hydrology Program

(Hydrology Manual Date - August 1986)

CIVILCADD/CIVILDESIGN Engineering Software, (c) 1989-2018 Version 9.0
Rational Hydrology Study Date: 09/06/22

Rich-Haven Specific Plan
Hydrology Study for Allowable Q
100-yr Storm
Mill Creek Storm Drain

Program License Serial Number 6440

********* Hydrology Study Control Information **********

Rational hydrology study storm event year is 100.0
Computed rainfall intensity:
Storm year = 100.00 1 hour rainfall = 1.200 (In.)
Slope used for rainfall intensity curve b = 0.6000
Soil antecedent moisture condition (AMC) = 2

The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 0.198
Area averaged SCS curve number =   1.$

Subject: ***Consolidated Geotechnical Report to Support the Environmental Impact Report (EIR) for Rich-Haven Specific Plan, City of Ontario, California***

In accordance with your request, LGC Geotechnical, Inc. has prepared a geotechnical report to support the Environmental Impact Report (EIR) for the Rich-Haven Specific Plan in the City of Ontario, California. This report summarizes the results of our background review, previous subsurface explorations, and geotechnical analyses of the data collected, and presents our findings, conclusions, and preliminary recommendations for the proposed site.

If you should have any questions regarding this report, please do not hesitate to contact our office. We appreciate this opportunity to be of service.

Respectfully,

LGC Geotechnical, Inc.

1.0 INTRODUCTION

1.1 Purpose and Scope of Services

This compilation report presents the results of our previous geotechnical evaluations within the Rich-Haven Specific Plan area (see Site Location Map, Figure 1). The purpose of our work was to review previous reports and subsurface data in order to prepare a geotechnical report providing conclusions and preliminary recommendations to support the EIR. The geotechnical data from our previous subsurface geotechnical explorations can be found in Appendix B through Appendix I. Our scope of services included:

- Review of pertinent readily available geotechnical information and geologic maps (Appendix A).
- Review previous subsurface investigations including excavation, sampling, and logging of 64 small-diameter hollow stem borings (Appendix B through Appendix I).
- Review the previously pushed 41 Cone Penetration Test (CPT) soundings (Appendix B through Appendix I).
- Review previously performed infiltration testing within 11 of the hollow stem borings (Appendix B through Appendix I).
- Review the previous excavation of 86 geotechnical trenches (Appendix B through Appendix I).
- Review the previous excavation of 151 shallow trenches to assess the organic content of near surface "soils" (Appendix B through Appendix I).
- Review previous laboratory testing of representative samples obtained during our previous subsurface investigations (Appendix B through Appendix I).
- Geotechnical analysis and evaluation of the data obtained during these previous evaluations of the site.
- Preparation of this report presenting our findings, conclusions and preliminary recommendations with respect to the proposed site development.

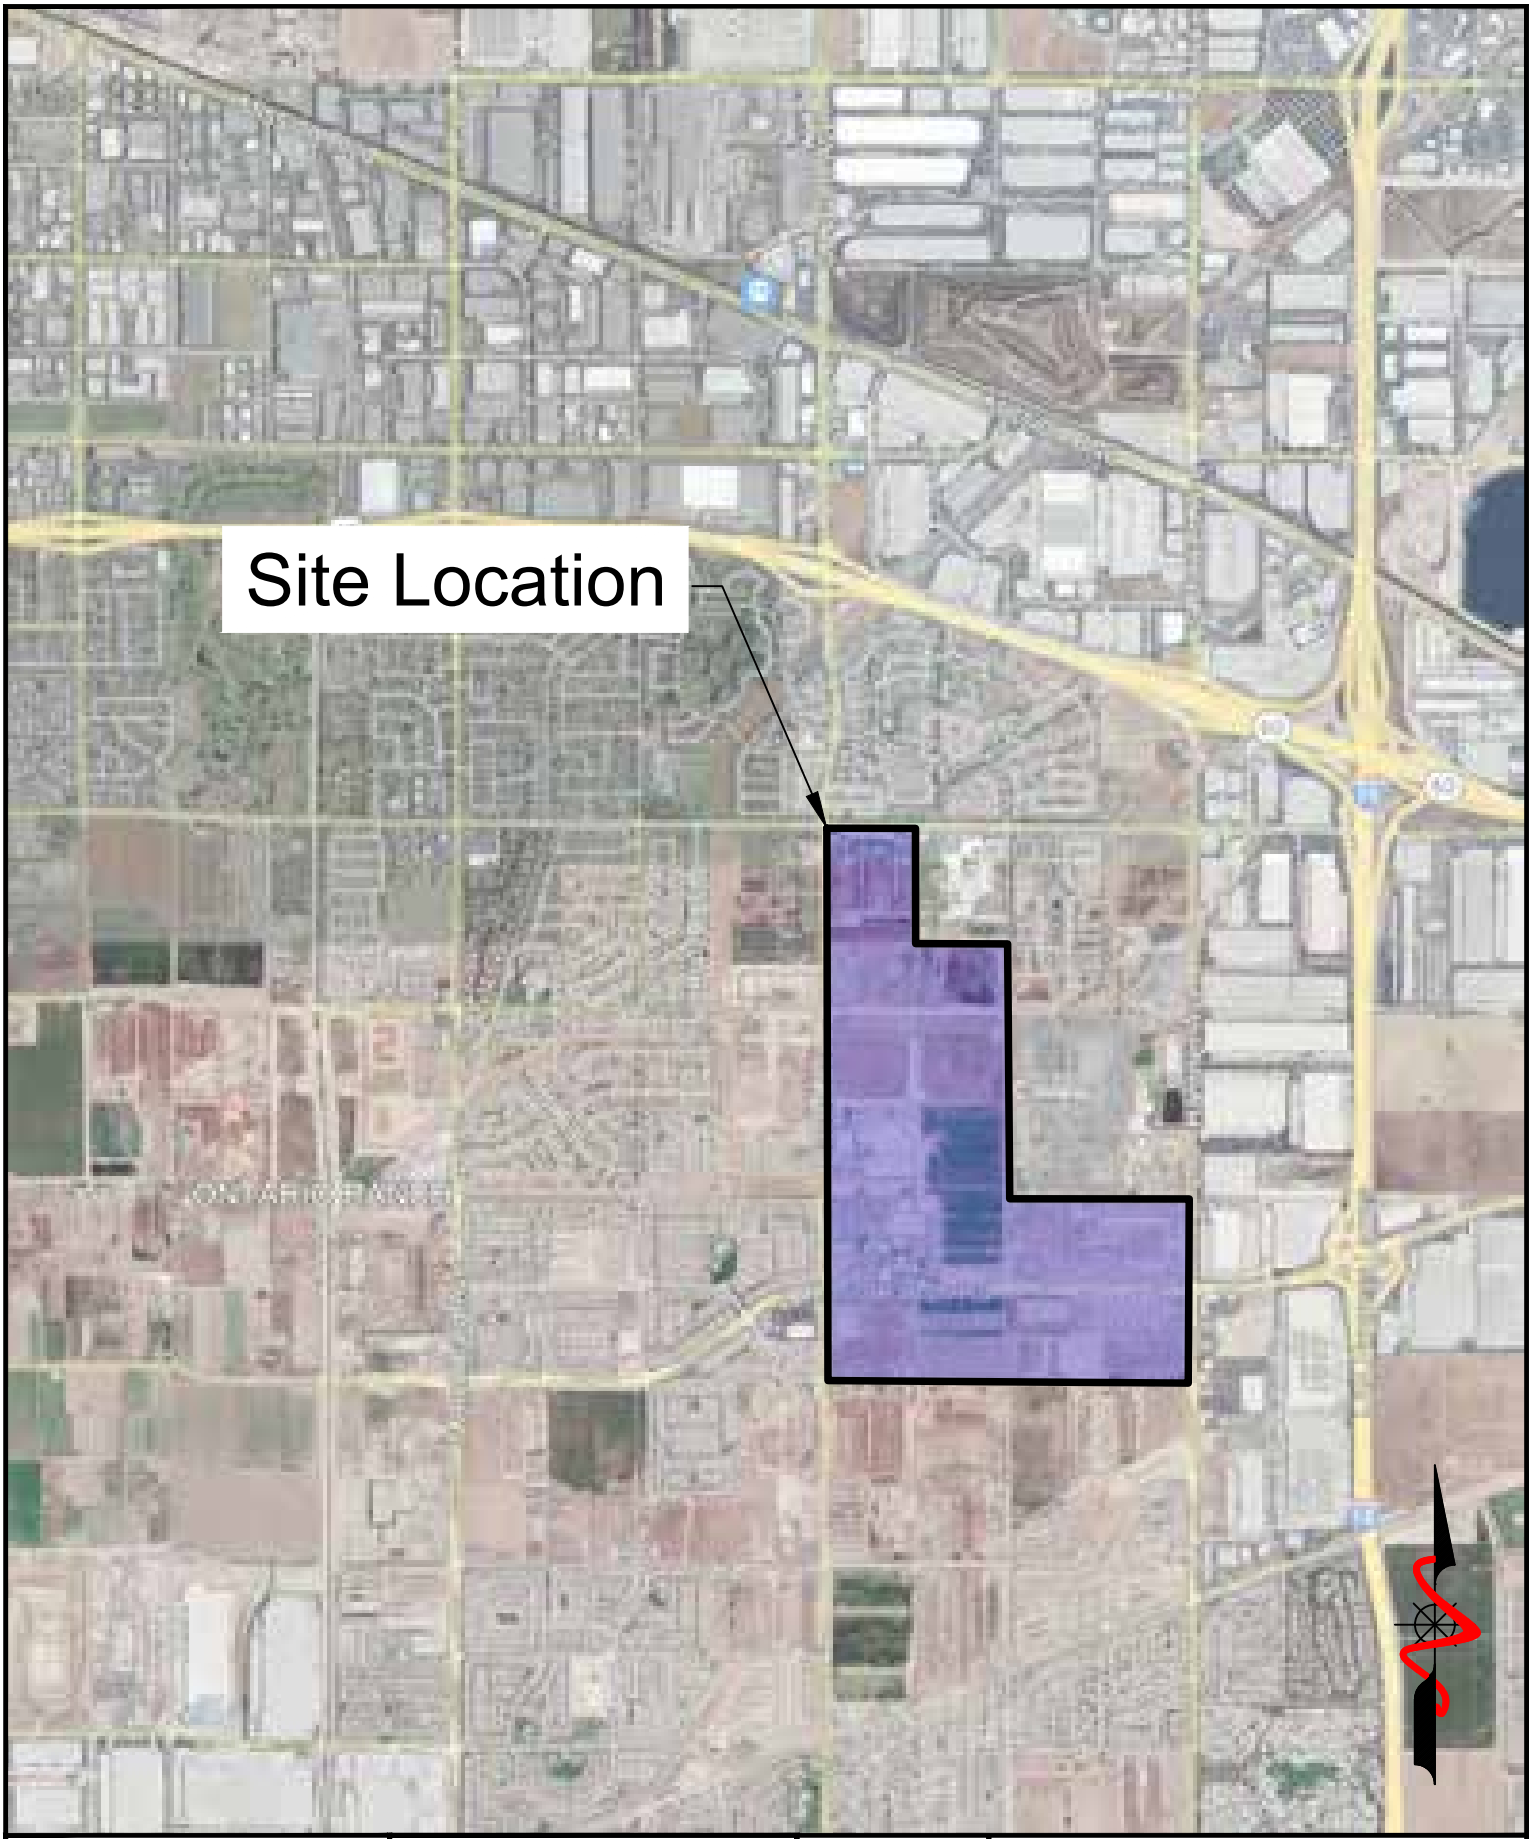
Note that some of the data (Borings, CPT's, Trenches, Lab Data, etc.) from Appendix F is not a part of the subject Specific Plan.

1.2 Existing Site Conditions and Proposed Improvements

The approximately 575-acre irregularly shaped site is bound to the west by Haven Avenue, to the north by East Riverside Drive, a school, and Southern California Edison (SCE) Substation, to the east by a school, an existing residential community, SCE substation, and Hamner Avenue and to the south by existing farms and a new residential development (Figure 1). Review of historic aerial photographs suggests the following:

As far back as 1938 the site was used for primarily agricultural farming and some livestock farming. Between the years 1959 and 1985 a larger percentage of the land had started to be used for livestock farming. By 2016, Ontario Ranch Road had been constructed and by 2018, some of the new residential developments had begun.

Based on the preliminary conceptual site plans, it is our understanding that site development will consist of construction of various residential, commercial, and industrial developments. Based on our experience, the proposed residential developments will be at-grade with relatively light building loads (column and wall loads assumed to be a maximum of approximately 30 kips and 3 kips per lineal foot, respectively). The proposed industrial buildings are anticipated to be an at-grade concrete tilt-up structure with estimated maximum column and wall loads of approximately



150 kips and 10 kips per linear foot, respectively.

The geotechnical engineer of record should be provided with updated project plans when they become available, in order to either confirm or modify the recommendations provided herein. Additional field work and/or laboratory testing will be necessary for final engineering.

1.3 Previous Site Evaluations

LGC Geotechnical has previously performed eight separate geotechnical evaluations within the subject Specific Plan. These evaluations have been performed from 2016 through 2021. A separate geotechnical evaluation report has been prepared for each of eight properties within the Specific Plan (LGC, 2017a, 2017b, 2017c, 2018, 2019, 2020, 2021a, 2021b, and 2021c).

Within each appendix, the approximate locations of the previous subsurface work (borings, CPTs, test pits, etc.) are presented on our geotechnical map. The previous exploration logs, laboratory testing, etc. have been included in Appendix B through Appendix I.

2.0 GEOTECHNICAL CONDITIONS

2.1 Regional Geology

The subject site is located south of the San Gabriel Mountains within the broad alluvial plain of the Santa Ana River Basin within the Peninsular Ranges Geomorphic Province. Specifically, the Specific Plan is located within the northern portion of the Perris Block, a geologic zone consisting of granitics overlain by sedimentary deposits that are bounded by active faults including the northwest-trending Whittier-Elsinore Fault Zone at the southwest and the northwest-trending San Jacinto Fault Zone at the northeast (USGS, 2002). The roughly rectangular Perris Block is transected by the southwest-trending Santa Ana River that passes several miles south of the subject site.

Regional geologic mapping and local topographic expressions do not indicate the presence of large-scale landslides within or adjacent to the Specific Plan.

2.2 Site Geology and Generalized Subsurface Conditions

Based on regional mapping (USGS, 2003), the subject site is underlain by Holocene- to Pleistocene-age eolian (wind-blown) sedimentary deposits. The materials below the eolian deposits are young alluvial fan deposits. As indicated in our field explorations, soils generally consisted of medium dense to dense sands with varying amounts of silt interbedded with thinner layers of stiff to very stiff fine-grained soils (i.e., silts and clays) to the maximum explored depth of approximately 50 feet below existing grade. Descriptions of the subsurface conditions are presented on the exploratory logs located in Appendix B through Appendix I.

Due to previous/current land use as farming, localized areas are underlain by near surface fill materials, topsoil, manure, etc. The lateral limits and depths (typically less than 5 feet) of these materials will be further evaluated during final engineering.

2.3 Groundwater

Groundwater was not encountered to the maximum explored depth of approximately 50 feet below existing grade. Groundwater levels recorded in the area by California Department of Water Resources are at depths greater than 120 feet below the ground surface (CDWR, 2018). Note that localized perched groundwater was found at a depth of approximately 40 feet below existing grade in the southeastern portion of the site.

In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present within the near-surface deposits due to local seepage or during rainy seasons. Groundwater conditions below the site may be variable, depending on numerous factors including seasonal rainfall, local irrigation and groundwater pumping, among others.

2.4 Field Infiltration Testing

Estimation of infiltration rates was performed in general accordance with guidelines set forth by the County of San Bernardino (2013). In general, a 3-inch diameter perforated PVC pipe was placed in each borehole to be tested and the annulus was backfilled with gravel, including placement of about 2 inches of gravel at the bottom of the borehole. The observed infiltration rates are considered representative of the site soils in the area of the proposed infiltration basins/systems. These observed infiltration rates do not include any factor of safety. Observed infiltration rates have been normalized to correct the 3-Dimensional flow that occurs within the field test to 1-Dimensional flow out of the bottom of the boring. The approximate infiltration test locations and the infiltration test data are located in Appendix B through Appendix I.

Eleven infiltration tests were run by LGC Geotechnical within the limits of the site. Infiltration tests were ran at depth of approximately 15 to 20 feet below existing grade. Infiltration rates ranged from approximately 0.6 inch/hr. to 7.0 inch/hr. for an average of approximately 2.6 inch/hr. These rates do not include a factor of safety.

It should be emphasized that infiltration test results are only representative of the location and depth where they are performed. Varying subsurface conditions may exist outside of the test locations which could alter the calculated infiltration rates indicated above. Infiltration tests are performed using relatively clean water free of particulates, silt, etc.

2.5 Faulting and Seismic Hazards

The subject Specific Plan is not located within a State of California Earthquake Fault Zone (i.e., Alquist-Priolo Earthquake Fault Act Zone) and no active faults are known to cross the site (CGS, 2007). A fault is considered "active" if evidence of surface rupture in Holocene time (the last approximately 11,000 years) is present. The possibility of damage due to ground rupture is considered low since no active faults are known to cross the site.

Secondary effects of seismic shaking resulting from large earthquakes on the major faults in the Southern California region, which may affect the site, include ground lurching and shallow ground rupture, soil liquefaction, and dynamic settlement. These secondary effects of seismic shaking are a possibility throughout the Southern California region and are dependent on the distance between the site and causative fault and the onsite geology. The closest major active faults that could produce these secondary effects include the Chino-Central, San Jose, Elsinore, Sierra Madre and San Andreas Faults, among others. A discussion of these secondary effects is provided in the following sections.

2.5.1 Liquefaction and Dynamic Settlement

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions coexist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion. Studies indicate that loose, saturated, near-surface, cohesionless soils exhibit the highest liquefaction

potential, while dry, dense, cohesionless soils, and cohesive soils exhibit low to negligible liquefaction potential. In general, cohesive soils are not considered susceptible to liquefaction. Effects of liquefaction on level ground include settlement, sand boils, and bearing capacity failures below structures. Furthermore, dynamic settlement of dry sands can occur above the groundwater table as the sand particles tend to settle and densify as a result of a seismic event.

Based on our review of the City of Ontario General Plan (ECI, 2006), the subject site is located in an area of "low to moderate" liquefaction susceptibility based only on soil type (sediments being less than 10,000 years old and unconsolidated). Based on our evaluation and analysis, site soils are generally not susceptible to liquefaction due to a lack of groundwater in the upper 50 feet and liquefaction potential is considered low to very low.

2.5.2 Lateral Spreading

Lateral spreading is a type of liquefaction induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move downslope towards a free face (such as a river channel or an embankment). Lateral spreading may cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures.

Due to the depth to groundwater, low potential for liquefaction and lack of nearby "free face" conditions, the potential for lateral spreading is considered very low.

2.6 Seismic Design Criteria

The site seismic characteristics were evaluated per the guidelines set forth in Chapter 16, Section 1613 of the 2019 California Building Code (CBC) and applicable portions of ASCE 7-16 which has been adopted by the CBC. Please note that the following seismic parameters are only applicable for code-based acceleration response spectra and are not applicable for where site-specific ground motion procedures are required by ASCE 7-16. The following coordinates are from the northwest portion of the Specific Plan as this yields the most conservative seismic analysis. Representative site coordinates of latitude 34.018410 degrees north and longitude -117.575156 degrees west were utilized in our analyses. For each individual developments, the seismic analysis can be updated based on the proposed improvements, their location, and current building code. The maximum considered earthquake (MCE) spectral response accelerations (S_{MS} and S_{M1}) and adjusted design spectral response acceleration parameters (S_{DS} and S_{D1}) for Site Class D are provided in Table 1 on the following page. Since site soils are Site Class D, additional adjustments are required to code acceleration response spectrums as outlined below and provided in ASCE 7-16. The structural designer should contact the geotechnical consultant if structural conditions (e.g., number of stories, seismically isolated structures, etc.) require site-specific ground motions.

TABLE 1

Seismic Design Parameters

Selected Parameters from 2019 CBC, Section 1613 - Earthquake Loads	Seismic Design Values	Notes/Exceptions
Distance to applicable faults classifies the site as a "Near-Fault" site.		Section 11.4.1 of ASCE 7
Site Class	D*	Chapter 20 of ASCE 7
Ss (Risk-Targeted Spectral Acceleration for Short Periods)	1.612g	From SEAOC, 2022
S_1 (Risk-Targeted Spectral Accelerations for 1-Second Periods)	0.585g	From SEAOC, 2022
F_a (per Table 1613.2.3(1))	1.000	For Simplified Design Procedure of Section 12.14 of ASCE 7, F_a shall be taken as 1.4 (Section 12.14.8.1)
F_v (per Table 1613.2.3(2))	1.715	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
S_{MS} for Site Class D [Note: $S_{MS} = F_a S_S$]	1.612g	-
S_{M1} for Site Class D [Note: $S_{M1} = F_v S_1$]	1.003g	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
S_{DS} for Site Class D [Note: $S_{DS} = (^2/_3)S_{MS}$]	1.075g	-
S_{D1} for Site Class D [Note: $S_{D1} = (^2/_3)S_{M1}$]	0.669g	Value is only applicable per requirements/exceptions per Section 11.4.8 of ASCE 7
C_{RS} (Mapped Risk Coefficient at 0.2 sec)	0.940	ASCE 7 Chapter 22
C_{R1} (Mapped Risk Coefficient at 1 sec)	0.917	ASCE 7 Chapter 22
*Since site soils are Site Class D and S_1 is greater than or equal to 0.2, the seismic response coefficient Cs is determined by Eq. 12.8-2 for values of $T \leq 1.5T_s$ and taken equal to 1.5 times the value calculated in accordance with either Eq. 12.8-3 for $T_L \geq T > T_s$, or Eq. 12.8-4 for $T > T_L$. Refer to ASCE 7-16.		

A deaggregation of the PGA based on a 2,475-year average return period (MCE) indicates that an earthquake magnitude of 6.75 at a distance of approximately 13.5 km from the site would contribute the most to this ground motion (USGS, 2014).

Section 1803.5.12 of the 2019 CBC (per Section 11.8.3 of ASCE 7) states that the maximum considered earthquake geometric mean (MCE_G) Peak Ground Acceleration (PGA) should be used for liquefaction potential. The PGA_M for the site is equal to 0.739g (SEAOC, 2022).

2.7 Near Surface Organic Rich Soils

Based on previous/current land use near surface organic materials (topsoil, manure, etc.) are present throughout. These lateral extent and depth of these materials will be further evaluated during final engineering, including recommendations for offsite export.

2.8 Corrosivity to Concrete and Metal

Based on laboratory sulfate test results, the near surface soils are designated to a class "S0" per ACI 318, Table 19.3.1.1 with respect to sulfates. Concrete in direct contact with the onsite soils can be designed according to ACI 318, Table 19.3.2.1 using the "S0" sulfate classification.

Laboratory testing will need to be performed at the completion of grading by the project corrosion engineer to further evaluate the as-graded soil corrosivity characteristics. Accordingly, revision of the corrosion potential may be needed, should future test results differ substantially from the conditions reported herein. The client and/or other members of the development team should consider this during the design and planning phase of the project and formulate an appropriate course of action.

2.9 Expansion Potential

Based on the results of previous laboratory testing by others and our recent laboratory testing, site soils are anticipated to have a "Very Low" expansion potential (EI of 20 or less per ASTM D4829). Final expansion potential of site soils should be determined at the completion of grading. Results of expansion testing at finish grades will be utilized to confirm final foundation design recommendations.

3.0 CONCLUSIONS

Based on the results of our previous subsurface geotechnical evaluations, it is our opinion that the proposed Specific Plan is feasible from a geotechnical standpoint, provided that the recommendations contained in the following sections are incorporated during site grading and development. A summary of our geotechnical conclusions are as follows:

- The near-surface loose and compressible soils are not suitable for the planned improvements in their present condition and will require remedial grading in order to provide adequate support for the proposed improvements.
- Groundwater was not encountered in our field evaluation. Records indicate groundwater levels recorded in the area are at depths greater than 120 feet below the ground surface.
- The subject study area is not located within a mapped State of California Earthquake Fault Zone (i.e., Alquist-Priolo Earthquake Fault Act Zone), and based upon our review of published geologic mapping, no known active or potentially active faults are known to exist within or in the immediate vicinity of the site. Therefore, the potential for ground rupture as a result of faulting is considered very low.
- The main seismic hazard that may affect the site is ground shaking from one of the active regional faults. The subject site will likely experience strong seismic ground shaking during its design life.
- Site soils are generally not susceptible to liquefaction due to a lack of groundwater in the upper 50 feet.
- Based on the results of preliminary laboratory testing, site soils are anticipated to have "Very Low" expansion potential. This will be confirmed during final engineering.
- Based on laboratory sulfate test results, the near surface soils are designated to a class "S0" per ACI 318, Table 19.3.1.1 with respect to sulfates.). Concrete in direct contact with the onsite soils can be designed according to ACI 318, Table 19.3.2.1 using the "S0" sulfate classification.
- Field testing resulted in observed infiltration rates ranging from 0.6 to 7.0 inches per hour for an average of approximately 2.6 inches per hour. The observed infiltration rates do not include a factor of safety.

4.0 RECOMMENDATIONS

The following recommendations are to be considered preliminary and should be confirmed upon completion of final engineering studies and ultimately after grading/earthwork operations. In addition, they should be considered minimal from a geotechnical viewpoint, as there may be more restrictive requirements from the architect, structural engineer, building codes, governing agencies, or the owner.

It should be noted that the following geotechnical recommendations are intended to provide sufficient information to develop the site in general accordance with the 2019 CBC requirements. With regard to the possible occurrence of potentially catastrophic geotechnical hazards such as fault rupture, earthquake-induced landslides, liquefaction, etc. the following geotechnical recommendations should provide adequate protection for the proposed development to the extent required to reduce seismic risk to an "acceptable level." The "acceptable level" of risk is defined by the California Code of Regulations as "that level that provides reasonable protection of the public safety, though it does not necessarily ensure continued structural integrity and functionality of the project" [Section 3721(a)]. Therefore, repair and remedial work of the proposed improvement may be required after a significant seismic event. With regards to the potential for less significant geologic hazards to the proposed development, the recommendations contained herein are intended as a reasonable protection against the potential damaging effects of geotechnical phenomena such as expansive soils, fill settlement, groundwater seepage, etc. It should be understood, however, that our recommendations are intended to maintain the structural integrity of the proposed development and structures given the site geotechnical conditions but cannot preclude the potential for some cosmetic distress or nuisance issues to develop as a result of the site geotechnical conditions.

The geotechnical recommendations contained herein must be confirmed to be suitable or modified based on the actual as-graded conditions.

4.1 Site Earthwork

Rough grading shall include export of high organic content soils, remedial earthwork grading including mixing and blending followed by placement of engineered compacted fill to design grades. Geotechnical recommendations for precise grading and construction of the proposed new improvements will be provided, as necessary.

We recommend that earthwork onsite be performed in accordance with the following recommendations, future grading plan review report(s), the 2019 CBC/City of Ontario requirements, and the General Earthwork and Grading Specifications for Rough Grading included in Appendix J. In case of conflict, the following recommendations shall supersede those included in Appendix J. The following recommendations may be revised based on future subsurface work, geotechnical analysis, grading plan review reports, or based on the actual conditions encountered during site grading.

4.1.1 Site Preparation

Prior to grading, areas to be developed should undergo the stripping and clearing of vegetation, high organic content soil removal/export and clearing of surface obstructions, pavements, foundation and slab elements from previous land use. Vegetation, debris, and excessive organic material should be removed and properly disposed of offsite. Recommendations for removal of organic rich soils are provided at final engineering. Holes resulting from removals of buried obstructions, which extend below proposed remedial and/or finish grades, should be replaced with suitable compacted fill material.

If cesspools or septic systems are encountered, they should be removed in their entirety. The resulting excavation should be backfilled with properly compacted fill soils. As an alternative, cesspools can be backfilled with lean sand-cement slurry. Any encountered wells should be properly abandoned in accordance with regulatory requirements.

4.1.2 Remedial Grading Depths

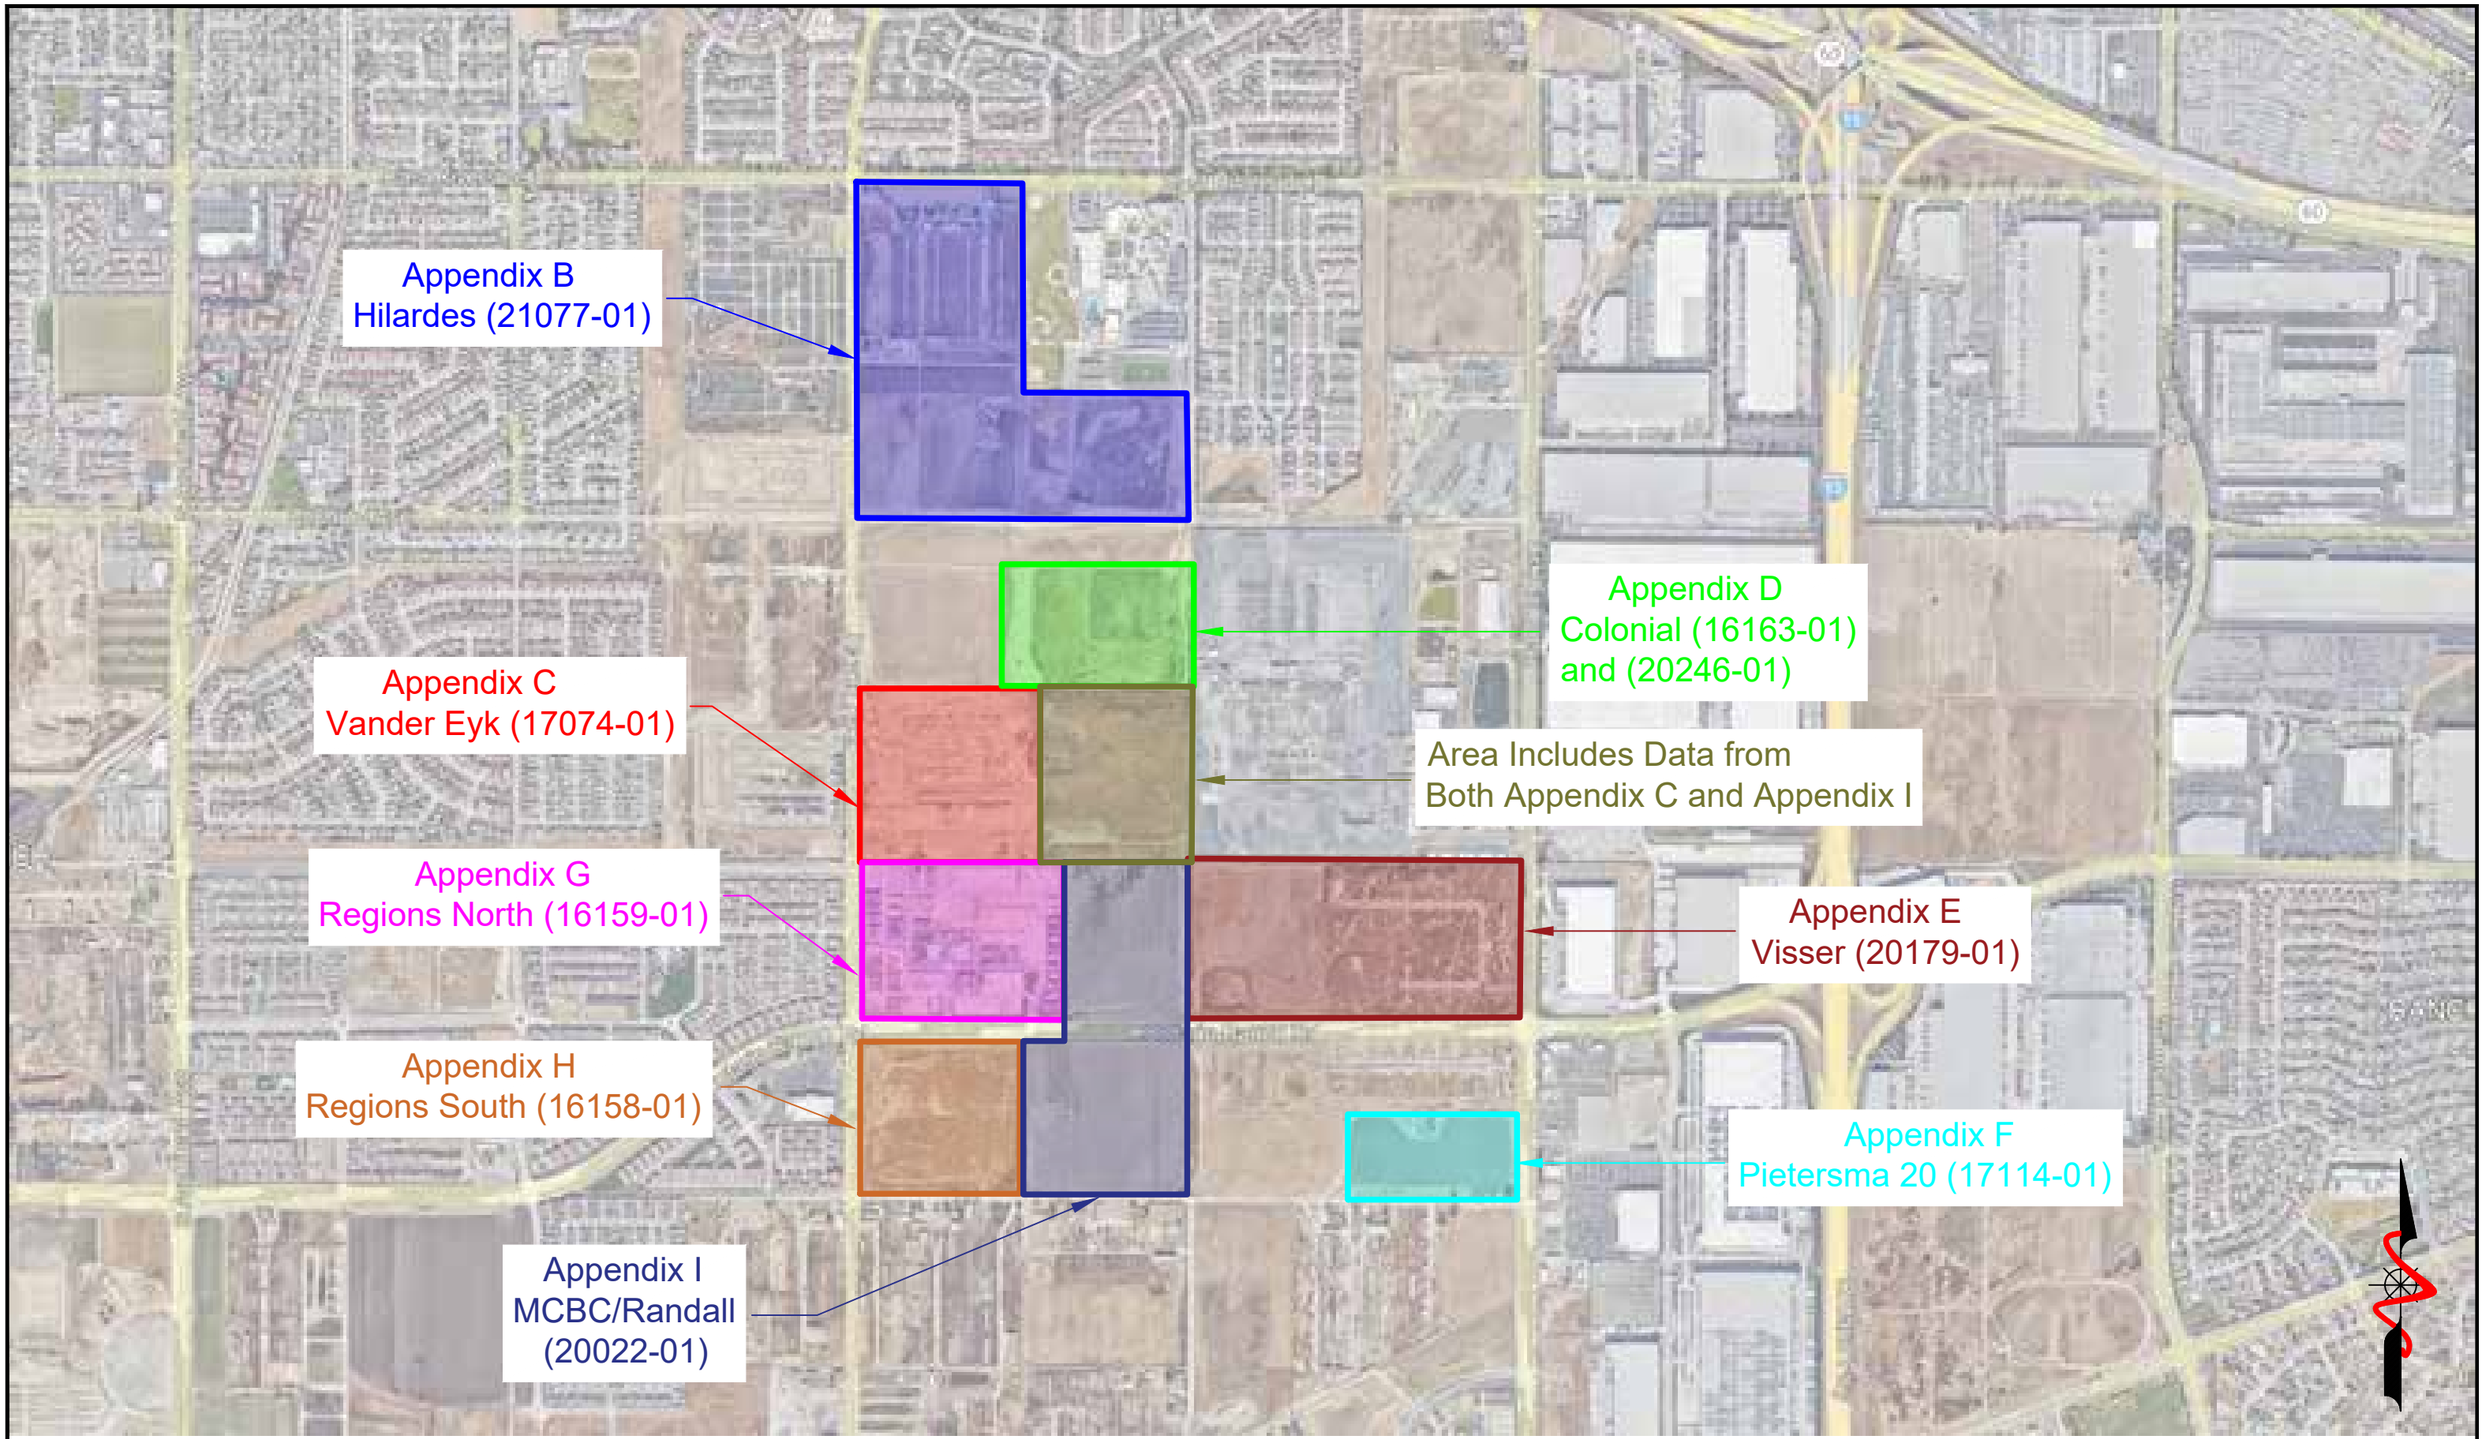
In order to provide a relatively uniform bearing condition for the planned improvements, we recommend the near surface soils be temporarily removed and recompacted as fill. Based on our experience the depth of remedial grading averages approximately 5 feet below existing grade. Local conditions may be encountered during excavation that could require additional remedial grading beyond the above-noted minimum in order to obtain an acceptable subgrade. Material to be placed as fill should be brought to near-optimum moisture content (generally within optimum and 2 percent above optimum moisture content) and recompacted to at least 90 percent relative compaction (per ASTM D1557).

The actual depths and lateral extents of grading will be determined by the geotechnical consultant, based on subsurface conditions encountered during grading. Removal areas and areas to be over-excavated should be accurately staked in the field by the Project Surveyor.

4.2 Preliminary Foundation Recommendations (Residential, Industrial, and Commercial)

The proposed structure(s) may be supported on a shallow foundation consisting of spread or continuous footings and conventional slabs, provided earthwork is performed in accordance with the recommendations presented in this report. Since the site soils are anticipated to be "Very Low" expansion potential (EI of 20 or less per ASTM D4829), special design considerations from a geotechnical perspective are not anticipated, however, this must be verified based on as-graded conditions. Footings should be supported on properly compacted fill.

5.0 LIMITATIONS



Our services were performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable soils engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

This report is based on data obtained from limited observations of the site, which have been extrapolated to characterize the site. While the scope of services performed is considered suitable to adequately characterize the site geotechnical conditions relative to the proposed development, no practical evaluation can completely eliminate uncertainty regarding the anticipated geotechnical conditions in connection with a subject site. Variations may exist and conditions not observed or described in this report may be encountered during grading and construction.

This report is issued with the understanding that it is the responsibility of the owner, or of his/her representative, to ensure that the information and recommendations contained herein are brought to the attention of the other consultants (at a minimum the civil engineer, structural engineer, landscape architect) and incorporated into their plans. The contractor should properly implement the recommendations during construction and notify the owner if they consider any of the recommendations presented herein to be unsafe, or unsuitable.

The findings of this report are valid as of the present date. However, changes in the conditions of a site can and do occur with the passage of time, whether they be due to natural processes or the works of man on this or adjacent properties. The findings, conclusions, and recommendations presented in this report can be relied upon only if LGC Geotechnical has the opportunity to observe the subsurface conditions during grading and construction of the project, in order to confirm that our preliminary findings are representative for the site. This report is intended exclusively for use by the client, any use of or reliance on this report by a third party shall be at such party's sole risk.

In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and modification.

APPENDIX C

Laboratory Testing Procedures and Test Results

The laboratory testing program was formulated towards providing data relating to the relevant engineering properties of the soils with respect to residential construction. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on relatively undisturbed samples obtained from the test borings and/or trenches. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Expansion Index: The expansion potential of selected samples was evaluated by the Expansion Index Test, Standard ASTM D4829. Specimens are molded under a given compactive energy to approximately the optimum moisture content and approximately 50 percent saturation or approximately 90 percent relative compaction. The prepared 1-inch-thick by 4-inch-diameter specimens are loaded to an equivalent 144 psf surcharge and are inundated with tap water until volumetric equilibrium is reached. The results of these tests are presented in the table below.

Sample Location	**Expansion Index**	**Expansion Potential***
HS-1 @ 1-5 feet	2	Very Low
HS-6 @2.5-7.5 feet	25	Low

* ASTM D4829

Grain Size Distribution/Fines Content: Representative samples were dried, weighed and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve and dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Laboratory Testing Procedures and Test Results

Sample Location	Description	% Passing # 200 Sieve
HS-1 @ 5 feet	Sandy Silt	77
HS-2 @ 5 feet	Silty Sand	32
HS-3 @ 5 feet	Silty Sand	31
HS-4 @ 5 feet	Silty Sand	31
HS-5 @ 5 feet	Silty Sand	57
HS-1 @ 1-5 feet	Silty Sand with Gravel	29
HS-2 @ 1-5 feet	Clay	88
HS-6 @ 2.5-7.5 feet	Silty Sand	19

Consolidation: Two consolidation test were performed per ASTM D2435. A sample (2.4 inches in diameter and 1 inch in height) was placed in a consolidometer and increasing loads were applied. The sample was allowed to consolidate under "double drainage" and total deformation for each loading step was recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curve is provided in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
*HS-1 @ 1-5 feet	Olive Silty Sand with Gravel	129.5	7.5
HS-2 @ 1-5 feet	Yellowish Brown Clay	114.0	13.5
HS-6 @ 2.5-7.5 feet	Olive Brown Silty Sand	114.0	14.0
OTP-10 @ 1-3 feet	Dark Brown Sand with Silt	109.0	14.0
TP-1 @ 5-8 feet	Grayish Brown Sand	101.5	9.0

*Note: These max dry density results are based on a rock correction with approximately 23% retained on the No. 4 sieve.

Laboratory Testing Procedures and Test Results

Chloride Content: Chloride content was tested in accordance with Caltrans Test Method (CTM) 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-1 @ 1-5 feet	100

Soluble Sulfates: The soluble sulfate contents of selected samples were determined by standard geochemical methods (CTM 417). The soluble sulfate content is used to determine the appropriate cement type and maximum water-cement ratios. The test results are presented in the table below.

Sample Location	Sulfate Content (ppm)	Sulfate Exposure Class *
HS-1 @ 1-5 feet	128	S0

*Based on ACI 318R-14, Table 19.3.1.1

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-1 @ 1-5 feet	7.85	1,280

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in the Table 6.

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution/Fines Content: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Sample Location	Description	% Passing # 200 Sieve
HS-3 @ 7.5 ft	Silty Sand	37
HS-4 @ 5 ft	Silty Sand	29
HS-8 @ 10 ft	Sandy Silt	65

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined per ASTM D4318 for engineering classification of fine-grained material and presented in the table below. The USCS soil classification indicated in the table below is based on the portion of sample passing the No. 40 sieve and may not necessarily be representative of the entire sample. The plot is provided in this Appendix.

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-7 @ 15 ft	NP	NP	NP	ML

Consolidation: A consolidation test was performed per ASTM D2435. Sample (2.4 inches in diameter and 1-inch in height) was placed in a consolidometer and increasing loads were applied. The sample was allowed to consolidate under "double drainage" and total deformation for each loading step was

recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curve is provided in this Appendix.

Collapse/Swell Potential: Collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The curves are presented in this Appendix.

Direct Shear: A direct shear test was performed on a driven sample. The ring samples were soaked for a minimum of 24 hours prior to testing. The samples were tested under various normal loads using a motor-driven, strain-controlled, direct-shear testing apparatus (ASTM D3080). The plot is provided in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-3 @ 2.5-5 ft	Sand with Silt	123.5	8.5
HS-4 @ 2.5-5 ft	Silty Sand	118.5	9.0

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-3 @ 2.5-5 ft	2	Very Low
HS-4 @ 2.5-5 ft	1	Very Low
HS-6 @ 2.5-5 ft	0	Very Low

* Per ASTM D4829

Soluble Sulfates: The soluble sulfate content of select samples was determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content, %
HS-3 @ 2.5-5 ft	< 0.02
HS-4 @ 2.5-5 ft	< 0.02

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-3 @ 2.5-5 ft	544
HS-4 @ 2.5-5 ft	104

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-3 @ 2.5-5 ft	7.8	190
HS-4 @ 2.5-5 ft	6.3	737

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140).

Sample Location	Description	% Passing # 200 Sieve
HS-1 @ 5.0 ft	Silty Sand	34
HS-2 @ 2.5 ft	Silty Sand	36
HS-3 @ 5.0 ft	Sandy Silt	71
HS-6 @ 7.5 ft	Silty Sand	43
I-1 @ 14 ft	Sandy Silt	61
I-2 @ 1-5 ft	Silty Sand	34
I-2 @ 20 ft	Sand with Silt	8

Collapse/Swell Potential: Collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The curves are presented in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-4 @ 2 to 5 ft	Silty Sand	113.0	11.5
HS-6 @ 2 to 5 ft	Silty Sand	104.5	12.5

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-4 @ 2 to 5 ft	1	Very Low
HS-6 @ 2 to 5 ft	0	Very Low
I-2 @ 1-5 ft	0	Very Low

* Per ASTM D4829

Soluble Sulfates: The soluble sulfate content of select sample was determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content, %
HS-4 @ 2 to 5 ft	< 0.02
I-2 @ 1-5 ft	< 0.03

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-4 @ 2 to 5 ft	148
I-2 @ 1-5 ft	120

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-4 @ 2 to 5 ft	7.63	1,480
I-2 @ 1-5 ft	8.53	1,994

APPENDIX C

Laboratory Test Results (Continued)

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in Table 9.

ONE-DIMENSIONAL SWELL OR SETTLEMENT POTENTIAL OF COHESIVE SOILS

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140).

Sample Location	Description	% Passing # 200 Sieve
HS-1 @ 5.0 ft	Silty Sand	34
HS-2 @ 2.5 ft	Silty Sand	36
HS-3 @ 5.0 ft	Sandy Silt	71
HS-6 @ 7.5 ft	Silty Sand	43
I-1 @ 14 ft	Sandy Silt	61
I-2 @ 1-5 ft	Silty Sand	34
I-2 @ 20 ft	Sand with Silt	8

Collapse/Swell Potential: Collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The curves are presented in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-4 @ 2 to 5 ft	Silty Sand	113.0	11.5
HS-6 @ 2 to 5 ft	Silty Sand	104.5	12.5

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-4 @ 2 to 5 ft	1	Very Low
HS-6 @ 2 to 5 ft	0	Very Low
I-2 @ 1-5 ft	0	Very Low

* Per ASTM D4829

Soluble Sulfates: The soluble sulfate content of select sample was determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content, %
HS-4 @ 2 to 5 ft	< 0.02
I-2 @ 1-5 ft	< 0.03

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-4 @ 2 to 5 ft	148
I-2 @ 1-5 ft	120

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-4 @ 2 to 5 ft	7.63	1,480
I-2 @ 1-5 ft	8.53	1,994

APPENDIX C

Laboratory Test Results (Continued)

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in Table 9.

SHEET 3 of 3

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution/Fines Content: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Sample Location	Description	% Passing # 200 Sieve
HS-1 @ 1-5 ft	Silty Sand	28
HS-1 @ 7.5 ft	Silty Sand	36
HS-4 @ 5 ft	Silty Sand	35
HS-4 @ 15 ft	Silt with Sand	79

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined per ASTM D4318 for engineering classification of fine-grained material and presented in the table below. The USCS soil classification indicated in the table below is based on the portion of sample passing the No. 40 sieve and may not necessarily be representative of the entire sample. The plot is provided in this Appendix.

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-4 @ 35 ft	27	18	9	CL

APPENDIX C

Laboratory Test Results (Continued)

Consolidation: One consolidation tests were performed per ASTM D2435. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and increasing loads were applied. The samples were allowed to consolidate under "double drainage" and total deformation for each loading step were recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curve is provided in this Appendix.

Collapse/Swell Potential: Two collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The curves are presented in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-1 @ 1-5 ft	Silty Sand	123.5	9.5
HS-5 @ 1-5 ft	Silty Sand	120.0	5.5

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-1 @ 1-5 ft	1	Very Low
HS-4 @ 1-5 ft	0	Very Low

* Per ASTM D4829

Soluble Sulfates: The soluble sulfate content of select samples was determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content, %
HS-1 @ 1-5 ft	< 0.02%
HS-4 @ 1-5 ft	< 0.02%

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-1 @ 1-5 ft	193
HS-4 @ 1-5 ft	64

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-1 @ 1-5 ft	7.91	3998
HS-4 @ 1-5 ft	8.11	1700

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in Table 9.

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution/Fines Content: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Sample Location	Description	% Passing # 200 Sieve
HS-1 @ 7.5 ft	Sand with Silt	8
HS-2 @ 0-5 ft	Sandy Silt	63
HS-3 @ 7.5 ft	Sand	2
HS-4 @ 0-5 ft	Silty Sand	40
HS-10 @ 0-5 ft	Silty Sand	38
HS-10 @ 7.5 ft	Silty Sand	17

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined per ASTM D4318 for engineering classification of fine-grained material and presented in the table below. The USCS soil classification indicated in the table below is based on the portion of sample passing the No. 40 sieve and may not necessarily be representative of the entire sample. The plot is provided in this Appendix.

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-4 @ 7.5 ft	22	19	3	ML
HS-6 @ 7.5 ft	35	32	3	ML

APPENDIX C

Laboratory Test Results (Continued)

Consolidation: Two consolidation tests were performed per ASTM D2435. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and increasing loads were applied. The samples were allowed to consolidate under "double drainage" and total deformation for each loading step were recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curves are provided in this Appendix.

Collapse/Swell Potential: Three collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The curves are presented in this Appendix.

Direct Shear: Two direct shear test were performed on driven samples. The ring samples were soaked for a minimum of 24 hours prior to testing. The samples were tested under various normal loads using a motor-driven, strain-controlled, direct-shear testing apparatus (ASTM D3080). The plots are provided in this Appendix.

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-2 @ 2-5 ft	Sandy Silt	121.0	10.5
HS-4 @ 2-5 ft	Silty Sand	120.5	11.5
HS-10 @ 2-5 ft	Silty Sand	129.0	7.0

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-2 @ 0-5 ft	15	Very Low
HS-4 @ 0-5 ft	14	Very Low
HS-10 @ 0-5 ft	6	Very Low

* Per ASTM D4829

APPENDIX C

Laboratory Test Results (Continued)

R-value Test: R-value test was performed in general accordance with California Test Method 301. The plot is included in the Appendix.

Sample Location	R-value
HS-7 @ 0-5 ft	61

Soluble Sulfates: The soluble sulfate content of select samples was determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content, %
HS-2 @ 0-5 ft	< 0.02%
HS-4 @ 0-5 ft	< 0.01%
HS-10 @ 0-5 ft	< 0.01%

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-2 @ 0-5 ft	21
HS-4 @ 0-5 ft	43
HS-10 @ 0-5 ft	62

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-2 @ 0-5 ft	7.66	3700
HS-4 @ 0-5 ft	6.98	3000
HS-10 @ 0-5 ft	7.77	5950

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in this Table 5.

APPENDIX C

Laboratory Testing Procedures and Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined in accordance with ASTM Test Method D4318 for engineering classification of fine-grained material and presented in the table below:

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-1 @ 45 feet	27	16	11	CL
HS-2 @ 15 feet	20	19	1	ML
HS-2 @ 30 feet	30	22	8	CL
HS-2 @ 45 feet	31	25	6	ML
HS-4 @ 10 feet	NP	NP	NP	NP
HS-6 @ 15 feet	NP	NP	NP	NP

Grain Size Distribution: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve. The portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D422 (CTM 202). Where an appreciable amount of fines were encountered (greater than 20 percent passing the No. 200 sieve) a hydrometer analysis was done to determine the distribution of soil particles passing the No. 200 sieve.

Sample Location	**Description**	**% Passing # 200 Sieve**
HS-2 @ 15 feet	Sandy Silt	73
HS-2 @ 30 feet	Sandy Silt	60
HS-2 @ 45 feet	Sandy Clay	77
HS-6 @ 15 feet	Sandy Silt	71
HS-7 @ 15 feet	Sandy Silt	88

Expansion Index: The expansion potential of selected samples were evaluated by the Expansion Index Test, Standard ASTM D4829. Specimens are molded under a given compactive energy to approximately the optimum moisture content and approximately 50 percent saturation or approximately 90 percent relative compaction. The prepared 1-inch-thick by 4-inch-diameter specimens are loaded to

an equivalent 144 psf surcharge and are inundated with tap water until volumetric equilibrium is reached. The results of these tests are presented in the table below.

Sample Location	Expansion Index	Expansion Potential*
HS-2 @ 15-20 feet	5	Very Low

*Per Chapter 18 of the 2007 C.B.C.; ASTM D 4829 Section 5.3

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-1 @ 0-5 feet	Brown Silty Sand	121.0	8.5

Collapse /Swell Potential: Collapse test were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The Curves are presented in this Appendix.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on relatively undisturbed samples obtained from the test borings and/or trenches. The results of these tests are presented in the boring and/or trench logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in the table below:

Sample Location	Organic Content (%)
TP-1 @ 1-2 feet	1.0
TP-1 @ 2-3 feet	0.9
TP-1 @ 5-7 feet	0.9
TP-1 @ 9-10 feet	0.8
TP-2 @ 1-3 feet	2.2
TP-2 @ 5-6 feet	1.1
TP-3 @ 2-3 feet	0.5
TP-3 @ 4-5 feet	1.1
TP-3 @ 8-9 feet	1.0

TP-4 @ 3-4 feet	0.6
TP-4 @ 5-7 feet	0.2
TP-5 @ 0-1 feet	4.6
TP-5 @ 1-2 feet	2.3
TP-5 @ 3-4 feet	0.6
TP-5 @ 6-7 feet	0.6
TP-6 @ 0-1 feet	55.3
TP-6 @ 2-3 feet	0.9
TP-6 @ 4-5 feet	0.6
TP-7 @ 0-1 feet	7.3
TP-7 @ 1-3 feet	0.8
TP-7 @ 3-4 feet	0.5
TP-8 @ 3-4 feet	0.5
TP-8 @ 6-8 feet	0.4
TP-9 @ 2-3 feet	1.1
TP-9 @ 6 feet	8.3
TP-9 @ 7-9 feet	0.9
TP-9 @ 18 feet	0.6
TP-10 @ 0-2 feet	3.2
TP-10 @ 2-4 feet	2.1
TP-10 @ 7-9 feet	0.5
TP-11 @ 0-1 feet	1.6
TP-11 @ 2-3 feet	3.2
TP-12 @ 0-3 feet	3.1
TP-12 @ 4-5 feet	1.2
TP-13 @ 2-3 feet	1.2
TP-14 @ 6-8 feet	4.4
TP-14 @ 9-10 feet	1.0
TP-16 @ 2-3 feet	0.8
TP-16 @ 8-9 feet	1.0

MOISTURE, ORGANIC MATTER and ASH CONTENT of SOILS

ASTM D 2974 (Test Methods A & C)

Project Name: Regions North | Tested By: G. Berdy | Date: 02/17/17

Project No. : 16159-01 | Input By: J. Ward | Date: 02/24/17

Client: LGC Geotechnical, Inc.

APPENDIX C

Laboratory Testing Procedures and Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Grain Size Distribution: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve. The portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D422 (CTM 202). Where an appreciable amount of fines were encountered (greater than 20 percent passing the No. 200 sieve) a hydrometer analysis was done to determine the distribution of soil particles passing the No. 200 sieve.

Sample Location	Description	% Passing # 200 Sieve
HS-2 @ 10 feet	Clayey Sand	61
HS-2 @ 25 feet	Sandy Silt	68
HS-3 @ 5 feet	Sandy Clay	70
HS-4 @ 20 feet	Sandy Silt	63
HS-5 @ 15 feet	Silty Sand	48
HS-5 @ 35 feet	Sandy Clay	60

Expansion Index: The expansion potential of selected samples were evaluated by the Expansion Index Test, Standard ASTM D4829. Specimens are molded under a given compactive energy to approximately the optimum moisture content and approximately 50 percent saturation or approximately 90 percent relative compaction. The prepared 1-inch-thick by 4-inch-diameter specimens are loaded to an equivalent 144 psf surcharge and are inundated with tap water until volumetric equilibrium is reached. The results of these tests are presented in the table below.

Sample Location	Expansion Index	Expansion Potential*
HS-4 @ 5-7.5 feet	6	Very Low

*Per Chapter 18 of the 2007 C.B.C.; ASTM D 4829 Section 5.3

Collapse /Swell Potential: Collapse test were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The Curves are presented in this Appendix.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on relatively undisturbed samples obtained from the test borings and/or trenches. The results of these tests are presented in the boring and/or trench logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Chloride Content: Chloride content was tested in accordance with Caltrans Test Method (CTM) 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-4 @ 5-7.5 feet	11

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The electrical resistivity of a soil is a measure of its resistance to the flow of electrical current. As a result of a decrease in resistivity, the potential for corrosion increases. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-4 @ 5-7.5 feet	7.43	1000

Soluble Sulfates: The soluble sulfate contents of selected samples were determined by standard geochemical methods (CTM 417). The soluble sulfate content is used to determine the appropriate cement type and maximum water-cement ratios. The test results are presented in the table below.

Sample Location	Sulfate Content (ppm)	Sulfate Exposure*
HS-4 @ 5-7.5 feet	84	S0

*Per ACI 318

THIS SUMMARY APPLIES ONLY AT THE LOCATION OF THIS BORING AND AT THE TIME OF DRILLING. SUBSURFACE CONDITIONS MAY DIFFER AT OTHER LOCATIONS AND MAY CHANGE AT THIS LOCATION WITH THE PASSAGE OF TIME. THE DATA PRESENTED IS A SIMPLIFICATION OF THE ACTUAL CONDITIONS ENCOUNTERED. THE DESCRIPTIONS PROVIDED ARE QUALITATIVE FIELD DESCRIPTIONS AND ARE NOT BASED ON QUANTITATIVE ENGINEERING ANALYSIS.

SAMPLE TYPES:

B	BULK SAMPLE
R	RING SAMPLE (CA Modified Sampler)
G	GRAB SAMPLE
SPT	STANDARD PENETRATION TEST SAMPLE
▽	GROUNDWATER TABLE

TEST TYPES:

DS	DIRECT SHEAR
MD	MAXIMUM DENSITY
SA	SIEVE ANALYSIS
S&H	SIEVE AND HYDROMETER
EI	EXPANSION INDEX
CN	CONSOLIDATION
CR	CORROSION
AL	ATTERBERG LIMITS
CO	COLLAPSE/SWELL
RV	R-VALUE
-#200	% PASSING # 200 SIEVE

Table 8 - Summary of Organic Content - Organic Removal & Export Depths

Project Name	Richland - MCBC, Ontario
Project Number	20179-01
ENG./GEOL.	RLD/ARN
Date	June 2021

APPENDIX C

Laboratory Test Results

The laboratory testing program was directed towards providing quantitative data relating to the relevant engineering properties of the site soils. Samples considered representative of site conditions were tested in general accordance with American Society for Testing and Materials (ASTM) procedure and/or California Test Methods (CTM), where applicable. The following summary is a brief outline of the test type and a table summarizing the test results.

Moisture and Density Determination Tests: Moisture content (ASTM D2216) and dry density determinations (ASTM D2937) were performed on driven samples obtained from the test borings. The results of these tests are presented in the boring logs. Where applicable, only moisture content was determined from undisturbed or disturbed samples.

Grain Size Distribution/Fines Content: Representative samples were dried, weighed, and soaked in water until individual soil particles were separated (per ASTM D421) and then washed on a No. 200 sieve (ASTM D1140). Where applicable, the portion retained on the No. 200 sieve was dried and then sieved on a U.S. Standard brass sieve set in accordance with ASTM D6913 (sieve).

Sample Location	**Description**	**% Passing # 200 Sieve**
HS-1 @ 1-5 ft	Silty Sand	14
HS-2 @ 1-5 ft	Silty Sand	20
HS-5 @ 1-5 ft	Silty Sand	31
HS-6 @ 1-5 ft	Silty Sand	27
HS-8 @ 5 ft	Sand with Silt	6
I-3 @ 1-5 ft	Silty Sand with Gravel	17
*HS-4 @ 5 ft	Silty Sand	29
*HS-8 @ 10 ft	Sandy Silt	65

*testing from LGC Geotechnical (2017)

APPENDIX C

Laboratory Test Results (Continued)

Atterberg Limits: The liquid and plastic limits ("Atterberg Limits") were determined per ASTM D4318 for engineering classification of fine-grained material and presented in the table below. The USCS soil classification indicated in the table below is based on the portion of sample passing the No. 40 sieve and may not necessarily be representative of the entire sample. The plots are provided in this Appendix.

Sample Location	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index (%)	USCS Soil Classification
HS-2 @ 7.5 ft	33	19	14	CL
HS-7 @ 7.5 ft	NP	NP	NP	ML

Consolidation: Two consolidation tests were performed per ASTM D2435. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and increasing loads were applied. The samples were allowed to consolidate under "double drainage" and total deformation for each loading step were recorded. The percent consolidation for each load step was recorded as the ratio of the amount of vertical compression to the original sample height. The consolidation pressure curves are provided in this Appendix.

Collapse/Swell Potential: Five collapse tests were performed per ASTM D4546. Samples (2.4 inches in diameter and 1-inch in height) were placed in a consolidometer and loaded to their approximate in-situ effective stress. The curves are presented in this Appendix.

Direct Shear: Two direct shear test were performed, one on a driven sample and one on a 90% relative compaction remolded sample. The ring samples were soaked for a minimum of 24 hours prior to testing. The samples were tested under various normal loads using a motor-driven, strain-controlled, direct-shear testing apparatus (ASTM D3080). The plots are provided in this Appendix.

APPENDIX C

Laboratory Test Results (Continued)

Maximum Density Tests: The maximum dry density and optimum moisture content of typical materials were determined in accordance with ASTM D1557. The results of these tests are presented in the table below:

Sample Location	Sample Description	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-2 @ 1-5 ft	Brown Silty Sand	112.5	7.5
HS-6 @ 1-5 ft	Olive brown Silty Sand	120.0	10.5
*HS-4 @ 2.5-5 ft	Light olive brown Silty Sand	118.5	9.0

*testing from LGC Geotechnical (2017)

Expansion Index: The expansion potential of selected representative samples was evaluated by the Expansion Index Test per ASTM D4829.

Sample Location	Expansion Index	Expansion Potential*
HS-2 @ 1-5 ft	0	Very Low
HS-6 @ 1-5 ft	3	Very Low
I-3 @ 1-5 ft	0	Very Low
*HS-4 @ 2.5-5 ft	1	Very Low
*HS-6 @ 2.5-5 ft	0	Very Low

*testing from LGC Geotechnical (2017)

R-value Test: R-value test was performed in general accordance with California Test Method 301. The plot is included in the Appendix.

Sample Location	R-value
HS-5 @ 1-5 ft	65

Soluble Sulfates: The soluble sulfate content of select samples was determined by standard geochemical methods (CTM 417). The test results are presented in the table below.

Sample Location	Sulfate Content, %
HS-2 @ 1-5 ft	<0.01%
HS-6 @ 1-5 ft	<0.01%
I-3 @ 1-5 ft	<0.03%
*HS-4 @ 2.5-5 ft	<0.02%

*testing from LGC Geotechnical (2017)

Chloride Content: Chloride content was tested per CTM 422. The results are presented below.

Sample Location	Chloride Content, ppm
HS-2 @ 1-5 ft	50
HS-6 @ 1-5 ft	260
I-3 @ 1-5 ft	110
*HS-4 @ 2.5-5 ft	104

*testing from LGC Geotechnical (2017)

Minimum Resistivity and pH Tests: Minimum resistivity and pH tests were performed in general accordance with CTM 643 and standard geochemical methods. The results are presented in the table below.

Sample Location	pH	Minimum Resistivity (ohms-cm)
HS-2 @ 1-5 ft	8.73	5798
HS-6 @ 1-5 ft	8.08	1600
I-3 @ 1-5 ft	8.57	4650
*HS-4 @ 2.5-5 ft	6.33	737

*testing from LGC Geotechnical (2017)

Organic Matter Content of Soils: Organic matter content tests were performed in general accordance with ASTM D 2974 (Test Methods A & C). The results are presented in Table 9.

Infiltration Test Data Sheet

LGC Geotechnical, Inc
131 Calle Iglesia Suite 200, San Clemente, CA 92672 tel. (949) 369-6141

Project Name: Richland- MCBC
Project Number: 20220-01
Date: 12/21/2020
Boring Number: I-1

Test hole dimensions (if circular)	
Boring Depth (feet)*:	18
Boring Diameter (inches):	8
Pipe Diameter (inches):	3

*measured at time of test

Test pit dimensions (if rectangular)	
Pit Depth (feet):	
Pit Length (feet):	
Pit Breadth (feet):	

*Pre-Test (Sandy Soil Criteria)**

Trial No.	Start Time (24:HR)	Stop Time (24:HR)	Time Interval (min)	Initial Depth to Water (feet)	Final Depth to Water (feet)	Total Change in Water Level (feet)	Greater Than or Equal to 0.5 feet (yes/no)
1	9:30	9:55	25.0	16.20	17.82	1.62	Yes
2	10:00	10:25	25.0	16.32	17.85	1.53	Yes

*If two consecutive measurements show that six inches of water seeps away in less than 25 minutes, the test shall be run for an additional hour with measurements taken every 10 minutes. Otherwise, pre-soak (fill) overnight, and then obtain at least twelve measurements per hole over at least six hours (approximately 30 minute intervals) with a precision of at least 0.25 inches

Main Test Data

Trial No.	Start Time (24:HR)	Stop Time (24:HR)	Time Interval, Δt (min)	Initial Depth to Water, D_o (feet)	Final Depth to Water, D_f (feet)	Change in Water Level, ΔD (feet)	Calculated Infiltration Rate(in/hr)
1	1:50	2:00	10.0	15.04	16.71	1.67	8.7
2	2:02	2:12	10.0	14.89	16.64	1.75	8.7

Appendix J
General Earthwork and Grading Specifications for Rough Grading

General Earthwork and Grading Specifications for Rough Grading

1.0 General

1.1 Intent

These General Earthwork and Grading Specifications are for the grading and earthwork shown on the approved grading plan(s) and/or indicated in the geotechnical report(s). These Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the specific recommendations in the geotechnical report shall supersede these more general Specifications. Observations of the earthwork by the project Geotechnical Consultant during the course of grading may result in new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

1.2 The Geotechnical Consultant of Record

Prior to commencement of work, the owner shall employ a qualified Geotechnical Consultant of Record (Geotechnical Consultant). The Geotechnical Consultant shall be responsible for reviewing the approved geotechnical report(s) and accepting the adequacy of the preliminary geotechnical findings, conclusions, and recommendations prior to the commencement of the grading.

Prior to commencement of grading, the Geotechnical Consultant shall review the "work plan" prepared by the Earthwork Contractor (Contractor) and schedule sufficient personnel to perform the appropriate level of observation, mapping, and compaction testing.

During the grading and earthwork operations, the Geotechnical Consultant shall observe, map, and document the subsurface exposures to verify the geotechnical design assumptions. If the observed conditions are found to be significantly different than the interpreted assumptions during the design phase, the Geotechnical Consultant shall inform the owner, recommend appropriate changes in design to accommodate the observed conditions, and notify the review agency where required.

The Geotechnical Consultant shall observe the moisture-conditioning and processing of the subgrade and fill materials and perform relative compaction testing of fill to confirm that the attained level of compaction is being accomplished as specified. The Geotechnical Consultant shall provide the test results to the owner and the Contractor on a routine and frequent basis.

1.3 The Earthwork Contractor

The Earthwork Contractor (Contractor) shall be qualified, experienced, and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing the grading in accordance with the project plans and specifications. The Contractor shall prepare and submit to the owner and the Geotechnical Consultant a work plan that indicates the sequence of earthwork grading, the number of “equipment” of work and the estimated quantities of daily earthwork

contemplated for the site prior to commencement of grading. The Contractor shall inform the owner and the
Geotechnical Consultant of changes in work schedules and updates to the work plan at least 24 hours in advance of such changes so that appropriate personnel will be available for observation and testing. The Contractor shall not assume that the Geotechnical Consultant is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish the earthwork in accordance with the applicable grading codes and agency ordinances, these Specifications, and the recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of the Geotechnical Consultant, unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, insufficient buttress key size, adverse weather, etc., are resulting in a quality of work less than required in these specifications, the Geotechnical Consultant shall reject the work and may recommend to the owner that construction be stopped until the conditions are rectified. It is the contractor's sole responsibility to provide proper fill compaction.

2.0 Preparation of Areas to be Filled

2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots, and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies, and the Geotechnical Consultant.

The Geotechnical Consultant shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 1 percent of organic materials (by volume). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area.

As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed. The contractor is responsible for all hazardous waste relating to his work. The Geotechnical Consultant does not have expertise in this area. If hazardous waste is a concern, then the Client should acquire the services of a qualified environmental assessor.

2.2 Processing

Existing ground that has been declared satisfactory for support of fill by the Geotechnical Consultant shall be scarified to a minimum depth of 6 inches. Existing ground that is not satisfactory shall be over-excavated as specified in the following section. Scarification shall continue until soils are broken down and free of oversize material and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

2.3 Over-excavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by the Geotechnical Consultant during grading.

2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), the ground shall be stepped or benched. Please see the Standard Details for a graphic illustration. The lowest bench or key shall be a minimum of 15 feet wide and at least 2 feet deep, into competent material as evaluated by the Geotechnical Consultant. Other benches shall be excavated a minimum height of 4 feet into competent material or as otherwise recommended by the Geotechnical Consultant. Fill placed on ground sloping flatter than 5:1 shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by the Geotechnical Consultant as suitable to receive fill. The Contractor shall obtain a written acceptance from the Geotechnical Consultant prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys, and benches.

3.0 Fill Material

3.1 General

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by the Geotechnical Consultant prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to the Geotechnical Consultant or mixed with other soils to achieve satisfactory fill material.

3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 8 inches, shall not be buried or placed in fill unless location, materials, and placement methods are specifically accepted by the Geotechnical Consultant. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 vertical feet of finish grade or within 2 feet of future utilities or underground construction.

3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of the geotechnical consultant. The potential import source shall be given to the Geotechnical Consultant at least 48 hours (2 working days) before importing begins so that its suitability can be determined and appropriate tests performed.

4.0 Fill Placement and Compaction

4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill (per Section 3.0) in near-horizontal layers not exceeding 8 inches in loose thickness. The Geotechnical Consultant may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended, and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM Test Method D1557).

4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, it shall be uniformly compacted to not less than 90 percent of maximum dry density (ASTM Test Method D1557). Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by backrolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet in fill elevation, or by other methods producing satisfactory results acceptable to the Geotechnical Consultant. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of maximum density per ASTM Test Method D1557.

4.5 Compaction Testing

Field tests for moisture content and relative compaction of the fill soils shall be performed by the Geotechnical Consultant. Location and frequency of tests shall be at the Consultant's discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

4.6 Frequency of Compaction Testing

Tests shall be taken at intervals not exceeding 2 feet in vertical rise and/or 1,000 cubic yards of compacted fill soils embankment. In addition, as a guideline, at least one test shall be taken on slope faces for each 5,000 square feet of slope face and/or each 10 feet of vertical height of slope. The Contractor shall assure that fill construction is such that the testing schedule can be accomplished by the Geotechnical Consultant. The Contractor shall stop or slow down the earthwork construction if these minimum standards are not met.

4.7 Compaction Test Locations

The Geotechnical Consultant shall document the approximate elevation and horizontal coordinates of each test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that the Geotechnical Consultant can determine the test locations with sufficient accuracy. At a minimum, two grade stakes within a horizontal distance of 100 feet and vertically less than
5 feet apart from potential test locations shall be provided.

5.0 Subdrain Installation

Subdrain systems shall be installed in accordance with the approved geotechnical report(s), the grading plan, and the Standard Details. The Geotechnical Consultant may recommend additional subdrains and/or changes in subdrain extent, location, grade, or material depending on conditions encountered during grading. All subdrains shall be surveyed by a land surveyor/civil engineer for line and grade after installation and prior to burial. Sufficient time should be allowed by the Contractor for these surveys.

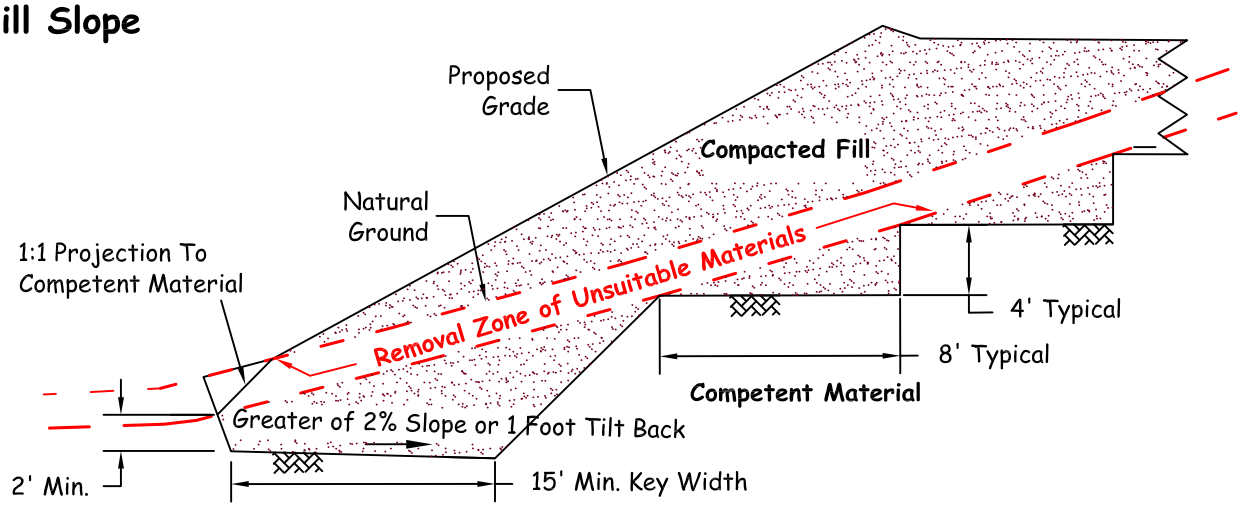
6.0 Excavation

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by the Geotechnical Consultant during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by the Geotechnical Consultant based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, evaluated, and accepted by the Geotechnical Consultant prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by the Geotechnical Consultant.

7.0 Trench Backfills

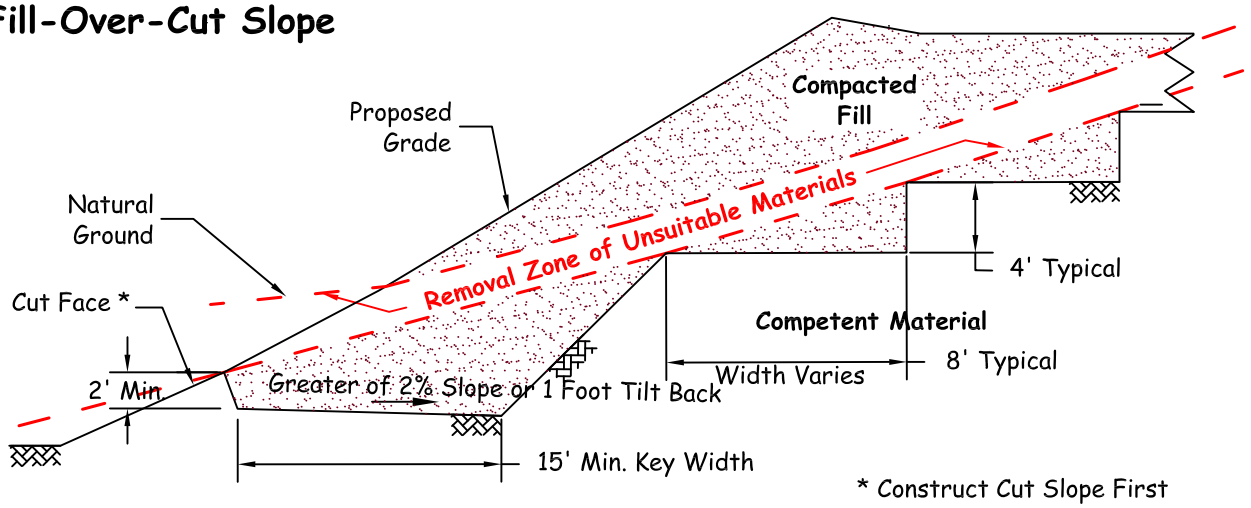
7.1 The Contractor shall follow all OHSA and Cal/OSHA requirements for safety of trench excavations.

7.2 All bedding and backfill of utility trenches shall be done in accordance with the applicable provisions of Standard Specifications of Public Works Construction. Bedding material shall have a Sand Equivalent greater than 30 (SE>30). The bedding shall be placed to 1 foot over



the top of the conduit and densified by jetting. Backfill shall be placed and densified to a minimum of 90 percent of maximum from 1 foot above the top of the conduit to the surface.

7.3 The jetting of the bedding around the conduits shall be observed by the Geotechnical Consultant.



7.4 The Geotechnical Consultant shall test the trench backfill for relative compaction. At least one test should be made for every 300 feet of trench and 2 feet of fill.

7.5 Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to the Geotechnical Consultant that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method.

1.0 INTRODUCTION

The Rich-Haven Specific Plan was approved by the City of Ontario in 2015, with subsequent Specific Plan Amendments approved in 2016, 2018 and 2021. The current project, The Rich Haven 2022 Specific Plan Amendment Project development concept permits a maximum of 7,194 dwelling units (all residential types), a maximum of 990,902 square feet of commercial/office space, a maximum of 1,183,525 square feet of light industrial uses, 27 acres of public parkland, and approximately 20 acres of Southern California Edison (SCE) Parcel open space and SCE Easements.

The Rich Haven 2022 Specific Plan Amendment Project site is located in the City of Ontario, San Bernardino County, California (Figure 1). The site is approximately 590 acres located west of Interstate 15 (I-15), and south of State Route 60 (SR-60). Specifically, the site is east of Haven Avenue, south of East Riverside Drive, west of the SCE Mira Loma Substation and Hamner Avenue and north of Edison Avenue (Figures 2 and 3). The site is within NW, SW and SE Section 12 and NW and NE Section 13 of Township 2 South and Range 7 West of the Guasti, California, United States Geological Survey (USGS) 7.5-minute topographic quadrangle (Figure 1).

A site assessment and biological surveys were conducted at the site at the request of Applied Planning. The surveys conducted in late winter/spring 2022 included all of the project site; and consisted of;

- a general biological assessment,
- general plant and wildlife surveys,
- vegetation mapping,
- habitat assessment for assessing potential for special status plant species[1],
- habitat assessment for assessing potential for special status wildlife species[2],
- general assessment for Corps Waters/wetlands and CDFW streambeds.

Focused surveys for threatened, endangered and sensitive plant or wildlife species were not conducted as part of this assessment.

The entire Rich Haven 2022 Specific Plan Amendment Project site consists of approximately 590 acres of existing residential development, roads, disturbed areas, former agricultural areas and agricultural land located within the built-up city limits. The site has a history of disturbance and agricultural use, and has been extensively altered, with the entire area having been cleared, leveled, or otherwise reshaped at some point, which is evident from conditions on the site, and from comparing satellite imagery of the project site over the last several decades. No discernible natural hills, rock formations,

[1] Special status plant species = federal or state listed threatened or endangered species, or proposed endangered, threatened or candidate species, California Native Plant Society Species List (CNPS list 1-4), or otherwise sensitive species.

[2] Special status wildlife species = federal or state listed threatened or endangered species, or proposed endangered, threatened or candidate species, or otherwise sensitive species.

natural drainages or water courses remain at the site. Disking occurs regularly on portions not currently in active agricultural use. Earth movement and stockpiling of soils occurred in portions of the site.

The site slopes gently from north to southeast and topography varies from an elevation of approximately 716 feet above msl along the southeastern boundary to 795 feet above msl along the northern boundary of the site (Exhibit 3).

The site has a Mediterranean type climate, with hot dry summers, relatively cool winters and sparse rains. Annual precipitation for the region averages 13.3 inches, and average annual temperature ranges from 50^0 to 79^0 F. Rainfall during the 2021/2022 season was below normal throughout southern California (Appendix A).

2.0 METHODS

2.1 Biological Resources Information sources

In addition to the site visit, field surveys, vegetation mapping, wildlife inventories, and habitat assessments information on the biological resources of the project site was obtained by reviewing existing available data. Databases such as the California Natural Diversity Database (CNDDB 2022) and California Native Plant Society's Inventory of Rare and Endangered Vascular Plants of California (Tibor 2001) were reviewed regarding the potential occurrence of any special status species or sensitive habitat within or in close proximity of the project site.

Biological surveys conducted for the Rich Haven Specific Plan (Draft EIR, SCH Number 2006051081), City of Ontario 2007, were examined as a part of this review.

The resources used in this thorough archival review included the following;

- California Natural Diversity Data Base (CNDDB) for the USGS 7.5' quadrangle which comprised the study area: Guasti and neighboring quads for pertinent data,
- California Native Plant Society Inventory of rare and endangered vascular plants of California (Tibor 2001; CNPS On-line Inventory),
- Special Animals (including California Species of Special Concern), CDFW, Natural Heritage Division, January 2022,
- Special Vascular Plants, Bryophytes, and Lichens List, CDFW, Natural Heritage Division, January 2022,
- State and Federally Listed Endangered, Threatened and Rare Plants of California, CDFW, Natural Heritage Division, January 2022,
- State and Federally Listed Endangered and Threatened Animals of California, CDFW, Natural Heritage Division, January 2022,
- Published literature (Chesser *et. al.* 2013, Sibley 2000, Small 1994, Moyle *et al.* 1995, Jennings and Hayes 1994, Stebbins 1985, Webster *et al.* 1980, Burt and Grossenheider 1976),
- Specific surveys conducted at the project site, including; general biological surveys (City of Ontario 2007), special status plant surveys (Bonterra Consulting, 2005), burrowing owl surveys (Bonterra Consulting, 2005, VCS Environmental, 2022), San Bernardino kangaroo rat, Los Angeles pocket mouse, northwestern San Diego pocket mouse and San Diego Desert woodrat habitat assessments (Bonterra Consulting, 2005), Delhi Sands flower-loving fly surveys (Bonterra Consulting, 2005, 2006) and delineation of jurisdictional waters (RBF Consulting, 2006).

2.2 Vegetation mapping, habitat assessment for special status plant species and general botanical surveys

Vegetation mapping, habitat assessments and general botanical surveys were conducted on 21 February, 1 March, 28 and 30 May and 7 June 2022 by Glen Morrison. Vegetation types within the project site were mapped according the state-wide A Manual of California Vegetation, Second Edition (Sawyer *et al.* 2009). This is the mapping system recognized and recommend by regulatory agencies. Vegetation was mapped to the association level by hand on an aerial photographic base map conducted while walking throughout the study area. A general plant species list was compiled concurrently with the vegetation mapping surveys (Appendix B). Scientific and common nomenclature in Hickman (1993) was used as the taxonomic resource. The equivalent vegetation community under the old Holland classification system (Holland 1986) was also noted. Ornamentally planted species, and species found only in gardened areas were not included in the species list and associated numerical calculations if they did not also occur in a wild-growing capacity in the areas noted as supporting substantial amounts of wild plant life.

The habitat assessment for special status plant species was conducted concurrently with the vegetation mapping, and concentrated on habitats with the highest potential for yielding special status species, although all areas of the project site were checked. Each habitat within the study area was traversed on foot, examining the areas for particular features such as seeps, unique geologic types, exposures, etc., that would indicate the presence of a preferred habitat for special status plant species. Methods followed the state guidelines for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

2.3 Wildlife surveys and habitat assessment for special status wildlife

Field surveys for wildlife and habitat assessment for special status wildlife species were conducted on 11 February, 10 and 24 March, 18 and 26 May, 2 and 26 June 2022 by Paul Galvin. All portions of the site were traversed on foot to survey each vegetation community, look for evidence of wildlife presence and conduct an assessment of potential habitat for special status species. Wildlife species were detected during the field surveys by sight, vocalizations, burrows, tracks, scat, scrapings and other sign. No specialized techniques, such as trapping, mist nets or taped calls, were used during the surveys.

Latin and common names of wildlife referred to in this report follow Powell and Hogue (1979), Hogue 1993 and NatureServe http://www.natureserve.org/explorer/) for invertebrates; NatureServe for fish; North American Herpetology (http://www.naherpetology.org/nameslist) for amphibians and reptiles; American Ornithologists' Union Checklist of North American Birds - for birds; Baker at al. 2003 for mammals; and Grenfell et al. 2003, California Department of Fish and Game & California Interagency Wildlife Task Group

(http://www.dfg.ca.gov/whdab/pdfs/species_list.pdf) and Perrins et al. 1983 for common names.

2.4 Wetland Delineation

Although a formal wetland delineation was not conducted, the project area was checked in the field for the presence of streambeds, definable channels, wetland and riparian vegetation and hydric soils. All areas of topographic relief suspected of representing historic or current drainage patterns were inspected on-foot.

Field visits were conducted on 11 February, 10 March, 18 and 26 May, 2022 by Paul Galvin.

3.0 RESULTS

3.1 Soils

Historically, the soils on the study area are from the Delhi association and are nearly level to strongly sloping, somewhat excessively drained, very deep soils on alluvial fans in coarse-textured, wind-re-formed granitic material (NRCS Soil Survey 2022, Woodruff 1980).

The site has a history of agricultural use, and site soils have been extensively altered and amended over time. So current soils have been significantly altered compared with historic conditions. The following soils are mapped as occurring within the project area:

Delhi fine sand (Db)
This nearly level to strongly sloping soil is on alluvial fans that have been reworked by wind action. Typically the upper 40 inches consist of pale-brown (10YR 6/3) sand and fine sand, single grained, loose when dry. This soil is used for grapes, pasture plants, alfalfa and some citrus.

Hanford coarse sandy loam, 2 to 8 percent slopes (HcC)
This soil consists of well-drained and somewhat excessively drained soil on alluvial fans, and is derived from granitic materials. The upper 18 inches consist of grayish-brown (10YR 5/2) and very dark grayish brown (10YR 3/2) coarse sandy loam. This soil is used for irrigated citrus, truck crops, grapes, dryland grain, pasture and non-farm purposes.

Hilmar loamy fine sand (Hr)
Hilmar loamy fine sand consists of moderately well-drained drained, nearly level to gently sloping soils that formed in alluvium from granitic sources. They occur on alluvial fans. Surface soils are light grayish-brown (2.5Y 5/2) when dry, dark grayish brown (2.5Y 4/2) when moist; sandy loam. Vegetation is mostly annual forbs and grasses. Soils may be used for dryland crops and pasture.

Tujunga loamy sand, 0 to 5 percent slopes (TuB)
This gently to moderately sloping soil occurs on alluvial fans and on flood plains. This soil developed in alluvium predominantly from granitic materials. The upper 36 inches consist of light-gray (10YR 6/1), gray (10YR 5/1) when moist, loamy sand. This soil is used for dryland grain, pasture, range and, if protected from flooding, for irrigated truck crops.

3.2 Vegetation communities

The Rich Haven 2022 Specific Plan Amendment Project site has been significantly impacted due to years of disking, dumping, disturbance and agriculture (Photographs 1 through 10, Appendix E). Currently the site contains one vegetation community and three additional land types; Ruderal grassland, agriculture, disturbed and developed. Vegetation types within the project site were mapped according the state-wide A Manual of California Vegetation (Sawyer *et al.* 2009) to the extent possible. Since this system focuses on native vegetation communities many disturbed and man-made land covers do not fit cleanly into the system. The best fit possible was made to map and classify the onsite vegetation. The equivalent vegetation community under the old Holland classification system (Holland 1986) is also noted. Dirt roads and disturbed areas were mapped as the vegetation community which they occur.

Ruderal grassland
Ruderal is a low to medium growing herbaceous vegetation type dominated by annual grasses and forbs of Mediterranean origin. It is a type of non-native grassland community, mapped under the semi-natural herbaceous stands by Sawyer *et al.* (2009). Ruderal communities occurred in areas that were recently and frequently disturbed. Holland (1986) classified this habitat type as non-native grasslands.

On the project site, the ruderal grassland is associated with areas of recent disking, old agriculture and frequent disturbances. The dominant species varied across this area, but the most abundant species were Menzies' fiddleneck (*Amsinckia menziesii*), wall barley (*Hordeum murinum*), common red sage (*Kochia scoparia*) and London rocket (*Sisymbrium irio*). Other species present included redstem filaree (*Erodium cicutarium*), cheeseweed (*Malva parviflora*), stinknet (*Oncosiphon piluliferum*) and summer mustard (*Hirschfeldia incana*).

Native species Spencer primrose (*Camissoniopsis micrantha*), bush sunflower (*Encelia californica*) and California buckwheat (*Eriogonum fasciculatum*) occurred at a few locations.

Within the areas mapped as ruderal grassland were a few Goodding's black willow (*Salix gooddingii*), Spanish false fleabane (*Pulicaria paludosa*), southern cattail (*Typha domingensis*) and fragrant flatsedge (*Cyperus odoratus*) that occurred in the old ponds and wet areas associated with former agriculture practices.

A total of 179.7 acres of Ruderal grassland occurred in the project site (Figure 5).

Agriculture
The agricultural areas can include irrigated row crops, exotic trees, fields not in current use, recently disked fields and glass-houses, in addition to sheds, temporary dwellings and other structures.

On the project site agriculture included dairy areas (with associated buildings and structures) and irrigated fields (that were very strongly dominated by wall barley). There were some old ponds and wet areas associated with agriculture practices. Within this area there were also dirt piles, disturbed areas devoid of vegetation and access roads.

A total of 171.5 acres of Agriculture occurred onsite (Table 1; Figure 5).

Disturbed

Disturbed areas include recently and frequently disked or graded areas lacking vegetation. On the project site, the disturbed areas consisted of former agriculture areas and open areas that are devoid of vegetation. Within this area there were also dirt moving operations, stock-piling of soil and recently graded areas.

A total of 110.1 acres of disturbed occurred onsite (Table 1; Figure 5).

Developed

A significant portion of the site has been developed and was in active use by the residents of the properties onsite. The developed areas are a mixture of residential structures, associated parks and roads. Also included is an area in the southern portion that is under active development for new homes.

A total of 129.2 acres of developed occurred onsite (Table 1; Figure 5).

Table 1: Vegetation communities/Land cover types at the Rich Haven 2022 Specific Plan Amendment project site.

Vegetation communities/Land Cover Type	**PROJECT SITE**
Ruderal grassland	179.7
Agricultural	171.5
Disturbed	110.1
Developed	129.2
Site total	**590.5**

3.3 Plant Inventory

Plant species at the Rich Haven 2022 Specific Plan Amendment Project site consisted of species associated with open and disturbed habitats. A total of 68 vascular plant species, representing 31 families were detected at the project site during the current surveys (Appendix B). About 37% (25) were native and the remaining 43 species were exotic or planted. The best represented family was Asteraceae (12 species).

3.4 Special Status Plant Species

There are no historic site records for any special status plant species onsite (CNDDB 2022). Based on a review of CNDDB, the CNPS Inventory of Rare and Endangered Vascular Plants of California (Tibor 2001, CNPS 2022), and field surveys, a few special status species were identified for additional analysis, although none are expected to occur onsite (Table 1).

No special-status plants were observed on the Rich Haven 2022 Specific Plan Amendment Project site during the 2022 site surveys. Due to the extensive historical, and ongoing human land use on the project site, and the alteration of land features (rocky outcrops, hillsides, creeks, drainages etc) that would typically provide refuge for rare plants and threatened plants amidst human activity, it is exceedingly unlikely that any special status plants could occur on the project site. Furthermore, the lack of any native-dominated plant cover, which would be the typical habitat for any potentially rare species in this area, suggests this is rather unlikely, as well.

In addition, focused surveys for special status plant species were conducted at the site in 2005 (Bonterra Consulting, 2005), and special status plant species were determined to be absent from the site.

Figure 4: Soils at the Rich Haven 2022 Specific Plan Amendment Project site. Source: NRCS Soil Survey 2022.

Figure 5: Vegetation map of Rich Haven 2022 Specific Plan Amendment Project site (in red). Source: Google Earth, Inc.

Table 2: Special status plant species that occurred or have the potential to occur in the Rich Haven 2022 Specific Plan Amendment Project site: Definitions - status: Fed = federal, FE = federal endangered, FT = federal threatened, FPE = federally proposed for listing as endangered, FPT = federally proposed for listing as threatened, FC = federal candidate species, FSC = federal special concern species, state = state of California, SE = state endangered, ST = state threatened, SCE = state candidate for listing as endangered, SCT = state candidate for listing as threatened, SC = state species of concern, FP = fully protected species, none = no federal or state listing, see Appendix C for CNPS Status. Occurrence onsite: Occurs = known to occur onsite, Unlikely = could occur due to presence of suitable habitat onsite but not detected during current survey, Not Expected = does not occur due to limited suitable habitat onsite and not detected.

Scientific Name	Common Name	Status	Occurrence Onsite	Habitat
Abronia villosa var. aurita *NYCTAGINACEAE*	Chaparral sand-verbena	Fed: None State: None CNPS 1B.1	Unlikely	Annual herb occurs on sandy soils in desert dunes, coastal scrub and chaparral. Blooms from January-September from 80-1600 meters.
Ambrosia pumila *ASTERACEAE*	San Diego ambrosia	Fed: none State: none CNPS: 1B.1	Unlikely	Dry sunny sites, grasslands, disturbed areas, <500ft, blooms June-September.
Centromadia pungens ssp. laevis ASTERACEAE	Smooth tarplant	Fed: None State: None CNPS 1B.1	Unlikely	Chenopod scrub, meadows and seeps, playas, riparian woodland, valley and foothill grassland
Chorizanthe parryi var. parryi POLYGONACEAE	Parry's spineflower	Fed: None State: None CNPS 1B.1	Unlikely	Coastal scrub and chaparral in open gravelly or sandy areas. Blooms from April-June from 40-1075 meters.
Deinandra paniculata ASTERACEAE	San Diego tarweed	Fed: None State: None CNPS 4.2	Unlikely	Valley and foothill grassland, coastal scrub, typically in non-wetlands
Dodecahema leptoceras *POLYGONACEAE*	Slender horned spine flower	Fed: FE State: SE CNPS: 1B.1	Unlikely	Sandy places in sage scrub, grassland. Blooms from April-June from 200-760 meters.
Horkelia cuneata ssp. puberula ROSACEAE	Mesa horkelia	Fed: None State: None CNPS: 1B.1	Unlikely	Perennial herb found in dry sandy soils in the outer coast ranges in chaparral, coastal scrub, and cismontane woodland. Blooms from February through July from 70-810 meters.
Mucronea californica	California spineflower	Fed: None	Unlikely	Coastal strand, chaparral, foothill woodland, northern

Scientific Name	Common Name	Status	Occurrence Onsite	Habitat
POLYGONACEAE		State: None CNPS: 4.2		coastal scrub, coastal sage scrub, valley grassland/dunes and coastal/annual herb/0-1,000m/March-July
Phacelia stellaris HYDROPHYLLACEAE	Brad's phacelia	Fed: None State: None CNPS 1B.1	Unlikely	Coastal scrub and dunes in open sandy areas. Blooms from spring.
Pseudognaphalium leucocephalum ASTERACEAE	White rabbit-tobacco	Fed: None State: None CNPS 2B.2	Unlikely	Coastal scrub, chaparral, cismontane woodland, riparian woodland, sandy, gravelly soil. Blooms from July – December.
Symphyotrichum defoliatum ASTERACEAE	San Bernardino aster	Fed: None State: None CNPS 1B.2	Unlikely	Grassland and meadow habitat near water and in disturbed areas.

3.5 Wetlands and streambeds

A formal jurisdictional delineation was not conducted onsite; however a general assessment of onsite drainage features was conducted as part of the biological assessment.

The site does not contain any lakes, rivers, creeks, streambeds, wetlands, vernal pools, temporary rain pools or riparian areas. There are no areas onsite that are subject to the jurisdiction to the US Army Corps of Engineers, the California Department of Fish and Wildlife or Regional Water Quality Control Board.

Some wet areas, shallow temporary ponds and earthen detention basins did occur within the old and existing agricultural areas. These were all man-made and associated with agricultural activities. They were not associated with any natural drainages, creeks or wetlands and are not subject to the jurisdiction to the US Army Corps of Engineers, the California Department of Fish and Wildlife or Regional Water Quality Control Board.

A formal jurisdictional delineation conducted in 2006 (RBF Consulting, 2006) found no areas of the site subject to the jurisdiction to the US Army Corps of Engineers, the California Department of Fish and Wildlife or Regional Water Quality Control Board.

3.6 Wildlife overview

Wildlife at the study area consisted of common species and species associated with open, disturbed habitats. The most abundant species detected during the site visit were birds such as European starling (*Sturnus vulgaris*), white-crowned sparrow (*Zonotrichia leucophrys*), mourning dove (*Zenaida macroura*) and house finch (*Carpodacus mexicanus*). A total of 39 wildlife species were detected during the site visits, including three reptile, 32 bird and four mammalian species (Appendix D).

3.7 Special status wildlife species

Three special-status wildlife species; California horned lark (*Eremophila alpestris actia*), loggerhead shrike (*Lanius ludovicianus*) and San Diego black-tailed jackrabbit (*Lepus californicus bennettii*); were observed on the Rich Haven 2022 Specific Plan Amendment Project site during the 2022 site surveys. Based on a review of CNDDB (2022), published literature and field surveys and assessments, a number of special status wildlife species were identified as potentially occurring onsite, including some species with historic records from the project vicinity (Table 3). All special status wildlife species with some potential to occur onsite are addressed in Table 3. The three special status species detected and two additional special status species; Delhi Sands Flower-Loving Fly (*Rhaphiomidas terminatus abdominalis*) and burrowing owl (*Athene cunicularia*) are additionally discussed below.

California horned lark (*Eremophila alpestris actia*)
California horned larks occur in open areas with little or no ground cover, such as grassland or ruderal vegetation and disturbed areas within scrub habitats. A few California horned larks were observed foraging along dirt roads onsite several times in spring 2022. No horned larks were detected during subsequent site visits, indicating that the larks were non-breeding wintering or migrating individuals. No nesting onsite was detected.

Loggerhead shrike (*Lanius ludovicianus*)
Loggerhead shrikes occur in grassland, scrub and other open habitats with perching structures. Nests are placed in trees and shrubs. Two loggerhead shrikes were observed foraging onsite during the February site visit. No loggerhead shrikes were detected during subsequent site visits, indicating that the shrikes were non-breeding wintering or migrating individuals. No nesting onsite is expected.

San Diego black-tailed jackrabbit (*Lepus californicus bennettii*)
San Diego black-tailed jackrabbit occurs along the coastal side of the southern California mountain ranges. It primarily occurs in open grasslands, agricultural fields and sparse coastal scrub. Nests under bushes or shrubs that have shallow depressions. Two San Diego black-tailed jackrabbit were observed foraging onsite during the February site visit.

Delhi Sands Flower-Loving Fly (*Rhaphiomidas terminatus abdominalis*)
The federally endangered Delhi Sands Flower-Loving Fly is restricted to the Delhi Sands formation, on ancient inland sand dunes. The project site is located within the Ontario Recovery Unit of the Recovery Plan for Delhi Sands Flower-loving Fly (USFWS 1997). Historically, much of the project site supported Delhi fine sand, which is the soil type required for Delhi Sands Flower-Loving Fly occurrence.

However, the site has a history of agricultural use, and site soils have been extensively altered and amended over time. So current soils are significantly altered compared with historic conditions; and degraded from the perspective of supporting Delhi Sands Flower-Loving Fly.

Delhi Sands Flower-Loving Fly lay eggs in fine sand, where the larva develop over a 1-2 year period. Soil disturbances from agricultural and other activates likely kill the larva, which precludes the fly from these areas.

Delhi Sands Flower-Loving Fly require habitat with vegetation cover from absent (wind blow sand) to sparse (less than 50% vegetation cover). Suitable vegetation includes telegraph weed (*Heterotheca grandiflora*), California buckwheat (*Eriogonum fasciculatum*), California croton (*Croton californicus*), annual bur-sage (*Ambrosia acanthicarpa*) and other native or non-native species (USFWS 1997, 2008). All of these plant species are either absent from the site or present in very low numbers and site

vegetation is typically dense from non-native plant species (in most areas close to 100% vegetation cover).

Delhi Sands Flower-Loving Fly are unlikely to occur onsite for the following reason;

- Soils are significantly altered and degraded,
- Soil disturbances from agricultural and other activates likely kill any fly larva,
- Suitable native vegetation species are absent from the site, and,
- Site vegetation is generally too dense to support flies.

In addition, focused surveys for Delhi Sands flower-loving fly were conducted at the site in 2005 and 2006 (Bonterra Consulting, 2005 and 2006), and Delhi Sands flower-loving fly were determined to be absent from the site.

Burrowing owls (*Athene cunicularia*)

Burrowing owls (*Athene cunicularia*) occur in shortgrass prairies, grasslands, lowland scrub, agricultural lands (particularly rangelands), prairies, coastal dunes, desert floors, and some artificial, open areas as a yearlong resident. They require large open expanses of sparsely vegetated areas on gently rolling or level terrain with an abundance of active small mammal burrows. As a critical habitat feature, they require the use of rodent or other burrows for roosting and nesting cover. They can also use pipes, culverts, and nest boxes (USFWS 2003, Haug *et al.* 1993, Zeiner *et al.* 1990).

No burrowing owls or their sign were detected during the surveys and there was no evidence that any burrowing owls occur onsite. No onsite burrows showed any evidence of owl occupancy. Burrowing owls are presumed absent from the site.

Focused surveys for burrowing owl were conducted at the site in 2005 (Bonterra Consulting, 2005), and several owls were detected. However, owls no longer occur at these locations.

Focused surveys for burrowing owl were conducted over the northern portions of the site in 2022 (VCS Environmental, 2022). No burrowing owls or their sign were detected during the surveys and there was no evidence that any burrowing owls occur onsite.

3.8 Wildlife movement corridors and linkages

The terms “wildlife corridors” and “linkages” are based upon fundamental ecological concepts, but can be easily misinterpreted because: 1) universally accepted definitions of these terms have not been established; 2) each term can be interpreted using different time scales (i.e. daily, seasonal, annual and evolutionary) and spatial scales (i.e. microclimate, local, community, and landscape) which changes their meaning; 3) the areas and values change from species to species; and, 4) the understanding of how these processes work is on-going and conclusions are subject to revision. The following definitions are intended to provide a working understanding of corridors and linkages and

are summarized from several sources (SCWP 2003, USCA9D 1990, Barrett and Livermore 1983, Beier 1993).

Wildlife corridor - Wildlife corridors are areas which animals can use to move from one patch of suitable habitat to another. These areas would be expected to have the least habitat fragmentation relative to surroundings areas. A wildlife corridor establishes connectivity for animals to move, live, reproduce and respond to functional ecological processes during the course of a year to several years. The quality and functionality of a particular wildlife corridor varies from species to species.

Wildlife crossings are generally small, narrow wildlife corridors that allow wildlife to pass through an obstacle or barrier such as a roadway to reach another patch of habitat. Wildlife crossings are manmade and include culverts, drainage pipes, underpasses, tunnels, and, more recently, crossings created specifically for wildlife movement over or under highways.

Both wildlife crossings and wildlife corridors function to prevent habitat fragmentation that would result in the loss of species that require large contiguous expanses of unbroken habitat and/or that occur in low densities.

Linkages – Linkages are areas that provide for long term movement or interaction of wildlife to maintain natural evolutionary and ecological patterns. Linkages are fundamental for gene flow and large scale ecological processes. These areas are usually defined by the zones of "least resistance" for the genes of a given species to move or "flow" between core reserve populations.

No wildlife corridors or linkages are known at the Rich Haven 2022 Specific Plan Amendment Project site. The site is open but much of the project vicinity is already developed and it is unlikely that the site is of any significance to wildlife movement.

Table 3: Special status wildlife species that occurred or have the potential to occur in the Rich Haven 2022 Specific Plan Amendment Project site. Definitions - status: Fed = federal, FE = federal endangered, FT = federal threatened, FPE = federally proposed for listing as endangered, FPT = federally proposed for listing as threatened, FC = federal candidate species, FSC = federal special concern species, state = state of California, SE = state endangered, ST = state threatened, SCE = state candidate for listing as endangered, SCT = state candidate for listing as threatened, CSC = California species of special concern, FP = fully protected species, CNDDB = species listed under the states CNDDB program, none = no federal or state listing. Occurrence onsite: Occurs = known to occur onsite, Unlikely = could occur due to presence of suitable habitat onsite but not detected during current survey, Not Expected = does not occur due to limited suitable habitat onsite and not detected.

Scientific Name	Common Name	ESA/CESA Status	Other Status	Occurrence onsite	Habitat/comments
Invertebrates					
Rhaphiomidas terminatus abdominalis	Delhi Sands Flower-Loving Fly	Fed: FE State: None	CNDDB Ranked	Unlikely	Restricted to the Delhi Sands formation, on ancient inland sand dunes.
Amphibians					
Spea hammondii	Western spadefoot	ESA: None CESA: None	DFG: SSC	Not Expected, no pools present	grassland, open habitats with sandy or gravelly soil; temporary rainpools for breeding
Reptiles					
Phrynosoma blainvillii	coast horned lizard	ESA: None CESA: None	CDFW: SSC	Unlikely	sandy washes and open sandy areas within coastal sage scrub, grassland, chaparral, oak and riparian woodland
Aspidoscelis hyperytha	orange-throated whiptail	ESA: None CESA: None	CDFW: WL	Unlikely	open, sparsely covered land, often with well-drained sandy or loose soils in coastal sage scrub, grassland, chaparral, oak woodland and riparian habitats
Aspidoscelis tigris stejnegeri	coastal whiptail	ESA: None CESA: None	CDFW: SSC	Unlikely	Semiarid habitats with open sparsely vegetated areas, scrub, chaparral, grassland and woodland habitats
Anniella stebbinis	Southern California legless lizard	ESA: None CESA: None	CDFW: SSC	Unlikely	Sandy, loose loamy soils in chaparral, oak woodland, coastal sage scrub
Salvadora hexalepis virgultea	Coast patch-nosed snake	ESA: None CESA: None	CDFW: SSC	Unlikely	habitat generalist, associated with brushy or shrubby vegetation
Arizona elegans occidentalis	California glossy snake	ESA: None CESA: None	CDFW: SSC	Unlikely	arid scrub, rocky washes, grasslands, chaparral. Appears to prefer microhabitats of open areas and areas with soil loose enough for easy burrowing.
Birds					
Accipiter cooperi	Cooper's hawk	ESA: None CESA: None	CDFW: WL	Unlikely	mature forests, open woodlands, wood edges, river groves, riparian woodland

Accipiter striatus	sharp-shinned hawk	ESA: None CESA: None	CDFW: WL	Unlikely	wide variety of habitats used by wintering and migrating birds, but mostly associated with woodland and scrubland; breeds in mountains, does not breed in southern California
Aquila chrysaetos	golden eagle	ESA: None CESA: None	CDFW: SSC, FP FW: BCC	Unlikely	Open mountains, foothills, plains, open country
Buteo regalis	ferruginous hawk	ESA: None CESA: None	CDFW: WL FW: BCC	Unlikely	plains, prairies, grasslands, does not breed in southern California
Buteo swainsoni	Swainson's hawk	ESA: None CESA: None	FW: BCC	Unlikely	prairies, grasslands, more widespread in migration
Circus cyaneus	northern harrier	ESA: None CESA: None	CDFW: SSC	Unlikely	grassland, marshes, agricultural land, open areas in scrub and chaparral; ground or shrub nesting
Elanus leucurus	white-tailed kite	ESA: None CESA: None	CDFW: FP	Unlikely	forages in grasslands; nests and roosts in oak and riparian woodland
Falco columbarius	merlin	ESA: None CESA: None	CDFW: WL	Unlikely	nests in open woodlands, savanna, does not breed in southern California, woodlands, open areas in winter, migration
Falco mexicanus	prairie falcon	ESA: None CESA: None	CDFW: WL FW: BCC	Unlikely	open arid country, grasslands, more widespread in winter
Falco peregrinus anatum	American peregrine falcon	ESA: SE CESA: None	CDFW: FP FW: BCC	Unlikely	nest on cliffs or rock outcroppings, usually near water; forages over open country (grassland, scrub, marshes)
Asio flammeus	short-eared owl	ESA: None CESA: None	CDFW: SSC	Potential	grasslands, open habitats
Athene cunicularia	burrowing owl	ESA: None CESA: None	CDFW: SSC FW: BCC	Potential	grasslands, farmland and other open habitats
Lanius ludovicianus	loggerhead shrike	ESA: None CESA: None	CDFW: SSC	Occurs, non-breeding individuals	grassland, scrub and other open habitats with perching structures; nests in trees and shrubs
Eremophila alpestris actia	California horned lark	ESA: None CESA: None	CDFW: WL	Occurs, non-breeding individuals	Open areas with little or no ground cover, such as grassland or ruderal vegetation
Agelaius tricolor	Tricolored blackbird	ESA: None CESA: ST	CDFW: SSC FW: BCC	Unlikely	Highly social and gregarious bird forms large colonies, typically in marshes and agricultural areas
Mammals					

Lasiurus xanthinus	Western yellow bat	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	Usually occur in riparian, oak or pinyon-juniper woodland and urban areas, Roosts in trees
Antrozous pallidus	pallid bat	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	Coastal sage scrub, oak woodland and chaparral; roosts in caves, mines, rock crevices, trees and buildings
Macrotus californicus	California leaf-nosed bat	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	roosts in caves or old mines
Corynorhinus townsendii	Western big-eared bat	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	roosts in caves, old mines or buildings
Myotis thysanodes	fringed myotis	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	caves, old buildings
Myotis volans	long-legged myotis	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	buildings, pockets and crevices in rocks
Myotis yumanensis	Yuma myotis	ESA: None CESA: None	CDFW: SSC WBWG: LM	Unlikely	caves, tunnels and buildings in arid areas
Eumops perotis californicus	California mastiff bat	ESA: None CESA: None	CDFW: SSC WBWG: H	Unlikely	widespread forager; roosts in cliffs and buildings
Chaetodipus fallax fallax	Northwestern San Diego pocket Mouse	ESA: None CESA: None	CDFW: SSC	Unlikely	occurs in open scrub and grassland areas, in the valleys and foothills
Onychomys torridus ramona	southern grasshopper mouse	ESA: None CESA: None	CDFW: SSC	Unlikely	annual grassland and coastal sage scrub
Perognathus longimembris brevinasus	Los Angeles little pocket mouse	ESA: None CESA: None	DFG: CSC CNDDB Ranked	Unlikely	occurs in lower elevation scrub and grassland with open ground and fine, sandy soil
Neotoma lepida intermedia	San Diego desert woodrat	Fed: none State: none	CDFW: SSC	Unlikely	cactus patches and rock outcroppings in coastal sage scrub
Lepus californicus bennettii	San Diego black-tailed jackrabbit	ESA: None CESA: None	CDFW: SSC	Occurs	coastal sage scrub, grassland and chaparral
Taxidea taxus	American badger	ESA: None CESA: None	CDFW: SSC	Unlikely	widespread in natural habitats

4.0 BIOLOGICAL CONSTRAINTS

There are a number of potential biological constraints at Rich Haven 2022 Specific Plan Amendment Project site. Any significant impacts to these biological constraints that would result from the proposed project would require appropriate mitigation.

Significance of impacts to biological resources are assessed using impact significance threshold criteria, which reflect the policy statement contained in California Environmental Quality Act (CEQA), Section 21001(c) of the California Public Resources Code. Accordingly, the State Legislature has established the following policy of the State of California:

> *Prevent the elimination of fish or wildlife species due to man's activities, ensure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities..*

Determining whether a project may have a significant effect, or impact, plays a critical role in the CEQA process. According to the CEQA Guidelines, (Section 15064.7, Thresholds of Significance), each public agency is encouraged to develop and adopt (by ordinance, resolution, rule, or regulation) thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant. In the development of thresholds of significance for impacts to biological resources CEQA Guidelines provides guidance primarily in Section 15065, Mandatory Findings of Significance, and the CEQA Guidelines, Appendix G, Environmental Checklist Form. Section 15065(a) states that a project may have a significant effect where:

> *The project has the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or wildlife community, reduce the number or restrict the range of an endangered, rare, or threatened species, ..*

Therefore, impacts to biological resources are considered potentially significant (before considering offsetting mitigation measures) if one or more of the following criteria discussed below would result from implementation of the proposed project;

> Appendix G of the State CEQA Guidelines indicate that a project may be deemed to have a significant effect on the biological resources if the project is likely to:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

4.1 List of the potential biological constraints at the Rich Haven 2022 Specific Plan Amendment Project site

1. Nesting birds,
2. Special status wildlife species present onsite; California horned lark, loggerhead shrike and San Diego Black-tailed jackrabbit.
    a. California horned lark is not federally or state listed as threatened or endangered. It is listed as a state Species of Special Concern (SSC) in California. Although listed as a SSC, the California horned lark is considered widespread and relatively common throughout coastal southern California. It primarily occurs in open grasslands, agricultural fields and sparsely vegetated areas. These habitats are still relatively common in southern California. Due to the presence of suitable habitat throughout southern California and the fact that larks are relatively widespread and common, impacts of the project on the California horned lark would not be considered significant. Potential nesting California horned larks would be protected by Mitigation Measure 1.
    b. Loggerhead shrike is not federally or state listed as threatened or endangered. It is listed as a state Species of Special Concern (SSC) in California. Although listed as a SSC, the loggerhead shrike is considered widespread and relatively common throughout coastal southern California

during the non-breeding season. It primarily occurs in open grasslands, agricultural fields and sparse scrub habitats. These habitats are still relatively common in southern California. Due to the presence of suitable habitat throughout southern California and the fact that shrikes are relatively widespread and common, impacts of the project on the loggerhead shrike would not be considered significant. Potential nesting loggerhead shrikes would be protected by Mitigation Measure 1.

c. San Diego black-tailed jackrabbit is not federally or state listed as threatened or endangered. It is listed as a state Species of Special Concern (SSC) in California. Although listed as a SSC, the San Diego black-tailed jackrabbit is considered abundantly widespread and relatively common throughout coastal southern California. It primarily occurs in open grasslands, agricultural fields and sparse coastal scrub. These habitats are still relatively common in southern California. Due to the presence of suitable habitat throughout southern California and the fact that jackrabbits are relatively widespread and common, impacts of the project on the San Diego black-tailed jackrabbit would not be considered significant.

4.2 Permits and consultations likely required

As a result of these potential biological constraints, any proposed project at the Rich Haven 2022 Specific Plan Amendment Project would require the following permits/consultations/co-ordination;

California Environmental Quality Act (CEQA);
CEQA Document

Federal Migratory Bird Treaty Act of 1918 (MBTA);
The MBTA governs the taking and killing of migratory birds, their eggs, parts, and nests and prohibits the take of any migratory bird, their eggs, parts, and nests. No take of migratory birds is allowed under this act. Construction work must comply with the MBTA.

4.3 Recommended mitigation measures

1) *Avoidance of Nesting Migratory Birds**:** If possible, all vegetation removal activities shall be scheduled from August 1 to February 1, which is outside the general avian nesting season. This would ensure that no active nests would be disturbed and that removal could proceed rapidly. If vegetation is to be cleared during the nesting season, all suitable habitat will be thoroughly surveyed within 72 hours prior to clearing for the presence of nesting birds by a qualified biologist (Project Biologist). The Project Biologist shall be approved by the City*

and retained by the Applicant. The survey results shall be submitted by the Project Applicant to the City Planning Department. If any active nests are detected, the area shall be flagged and mapped on the construction plans along with a minimum 300-foot buffer, with the final buffer distance to be determined by the Project Biologist. The buffer area shall be avoided until, as determined by the Project Biologist, the nesting cycle is complete or it is concluded that the nest has failed. In addition, the Project Biologist shall be present on the site to monitor the vegetation removal to ensure that any nests, which were not detected during the initial survey, are not disturbed.

2) *Avoidance of Nesting Burrowing Owls**:** No more than 72 hours prior to any site disturbances, focused surveys for the burrowing owl shall be conducted. If absence of this species is confirmed, project work can proceed. If however, burrowing owl is located on site, the appropriate resource agencies (CDFW and USFWS) shall be contacted. The Project Applicant shall consult with the wildlife agencies regarding the most appropriate methods and timing for removal of owls. As necessary, owls will be actively evicted following agency approved protocols (i.e., placing a one-way door at the burrow entrance to ensure that owls cannot access the burrow once they leave). Any such active eviction shall occur outside of the breeding/nesting season. That is, active eviction shall be accomplished between September 1 and February 15. If more than 30 days has elapsed between owl eviction and completion of clearing and grubbing activities, a subsequent survey for the burrowing owl shall be conducted to ensure that owls have not re-populated the site. Any reoccupation by owls will require subsequent protocol active eviction.*

6.2 Appendix B: Plant species detected at the Rich Haven 2022 Specific Plan Amendment Project site, 2022.

SCIENTIFIC NAME (SYNONYM)	COMMON NAME
ANGIOSPERMS - DICOTYLEDONES	**DICOTS**
ADOXACEAE	**MUSKROOT FAMILY**
Sambucus nigra spp. caerulea (= S. mexicana)	Blue Elderberry
AMARANTHACEAE	**AMARANTH FAMILY**
*Amaranthus albus**	Tumbling Pigweed
Amaranthus palmeri	Palmer's Pigweed
*Amaranthus retroflexus**	Rough Pigweed
ANACARDIACEAE	**SUMAC or CASHEW FAMILY**
*Schinus molle**	Peruvian Pepper Tree
APOCYNACEAE	**DOGBANE FAMILY**
Asclepias fascicularis	Narrow-leaved Milkweed
ASTERACEAE	**SUNFLOWER FAMILY**
Ambrosia acanthicarpa	Sand-bur or Annual Bur-sage
*Centaurea melitensis**	Tocalote
Encelia californica	California Brittlebush
*Erigeron bonariensis**	flax-leaved horseweed
Erigeron canadensis	Canada horseweed
Heterotheca grandiflora	Telegraph Weed
*Lactuca serriola**	Prickly or Wild Lettuce
Layia platyglossa	Common Tidy Tips
*Oncosiphon piluliferum**	Stinknet
Pseudognaphalium stramineum (= Gnaphalium s.)	Cotton-Batting Plant
*Pulicaria paludosa**	Spanish Sunflower
Verbesina encelioides (= V. encelioides ssp. exauriculata)*	Golden Crownbeard
BIGNONIACEAE	**TRUMPET-CREEPER FAMILY**
Jacaranda mimosifolia	Jacaranda
BORAGINACEAE	**BORAGE FAMILY**
Amsinckia menziesii (= A. m. var. m.)	Rigid Fiddleneck
Amsinckia tessellata var. gloriosa	Devil's Lettuce
BRASSICACEAE	**MUSTARD FAMILY**
*Capsella bursa-pastoris**	Shepherd's Purse
Hirschfeldia incana	Shortpod or Summer Mustard
*Sisymbrium irio**	London Rocket
CHENOPODIACEAE	**GOOSEFOOT FAMILY**
Chenopodium album (= C. missouriense)*	Lamb's Quarter
Chenopodium berlandieri	Pitseed Goosefoot
*Kochia scoparia**	Kochia
*Salsola tragus**	Russian Thistle
CONVOLVULACEAE	**MORNING-GLORY FAMILY**
*Convolvulus arvensis**	Field Bindweed
CRASSULACEAE	**STONECROP FAMILY**
Crassula connata	Sand Pygmy-Stonecrop

EUPHORBIACEAE	**SPURGE FAMILY**
*Euphorbia maculata**	spotted spurge
FABACEAE	**LEGUME FAMILY**
Acmispon americanus var. americanus (= Lotus purshianus var. purshianus)	American Lotus
*Medicago sativa**	Alfalfa, Lucerne
*Melilotus officinalis**	Yellow Sweet-Clover
*Parkinsonia aculeata**	Jerusalem-Thorn or Mexican Palo Verde
GERANIACEAE	**GERANIUM FAMILY**
*Erodium brachycarpum**	Short-Fruited Filaree
*Erodium cicutarium**	Red-Stemmed Filaree
LAMIACEAE	**MINT FAMILY**
*Marrubium vulgare**	Common Horehound
MALVACEAE	**MALLOW FAMILY**
*Malva parviflora**	Cheeseweed
MYRSINACEAE	**MYSINE FAMILY**
*Lysimachia arvensis**	Scarlet Pimpernel
MYRTACEAE	**MYRTLE FAMILY**
*Eucalyptus camaldulensis**	River Red Gum
OLEACEAE	**OLIVE FAMILY**
*Olea europaea**	European Olive
ONAGRACEAE	**EVENING PRIMROSE FAMILY**
Camissoniopsis hirtella (= Camissonia h.)	Field Sun Cup
Camissoniopsis micrantha (= Camissonia m.)	Small-flowered Evening Primrose
POLYGONACEAE	**BUCKWHEAT FAMILY**
Eriogonum fasciculatum	California Buckwheat
Persicaria lapathifolium (= Polygonum l.)*	Pale Smartweed
*Polygonum aviculare**	Knotweed, Smartweed
*Rumex crispus**	Curly Dock
PORTULACACEAE	**PURSLANE FAMILY**
*Portulaca oleracea**	Common Purslane
SALICACEAE	**WILLOW FAMILY**
Salix gooddingii	Goodding's or Black Willow
Salix lasiolepis	Arroyo Willow
SAPINDACEAE	**SOAPBERRY FAMILY**
*Cupaniopsis anacardioides**	Carrotwood
SOLANACEAE	**NIGHTSHADE FAMILY**
*Nicotiana glauca**	Tree Tobacco
*Solanum americanum**	White Nightshade
URTICACEAE	**NETTLE FAMILY**
Urtica dioica	American Stinging Nettle
ZYGOPHYLLACEAE	**CALTROP FAMILY**
*Tribulus terrestris**	Puncture Vine
ANGIOSPERMS - MONOCOTYLENDONES	**MONOCOTS**
ARECACEAE	**PALM FAMILY**
Washingtonia filifera†	California Fan Palm
*Washingtonia robusta**	Mexican Fan Palm

CYPERACEAE	**SEDGE FAMILY**
Cyperus odoratus	Fragrant Umbrella-Sedge
POACEAE	**GRASS FAMILY**
*Arundo donax**	Giant Reed
*Bromus catharticus**	Rescue Grass
*Bromus diandrus**	Common Ripgut Grass
*Cynodon dactylon**	Bermuda Grass
Festuca perennis (= Lolium multiflorum)*	Italian Ryegrass
*Hordeum murinum**	Wall Barley
Leptochloa fusca ssp. uninervia (= L. uninervia)	Dense-Flowered Sprangletop
*Polypogon monspeliensis**	Rabbitfoot Grass
TYPHACEAE	**CATTAIL FAMILY**
Typha domingensis	Southern or Slender Cattail

KEY: Asterisk (*) = non-native species or cultivated; †Planted/horticultural; $^{+}$ = sensitive species; Sources: Taxonomy - Hickman (1993), http://ucjeps.berkeley.edu/interchange.html, March 2022; Common names and non-native species designations according to Roberts (1998), then Hickman (1993)

6.3 Appendix C: California Native Plant Society Categories

CNPS Status based on California Native Plant Society's Inventory of Rare and Endangered Vascular Plants of California (Tibor 2001):

List 1A: Plants Presumed Extinct in California
The plants of List 1A are presumed extinct because they have not been seen or collected in the wild for many years. Although most of them are restricted to California, a few are found in other states as well. There is a difference between "extinct" and "extirpated." A plant is extirpated if it has been locally eliminated. It may be doing quite nicely elsewhere in its range. All of the plants constituting List 1A meet the definitions of Sec. 1901, Chapter 10 (Native Plant Protection) of the California Department of Fish and Game Code and are eligible for state listing.

List 1B: Plants Rare, Threatened or Endangered in California and Elsewhere
The plants of List 1B are rare throughout their range. All but a few are endemic to California. All of them are judged to be vulnerable under present circumstances or to have a high potential for becoming so because of their limited or vulnerable habitat, their low numbers of individuals per population (even though they may be wide ranging), or their limited number of populations. All of the plants constituting List 1B meet the definitions of Sec. 1901, Chapter 10 (Native Plant Protection) of the California Department of Fish and Game Code and are eligible for state listing.

List 2: Plants Rare, Threatened or Endangered in California, But More Common Elsewhere
Except for being common beyond the boundaries of California, the plants of List 2 would have appeared on List 1B. Based on the "Native Plant Protection Act," plants are considered without regard to their distribution outside the state. All of the plants constituting List 2 meet the definitions of Sec. 1901, Chapter 10 (Native Plant Protection) of the California Department of Fish and Game Code and are eligible for state listing.

List 3: Plants About Which We Need More Information—A Review List
The plants that comprise List 3 are an assemblage of taxa that have been transferred from other lists or that have been suggested for consideration. The necessary information that would assign most to a sensitivity category is missing.

List 4: Plants of Limited Distribution—A Watch List
The plants in this category are of limited distribution in California and their vulnerability or susceptibility to threat appears low at this time. While these plants cannot be called "rare" from a statewide perspective, they are uncommon enough that their status should be monitored regularly. Many of them may be significant locally. Should the degree of endangerment or rarity of a plant change, they will be transferred to a more appropriate list.

Threat Code Extensions and their meanings:

.1- Seriously endangered in California

.2- Fairly endangered in California

.3- Not very endangered in California

6.4 Appendix D: Wildlife species detected at the Rich Haven 2022 Specific Plan Amendment Project site, 2022.

FAMILY/SPECIES NAME	COMMON NAME
REPTILIA	**REPTILES**
PHRYNOSOMATIDAE	**ZEBRA-TAILED, EARLESS, FRING-TOED, SPINY, TREE, SIDE-BLOTCHED AND HORNED LIZARDS**
Sceloporus occidentalis	Western Fence Lizard
Uta stansburiana	Common Side-blotched Lizard
COLUBRIDAE	**HARMLESS EGG-LAYING SNAKES**
Pituophis catenifer	Gopher Snake
AVES	**BIRDS**
CATHARTIDAE	**NEW WORLD VULTURES**
Cathartes aura	Turkey Vulture
ACCIPITRIDAE	**HAWKS, KITES, EAGLES AND ALLIES**
Buteo jamaicensis	Red-tailed Hawk
RECURVIROSTRIDAE	**STILTS AND AVOCETS**
Himantopus mexicanus	Black-necked Stilt
CHARADRIIDAE	**LAPWINGS AND PLOVERS**
Charadrius vociferus	Killdeer
LARIDAE	**GULLS, TERNS AND SKIMMERS**
Larus delawarensis	Ring-billed Gull
COLUMBIDAE	**PIGEONS AND DOVES**
Columba livia	Rock Pigeon
Streptopelia decaocto	Eurasian Collared-Dove
Zenaida macroura	Mourning Dove
TROCHILIDAE	**HUMMINGBIRDS**
Calypte anna	Anna's Hummingbird
FALCONIDAE	**CARCARAS AND FALCONS**
Falco sparverius	American Kestrel
TYRANNIDAE	**TYRANT FLYCATCHERS**
Sayornis nigricans	Black Phoebe
Sayornis saya	Say's Phoebe
Tyrannus vociferans	Cassin's Kingbird
LANIIDAE	**SHRIKES**
Lanius ludovicianus+	Loggerhead Shrike
CORVIDAE	**JAYS AND CROWS**
Corvus brachyrhynchos	American Crow
Corvus corax	Common Raven
ALAUDIDAE	**LARKS**
Eremophila alpestris actia+	California Horned Lark
HIRUNDINIDAE	**SWALLOWS**
Stelgidopteryx serripennis	Northern Rough-winged Swallow
Petrochelidon pyrrhonota	Cliff Swallow
Hirundo rustica	Barn Swallow
MIMIDAE	**MOCKINGBIRDS AND THRASHERS**
Mimus polyglottos	Northern Mockingbird

STURNIDAE	**STARLINGS**
Sturnus vulgaris	European Starling
MOTACILLIDAE	**WAGTAILS AND PIPITS**
Anthus rubescens	American Pipit
PARULIDAE	**WOOD-WARBLERS**
Setophaga coronata	Yellow-rumped Warbler
EMBERIZIDAE	**EMBERIZIDS**
Passerculus sandwichensis	Savannah Sparrow
Melospiza melodia	Song Sparrow
Zonotrichia leucophrys	White-crowned Sparrow
ICTERIDAE	**BLACKBIRDS**
Agelaius phoeniceus	Red-winged Blackbird
Sturnella neglecta	Western Meadowlark
Icterus bullockii	Bullock's Oriole
FRINGILLIDAE	**FRINGILLINE AND CARDUELINE FINCHES**
Haemorhous mexicanus	House Finch
PASSERIDAE	**OLD WORLD SPARROWS**
Passer domesticus	House Sparrow
MAMMALIA	**MAMMALS**
LEPORIDAE	**RABBITS & HARES**
Sylvilagus audubonii	Desert Cottontail
Lepus californicus	Black-Tailed Jackrabbit
SCIURIDAE	**SQUIRRELS, CHIPMUNKS & MARMOTS**
Otospermophilus beecheyi	California Ground Squirrel
CANIDAE	**FOXES, WOLVES & RELATIVES**
Canis latrans	Coyote

MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to Applied Planning to complete a Cultural Resources Assessment of the proposed Rich-Haven Specific Plan Areas of Change Project in the City of Ontario (City), San Bernardino County, California. A cultural resources records search, additional research, intensive-level pedestrian field survey, Native American Heritage Commission (NAHC) Sacred Lands File Search, and vertebrate paleontological resources overview were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). Please note that the current study updates *Historic Architecture Assessment for the Rich Haven Specific Plan* prepared by Michael Dice for the project in 2006. While the original study was deemed adequate in 2006, per CEQA the current effort is necessary to:

- Update the cultural resources records search to ensure that expectations for historic-period and prehistoric resources are accurate;
- Update the field survey to assess potential for significant historic and prehistoric cultural resources due to changing field conditions;
- Update significance evaluations of all cultural resources to determine whether eligibility status has changed since the original study;
- Evaluate any resources that have become historic in age (i.e. 45 or more years old) since the original study took place.

The current study also relies on *The City of Ontario's Historic Context for the New Model Colony Area* by Galvin & Associates (2004) for historical context.

The records search has revealed that 16 previous cultural resource studies have taken place, and five cultural resources have been identified within one half-mile of the project site. Two of the previous studies assessed the project site for cultural resources (only Dice's included significance evaluations), and all five of the resources in the records search radius were identified within the project site boundaries. During the field survey, each of the five resources identified by the records search were recorded and evaluated or updated for California Register of Historical Resources (California Register) listing eligibility (i.e. significance under CEQA). Each of the five resources are recommended not eligible for the California Register. Therefore, no significant impact related to historical resources is anticipated and no further investigations are recommended for the proposed project unless:

- The proposed project is changed to include areas that have not been subject to this cultural resource assessment;
- Cultural materials are encountered during project activities.

The current study attempted to determine whether significant archaeological deposits were present on the proposed project site. Although none were yielded during the records search and field survey, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist should have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register of Historic Places (National Register), plans for the treatment,

evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- Historic-period artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- Historic-period structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- Prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- Groundstone artifacts, including mortars, pestles, and grinding slabs;
- Dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;
- Human remains.

Findings were negative during the Sacred Lands File search with the NAHC. The results of the Sacred Lands File search are provided in Appendix C. The State Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB 52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

According to CEQA Guidelines, projects subject to CEQA must determine whether the project would “directly or indirectly destroy a unique paleontological resource”. The Paleontological Overview provided in Appendix E has recommended that:

> The geologic unit underlying this project are mapped as young Eolian sand and dune deposits from the Holocene period (Morton and Miller, 2006). Eolian units are considered to be of some preservation value, but any material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. The Western Science Center does not have any localities within the project area or within a 1 mile radius.
>
> Should excavation activity associated with the development of the project area extend beyond the current project into the surround alluvial units, paleontological resources would be possible. However, under current project parameters, and with the geologic units described, it would be unlikely for fossil material to be preserved.

If human remains are encountered during any project activities, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

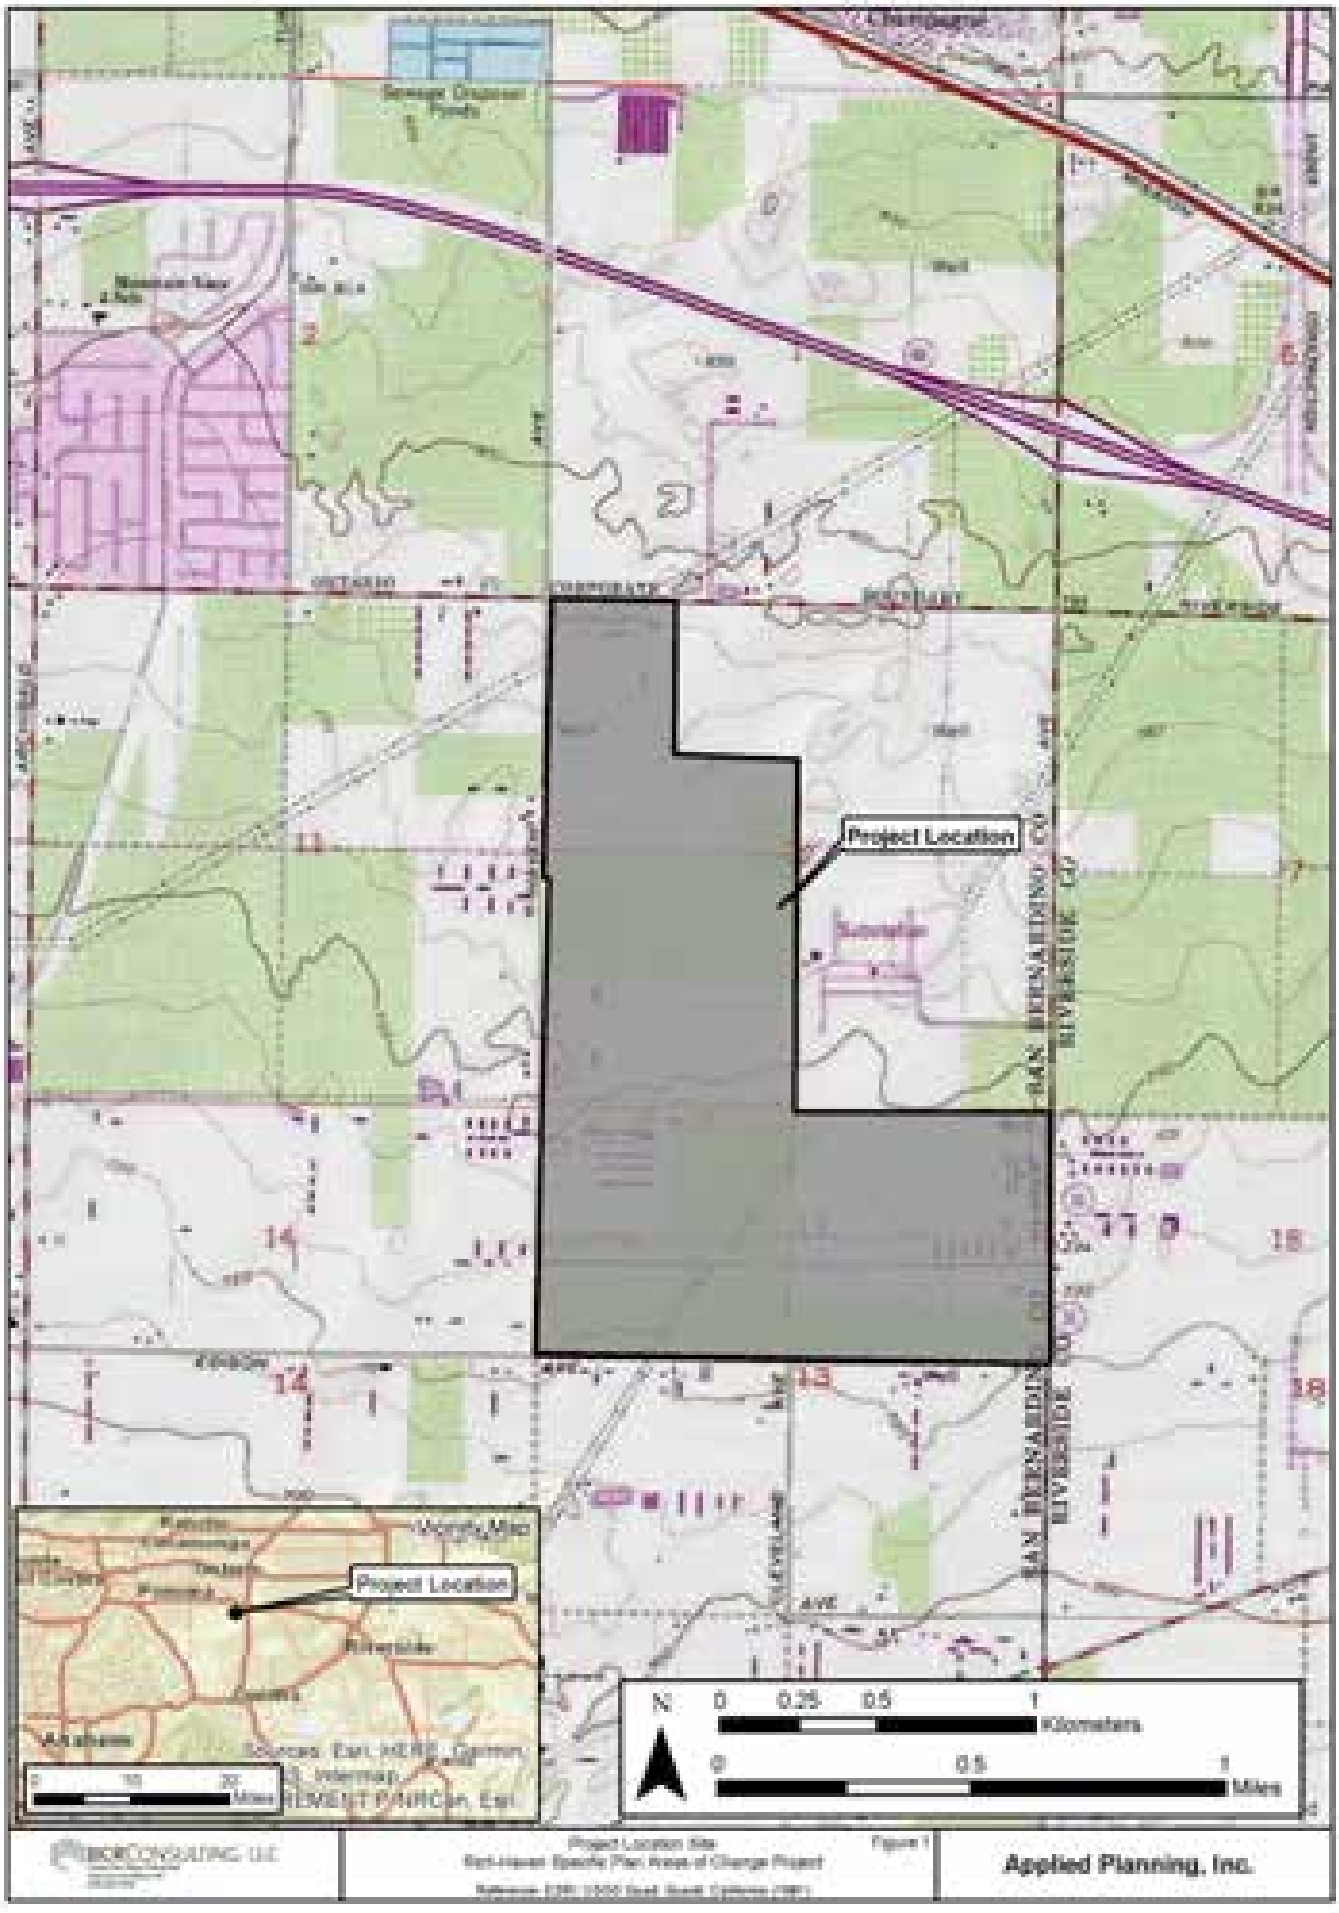
INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to Applied Planning to complete a Cultural Resources Assessment of the proposed Rich-Haven Specific Plan Areas of Change Project in the City of Ontario (City), San Bernardino County, California. The project occupies approximately 584 acres and is bounded a plant nursery to the west, dairy properties to south, a high school to the east, and residential properties and a preschool to the north. A cultural resources records search, additional research, intensive-level pedestrian field survey, Sacred Lands File search with the Native American Heritage Commission (NAHC), and paleontological overview were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The project site is located in Sections 12 and 13 of Township 2 South, Range 7 West, San Bernardino Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) *Guasti, California* (1981) and *Corona North* (1981) 7.5-minute topographic quadrangles (Figure 1).



Regulatory Setting

The California Environmental Quality Act. CEQA applies to all discretionary projects undertaken or subject to approval by the state's public agencies (California Code of Regulations 14(3), § 15002(i)). Under CEQA, "A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (Cal. Code Regs. tit. 14(3), § 15064.5(b)). State CEQA Guidelines section 15064.5(a) defines a "historical resource" as a resource that meets one or more of the following criteria:

- Listed in, or eligible for listing in, the California Register of Historical Resources (California Register)
- Listed in a local register of historical resources (as defined at Cal. Public Res. Code § 5020.1(k))
- Identified as significant in a historical resource survey meeting the requirements of § 5024.1(g) of the Cal. Public Res. Code
- Determined to be a historical resource by a project's lead agency (Cal. Code Regs. tit. 14(3), § 15064.5(a))

A historical resource consists of "Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California…Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing in the California Register of Historical Resources" (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)).

The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of significant impacts must lessen or eliminate the physical impact that the project will have on the resource.

Section 5024.1 of the Cal. Public Res. Code established the California Register. Generally, a resource is considered by the lead agency to be "historically significant" if the resource meets the criteria for listing in the California Register (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)). The eligibility criteria for the California Register are similar to those of the National Register of Historic Places (National Register), and a resource that meets one or more of the eligibility criteria of the National Register will be eligible for the California Register. The California Register program encourages public recognition and protection of resources of architectural, historical, archaeological, and cultural significance, identifies historical resources for state and local planning purposes, determines eligibility for state historic preservation grant funding and affords certain protections under CEQA. Criteria for Designation:

1. Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. Associated with the lives of persons important to local, California or national history.
3. Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). Fifty years is normally considered sufficient time for a potential historical resource, and in order that the evaluation remain valid for a minimum of five years after the date of this report, all resources older than 45 years (i.e. resources from the "historic-period") will be evaluated for California Register listing eligibility, or CEQA significance. The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Finally, CEQA requires that significant effects on unique archaeological resources be considered and addressed. CEQA defines a unique archaeological resource as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

CEQA Guidelines Section 15064.5 Appendix G includes significance criteria relative to archaeological and historical resources. These have been utilized as thresholds of significance here, and a project would have a significant environmental impact if it would:

a) cause a substantial adverse change in the significance of a historical resource as defined in section 10564.5;

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 10564.5;

c) Disturb any human remains, including those interred outside of formal cemeteries.

City of Ontario Designation Criteria. In addition to evaluation for California Register listing eligibility, the City of Ontario Development Code Article 26: Historic Preservation (Section 9-1.2615) provides the following designation criteria for a property to qualify as a City Historic Landmark:

a. It exemplifies or reflects special elements of the City's history;

b. It is identified with persons or events significant in local, state, or national history;

c. It is representative of the work of a notable builder, designer, architect, or artist;

d. It embodies distinguishing architectural characteristics of a style, type, period, or method of construction;

e. It is a noteworthy example of the use of indigenous materials or craftsmanship;

f. It embodies elements that represent a significant structural, engineering, or architectural achievement or innovation;

g. It has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community or the City; or

h. It is one of the few remaining examples in the City, region, state, or nation possessing distinguishing characteristics of an architectural or historical type or specimen.

Cultural resources would be subject to evaluation for the above City Historic Landmark designation criteria.

Tribal Cultural Resources. The Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB 52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any California Native American tribe that requests consultation and is

traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff are available to answer questions and address comments as necessary.

Paleontological Resources. CEQA provides guidance relative to significant impacts on paleontological resources, indicating that a project would have a significant impact on paleontological resources if it disturbs or destroys a unique paleontological resource or site or unique geologic feature. Section 5097.5 of the California Public Resources Code specifies that any unauthorized removal of paleontological remains is a misdemeanor. Further, California Penal Code Section 622.5 sets the penalties for damage or removal of paleontological resources. CEQA documentation prepared for projects would be required to analyze paleontological resources as a condition of the CEQA process to disclose potential impacts. Please note that as of January 2018 paleontological resources are considered in the geological rather than cultural category. Therefore, paleontological resources are not summarized in the body of this report. A paleontological overview completed by the Western Science Center is provided as Appendix E.

NATURAL SETTING

The project is located in the Chino Valley, which is bounded on the west by the San Jose Hills, on the south by the Chino Hills, on the north by the foothills of the San Gabriel Mountains (USGS 1981), and on the east by La Sierra and the Jurupa Mountains. Local rainfall ranges from 5 to 15 inches annually (Jaeger and Smith 1971:36-37). The area containing the project site exhibits a gradual southerly slope, and lies on a flood plain that feeds the Santa Ana River approximately four miles to the south (USGS 1981). The native biology of the region is difficult to reconstruct due to recent and historical agricultural, municipal, and industrial impacts. However, the project site is situated in the Upper Sonoran Life Zone, which is locally present between approximately 500 and 5,000 feet AMSL. This zone typically comprises cismontane valleys and low mountain slopes dominated by mixed coastal sage scrub and chaparral vegetation communities (Williams 2008).

CULTURAL SETTING

Prehistoric Context

The project site is located within the traditional boundaries of the Gabrielino (Bean and Smith 1978; Kroeber 1925). The Gabrielino probably first encountered Europeans when Spanish explorers reached California's southern coast during the 15th and 16th centuries (Bean and Smith 1978; Kroeber 1925). The first documented encounter, however, occurred in 1769 when Gaspar de Portola's expedition crossed Gabrielino territory (Bean and Smith 1978). Other brief encounters took place over the years and are documented in McCawley 1996 (citing numerous sources). The Gabrielino name has been attributed by association with the Spanish mission of San Gabriel, and refers to a subset of people sharing speech and customs with other Cupan speakers (such as the Juaneño/Luiseño/Ajachemem) from the greater Takic branch of the Uto-Aztecan language family (Bean and Smith 1978). Gabrielino villages occupied the watersheds of various rivers (locally including the Santa Ana) and intermittent streams. Chiefs were usually descended through the male line and

often administered several villages. Gabrielino society was somewhat stratified and is thought to have contained three hierarchically ordered social classes which dictated ownership rights and social status and obligations (Bean and Smith 1978:540-546). Plants utilized for food were heavily relied upon and included acorn-producing oaks, as well as seed-producing grasses and sage. Animal protein was commonly derived from rabbits and deer in inland regions, while coastal populations supplemented their diets with fish, shellfish, and marine mammals (Boscana 1933, Heizer 1968, Johnston 1962, McCawley 1996). Dog, coyote, bear, tree squirrel, pigeon, dove, mud hen, eagle, buzzard, raven, lizards, frogs, and turtles were specifically not utilized as a food source (Kroeber 1925:652).

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the area is thought to be a Spaniard called Father Francisco Garces. Having become familiar with the area, Garces acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). Garces was followed by Alta California Governor Pedro Fages, who briefly explored the region in 1772. Searching for San Diego Presidio deserters, Fages had traveled through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However, beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranchos through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought further diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that continue to this day (Beattie and Beattie 1974; Cleland 1941).

Ontario. Ontario, California was founded as a township in September 1882 by George and William B. Chaffey, named after their home of Ontario, Canada. The brothers purchased 6,218 acres of land with water rights and set aside 640 acres for the community of Ontario.

Half of the initial 640 acres was deeded to the Chaffey Agricultural College as an endowment. On December 10, 1891, Ontario was incorporated as a city under the California Constitution with a City Council-City Manager form of government. In 1903, Ontario was proclaimed a "Model Irrigation Colony" by an Act of Congress. Ontario had many modern innovations, many of which still show their value today. An impressive two-hundred feet wide and eight miles long, Euclid Avenue (on the National Register) was the stately back-bone of the colony. Provisions for an electric railway, water rights for each landowner, a local educational institution, electric lights, one of the first long distance telephone lines, and public access to water and transportation set a new standard for rural communities and irrigation practices and ensured the success of the Model Colony. Water originating from the nearby San Gabriel Mountains was readily available. In addition to accessible water, climate conditions in Ontario were similar to those in the Mediterranean with dry, hot summers and cool, moist winters as regular occurrences. Ontario first developed as an agricultural community, largely, but not exclusively, devoted to the citrus industry. In addition to oranges, the production of peaches, walnuts, lemons, olives and grapes were also important to the growth of Ontario and neighboring cities (City of Ontario; Galvin & Associates 2004:7).

In 1923, airplane enthusiasts Waldo Waterman and Archie Mitchell established Latimer Field. From that point on, Ontario became an aviation town. Urban growth pushed the fliers east until they took up their permanent residence located at the Ontario World Airport. During WWII, this airport was a busy training facility for pilots. After WWII, construction boomed in Ontario as the city's growth more than doubled by the end of the 1950s. In 1954, four new schools were built, with land for three more being purchased. That same year, the Interstate 10 opened for public use, diminishing or altering commercial traffic through Ontario. The downtown area found competition in neighborhood shopping centers that featured large parking lots and national brand chain stores (Rounds 1999:125-126). As the citrus industry declined, large tracts of orange groves gave way to new housing for settlers to the region. Following the 1960s and 1970s, the city's population had grown from 46,617 to 87,300 residents as Ontario expanded its boundaries eastward to encompass Guasti and the large tracts of vineyards beyond it (Rounds 1999:130). Ontario has become a diversified community with approximately 173,000 residents in 2015. Although the City boundaries have been extended from 0.38 square miles in 1891 to almost 50 square miles today, Ontario's Historic Downtown still retains the original subdivision pattern established by the Chaffey brothers (City of Ontario 2018).

Local Dairies. Dairies within the Chino Valley followed three distinct phases: Free grazing of cattle (1900-1930), mechanization of milking (1931-1949), and scientific, large capacity dairies (Post-1950). The first phase from 1900 to 1930, was marked by the free grazing of cattle with dairies that were situated around the perimeter of population centers to service those areas. The second phase of dairies was spurred by the growing population and saw the transition from free grazing to dry-lot dairying that utilized mechanization in the milking process. Due to a combination of labor shortage caused by World War II and subsequent population increase throughout the 1950's and 60's, dairies were forced to move onto smaller plots of land and utilize machinery. Technological advancements allowed for feeding and breeding techniques that produced larger herds which could be handled more efficiently by mechanization (Galvin and Associates 2004). The dairy industry in the Chino Valley had its peak in production during the 1980's, but as residential needs collided with agricultural land uses developers began to buy up the dairy properties and convert the land to residential subdivisions and other

commercial and industrial uses (Allen 2018; see also Dice 2006 and Galvin & Associates 2004).

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study. Mr. Brunzell meets the United States Secretary of the Interior Professional Qualification Standards for Archaeology and Architectural History. Mr. Brunzell completed the Department of Park and Recreation (DPR) 523 forms and wrote the technical report with contributions from BCR Consulting Staff Archaeologist Timothy Blood, M.S. BCR Consulting Archaeological Crew Chief Nick Shepetuk, B.A. and Archaeological Field Technicians John Defachelle, B.A. and Fabian Reyes-Martinez, B.A. conducted the field survey.

METHODS

This work was completed pursuant to CEQA, the Public Resources Code (PRC) Chapter 2.6, Section 21083.2, and California Code of Regulations (CCR) Title 14, Chapter 3, Article 5, Section 15064.5. The work is also completed pursuant to City Development Code Article 26: Historic Preservation. The pedestrian cultural resources survey was intended to locate and document previously recorded or new cultural resources, including archaeological sites, features, isolates, and historic-period buildings, that exceed 45 years in age within defined project boundaries. The project site was examined using 15-meter transect intervals, where accessible. This study is intended to determine whether cultural resources are located within the project boundaries, whether any cultural resources are significant pursuant to the above-referenced regulations and standards, and to develop specific mitigation measures that will address potential impacts to existing or potential resources. Tasks pursued to achieve that end include:

- Cultural resources records search to review the results of any studies conducted within a half-mile radius of the project boundaries;
- Additional research through various local and regional resources;
- Systematic pedestrian survey of the entire accessible project site;
- California Register eligibility evaluation for resources identified;
- Development of recommendations and mitigation measures for cultural resources documented within the project boundaries, following CEQA;
- Completion of DPR 523 forms for any discovered cultural resources.

Research

Records Search. On March 10th, 2022 (prior to the field survey) a records search was conducted at the South Central Coastal Information Center (SCCIC) at California State University, Fullerton. This archival research reviewed the status of all recorded historic and prehistoric cultural resources, and survey and excavation reports completed within one half-mile of the project site. Additional resources reviewed included the National Register, the California Register, and documents and inventories published by the California Office of Historic Preservation. These include the lists of California Historical Landmarks, California Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Additional Research. BCR Consulting performed additional research through City of Ontario permit records, the Robert E. Ellingwood Model Colony History Room of the Ontario Library, the San Bernardino County Historical Archives, and through various internet resources.

Field Survey

An intensive-level cultural resources field survey of the project site was conducted on February 25 and 28, and June 13, 2022. The survey was conducted by walking parallel transects spaced approximately 15 meters apart across the accessible project site. Inaccessible areas such as fenced yards, building interiors, and livestock enclosures and feeding areas were not subject to systematic survey. Cultural Resources were recorded on DPR 523 forms. Digital photographs were taken at various points within the project site. These included overviews as well as detail photographs of all cultural resources. Cultural resources were recorded per the California OHP *Instructions for Recording Historical Resources* in the field using:

- Detailed note taking for entry on DPR Forms (see Appendix B)
- Hand-held Garmin Global Positioning systems for mapping purposes
- Digital photographic overviews and photographs of all cultural resources (see Appendix B and D).

RESULTS

Research

Records Search. Data from the SCCIC revealed that 16 previous cultural resources studies have taken place, and five cultural resources have been recorded within one half-mile of the project site. One of the previous studies from the record search and another provided by Applied Planning (Dice 2006) have assessed the project site for cultural resources revealing that five cultural resources have been previously recorded within its boundaries. The records search results are summarized in Table A, and a cultural resources location figure and complete records search bibliography are provided in Appendix A.

Table A. Cultural Resources and Reports Within One Half-Mile of the Project Site

USGS 7.5 Min Quad	Cultural Resources Within One Half-Mile of Project Site	Studies W/in One Half-Mile
Guasti (1981), *Corona North* (1981)	P-36-12621: Hist.-Period Residence (NW Corner of project) P-36-12622: Hist.-Period Residence (S Portion of Project) P-36-12623: Hist.-Period Residence (SE Corner of Project) P-36-25440-Hist.-Period Transmission Line (Central Project) P-36-26051-Hist.-Period Transmission Line (SE corner of Project)	SB-1029, 1358, 1499, 2162, 4134, 4677, 5701, 5976, 6095, 6818, 7655, 7756, 7956, 7968*, 7977; Dice 2006*

*Previously assessed a portion of the project site. SB-7968 did not include evaluations and has not been used as heavily the comprehensive study completed by Dice (2006).

Additional Research. Additional research was performed for the project site to provide the background for the historic-period cultural properties within its boundaries (see also Field Survey Results, below). Please note that figures for this section are provided in Appendix B.

P-36-12621. This property occupies the northwest corner of the project site. It was originally developed as a dairy farm complex between 1956-57 with a residence that was followed by the construction of two barns (Dice 2006). The property was purchased by dairy farmers Frank and Lois Hilarides in 1976 when another residence was built on the parcel and dairy production was expanded. Frank and Lois had operated a dairy farm in Cerritos since soon after their engagement in 1952. Population increases made dairy farming difficult in L.A. county which prompted the Hilarides to relocate the Chino Valley (Long Beach Press-Telegram 1952; Independent Press Telegram 1976). They built the 1976 residence on the property and Frank subsequently won awards for milk quality and was a member of the California Milk Advisory board (Chino Champion 1978; Chino Valley News 1980). Assessor records indicate that Frank and Lois remained at the property until selling in 1998.

P-36-12622. This property is located in the southwest corner of the project site. Lester J. Scritsmier developed the 38.99-acre plot of land in 1947 as a hog farm for the Standard Feeding Company. Three single-family residences were built and most likely used to house workers. The dominant industry at the time in the City of Ontario was citrus which makes it probable that this was the first hog ranch in the area. Scritsmier held onto the land until his death in 1985, after which it was sold by his wife, Sandra Scritsmier, in 2005 (Dice 2006). The property continued as a hog ranch until its demolition between 2006 and 2022.

P-36-12623. This property is located in the southeast corner of the project site. The buildings were constructed on a narrow 3.08-acre property in 1953. The adjacent 18.2 acre parcel likely comprised the dairy operation formerly connected with this property. Documentation indicates that John and Wilma Dykstra owned the property, and that it comprised a portion of the Dykstra Brothers Dairy. John died in 1994 although the dairy continued to operate. In 2003 it was sold to Ronald and Kristine Pietersma and the Bidardt family (Dice 2006).

P-36-25440. This resource is a segment of an east-west oriented approximately 12-mile 220kV electrical transmission alignment that crosses the southern portion of the project site. The alignment connects SCE Chino and Mira Loma Substations. It was originally built in 1937 as a parallel two-line single circuit but had several towers replaced in 1940. Insulators were replaced and other maintenance was performed on the greater alignment in 1953 (Tinsley Becker 2010). Topographic maps and aerial photos do not show the subject segment on the project site prior to 1981. It appears next to a second modern alignment between 1981 and 1985 (USGS 1981; United States Department of Agriculture 1985).

P-36-26051. This resource is a segment of the Hayfield-Chino 220kV electrical transmission alignment that crosses the southeast corner of the project site. The greater alignment was constructed between 1945 and 1946 as a three-phase single circuit line between Chino and east of Coachella. As substations were added, segments of the transmission line were renamed to match the names of their substations (Tinsley Becker 2014). One tower from this alignment is located in the subject segment. It is visible on aerials after 1959 and as such does not appear to be original (United States Department of Agriculture 1959, 1966). According to recent documentation, the original transmission line had been completely removed and replaced by modern transmission lines by 2014 (Tinsley Becker 2014).

Field Survey

BCR Consulting Archaeological Crew Chief Nick Shepetuk, B.A. and Staff Archaeologist Johnny Defachelle, B.A. completed the field survey on February 25 and 28 and June 13, 2022. The project site has been completely disturbed by modern residential developments, historic-period and modern dairy and agricultural developments, and by the installation of public utility alignments. Vegetation included seasonal grasses and ornamental plants. Average visibility was approximately 50 percent and sediment comprised sandy silt with very few rocks. Each of the five previously-recorded cultural resources identified during the records search were revisited during the field survey. These are described in detail below. No additional cultural resources were identified.

P-36-12621. This resource includes a parcel comprising one single-family residence built circa 1957 and two hay shelters and a detached garage built after 1980. The residence was built in the Minimal Traditional style and features a moderately pitched hipped roof, smooth stucco cladding and horizontal wood board siding below the façade windows, decorative wood shutters flanking a façade window, narrow rectangular wood vent below the façade gable pitch and porch supports with decorative brackets. The building windows, doors, roof, and possibly the wood porch supports on the north elevation have been replaced (Dice 2006:8). One building that occupies the project site was constructed in 1976. In 2006 the building was not old enough to be a potential historical resource because it was not yet 45 or more years old (i.e. historic in age). Since it is now over 45 years old, it warrants recordation and evaluation as a potential historical resource. It comprises a 1976 single-family residence that features a rectangular layout and a stucco finish. The house has two steep pitched front-gabled elevations, a cross-gabled second story with roof dormers featuring side walls and two single-hung windows flanked by decorative shutters on the north elevation, and a gabled inset dormer on the south elevation. Composite shingles cover the roof which features wide eaves that are boxed without brackets. Most of the windows on the front elevation are also single-hung modern windows with decorative shutters, but there is a bay window that is flanked by two single-hung windows to the left of the main entrance. A shallow porch supported by unelaborated square columns makes up the front entrance to the building which is accessed through a wood-paneled double-door. The porch exhibits a decorative brick façade. The building has an attached three-car garage, and a brick chimney sits near the center of the building. It has been re-roofed and the windows do not appear to be original.

P-36-12622. This resource comprised 12 buildings and structures, and 27 animal pens/barns/shelters (Dice 2006:9). It included three single-family residences that were built circa 1947 in the Minimal Traditional Style, two garages and two prefabricated buildings that were also built in 1947, and several ancillary structures for animal feed and storage (Dice 2006). All buildings and structures have been demolished and the property is occupied by new condominiums.

P-36-12623. Ben Taniguchi and Rebecca Smith recorded P-36-012623 in 2006 as four buildings constructed in 1953 that comprised part of a dairy (Dice 2006). Building A was originally described in 2006 as a vernacular style barn built in 1953 that sat on a concrete foundation with a single-story, timber frame. It had one bay on its principal façade with the main entrance consisting of a large wood sliding door on the east elevation. The building

featured a front gable roof with composition shingles that was moderately pitched. There were also four stalls located on the south elevation that were most likely used for hay storage. Building A was revisited by BCR Consulting on June 13, 2022 and it was in poor condition with the roof caved in and the walls slumped.

Building B was originally described in 2006 as a vernacular style barn built in 1953 that featured a timber framed, one-story, modified box plan with a side gable addition. The building featured a moderately-pitched, double front gabled roof with a side-gable addition constructed at an unknown date. The building was in fair condition, but had a side-gabled addition to the west elevation. BCR Consulting revisited the barn on June 13, 2022 and discovered that the side gable addition was the only part intact. The main barn was in poor condition with a roof that had caved in and walls that had slumped.

Building C was originally recorded in 2006 as a residence constructed in the Minimal Traditional style. It featured an L-shaped plan with an asymmetrical principal façade that has five bays. The building is covered by a moderately-pitched, hipped roof covered with composition shingles. The building is clad in stucco. The majority of the windows are wood sash double-hung type. The building exhibited no visible alterations and was in good condition. When BCR Consulting revisited the building on June 13, 2022, the building was in good condition and had undergone minimal alterations since 2006.

Building D was originally recorded in 2006 as a Minimal Traditional style, single-family residence built in 1953. It featured a single story and rectangular plan with an attached garage. It had an exterior of smooth stucco and moderately-pitched, side gable roof that consisted of composite shingles. There were four windows on the primary façade that are square wood sash fixed windows. Two of the windows were flanked by decorative wood shutters. The windows and doors had been replaced, and the building was in good condition. When BCR Consulting revisited the building on June 13, 2022, it was in good condition and had undergone minimal alterations since 2006.

P-36-25440. This resource was originally recorded as an approximate 12-mile 220kV electrical transmission line that connects the SCE Chino and Mira Loma substations (Tinsley Becker 2010). The segment within the project site comprises five 90-foot tall double-circuit lattice steel towers with four legs resting on simple concrete footings. The towers appear to be modern, which is consistent with the aerial photo review that indicates a 1981-1985 construction date (USGS 1981, United States Department of Agriculture 1985).

P-36-26051. This resource was originally recorded as the Hayfield-Chino 220kV Transmission Alignment that was constructed between 1945 and 1946. It runs between Colton at the Highgrove substation (renamed Vista) and ends in Chino at the SCE Chino Substation. One tower from this segment was identified within the project site. Although aerial photos show a tower in that location between 1959 and 1966, recent documentation indicates that the original transmission line had been completely removed and replaced by modern transmission lines by 2014 (Tinsley Becker 2014).

SIGNIFICANCE EVALUATIONS

During the field survey, three historic-period residential/agricultural properties and two historic-period transmission lines were identified. CEQA calls for the evaluation and recordation of historic and archaeological resources. The criteria for determining the significance of impacts to cultural resources are based on Section 15064.5 of the *CEQA Guidelines* and Guidelines for the Nomination of Properties to the California Register. Properties eligible for listing in the California Register and subject to review under CEQA are those meeting the criteria for listing in the California Register, or designation under a local ordinance. One of the residential/agricultural properties (designated P-36-12622) was identified during the records search, but it is excluded from evaluation because it has been demolished and replaced by modern condominiums. Also, while the electric transmission alignment designated P-36-25540 appeared in the records search, additional research has shown that the segment that crosses the project site is not historic in age. Since the segment is not historic in age, it does not warrant further consideration as a potential historical resource for the current study.

Significance Criteria

California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion on the California Register or as a City Landmark, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the U.S.;
2. It is associated with the lives of persons important to local, California, or U.S. history;
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

City of Ontario Designation Criteria. In addition to evaluation for California Register listing eligibility, the City of Ontario Development Code Article 26: Historic Preservation (Section 9-1.2615) provides the following designation criteria for a property to qualify as a City Historic Landmark:

a. It exemplifies or reflects special elements of the City's history;
b. It is identified with persons or events significant in local, state, or national history;
c. It is representative of the work of a notable builder, designer, architect, or artist;

d. It embodies distinguishing architectural characteristics of a style, type, period, or method of construction;

e. It is a noteworthy example of the use of indigenous materials or craftsmanship;

f. It embodies elements that represent a significant structural, engineering, or architectural achievement or innovation;

g. It has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community or the City; or

h. It is one of the few remaining examples in the City, region, state, or nation possessing distinguishing characteristics of an architectural or historical type or specimen.

Evaluations

P-36-12621 California Register Evaluation. Although the subject property fits within a local dairy context of the second half of the 20th century, considerable research has failed to associate it with important events related to the founding and/or development of the industry. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Due to a lack of documentation, it was not possible to ascertain who was the original owner of the building when it was constructed between 1956 and 1957. Research has shown that Frank and Lois Hilarides purchased the property and constructed a residence there in 1976. While Frank Hilarides was an award-winning dairyman who sat on the California Milk Advisory Board, research did not indicate that he had any particular impact on the progression of the dairy industry, nor was he notable in local, state, or national history. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: One residence was built in the Minimal Traditional style and still maintains some of those elements such as a moderately pitched hipped roof, smooth stucco cladding with horizontal wood board siding below façade windows, decorative wood shutters flanking a façade window, a narrow rectangular wood vent below a façade gable pitch and porch supports with decorative brackets. However, there have been alterations to the building that include replacement of windows, doors, roof shingles and possibly the wood porch supports of the north elevation. These alterations have diminished its integrity as an example of the Minimal Traditional style. Also, the builder and architect are unknown and it does not appear to be the work of a master. With these considerations in mind, the 1956-1957 building does not appear to qualify for the California Register under Criterion 3 (see also Dice 2006:29). The 1976 residence remains in good condition, but it does not embody distinctive characteristics of a type, period, region, or method of construction, and does not represent the work of a master, or possess high artistic values. With these considerations in mind, the 1976 building does not appear to qualify for the California Register under Criterion 3. Criterion 4: Extensive research has exhausted this resources data potential, and as such the resource has not and is not likely to yield information important in prehistory or history. The subject property and its constituent historic-age buildings are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such the property is not recommended a historical resource under CEQA.

P-36-12621 City Historic Landmark Evaluation. While the property is a part of the dairy industry that developed in the mid to late 20th century in the Chino Valley, it is not currently

operational as a dairy and does not exemplify or reflect special elements of the City of Ontario (City Designation Criterion A). Research failed to connect any important people or events with the property (City Designation Criterion B). Research has not linked the property with a notable builder, designer, architect, or artist (City Designation Criterion C), and the buildings do not exhibit distinguishing architectural characteristics of a style, type, period, or method of construction (City Designation Criterion D). The property and its constituent buildings utilize common materials and methods that do not demonstrate noteworthy examples of the use of indigenous materials or craftsmanship (City Designation Criterion E). The buildings were not architecturally significant, and the dairy facilities are reflective of common dairy farming strategies that lack any significant structural, engineering, or architectural achievement or innovation (City Designation Criterion F). The property lacks unique characteristics or visual features that would qualify the property under City Designation Criterion G. Although few dairies remain from this era, the property exhibits a mix of styles that lack integrated features or distinguishing characteristics of a particular architectural or historic type or specimen (City Designation Criterion H). Based on the above evaluation, the subject property and its constituent buildings do not qualify as a City Historic Landmark.

P-36-12623 California Register Evaluation. Although the subject property fits within a local dairy context of the second half of the 20th century, considerable research has failed to associate it with important events related to the founding and/or development of the industry. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Although the Dykstra family who owned the property apparently operated a successful dairy business, research did not indicate that any family members made a significant impact on the dairy industry, nor were any of the family notable in local, state, or national history. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: The two residences were built in the Minimal Traditional style and still maintain some of those elements. However, the buildings are not outstanding representations of the style. Also, the builder(s) and architect(s) are unknown and the residences do not appear to be the work of a master. The barns are utilitarian, lack architectural distinction, and are in poor condition. Finally, the property does not exhibit distinctive characteristics (such as Ranch-style milk parlor and circular driveways) that have been established as hallmarks of post 1950 dairy farms (see Dice 2006:24). Therefore, the property does not appear to qualify for the California Register under Criterion 3. Criterion 4: Extensive research has exhausted this resources data potential, and as such the resource has not and is not likely to yield information important in prehistory or history. The subject property and its constituent historic-age buildings are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such the property is not recommended a historical resource under CEQA.

P-36-12623 City Historic Landmark Evaluation. While the property is a part of the dairy industry that developed in the mid to late 20th century in the Chino Valley. It does not exemplify or reflect special elements of the City of Ontario (City Designation Criterion A). Research failed to connect any important people or events with the property (City Designation Criterion B). Research has not linked the property with a notable builder, designer, architect, or artist (City Designation Criterion C), and the buildings to not exhibit distinguishing architectural characteristics of a style, type, period, or method of construction

(City Designation Criterion D). The property and its constituent buildings utilize common materials and methods that do not demonstrate noteworthy examples of the use of indigenous materials or craftsmanship (City Designation Criterion E). The buildings were not architecturally significant, and the dairy facilities are reflective of common dairy farming strategies that lack any significant structural, engineering, or architectural achievement or innovation (City Designation Criterion F). The property lacks unique characteristics or visual features that would qualify the property under City Designation Criterion G. Although few dairies remain from this era, the property does not exhibit distinctive characteristics (such as Ranch-style milk parlor and circular driveways) that have been established as hallmarks of post 1950 dairy farms (see Dice 2006:24; (City Designation Criterion H). Based on the above evaluation, the subject property and its constituent buildings do not qualify as a City Historic Landmark.

P-36-26051 California Register Evaluation. Research has not connected the Hayfield-Chino Transmission Line with any important events in local, county, state or national histories and it does not directly connect to any important infrastructure like the “Third Boulder Line” or the Colorado River Aqueduct (see Tinsley Becker 2014). Consequently, the Hayfield-Chino Transmission Line is not eligible under Criterion 1. Research also failed to associate the resource with significant people. It is therefore not eligible under Criterion 2. The resource consists of a common steel lattice tower and as such does not embody the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, or possess high artistic values. As a result, the Hayfield-Chino Transmission Line is not eligible under Criterion 3. Criterion 4: Extensive research has exhausted this resources data potential, and as such the resource has not and is not likely to yield information important in prehistory or history. It is therefore not eligible under Criterion 4. Based on these results, P-36-26051 recommended not eligible under any of the four criteria for listing on the California Register, and as such the property is not recommended a historical resource under CEQA.

P-36-26051 City Historic Landmark Evaluation. The property does not exemplify or reflect special elements of the City of Ontario (City Designation Criterion A). No significant persons or events were associated with the Hayfield-Chino Transmission Line (City Designation Criterion B). Research has not linked the property or any of its elements with a notable builder, designer, architect, or artist (City Designation Criterion C), and it lacks distinguishing architectural characteristics of a style, type, period, or method of construction (City Designation Criterion D). The structure utilizes common materials and methods that do not exhibit a noteworthy example of the use of indigenous materials or craftsmanship (City Designation Criterion E). The architectural features are minimal and utilitarian, and are reflective of common electrical infrastructure of the day that do not point to any significant structural, engineering, or architectural achievement or innovation (City Designation Criterion F). This is a ubiquitous type of resource and as such does not qualify under City Designation G or H.

RECOMMENDATIONS

BCR Consulting conducted a cultural resources assessment of the Rich-Haven Specific Plan Project in the City of Ontario, San Bernardino County, California. Five cultural resources were identified within the project site, but none are recommended eligible for the

California Register or as a City Landmark. Therefore, no significant impact related to historical resources is anticipated and no further investigations are recommended unless:

- The proposed project is changed to include areas that have not been subject to this cultural resource assessment;
- Cultural materials are encountered during project activities.

The current study attempted to determine whether significant archaeological deposits were present on the proposed project site. Although none were yielded during the records search and field survey, ground-disturbing activities have the potential to reveal buried deposits not observed on the surface. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist shall have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register, plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- historic-period artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- historic-period structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- groundstone artifacts, including mortars, pestles, and grinding slabs;
- dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;
- human remains.

Findings were negative during the Sacred Lands File search with the NAHC. The results of the Sacred Lands File search are provided in Appendix C. The Legislature added requirements regarding tribal cultural resources for CEQA in Assembly Bill 52 (AB 52) that took effect July 1, 2015. AB52 requires consultation with California Native American tribes and consideration of tribal cultural resources in the CEQA process. By including tribal cultural resources early in the CEQA process, the legislature intended to ensure that local and Tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts to tribal cultural resources. By taking this proactive approach, the legislature also intended to reduce the potential for delay and conflicts in the environmental review process. To help determine whether a project may have such an effect, the Public Resources Code requires a lead agency to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a Proposed Project. Since the City will initiate and carry out the required AB52 Native American Consultation, the results of the consultation are not provided in this report. However, this report may be used during the consultation process, and BCR Consulting staff is available to answer questions and address concerns as necessary.

According to CEQA Guidelines, projects subject to CEQA must determine whether the project would "directly or indirectly destroy a unique paleontological resource". The Paleontological Overview provided in Appendix E has recommended that:

> The geologic unit underlying this project are mapped as young Eolian sand and dune deposits from the Holocene period (Morton and Miller, 2006). Eolian units are considered to be of some preservation value, but any material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. The Western Science Center does not have any localities within the project area or within a 1 mile radius.
>
> Should excavation activity associated with the development of the project area extend beyond the current project into the surround alluvial units, paleontological resources would be possible. However, under current project parameters, and with the geologic units described, it would be unlikely for fossil material to be preserved.

If human remains are encountered during any project activities, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

 ***Resource Name or #:** 10601 E. Riverside Drive

Please note: The subject residence at 10601 East Riverside Drive is part of a larger historic-period agricultural complex designated P-36-12621 in 2006 (Dice 2006). This effort documents the building that was constructed at this property in 1976. It was not thoroughly addressed in 2006 because it was not yet historic in age (45 or more years old). It is now old enough to warrant consideration as a potential historical resource. The 1976 building is documented on pages 1 and 2; the evaluation for the entire property is updated on page 3; and an updated record of the portions of the property that do not include the 1976 residence is provided on page 4.

***P3a. Description:** The subject property is occupied by a 1976 single-family residence that features a rectangular layout and a stucco finish. The house has two steep pitched front-gabled elevations, a cross-gabled second story with roof dormers featuring side walls and two single-hung windows flanked by decorative shutters on the north elevation, and a gabled inset dormer on the south elevation. Composite shingles cover the roof which features wide eaves that are boxed without brackets. Most of the windows on the front elevation are also single-hung modern windows with decorative shutters, but there is a bay window that is flanked by two single-hung windows to the left of the main entrance. A shallow porch supported by unelaborated square columns makes up the front entrance to the building which is accessed through a wood-paneled double-door. The porch exhibits a decorative brick façade. The building has an attached three-car garage, and a brick chimney sits near the center of the building. It has been re-roofed and the windows do not appear to be original.

BUILDING, STRUCTURE, AND OBJECT RECORD

 ***NRHP Status Code**: 6Z ***Resource Name or #** (Assigned by recorder) 10601 E. Riverside Dr.

B1. Historic Name: N/A
B2. Common Name: N/A
B3. Original Use: Single-Family Residence
B4. Present Use: Single-Family Residence

***B5. Architectural Style:** Custom

***B6. Construction History:** The subject property was constructed in 1976. Aerial imagery shows that the building footprint has remained the same with no additions. A building permit search through the city of Ontario showed no evidence of any alterations or additions. The Property Information Management System for San Bernardino County only showed Frank and his wife Lois Hilarides as the owners from 1976 to 1998 before it came under the ownership of L & F Properties from 1998 to 2021. It was recently acquired by American Superior Land LLC.

***B10. Significance: Theme:** Agricultural Development
Area: Chino Valley **Period of Significance:** Late-20th Century
Property Type: Single Family Property **Applicable Criteria:** N/A

Applicable Criteria: N/A. **Additional Resource Attributes**: N/A
(Discuss importance in terms of historical/architectural context by theme, period, and geographic scope. Address Integrity.)
The subject property was originally developed as a dairy farm complex between 1956-57 with a residence that was followed by the construction of two barns (Dice 2006). The property was purchased by dairy farmers Frank and Lois Hilarides in 1976 when another residence was built on the parcel and dairy production was expanded. Frank and Lois had operated a dairy farm in Cerritos since soon after their engagement in 1952. Population increases made dairy farming difficult in L.A. county which prompted the Hilarides to relocate the Chino Valley (Long Beach Press-Telegram 1952; Independent Press Telegram 1976). They built the 1976 residence on the property and Frank subsequently won awards for milk quality and was a member of the California Milk Advisory board (Chino Champion 1978; Chino Valley News 1980). Assessor records indicate that Frank and Lois remained at the property until selling in 1998.

Local History
The history of the local dairy industry is closely tied to the surrounding cities: Corona, Ontario, Chino, and Norco (DeGrandpre 2018). An agricultural center had been established during the rancho (or Mexican) period and, being located on an alluvial plain at the nexus of three meandering watercourses, the region exhibited as much as four feet of fertile topsoil (USGS 1981). As a result, the area became known for successful orchard and row crops, and eventually (and perhaps most enduringly) dairy. Chino, which shares a border with Ontario, remained agricultural throughout the depression and World War II, but by the 1950s semi-rural subdivisions and dairies began to define the economic landscape (Musselwhite 2005). Favorable zoning encouraged dairy-farmers to settle, resulting in the formation of the most productive milk-producing community in the United States. Encroaching suburban settlements and the resulting zone changes have since caused many dairies to relocate, resulting in a reconfiguration of many parcels from agricultural to a retail/bedroom community (ibid).

Evaluation

California Register of Historical Resources requires that a significance criterion (1-4) be met for a resource to be eligible. A resource is eligible if (1) it is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; (2) it is associated with the lives of persons important in California's past; (3) it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or (4) it has yielded or is likely to yield information important in prehistory or history. The California Register also requires that sufficient time has passed since a resource's period of significance (normally 45 years) to "obtain a scholarly perspective on the events or individuals associated with the resources" (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Please note that the following evaluates the entire property designated P-36-12621.

Although the subject property fits within a local dairy context of the second half of the 20th century, considerable research has failed to associate it with important events related to the founding and/or development of the industry. It is therefore not eligible for the California Register under Criterion 1. Criterion 2: Due to a lack of documentation, it was not possible to ascertain who was the original owner of the building when it was constructed between 1956 and 1957. Research has shown that Frank and Lois Hilarides purchased the property and constructed a residence there in 1976. While Frank Hilarides was an award-winning dairyman who sat on the California Milk Advisory Board, research did not indicate that he had any particular impact on the progression of the dairy industry, nor was he notable in local, state, or national history. It is therefore not eligible for the California Register under Criterion 2. Criterion 3: One residence was built in the Minimal Traditional style and still maintains some of those elements such as a moderately pitched hipped roof, smooth stucco cladding with horizontal wood board siding below façade windows, decorative wood shutters flanking a façade window, a narrow rectangular wood vent below a façade gable pitch and porch supports with decorative brackets. However, there have been alterations to the building that include replacement of windows, doors, roof shingles and possibly the wood porch supports of the north elevation. These alterations have diminished its integrity as an example of the Minimal Traditional style. Also, the builder and architect are unknown and it does not appear to be the work of a master. With these considerations in mind, the 1956-1957 building does not appear to qualify for the California Register under Criterion 3 (see also Dice 2006:29). The 1976 residence remains in good condition, but it does not embody distinctive characteristics of a type, period, region, or method of construction, and does not represent the work of a master, or possess high artistic values. With these considerations in mind, the 1976 building does not appear to qualify for the California Register under Criterion 3. Criterion 4: Extensive research has exhausted this resources data potential, and as such the resource has not and is not likely to yield information important in prehistory or history. The subject property and its constituent historic-age buildings are therefore recommended not eligible under any of the four criteria for listing on the California Register, and as such the property is not recommended a historical resource under CEQA.

Updated Documentation of P-36-12621

P-36-12621 is on a parcel of 17.71 acres comprising five buildings, including a single-family residence constructed circa 1957, a 1976 residence, and two hay shelters and a detached garage constructed after 1980. The residence was recorded in 2006 as a minimal traditional style building that featured a moderately pitched hipped roof, smooth stucco cladding and horizontal wood board siding below the façade windows, decorative wood shutters flanking a façade window, narrow rectangular wood vent below the façade gable pitch and porch supports with decorative brackets (Dice 2006). BCR Consulting revisited the parcel on June 13, 2022 and identified the 1957 residence in the same condition and location recorded during the original study. The 1976 residence is located on the north side of the parcel at 10601 E. Riverside Drive. Since this is an independent residence that is over 45 years old, it has been individually designated and identified by address, and is evaluated on its own DPR form (above). The 2006 study recommended that the 1957 residence is not eligible for California Register of Historical Resources listing eligibility. BCR Consulting finds that this eligibility recommendation remains valid. The post-1980 elements are not historic in age and do not warrant further consideration.

***Recorded by:** Nick Shepetuk and Fabian Reyes-Martinez ***Date:** June 13, 2022 ☐ Continuation ☑ Update

P-36-12622 is on a parcel that consists of 38.99 acres and originally contained 12 buildings and structures, as well as 27 animal pens/barns/shelters (Dice 2006). BCR Consulting revisited the parcel on June 13, 2022 and discovered that all the buildings and structures had been demolished and condiminiums had been built with some units still being constructed.

Buildings A and B were originally recorded in 2006 as identical residences that were built in 1947 in the Minimal Traditional Style. Both were demolished during the construction of condominiums.

Buildings C and D were originally recorded in 2006 as garages that were constructed in 1947. Both were demolished during the construction of condominiums.

Building E was originally recorded in 2006 as a rectangular, prefabricated building that was built circa 1947. It was demolished during the construction of condominiums.

Building F was originally recorded in 2006 as a rectangular, prefabricated building that was most likely constructed in 1947. It was demolished during the construction of condominiums.

Building G was originally recorded in 2006 as a livestock sun shade that was demolished during the construction of condominiums.

Building I was originally recorded in 2006 as, “a shed roof supported by metal poles that covered a single width mobile home” (Dice 2006) that was demolished during the construction of condominiums.

Building H was originally recorded in 2006 as a residence constructed in the Minimal Traditional style in 1947. It was demolished during construction of condiminiums.

Building J was originally recorded in 2006 as a, “small outbuilding” (Dice 2006) and was demolished during construction of condiminiums.

Building K was originally recorded in 2006 as a modern double-width mobile home that was demolished during construction of condiminiums.

Building L was originally recorded in 2006 as large garage that was built circa 1990 and was demolished during construction of condiminiums.

Building M was originally recorded as, “several long and low barns of small animal pens in rows of three…located within the cluster of pens are some slightly larger structures that appear to be feed storage” (Dice 2006). All buildings and structures were demolished during the construction of condiminiums.

*Recorded by: Nick Shepetuk and Fabian Reyes-Martinez *Date: June 13, 2022 ☐ Continuation ☑ Update

Ben Taniguchi and Rebecca Smith recorded P-36-012623 in 2006 as four buildings constructed in 1953 that comprised part of a dairy (Dice 2006).

Building A was originally described in 2006 as a vernacular style barn built in 1953 that sat on a concrete foundation with a single-story, timber frame. It had one bay on its principal façade with the main entrance consisting of a large wood sliding door on the east elevation. The building featured a front gable roof with composition shingles that was moderately pitched. There were also four stalls located on the south elevation that were most likely used for hay storage. Building A was revisited by BCR Consulting on June 13, 2022 and it was in poor condition with the roof caved in and the walls slumped.

Building B was originally described in 2006 as a vernacular style barn built in 1953 that featured a timber framed, one-story, modified box plan with a side gable addition. The building featured a moderately-pitched, double front gabled roof with a side-gable addition constructed at an unknown date. The building was in fair condition, but had a side-gabled addition to the west elevation. BCR Consulting revisited the barn on June 13, 2022 and discovered that the side gable addition was the only part intact. The main barn was in poor condition with a roof that had caved in and walls that had slumped.

Building C was originally recorded in 2006 as a residence constructed in the Minimal Traditional style. It featured an L-shaped plan with an asymmetrical principal façade that has five bays. The building is covered by a moderately-pitched, hipped roof covered with composition shingles. The building is clad in stucco. The majority of the windows are wood sash double-hung type. The building exhibited no visible alterations and was in good condition. When BCR Consulting revisited the building on June 13, 2022, the building was in good condition and had undergone minimal alterations since 2006.

Building D was originally recorded in 2006 as a Minimal Traditional style, single-family residence built in 1953. It featured a single story and rectangular plan with an attached garage. It had an exterior of smooth stucco and moderately-pitched, side gable roof that consisted of composite shingles. There were four windows on the primary façade that are square wood sash fixed windows. Two of the windows were flanked by decorative wood shutters. The windows and doors had been replaced, and the building was in good condition. When BCR Consulting revisited the building on June 13, 2022, it was in good condition and had undergone minimal alterations since 2006.

*Recorded by: John Defachelle *Date: February 28, 2022 ☐ Continuation ☑ Update

This resource is a segment of an east-west oriented approximately 12-mile 220kV electrical transmission alignment that crosses the southern portion of the project site. The alignment connects SCE Chino and Mira Loma Substations. It was originally built in 1937 as a parallel two-line single circuit but had several towers replaced in 1940. Insulators were replaced and other maintenance was performed on the greater alignment in 1953 (Tinsley Becker 2010). Topographic maps and aerial photos do not show the subject segment on the project site prior to 1981. It appears next to a second modern alignment between 1981 and 1985 (United States Geological Survey 1981; United States Department of Agriculture 1985). BCR Consulting revisited the site on February 28, 2022 and found it in place as recorded in 2010.

***Recorded by:** John Defachelle ***Date:** February 28, 2022 ☐ Continuation ☑ Update

This resource is a segment of the Hayfield-Chino 220kV electrical transmission alignment that crosses the southeast corner of the project site. The greater alignment was constructed between 1945 and 1946 as a three-phase single circuit line between Chino and east of Coachella. As substations were added, segments of the transmission line were renamed to match the names of their substations (Tinsley Becker 2014). One tower from this alignment is located in the subject segment. It is visible on aerials after 1959 and as such does not appear to be original (United States Department of Agriculture 1959, 1966). According to recent documentation, the original transmission line had been completely removed and replaced by modern transmission lines by 2014 (Tinsley Becker 2014). BCR Consulting revisited this resource on February 28, 2022 and found it in place as recorded in 2014.

Re: Rich-Haven Specific Plan Areas of Change Project, San Bernardino County

Dear Mr. Brunzell:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

APPENDIX E

PALEONTOLOGICAL RESOURCES OVERVIEW

WESTERN SCIENCE CENTER

March 2nd, 2022

BCR Consulting LLC
Nicholas Shepetuk
505 W 8th St.
Claremont, CA 91711

Dear Mr. Shepetuk,

This letter presents the results of a record search conducted for the Rich-Haven Specific Plan Areas of Change Project located in the City of Ontario, CA. The project area is located west of Interstate 15, east of Haven Avenue, north of Edison Avenue and south of East Riverside Drive in Township 2 South, Range 7 West, Sections 12 and 13 on the Guasti, California USGS 7.5 minute quadrangle.

The geologic unit underlying this project are mapped as young Eolian sand and dune deposits from the Holocene period (Morton and Miller, 2006). Eolian units are considered to be of some preservation value, but any material found is unlikely to be fossil material due to the relatively modern associated dates of the deposits. The Western Science Center does not have localities within the project area or within a 1 mile radius.

Should excavation activity associated with the development of the project area extend beyond the current project into surrounding alluvial units, paleontological resources would be possible. However, under current project parameters, and with the geologic units described, it would be unlikely for fossil material to be preserved.

If you have any questions, or would like further information, please feel free to contact me at bstoneburg@westerncentermuseum.org

Sincerely,

Brittney Elizabeth Stoneburg
Collections Technician

SB 610 WATER SUPPLY ASSESSMENT

SECTION 1 - INTRODUCTION

Senate Bill 610 (SB 610) was signed into California state law with an effective date of January 1, 2002. SB 610 amended existing legal requirements for confirmation of water supply sufficiency as a condition of approval for development projects. The confirmation of water supply sufficiency is achieved through an assessment of the water supplier's existing and future water sources, and existing and projected water demand in relation to a "project" as defined by California Water Code (CWC) section 10912, resulting in the production of a project-specific Water Supply Assessment ("WSA" or "Assessment"). Additional analysis is required in the WSA if any portion of the water supply includes groundwater. The WSA is prepared and adopted by the water supplier and included in the California Environmental Quality Act (CEQA) analysis for the project. The CEQA Lead Agency must then independently determine, based on the entire record, whether water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses (CWC section 10911).

Law

CWC section 10910:

> *(a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.*

CWC section 10912:

For the purpose of this part, the following terms have the following meanings:

> *(a) "Project" means any of the following:*
>
> *(1) A proposed residential development of more than 500 dwelling units.*

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

1.1 Purpose

The Ontario Municipal Utilities Company (OMUC) is a department of the City of Ontario (City) and the water supplier to the City. OMUC commissioned this Assessment from Albert A. Webb Associates (WEBB) on January 25, 2021 to answer the following key question pursuant to SB 610: whether the projected supply for the next 20 years, based on normal, single dry and multiple dry years, will meet the demand projected for the project plus existing and planned future uses, including agricultural and manufacturing uses.

This WSA has been prepared for *Amendment No. 3* to the *Rich-Haven Specific Plan (PSPA19-006)* (SPA3 or "Project"). The City of Ontario Planning Department is preparing a 2021 addendum to The Ontario Plan Certified Environmental Impact Report (EIR) and therefore, this Project is considered to be "subject to CEQA" pursuant to CWC section 10910.

The Project is considered a "project" pursuant to the following CWC section 10912 definition:

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

1.2 Background

The Rich-Haven Specific Plan encompasses approximately 602 gross acres in the County of San Bernardino, within the City of Ontario's 8,200-acre Ontario Ranch (previously referred to as the New Model Colony [NMC]) (**Figure 1, Regional Location**). The Rich-Haven Specific Plan is bounded to the north by East Riverside Drive and the western property line for Colony High School, to the west by Haven Avenue, to the south by Edison Avenue, and bounded to the east by Mill Creek Avenue and Hamner Avenue (**Figure 2, Project Vicinity**).

The Rich-Haven Specific Plan was first adopted by the Ontario City Council on Dec. 4, 2007 which included approximately 512 acres with potential development of 4,256 residential units and 889,200 square feet of commercial/office use. The first Specific Plan Amendment (SPA1) was adopted by City Council in March 2016, which brought the Specific Plan into conformance with the City General Plan that was adopted in 2010, which is referred to as The Ontario Plan (TOP). The second SPA (SPA2) was adopted by City Council in February 2018 and included the annexation of Planning Areas 9A & 9B (an additional 72.3 acres). This annexation brought the entire "NMC East Mixed Use District" within the boundaries of the Rich-Haven Specific Plan. As such, the maximum residential dwelling units and maximum commercial/office area increased to 7,194 units and 1,131,702 square feet, respectively. Two implementing projects within the Specific Plan have been approved by the City including Tentative Tract Map (TTM) No. 20134 and TTM No. 20081 (**Figure 3 – Existing Land Use Plan and Implementing Projects**).

1.3 Proposed Project

The proposed Project is the third SPA (SPA3); the primary changes of which are to transfer 518 dwelling units (DUs) from the NMC East Mixed Use District to the Residential District of the Specific Plan, and replace approximately 50 acres of Commercial with Light Industrial use. As stated in the *2021 Addendum to The Ontario Plan Certified EIR for the Rich-Haven Specific Plan 2021 Amendment*, the changes made by the Project to the previously approved 2018 land use plan include:

- *Certain Specific Plan Planning Areas would be reorganized/re-classified;*
- *Alternative residential products would be implemented;*
- *The Regional Commercial within Planning Area 6A is moved into Planning Area 9A with no net change to the combined 6A/9A uses in the Specific Plan;*
- *The maximum allowable development of commercial/office uses would be decreased; and*
- *A new Light Industrial Land Use would be established, allowing for development of light industrial warehouse uses in the southeasterly portion of the Specific Plan, adjacent to Hamner Avenue.*[1]

The changes proposed by SPA3 compared to the prior approved land use plan are shown below in **Table 1-1a** and **Table 1-1b** in ~~strikethrough~~ for deletions and <u>underline</u> for additions**.** The proposed Project land uses are shown in **Figure 4 – Proposed Project Land Use.** Currently, TTM No. 20345 is being proposed to the City within Planning Area 6A. This project currently proposes condominiums with 77 single-family attached units and 26 single-family detached units on approximately 7 acres.

[1] *The Specific Plan Mixed Use District allows for combinations of commercial, office, light industrial, and residential development at various densities/intensities. Any given proposal within the Specific Plan Mixed Use District is required to conform to applicable Specific Plan Design Guidelines and Development Standards; and trip generation (Average Daily Trips, ADT) of such proposals shall not exceed trip generation estimates (the "trip budget") identified in The Ontario Plan EIR. Such proposals shall be subject to review and approval by the Planning Director or Assignee. Proposals that exceed The Ontario Plan EIR trip budget and/or do not conform to applicable Specific Plan Design Guidelines and Development Standards may require further amendment of the Specific Plan and additional CEQA analysis* (2021 Addendum, p. 2-5).

Table 1-1a Project Residential District Land Use Summary

Residential District Planning Area	Specific Plan Land Use	Maximum Dwelling Units (DU)	Gross Acres (ac)	Gross Density (DU/ac)
1A	Residential - SFD	~~58~~ 115	~~12.8~~ 25.5	4.5
1B	Residential - SFD	~~57~~ 175	~~112.7~~ 24.5	~~4.5~~ 7.1

8A	Residential & Commercial	852	61.4	95,000	325,000	--
8B	Residential & Commercial	~~200~~ 407	19.7	20,000	123,400	--
Total Mixed Use District		~~5,361~~ 4,843	312.9	~~360,974~~ 385,974	~~1,131,702~~ 990,902	1,183,525
Total Residential and Mixed Use Districts		**7,194**	**602.0**	**~~360,974~~ 385,974**	**~~1,131,702~~ 990,902**	**1,183,525**

Notes: SF = square feet

Source: RHSPA3, p.3-5.

(1) Planning Area 6A includes approved TTM No. 20081, which proposes a combined total of 587 DU on 50.1 acres with no Commercial land uses.

With implementation of the Project, the Rich-Haven Specific Plan will continue to allow for up to a maximum of 7,194 dwelling units (all residential types), a new maximum of 990,902 square feet of commercial/office uses, and a new maximum of 1,183,525 square feet of light industrial uses.

According to the SPA3, there are currently 11 wells on the Project site, which will be destroyed. Two new potable water production wells will be constructed – one in Planning Area 5 and another in Planning Areas 1 or 8. The Conceptual Domestic Water Plan in the SPA3 states the following (p. 4-16):

Local backbone domestic water mains to be constructed as part of the Rich-Haven Specific Plan project will include 8-inch to 12-inch [diameter] water mains throughout the local backbone street system. Additionally, the Chino Basin Watermaster Water Quality Map identifies the Rich Haven area within an optimum water quality zone and requires that the owner/developer dedicate a total of two wells within the Specific Plan area to the City of Ontario for production of potable water. The owner/developer of Planning Area 5 has identified a well location site within the greenbelt in the area east of Mill Creek Avenue. A second well location site within the Specific Plan area shall be located within Planning Areas 1 or 8 as approved by the City. Master planned domestic water main lines serving the surrounding area and within the Specific Plan, as identified in the most currently approved Water Master Plan Update, shall be constructed prior to issuance of first occupancy.

Within the project site, a network of minimum 8-inch water lines will be installed. The proposed on-site public water system sizing is subject to the recommendations and approval of the required hydraulic analysis. All water mains and wells internal to the Rich-Haven Specific Plan project, will be provided by the merchant builder. In-tract water system design will be provided at the time of subdivision. Offsite water improvements to serve the Specific Plan will be implemented according to the most current version of the City's Water Master Plan.

Eleven existing wells have been identified within the Rich-Haven Specific Plan project site.

In compliance with the Chino Basin Watermaster's Well Procedure for Developers, a well use/destruction plan and schedule for all existing private/agricultural wells shall be submitted to the City of Ontario for approval prior to the issuance of permits for any construction activity. If a private well is actively used for water supply, the Developer shall submit a plan to abandon

> *such well and connect users to the City's water system (residential to the domestic water system and agricultural to the recycled water system) when available. Wells shall be destroyed/abandoned per the California Water Resource Guidelines and required permitting from the County Health Department. A copy of such permit shall be provided to the Engineering and Public Works Agency prior to issuance of grading and/or building permits.*

City Ordinance No. 2689 requires all new development to connect to, and use recycled water for all approved uses, including but not limited to landscape irrigation (codified in City Municipal Code Sections 6-8.7 to 6-8.279). A Water Master Plan has been developed for the Rich-Haven Specific Plan, which shall conform to the City of Ontario's Water Master Plan and will include both domestic and recycled water infrastructure (RHSPA3, p. 4-14). *Recycled water will be used in the Rich-Haven Specific Plan area for irrigation of parks, schools, street landscaping, recreational trails, parkways, common area residential landscaping and commercial/industrial landscaping* (RHSPA3, p. 4-17).

1.4 Prior Water Supply Assessment

A WSA and Written Verification of Sufficient Water Supply (WV) prepared pursuant to Senate Bill 221 for the 8,200-acre NMC (Ontario Ranch) was prepared by WEBB on behalf of the City dated October 27, 2004. The 2004 NMC WSA/WV was used for demonstrating water supply sufficiency for previous amendments to the Rich-Haven Specific Plan. Because SPA3 proposes a new land use not previously included in the land use plan (i.e., Light Industrial) and the industrial land use has a maximum area of more than 650,000 SF, and the City has updated its water use and water supply information since 2004, a new WSA is prepared herein consistent with CWC section 10910(3).

Law

CWC Section 10910:

(h) Notwithstanding any other provision of this part, if a project has been the subject of a water assessment that complies with the requirements of this part, no additional water assessment shall be required for subsequent projects that were part of a larger project for which a water assessment was completed and that has complied with the requirements of this part and for which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has concluded that its water supplies are sufficient to meet the projected water demand associated with the proposed project, in addition to the existing and planned future uses, including, but not limited to, agricultural and industrial uses, unless one or more of the following changes occurs:

(1) Changes in the project that result in a substantial increase in water demand for the project.

(2) Changes in the circumstances or conditions substantially affecting the ability of the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), to provide a sufficient supply of water for the project.

(3) Significant new information becomes available which was not known and could not have been known at the time when the assessment was prepared.

1.5 Project Relation to the Urban Water Management Plan

OMUC is the water supplier for the Project and has prepared a 2015 Urban Water Management Plan (UWMP), a copy of which is provided in Appendix A. Because the 2020 UWMP will not be adopted and supersede the previous UWMP until summer 2021, this WSA will rely on the 2015 UWMP. The 2015 UWMP was adopted by the City Council on July 21, 2016 and reviewed by the State Department of Water Resources (DWR). The assumptions on ultimate (buildout) water demand in the 2015 UWMP were derived from land use-based water demand factors (AKM, 2016), which build on the foundations laid out by the City's TOP land use plan (TOP, 2010). The

method used in the 2015 UWMP to calculate ultimate water demand assumed the NMC maximum residential densities (i.e., 5.0, 11.0, 25.0, and 40.0 du/ac) using adjusted gross acreages (i.e., acreages lacking rights-of-way for roads, flood control facilities, or railroads). Further, the method used for calculating the water demands of each Mixed Use District within the City was done individually based on unique density/intensity assumptions.

The land use designations on the Project site that were assumed in the 2015 UWMP are shown in **Figure 5 – Land Uses Assumed in the UWMP** and **Table 1-2** (next page).

Table 1-2 Land Uses Assumed in the UWMP

TOP Land Use Designation	TOP Adjusted Acreage[1]	Gross Acreage	Residential Units (Minimum)[2]	Residential Units (Maximum)[3]
Planning Areas 1A – 1F				
Low Density Residential (2.1 – 5.0 du/ac)	106.16	110.6	223	531
Planning Areas 2 and 3				
Open Space Non-Recreational (Edison Parcel)	18.01	20	0	0
Open Space Recreational	25.71	27	0	0
Planning Areas 4A - 4C				
Low Medium Density Residential (5.0-11.0 du/ac)	33.41	33	167	368
Planning Areas 5A - 5D				
Medium Density Residential (11.1 – 25.0 du/ac)	62.06	80.6	689	1,552
Planning Area 5E				
Open Space Non-Recreational (Edison Easement)	17.76	17.76	0	0
Subtotal	**263.1**	**289**	**1,079**	**2,451**
Planning Areas 6A – 9B				
NMC East Mixed Use Area[4] • > 14.0 – 50.0 du/ac. • 0.7 FAR for office and retail uses. • Subject to approved Specific Plans.	264.3	TOP Assumed Density/Intensity:[5] • 30% of area at 25 du/ac = 1,978 du. • 30% of area at 0.35 FAR for office & 40% of area at 0.30 FAR for retail uses=2,584,524 SF.		
Open Space Non-Recreational (SCE Corridor) / Neighborhood Edge	23.93	-	0	0
Total[6]	**551.33**	**577**	**--**	**4,429**

Source: For PAs 1A–5E, *Rich-Haven Specific Plan Amendment 3, Section 9.2 TOP Consistency Tables* (Nov. 2020).

Notes: TOP = The Ontario Plan; FAR = floor to area ratio; SCE = Southern California Edison; SF = square feet; du/ac = dwelling unit per acre; NMC = New Model Colony.

(1) Development area acreagesare based upon TOP Adjusted Gross Acreages. The TOP Adjusted Gross Acreage does not include the rights-of-way for roadways, flood control facilities, or railroads.

(2) Minimum dwelling units are calculated as the minimum density allowed multiplied by TOP Adjusted Acreage.

(3) Maximum dwelling units are calculated as the maximum density allowed multiplied by TOP Adjusted Acreage.

(4) From *City of Ontario, The Ontario Plan Draft EIR*, *Chapter 3. Project Description, p. 3-38.*

(5) From *Technical Memorandum, City of Ontario – Ultimate Citywide Water Demand Estimate, May 2016, Table 3 (TOP Approved Land Use Buildout Estimate (modified))*, included as Appendix B to the *Ontario 2015 UWMP.*

(6) Total areas and maximum units/square feet vary somewhat with each iteration of the land use plan because of adjustments to acreages over time and the Edison properties are not always included consistently.

As part of this Assessment, WEBB has confirmed with OMUC that there have been no substantial changes to the water supply portfolio as it is described in the 2015 UWMP and the same unit water demand factors are used herein as those used in the 2015 UWMP.

If a project's water demand has been accounted for in the water supplier's most recent UWMP, then the WSA may use the UWMP as the source of the information required in the WSA. The determination as to whether the Project's water demand has been accounted for in the most recent UWMP is located in Section 2 – Water Demand Analysis.

Relation of Water Supplier to other Urban Water Management Plans

The City is a member agency of the Inland Empire Utilities Agency (IEUA), which is the local distributor of recycled water and a local wholesale supplier of untreated imported water (State Water Project) from The Metropolitan Water District of Southern California (MWD). OMUC is also a member of the Water Facilities Authority (WFA), a Joint Powers Authority from which the City purchases treated imported water received from IEUA. In addition, OMUC is a member of the Chino Basin Desalter Authority (CDA), a Joint Exercise of Powers Agency from which OMUC purchases treated groundwater. Lastly, OMUC owns shares of the San Antonio Water Company (SAWCo), a mutual water company that provides potable water to OMUC through the WFA.

MWD has prepared a 2015 UWMP that includes IEUA and its member agencies (Appendix B); IEUA and WFA have prepared a 2015 Regional UWMP (Appendix C); CDA has prepared a 2015 UWMP (Appendix D); and SAWCo prepared a modified 2015 UWMP (Appendix E).

Law

CWC Section 10910:

(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code [CEQA]*, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).*

(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

1.6 Statewide and Local Water Conservation Efforts

Governor Brown proclaimed a statewide State of Emergency due to ongoing drought conditions on January 17, 2014. Since then, at least six Executive Orders and other Proclamations have been issued in response to impacts from extended statewide drought conditions. Executive Order B-37-16 issued on May 9, 2016, established a new water use efficiency framework for California. The order established longer-term water conservation measures that include permanent monthly water use reporting, new urban water use targets, reducing system leaks and eliminating wasteful practices, strengthening urban drought contingency plans and improving agricultural water management and drought plans. On April 7, 2017, Governor Brown issued Executive Order B-40-17 that ended the drought State of Emergency in all California counties except Fresno, Kings, Tulare, and Tuolumne. The Executive Order maintains the mandatory water reporting requirements and prohibitions on wasteful practices contained in Executive Order B-37-16, as described previously. In a related action, State agencies released a plan to implement Executive Order B-37-16 entitled, "Making Water Conservation a California Way of Life."

The Ontario City Council adopted Ordinance No. 3027 on September 1, 2015 in response to the Emergency Conservation Regulations mandated at that time by the State Water Resources Control Board. Ordinance 3027 updated the City's Water Conservation Plan that is codified in Chapter 8A, Title 6 of the City's Municipal Code ("Water Conservation Plan"). Updates included more stringent prohibitions and penalties, a voluntary conservation stage that is always in effect, and mandatory water shortage stages 1 through 4 that target a strict enforcement of water conservation routines following a water crisis (UWMP, p. 8-1). In addition, OMUC's citywide Water Shortage Contingency Plan describes the methods to achieve and the implications of reducing water supplies up to 50 percent (UWMP, Chapter 8). Lastly, the City and OMUC implement various programs to reduce water consumption, identified as Demand Management Measures in the UWMP, which include the Best Management Practices recommended by the California Urban Water Conservation Council, of which

the City and OMUC is a member. Currently, the City is in the voluntary stage of the Water Conservation Plan, which has the following voluntary water use restrictions:

- *Avoid hose washing of sidewalks, walkways, driveways, parking areas or other paved surfaces, except as required for sanitary purposes;*
- *Avoid using a hose for washing of an automobile unless equipped with a fitted shut-off nozzle;*
- *Public places (i.e., restaurant) where food is served, should avoid serving water unless requested by customer;*
- *Avoid watering outdoor landscaping more than every other day and during the hours of 6 AM and 6 PM;*
- *Avoid causing or allowing water to be applied to outdoor landscapes in a manner that causes runoff; and*
- *Promptly repair all leaks from indoor and outdoor plumbing fixtures*
- *Avoid using water to clean, fill or maintain levels in decorative fountains, ponds, lakes or other similar aesthetic structures unless such water is part of a recycling system.*

With the signing of Assembly Bill 1668 and SB606, the state has set an Indoor Residential Standard of 55 gallons per capita per day (GPCD) which will decrease to 50 GPCD by 2030 (CWC section 10609.4(a)). The per person unit water use factors used by the City in the 2015 UWMP for water demand planning purposes are based on a minimum of 60 gpd/person for high density residential with recycled water, up to 95 gpd/person for low density residential with recycled water use (UWMP Appendix B, p. 3).

1.7 Methodology of Analysis

This Assessment follows the DWR *Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001* (DWR 2003). Section 1 of this Assessment describes the existing and proposed land use designations of the Project site, the proposed Project's

relation to a previous WSA and the water supplier's most recent UWMP. Section 2 provides the water demand analysis of the Project; Section 3 reviews the projected water supplies for the Project; Section 4 contains the required discussion of the water supplier's groundwater supplies; and Section 5 concludes the Assessment by answering the primary question at hand.

SECTION 2 - WATER DEMAND ANALYSIS

The purpose of this section is to evaluate whether the proposed Project was considered in the water supplier's planning for water demand. This section will: 1) identify the various water use sectors, 2) identify water demand by those sectors for the next twenty years, and 3) compare the calculated water demand of the proposed Project to the water demand assumed in the most recent UWMP for the same property.

Law

CWC Section 10910:

(c) (2) (2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

2.1 Citywide Demographic Factors

A variety of demographic factors may affect water use. The UWMP Act lists several demographic factors to be detailed in UWMP's including climate, current and projected population, density, and the mix of customer types (CWC sections 10631(e)(1)-(2)). As

suggested by DWR, these data are provided herein and are taken generally from Ontario's 2015 UWMP (Appendix A).

Climate

The climate of the City including the Project site can be described as generally mild temperatures, virtually no days below freezing, and approximately 312 days of sunshine per year. The average annual high temperature is approximately 78 degrees Fahrenheit (°F), and the average annual low temperature is 53.2°F. The average annual rainfall is roughly 11.3 inches, which occurs between October and April. (UWMP, p. 3-8)

Population

The City is divided into two distinct areas: Old Model Colony (OMC) and Ontario Ranch. The OMC mostly consists of residential, commercial, and industrial developments including the Ontario Airport. Ontario Ranch is currently in the process of a planned conversion from agriculture to residential, commercial, industrial, and public uses. The combined OMUC service area population as of 2015, including both OMC and Ontario Ranch, is estimated at 168,777 persons. Based on the City General Plan (TOP) and anticipated development patterns, population at citywide buildout in 2040 is estimated at 368,239 persons as shown in **Table 2-1**, which is an increase of more than 118 percent over 20 years. Most of the anticipated growth will occur through infill, densification in the Old Model Colony and development in Ontario Ranch. (UWMP, p. 3-8)

Table 2-1 OMUC Service Area Population Estimates, 2010-2040

	2010	2015	2020	2025	2030	2035	2040[b]
Population Served[a]	163,924	168,777	180,591	202,262	236,647	288,709	368,239

Source: UWMP, p. 3-8.
(a) Does not include the residents located within the City but receive water service from Cucamonga Valley Water District.
(b) The City estimates buildout by 2040.

As of 2015, the number of housing units in the City is estimated at 47,871 units with a 5.3 percent vacancy rate. The population per household was estimated at 3.7 persons. The City aims to have a full range of housing types and community services that meet the special housing needs for all its residents, regardless of income level, age, or other status. (UWMP, p. 3-8)

2.2 City of Ontario's Current and Future Water Demand

OMUC serves at least 33,720 customer connections as part of its potable and non-potable water distribution system (UWMP, p. 2-1). In fiscal year 2019/2020 (FY 19/20), the total potable water demand in the OMUC service area was 31,385 acre-feet (AF) and the recycled water demand was 7,812 AF (OMUC 2021). The recorded water demands by customer type for the OMUC service area are provided in **Table 2-2**.

Table 2-2 Recorded Citywide Water Demand (AFY)

Customer Type	2005[a]		2010[a]		2015[b]		FY19/20
	Volume (AFY)	No. of Accounts	Volume (AFY)	No. of Accounts	Volume (AFY)	No. of Accounts[C]	Volume (AFY)[d]

(b) UWMP 2016, p. 4-3. Includes agricultural demands.
AFY = acre-feet per year

Water use patterns change during dry years. The expected changes to water demand and water supply during dry years are provided in Section 3 – Water Supply Analysis.

The two most common land use types in the OMUC service area are residential (8,762 acres or 28 percent) and industrial (4,671 acres or 15 percent), followed by undeveloped land (3,290 acres or 11 percent) (UWMP, p. 3-3). The ultimate citywide land use plan that was used for the 2015 UWMP plans for an increase of residential uses to 10,915 acres (34 percent of total), and the employment area including business parks and industrial uses is expected to cover about 8,103 acres (25 percent of total) at buildout (UWMP, p. 3-6). A comparison of acreage for existing (2015) and ultimate land uses within the OMUC service area according to the TOP is provided below in **Table 2-4**.

Table 2-4 Existing (2015) and Ultimate Citywide Land Use

Land Use Designation	Existing Land Use (acres)	Ultimate Land Use (acres)	Percent change
Rural residential	566	453	-20%
Single-family residential	7,074	7,466	6%
Multifamily residential	1,122	2,996	167%
Subtotal Residential:	**8,762**	**10,915**	**25%**
Commercial	1,821	3,321	82%
Industrial	4,671	8,103	73%
Open Space	734	2,293	212%
Public	341	99	-71%
Schools	457	627	37%
Airport	1,500	1,422	-5%
Landfill	209	137	-34%
Agriculture	2,939	-	-
Infrastructure	954	-	-
Right-of-ways	4,734	4,794	1%
Undeveloped	3,290	-	-
Unknown	735	-	-
Vacant buildings	198	-	-
Subtotal Non-Residential:	**22,583**	**20,796**	**-8%**
TOTAL	**31,345**	**31,711**	**1%**

Source: UWMP, p. 3-6.
Does not include areas within the City that are not served by OMUC.

The TOP anticipates buildout of the City by approximately 2040. As shown in Table 2-4, the land use types with the greatest increase in acreage from 2015 to buildout is planned to be in Open Space and Multifamily Residential. Conversely, the City is planning for a reduction in the area dedicated to Rural Residential, Public Facilities, Airport, and Landfill. Areas currently used by agriculture, infrastructure, undeveloped, unknown, and vacant buildings are expected to convert to other land use types. Overall, residential land uses may increase 25 percent from current, and non-residential land uses are expected to decrease moderately.

2.3 Project Site Land Use Assumed in the UWMP

The City's 2015 UWMP cites the same "Existing" and "Ultimate" Land Use Maps that were used in the City's 2012 Water Master Plan (AKM 2012), 2010 UWMP (AKM 2011), and 2010 TOP (p. 3-7). The land use designations within the Project site at the time of the 2015 UWMP and buildout assumptions are shown in Table 1-2 and Figure 5. The estimated water demand of the land uses assumed in the UWMP within the boundary of the Rich-Haven Specific Plan are detailed in **Spreadsheet 1**, using the City's current unit water demand factors. As summarized in **Table 2-5,** using the TOP land use types shown in the land use plan that was used in the 2015 UWMP, the UWMP buildout assumptions for the residential land uses including the mid-range (not the maximum) development assumptions for the NMC East Mixed Use District (Table 1-3), the estimated total water demand for the site that was accounted for in the 2015 UWMP is 2,241 acre-feet per year.

Table 2-5 Summary Water Demand of the Land Use Assumed in the UWMP

	Potable Water Demand (AFY)	Recycled Water Demand (AFY)	Total Water Demand (AFY)
Residential District	1,016	225	1,241
NMC East Mixed Use District	700	300	1,000
Total	**1,716**	**525**	**2,241**

Notes: AFY = acre feet per year; NMC = New Model Colony
Refer to Figure 5 and Spreadsheet 1.

All open space non-recreational planning areas were assumed to only have recycled water demand and no potable demand (i.e., Edison easements/parcels).

2.4 Project Water Demand[1]

The proposed Project land use summary is shown in Section 1, Tables 1-1a and 1-1b and Figure 4. The estimated total water demand of the proposed Project using the City's current unit water demand factors for potable and recycled water is detailed in **Spreadsheet 2.** As summarized in **Table 2-6,** the estimated total water demand for the Project is 2,771 AFY.

Table 2-6 Summary Project Water Demand

	Potable Water Demand (AFY)	Recycled Water Demand (AFY)	Total Water Demand (AFY)
Residential District	1,398	259	1,657
NMC East Mixed Use District	862	252	1,114
Total	**2,260**	**511**	**2,771**

Notes: AFY = acre feet per year; NMC = New Model Colony
Refer to Figure 4 and Spreadsheet 2.

All open space non-recreational areas were assumed to only have recycled water demand. Several additional assumptions had to be made that were not provided in the Project materials to estimate water demand for the Mixed Use District, as follows:

- For Mixed Use High Density Residential, the (gpd/du) water demand factors for potable and recycled were used (instead of gpd/acre) to reflect the anticipated vertical nature of the mixed use area;
- The Mixed Use Office water demand factor was used for all Mixed Use Regional Commercial areas to be conservative (instead of Mixed Use Non-Office water demand factor which is lower);
- When acreages were not provided in the Project land use plan for Regional Commercial areas in the Mixed Use District, the acreages were calculated assuming a floor-to-area (FAR) ratio of 0.70 and the given maximum building

[1] Rich-Haven Specific Plan Amendment No. 3.

square footage. FAR of 0.70 is the maximum allowed by the TOP for this Mixed Use District.

- No additional water demand was calculated for the Mixed Use Overlay in Planning Areas 6B and 8A, or the Edison easement in Planning Area 7B that is shown in the SPA3 land use map.

Conclusion

The estimated total water demand for the Project site that was assumed in the 2015 UWMP is approximately 2,241 AFY (Table 2-5). The estimated total water demand for the proposed Project is approximately 2,771 AFY (Table 2-6). This is a total difference of 530 AFY (potable and recycled combined); therefore, although the Project was accounted for in the latest UWMP, the proposed densification of the Residential District is higher than was assumed for the water demand projections of the latest UWMP. Because the water supplier's water demand projections assumed a lower development density than that which is proposed by the Project for the same property in the Residential District, it can be deduced that the water demand for the Project was not accounted for in the most recently adopted 2015 UWMP.

This Page Intentionally Left Blank

SECTION 3 - WATER SUPPLY ANALYSIS

This section identifies the sources of potable water utilized and available to the water supplier of the proposed Project. The purpose of this section is to evaluate the water supplies that could be utilized by the proposed Project during normal, single-dry, and multiple-dry water years during a 20-year projection.

OMUC is the water supplier to the City and the proposed Project. OMUC has five sources of water supply: City wells in the Chino Groundwater Basin; treated groundwater from the Chino Desalter Authority (CDA); recycled water from Inland Empire Utilities Agency (IEUA); purchased water from San Antonio Water Company (SAWCo); and imported wholesale water from the Water Facilities Authority (WFA).

Law

CWC Section 10910(d)(1)*:*

The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:

(A) Written contracts or other proof of entitlement to an identified water supply.

(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system.

(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.

(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.

3.1. Documenting Wholesale Water Supplies

Many retail water suppliers in California, including OMUC, receive supplies from one or more water wholesalers. SB 610 requires the WSA to document wholesale supplies received by: 1) describing the quantities of water received from each wholesaler in prior years; 2) identifying existing entitlements, water rights, and/or water service contracts held by the City for the wholesale supply; 3) provide proof of entitlements, water rights, service contracts, relevant capital outlay programs, and construction permits for necessary infrastructure to deliver wholesale supplies, if any; and 4) regulatory approvals required to convey or deliver the wholesale supply.

Wholesale Supplies Received

OMUC receives wholesale water supplies from the WFA who purchases untreated imported water from IEUA, who in turn obtains it from The Metropolitan Water District of Southern California (MWD). WFA and IEUA are both wholesale water suppliers and IEUA is a member agency of MWD. MWD is a wholesaler and contractor for State Water Project water which MWD imports from northern California. State Water Project water is available as stipulated by DWR in response to the hydrology and environmental regulations that can change available supply.[1] Therefore, imported water supplies to southern California can be highly variable; in January 2014 for example, the allocation of State Water Project water to all contractors was reduced to 0 percent due to persistent drought conditions. Nonetheless, MWD has projected in its

[1] DWR, *State Water Project Delivery Capability Report*, published every 2 years, as well as "Notice to State Water Project Contractors" issued as often as needed.

2015 UWMP 100 percent water supply reliability over the next 20 years (2015-2035) during average, single-dry, and multiple-dry years (MWD, pp. 2-15 to 2-17).

The amount of imported water purchased by IEUA from MWD is limited by a purchase order agreement that allows IEUA to purchase up to 93,283 acre-feet per year (AFY) at its lowest rate (Tier I) through Dec. 31, 2024 (IEUA Resolution no. 2014-12-1 located in Appendix F). Of this amount, IEUA wholesales imported water to the WFA, Cucamonga Valley Water District, and the Fontana Water Company. The purchase order agreement includes an annual minimum purchase commitment of 39,835 AFY, which is consistent with the minimum operational needs of the four water treatment plants that treat the imported water from MWD (IEUA/WFA, p. 3-10).

The WFA was formed in 1980 as a Joint Powers Authority by the cities of Chino, Chino Hills, Ontario, Upland, and Monte Vista Water District in order to construct and operate water treatment facilities for providing supplemental potable water to the member agencies. In 1985, the City established an agreement to purchase capacity in the WFA water treatment plant; a copy of which is located in Appendix G. Then, in 1988 the WFA finished construction of the Agua de Lejos Water Treatment Plant (WTP) in Upland to treat the imported water from IEUA and MWD to meet drinking water standards.

Currently, the Agua de Lejos WTP has the capacity to treat and disinfect 81 million gallons per day (mgd). Recorded flows through the Agua de Lejos WTP have ranged from 40 to 50 mgd during the peak summer months and can be as low as 9-12 mgd during winter months (www.wfajpa.org/facilities). As documented in WFA Ordinance No. 99-07-02 (located in Appendix H), the City owns 31.4 percent of the plant capacity of the Agua de Lejos WTP. As of 2015, that proportion is equivalent to approximately 28,451.6 AFY (UWMP, p. 6-14). As of CY 2020, OMUC can purchase up to 9,915 AF of imported supply through WFA at Tier 1 rates. Beyond that amount, OMUC could continue to purchase at Tier 2 rates. As of FY 19/20, OMUC purchased 6,513 AF of wholesale water from the WFA (OMUC 2021).

The actual and projected wholesale water supplies that are expected to be available to IEUA and WFA through 2040 are shown in **Table 3-1**.

Table 3-1 Wholesale Water Supplies Available to IEUA and WFA (AFY)

Imported Water	2010[a]	2015[b]	2020	2025	2030	2035	2040
	Actual		Projected[b]				
IEUA (raw)	54,934	58,906	69,752	69,752	69,752	69,752	69,752
WFA (potable)[c]	14,864	27,606	32,783	32,783	32,783	32,783	32,783

Note: IEUA = Inland Empire Utilities Agency; WFA = Water Facilities Authority; AFY = acre feet per year.
(a) Data for 2010 Actual from *2010 IEUA UWMP*, Table 3-2; and *2010 WFA UWMP*, Table 3-1.
(b) Data for 2015 Actual through 2040 Projected from *IEUA and WFA 2015 UWMP*, pp. 3-9 – 3-10 (Appendix C).
(c) Assumes 47 percent of IEUA's imported supply is for WFA for all future years beginning in 2020.

IEUA and WFA jointly prepared a 2015 Regional UWMP which states the following in terms of future water supply reliability (IEUA/WFA, p. 1-1):

> *The water resources management strategies detailed in this 2015 UWMP illustrate that despite past periods of extraordinary growth and prolonged drought, the region is well positioned to ensure adequate water supplies, reduce dependence on imported supplies and increase drought resilient water sources, while addressing water quality management challenges. This 2015 Regional UWMP is reflective of IEUA's holistic water resources management strategies to prepare for future uncertainty and to ensure sufficient water resources for the region.*

To reduce dependence on imported water supplies, OMUC joined the "Dry Year Yield Storage Program," which is described below.

Dry Year Yield Storage Program

The Dry Year Yield (DYY) storage program is a cooperative Conjunctive Use Program Agreement between MWD, IEUA, Chino Basin Watermaster, Three Valleys Municipal

Water District, and the Chino Basin groundwater producers (Agreement No. 49960 [DYY 2014]). Under the DYY Program, MWD can store up to 100,000 AFY of water in the Chino Groundwater Basin during wet years when surplus water is available, and to reduce imported water deliveries up to 33,000 AFY in dry, drought, or emergency periods, but not to exceed the amount of water in the MWD storage account.

The City executed an agreement with IEUA to participate in the DYY program in 2003. The DYY Agreement was amended in September 2014 to clarify storage measurement and extraction from the MWD storage account, define baseline conditions in calculations of performance targets, define procedures for variances in performance targets, revise administrative milestones, and make miscellaneous updates (refer herein to Appendix I for original agreement and amendments). The 2014 DYY amendments also provided for a minimum imported water delivery of 40,000 AFY during "call" years, establishing minimum needs for direct deliveries from MWD. As of June 30, 2020, the storage balance in the DYY account is 45,961 AF (OMUC 2021).

Participation in the DYY program obligates OMUC to reduce its use of imported water from WFA by a fixed amount, known as the "shift obligation" when MWD makes a "call" for their water stored in the Chino Basin. OMUC's shift obligation is 8,076 AFY, which is the amount OMUC purchases from WFA during a baseline year. OMUC purchases an additional 2,000 AFY from WFA that is then sold to neighboring water supplier Jurupa Community Services District (JCSD) who does not have an imported water connection. In 2014, JCSD entered into an agreement with the City to participate in the DYY program (a copy of which is located in Appendix J). During years when MWD makes a "call" for the water in their storage account, OMUC will decrease its purchase of WFA imported water by a combined total of 10,076 AF (8,076 AF plus 2,000 AF) compared to the previous year. To meet its obligation in the DYY program during a "call" year, JCSD will deliver 2,000 AF to OMUC from the Chino Basin Desalter Authority (CDA) (assuming JCSD's imported water baseline is 2,000 AFY) (JCSD 2014).

DYY funds from DWR local assistance grants were used for the construction of three OMUC groundwater wells (Wells 45, 46, and 47) and an ion-exchange facility located at John Galvin Park to treat water extracted from Wells 44 and 52. When MWD makes a "call" for its stored water, OMUC can operate these facilities to meet its shift obligation. MWD will then pay for the cost of operations and OMUC would pay MWD (through IEUA) the full-service water rate. OMUC can use the DYY facilities to meet its normal water demands during other periods but OMUC is responsible for the well operation and maintenance costs. (UWMP, p. 6-7)

The additional groundwater capacity provided by this program allows OMUC to increase the percentage supply used to meet peak demands and allow OMUC to be less reliant upon imported water supplies. (UWMP, p. 6-7)

3.2. Documenting Water Supplies

As of the 2015 UWMP, approximately 69 percent of OMUC's water supply came from groundwater, 20 percent from imported water, and 11 percent of supply was recycled water (UWMP, p. 6-16).

The recorded water supplies available to OMUC from 2000 to FY 2018/2019 are provided in **Table 3-2** (next page) and the projected water supplies available to OMUC from 2020-2040 are provided in **Table 3-3.** In addition, each water supply source is identified as a water supply entitlement, water right, or water service contract per SB 610 guidance. Appropriative rights to groundwater are discussed in Chapter 4 – Groundwater Analysis.

Table 3-2 Recorded OMUC Water Supplies (AFY)

Source	2000[a]	2005[b]	2010[c]	2015[d]	FY 19/20[e]	Form of Right	Amount of Right

Total Supply	**39,369**	**43,710**	**50,966**	**61,470**	**73,640**	**--**	**--**

Note: AFY = acre feet per year; FY = fiscal year;
Source: UWMP, Table 6-9, p. 6-16.

OMUC anticipates increasing its total water supply by pursuing: 1) full utilization of OMUC's groundwater rights in the Chino Basin allowed under the Chino Basin Groundwater Adjudication Judgment (including increased groundwater recharge with stormwater and recycled water described in Section 4); 2) expanding use of recycled water; and 3) expanding use of desalter water (UWMP, p. 6-16).

Water Supply Capacities

The capacity of each source of supply available to OMUC is provided in the *2012 Ontario Water Master Plan* (AKM 2012), which is provided in Appendix K. The City is currently preparing an update to its Water Master Plan; because it is not yet finalized and adopted, this Assessment will use the City's 2012 Water Master Plan. The capacity of the supply system refers to the maximum production rate based on the pumps and infrastructure. For example, the capacity of groundwater wells refers to a

pumping rate based on running the pumps at full utilization, 24-hours a day, 7 days a week. Although this maximum rate of pumping is assumed in terms of comparing capacities, pumps are rarely used at more than two-thirds capacity. Knowing the system capacity is important to ensure OMUC can meet all demands imposed upon the system, specifically meeting "average day demand" and "maximum day demand." Demand can be met with multiple supply sources, storage, or a combination of both. OMUC's reservoirs are not discussed in this Assessment, however, they are used to regulate hourly fluctuations in demand, provide fire flow, and supplement supply during an extended outage of a source (AKM 2012, p. 9-1).

OMUC is required to meet the following water supply criterion from the California Code of Regulations: "a source of supply equal to one maximum day demand, with one average day demand from local sources (AKM 2012, p. 9-1)." As the land uses and population changes in OMUC service area, so does the average and maximum day demands. The maximum capacities of existing sources of supply available to OMUC are provided in **Table 3-4**.

Table 3-4 Supply Capacities of Existing Sources

Source	AFY	mgd	gpm
Existing Wells[(a)]	63,936	57	39,638
WFA at Aqua de Lejos WTP[(b)]	28,490	25.4	17,663
CDA from Chino I Desalter	1,500	1.34	930
CDA from Chino II Desalter	7,033	6.3	4,357
Total Existing Capacity	**100,959**	**90**	**62,588**

Note: AFY = acre-feet per year; mgd = million gallons per day; gpm = gallons per minute.

From AKM 2012, Table 9-1 (Appendix K).

(a) OMUC, 2021.

(b) Combination of maximum capacities of WFA Turnouts 1 and 2 (16 mgd and 9 mgd, respectively).

The maximum capacities of the 'ultimate' sources of supply available to OMUC as of projections made in 2012, are provided in **Table 3-5**.

Table 3-5 Ultimate Capacities of Supply Sources

Source	AFY	mgd	gpm
Existing Wells[(a)]	63,936	57	39,638
Future Wells[(b)]	36,288	32.40	22,500
Subtotal	**100,224**	**89.4**	**62,138**
WFA at Aqua de Lejos WTP	28,490	25.4	17,663
CDA from Chino I Desalter	1,500	1.34	930
CDA from Chino II Desalter	7,033	6.28	4,361
Total	**137,247**	**122.42**	**22,954**

Note: AFY = acre-feet per year; mgd = million gallons per day; gpm = gallons per minute.
From Table 9-3 of AKM, 2012 (Appendix K).
(a) OMUC, 2021.
(b) Future well capacities assumed to 2,500 gpm each. 9 wells planned.

As stated in the 2012 Ontario Water Master Plan, the existing supply capacity of the OMUC groundwater wells alone meets the water supply criterion for both average day demand under existing and ultimate conditions, as well as maximum day demand for existing conditions (AKM 2012, p. 9-2). However, under ultimate conditions the supply capacity will require additional future wells, as shown in Table 3-5 to meet the water supply criterion for maximum day demand.

3.3. Descriptions of All Water Supply Projects

City Well Production

OMUC currently owns 17 active groundwater wells in the Chino Basin (OMUC 2021). The Chino Basin is one of the largest groundwater basins in southern California, with an estimated 5 million AF,[2] with another 1 million AF in additional storage capacity. OMUC is planning nine new wells with seven of those wells serving Ontario Ranch with a combined additional supply capacity of 36,288 AFY (AKM 2012, p. 9-2).

[2] The *2020 Safe Yield Recalculation Final Report* (May 15, 2020) indicates the estimated total volume of water in storage was 12.6 million AF in July 2018 (WEI 2020, p. 6-15).

In FY 19/20, OMUC pumped 18,395 AF (Table 3-2). OMUC's existing pumping capacity is approximately 63,936 AFY (Table 3-4). The recorded extractions from OMUC wells between 2011 and 2015 are shown in **Table 3-6.**

Table 3-6 Recorded Groundwater Production, 2011-2015 (AFY)

Supply	2011	2012	2013	2014	2015
City wells in Chino Basin	20,442	20,226	19,967	20,274	19,544

Note: AFY = acre feet per year
From UWMP, p. 6-5 (Appendix A).

As of 2015, approximately 58 percent of OMUC water supply came from groundwater pumped by its own wells in the Chino Basin. OMUC strives to maximize local water supplies and minimize the need for imported water from other regions (UWMP, p. 7-1). A thorough description of the City's groundwater rights pursuant to SB 610 guidance is provided in Section 4 – Groundwater Analysis.

Chino Basin Desalter Authority (CDA) Groundwater Production

OMUC is a member of the CDA, a joint exercise of powers agency created on September 25, 2001, along with JCSD, Santa Ana River Water Company, IEUA and the cities of Chino, Chino Hills, and Norco. Western Municipal Water District joined CDA on April 2, 2009. The goals of the CDA are:

- Achieve hydraulic control of the Chino Basin to prevent contaminated Chino Basin groundwater from entering Santa Ana River;
- Remove contamination (primarily nitrates, as well as TCE, PCE, and TCP) from groundwater in the southern portion of the Chino Basin; and
- Deliver the treated water to member agencies to offset the need for imported water.

CDA provides high-quality drinking water from two desalters (salt removers) that are anticipated to treat approximately 35,200 AFY of Chino Basin groundwater in 2020 and thereafter. This water is then sold to CDA members through "take or pay" contracts. The Chino I Desalter, located at 6905 Kimball Avenue in Chino, was completed in 2000 and expanded in August 2005 to its current rated capacity of 15,906 AFY (14.2 mgd). However, the Chino I Desalter cannot provide this rated capacity due to the high total dissolved solids (TDS) in the raw groundwater supply. The Chino II Desalter was completed in 2006 and is located at 11202 Harrel Street in the City of Jurupa Valley. The current rated capacity of Chino II Desalter is 11,201 AFY (10 mgd) and permitted capacity is 16,802 AFY (15 mgd), including 5,600 AFY (5 mgd) raw water bypass. However, the Chino II Desalter has not achieved the permitted capacity as a result of insufficient raw water supply. CDA is currently expanding the Chino II Desalter to a rated capacity of 25,427 AFY (22.7 mgd). (UWMP, p. 6-15)

Although Chino Desalter I capacity will not be increased, additional raw water capacity will be provided by five new CDA wells in the Chino Creek Well Field. All five wells have been drilled and equipped.

In FY 19/20, OMUC purchased approximately 6,636 AF from CDA (Table 3-2). As shown in Table 3-3, the water supply from CDA to OMUC is projected to stabilize at 8,533 AFY by 2020, which would be roughly 12 percent of the total 2040 water supply portfolio for OMUC. The City's capacity rights to CDA are described in Section 4 – Groundwater Analysis.

Inland Empire Utilities Agency (IEUA) Recycled Water Supply:

Recycled water is provided to OMUC from IEUA, which treats the City's wastewater at its four regional wastewater reclamation plants. OMUC has been using recycled water produced by IEUA since 1972. Currently, recycled water is used in the City for agricultural irrigation, landscape irrigation, golf course irrigation and industrial purposes.

OMUC is entitled to the recycled water generated from the City's share of sewer flows. In FY 19/20, this amount was 12,715 AF (OMUC 2021). In FY 19/20, 7,812 AF of recycled water was purchased by OMUC for direct use (Table 3-2). This represents roughly 60 percent utilization of recycled water supply available to OMUC in FY 19/20. Recorded and projected supplies of recycled water available to OMUC are listed in **Table 3-7**.

Table 3-7 Recorded and Future Recycled Water Supply (AFY)

Beneficial Use Type	2015	2020	2025	2030	2035	2040
Agricultural irrigation	3,349	2,177	1,372	1,118	529	295
Landscape irrigation	2,330	4,195	6,174	8,297	11,491	14,575
Golf course irrigation	540	600	615	570	700	720
Industrial use	989	957	957	957	957	957
Total	**7,208[a]**	**7,929**	**9,118**	**10,942**	**13,677**	**16,547**

Note: AFY = acre feet per year
From UWMP, p. 6-10 (Appendix A).
(a) Supply available for use in 2015 was 12,131 AF.

Over the next 20 years, landscape irrigation is projected to have the greatest increase in demand for recycled water within the OMUC service area. Agricultural properties are expected to convert to more urban land uses, while supplies to golf courses and industrial uses are expected to remain relatively stable. (UWMP, p. 6-12)

IEUA has prepared several recycled water studies, plans, and strategy documents to bring a regional recycled water delivery system to fruition. OMUC updated their Recycled Water Master Plan in 2012 (located in Appendix L) to fully coordinate with IEUA's recycled water planning efforts. OMUC is currently updating their 2012 Recycled Water Master Plan.

San Antonio Water Company (SAWCo) Potable Water Supply

SAWCo is a mutual water company and corporation located in Upland. SAWCo has provided water service to its active shareholders for over 130 years. Although SAWCo does not technically meet the threshold as a retailer or wholesale water agency that needs to prepare an UWMP, they have done so nonetheless in 2015; albeit modified from the State's format (SAWCo 2016).

SAWCo supplies water based on entitlement only, which is based on the number of shares held. The number of shares is finite and considered a commodity that can be divided or sold. The "entire water of the company" and the current entitlement for 2015 is equivalent to 11,552 AFY, which distributed among the 6,389 shares. The volume per share is variable. SAWCo has therefore determined, "…water use projections related to population growth and density, land use, zoning, development, and other typical indicators have no bearing on supply" (SAWCo 2016, p. 11). Notably, SAWCo expects to reduce entitlement in the future to 9,819 AFY based on supply trends and uses this amount for their water supply projections (SAWCo 2016, p. 36).

The City owns 295 shares of SAWCo, which equates to a current entitlement of 765 AFY of potable water to OMUC (UWMP, p. 6-8). In FY 19/20, OMUC received an actual volume of 565 AF (Table 3-2). OMUC has forecasted that future available supplies will be 765 AFY from 2020 to 2040 (Table 3-3). The City receives water from SAWCo indirectly through a connection made in 2015 from SAWCo to the WFA.

SAWCo water supplies are a mixture of surface water from San Antonio Creek, groundwater from the San Antonio Tunnel and three groundwater basins: Chino Basin, Cucamonga Basin and Six Basins (SAWCo 2016, p. 22). No new sources of supply are anticipated to be developed by SAWCo over the planning horizon. Actual and projected water productions (assuming water produced equals water demand) estimated by SAWCo are shown in **Table 3-8.**

Table 3-8 Recorded and Future SAWCo Water Supply (AFY)

Source	2015	2020	2025	2030	2035
Chino Basin	1,143.84	1,232.00	1,232.00	1,232.00	1,232.00
Cucamonga Basin	4,427.94	4,500.00	4,500.00	4,500.00	4,500.00
Six Basin	738.02	945.62	945.62	945.62	945.62
San Antonio Tunnel	696.80	949.52	949.52	949.52	949.52
Groundwater Sub-total	**7,006.60**	**7,627.14**	**7,627.14**	**7,627.14**	**7,627.14**
Surface Water (San Antonio Creek)	2,024.01	1,962.88	1,962.88	1,962.88	1,962.88
Total	**9,030.61**	**9,590.02**	**9,590.02**	**9,590.02**	**9,590.02**

Note: AFY = acre feet per year
From SAWCo 2016, Table 9, p. 22.

In terms of future reliability, SAWCo has stated the following in its 2015 UWMP (p. 32): "SAWCo has sufficient supplies to meet all obligations to its shareholders through the planning horizon." In addition, SAWCo has future transfer and exchange projects planned to mutually benefit certain shareholders during an emergency, including OMUC. The exact location, capacity and implementation schedule of these interconnections are under review (SAWCo 2016, p. 35).

3.4 Documenting Normal Year Water Supply and Demand

OMUC has assumed in its UWMP that customer water demand and available water supply are equal during "normal" precipitation years. However, OMUC has documented more than 100 percent of supply available during normal years, a single-dry year, and multiple-dry years according to Table 7-1 in the 2015 UWMP (Appendix A).

The normal year water supplies available to OMUC, as well as the normal year water demand projections are compared in **Table 3-9**. OMUC has estimated that sufficient supply will be available during any normal year occurring between 2020 and 2040.

Table 3-9 OMUC Projected Normal Year Supply and Demand (AFY)

	2020	2025	2030	2035	2040
Supply	39,369	43,710	50,966	61,470	73,640
Demand	39,369	43,710	50,966	61,470	73,640
Difference	0	0	0	0	0

Note: AFY = acre feet per year
From UWMP, Table 7-2 (Appendix A).

3.5 Documenting Dry Year Water Supply and Demand

The following assumptions are made in OMUC's 2015 UWMP to estimate future water supplies and demands during a single dry year (p. 7-5):

- *The provisions of a Stage 1 water shortage will be implemented, and customers will be subjected to a 10 percent consumption reduction.*
- *The supply of recycled water will be the same as in normal years and dry years.*
- *The reduction in WFA imported water supplies (equal to the shift obligation of 8,076 AFY) will be compensated by the extra groundwater production from the designated DYY wells during dry years. The DYY Program will expire in 2028 (unless renewed or replaced).*
- *The groundwater supply will be the same as in a normal year. The City has rights, storage and leases and can also purchase replenishment water.*[3]
- *Water losses have been included in the potable water demands as 7 percent of the annual demand.*

[3] Replenishment water, which is obtained by the Chino Basin Watermaster on behalf of all parties, can consist of reclaimed water, State water, and local supplies.

OMUC has determined that surplus water supplies will be available during a single dry year occurring anytime from 2020 to 2040, as shown in **Table 3-10**.

Table 3-10 OMUC Projected Single Dry Year Supply and Demand (AFY)

	2020	2025	2030	2035	2040
Supply	39,369	43,710	50,966	61,470	73,640
Demand	35,432	39,339	45,869	55,323	66,276
Difference	**+3,937**	**+4,371**	**+5,097**	**+6,147**	**+7,364**

Note: AFY = acre feet per year
From UWMP, Table 7-3 (Appendix A).

3.6 Documenting Multiple Dry Year Supply and Demand

OMUC has made the following assumptions in its UWMP to estimate future water supplies and demands during a three-year drought (UWMP, p. 7-6):

- *The first dry year is like a single dry year, in which customers voluntarily reduce consumption by 10 percent.*
- *The second dry year is considered a Stage 2 water shortage, and a 15 percent reduction in consumption is made mandatory. This will be imposed at the City Council's discretion.*
- *The third dry year is considered a Stage 3 water shortage, and a minimum of 20 percent consumption reduction is required. This will be imposed at the City Council's discretion.*
- *The supply of recycled water will be the same in normal years and dry years.*
- *The reduction in WFA supplies (8,076 AFY) will be compensated by extra groundwater production from the designated DYY wells during dry years. The DYY will expire in 2025 (unless renewed or replaced).*
- *The groundwater supply will be the same as in a normal year. The City has rights, storage and leases. The City can also purchase replenishment water.*

- *Water losses have been included in the potable water demands as 7 percent of the annual demand.*

OMUC has projected that surplus water supplies will be available during each year of a three-year drought that could occur anytime from 2020 to 2040, as shown in **Table 3-11.**

Table 3-11 OMUC Projected Multiple Dry Year Supply and Demand (AFY)

		2020	2025	2030	2035	2040
First Year	Supply	39,369	43,710	50,966	61,470	73,640
	Demand	35,432	39,339	45,869	55,323	66,276
	Difference	**+3,937**	**+4,371**	**+5,097**	**+6,147**	**+7,364**
Second Year	Supply	39,369	43,710	50,966	61,470	73,640
	Demand	33,464	37,154	43,321	52,250	62,594
	Difference	**+5,905**	**+6,557**	**+7,645**	**+9,221**	**+11,046**
Third Year	Supply	39,369	43,710	50,966	61,470	73,640
	Demand	31,495	34,968	40,773	49,176	58,192
	Difference	**+7,874**	**+8,742**	**+10,193**	**+12,294**	**+14,728**

Note: AFY = acre-feet per year
From UWMP, Table 7-4 (Appendix A).

3.7 Comparison of Available Water Supply and Demand

CWC section 10910 (c)(3) states: *If the projected water demand associated with the proposed project was not accounted for in the most recently adopted UWMP…the water assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.*

As described in Section 2, the annual total water demand for the proposed Project is estimated at 2,771 AFY and the total water demand estimated by the previously planned land use of the same area is 2,241 AFY (Tables 2-5 and 2-6). This increase of 530 AFY reflects a decrease as a result of the Project of -14 AFY recycled water demand and an increase of +544 AFY of potable water demand for the Project site that was not accounted for in the 2015 UWMP.

As shown in Table 3-3 and Table 3-9, the future water supplies available to OMUC do not exceed the future ultimate water demand. Further, the future water demands in the 2015 UWMP did not consider the increase in potable water demand from the proposed Project. However, the increased water demand of the Project is just 0.7 percent of the citywide ultimate 2040 water demand/water supply as estimated by the 2015 UWMP (i.e., 73,640 AFY). Notably, OMUC can purchase up to 9,915 AFY of imported supply through WFA at Tier 1 rates. Beyond that amount, OMUC could continue to purchase at Tier 2 rates. In FY 19/20, OMUC purchased about 6,513 AF from the WFA plant (Agua de Lejos WTP), which is well within their capacity rights of 28,451.6 AFY. There is ample availability for OMUC to purchase additional imported water from the WFA that is within their rights to meet the needs of the proposed Project.

With the signing of AB 1668 and SB 606, the state has set an Indoor Residential Standard of 55 gallons per capita per day (GPCD) which will decrease to 50 GPCD by 2030 (CWC section 10609.4(a)). The per person unit water use factors used by the City are based on a minimum of 60 gpd/person; therefore, a per-person savings of at least 5 gallons per day of indoor residential potable water use would be achieved. Assuming an ultimate citywide residential population of 372,392 persons[4] and water conservation efforts of at least 5 GPCD over the entire City, approximately 2,085 AFY of water could be conserved. This savings would more than cover the increased and unplanned potable water demand of the proposed Project.

[4] From *The Ontario Plan Approved Land Use Buildout Estimate (Modified)*, UWMP Appendix B p. 5.

Agricultural properties within OMUC service area are expected to convert to urban land uses, which is consistent with ongoing trends in the City. Most agricultural operations in the City are on private wells and/or use recycled water. As shown in Table 3-7, recycled water deliveries for agricultural irrigation are projected to decrease roughly 91 percent over the next 20 years. Further, industrial land uses (which may include some manufacturing uses) are the second most common type in the City (Table 2-2) and they are planned by the City General Plan to increase (Table 2-3).

Table 3-10 and Table 3-11 show that OMUC projects surplus water supplies available during single-dry and multiple-dry years in volumes sufficient enough to meet the demand of the proposed Project over the next 20 years. Section 4 will describe the supply available to OMUC through rights held to Chino Basin groundwater that are greater than the amount currently extracted. OMUC can also bank water and pump in excess of their rights in the Chino Basin with payment of a replenishment fee.

In conclusion, based on the information provided in the 2015 UWMP and updated information provided by OMUC for this Assessment, the City has sufficient water supplies to meet the demand of the Project by purchasing additional water from WFA, and by using existing groundwater supplies and pumping capacities that are more than adequate to meet the additional water demands of the proposed Project during normal, single-dry, and multiple-dry water years including future agricultural and manufacturing uses. With the implementation of water conservation efforts, OMUC will further ensure its ability to provide sufficient supply for the proposed Project. Section 4 will discuss the City's water rights in light of this water supply and capacity analysis.

SECTION 4 - GROUNDWATER ANALYSIS

SB 610 requires specific groundwater information to be included in the WSA if groundwater will be a source of water for the proposed project. As discussed in Section 3, groundwater is one of the sources of supply for OMUC and therefore part of the water supply for the proposed Project.

Law

CWC Section 10910 (f):

If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as over drafted or has projected that the basin will become over drafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project. A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

4.1 Review of Urban Water Management Plan (CWC Section 10910(f)(1))

The City's 2015 UWMP, prepared by AKM on behalf of the City of Ontario (OMUC) was adopted by City Council Resolution 2016-072 on June 21, 2016 (located in Appendix A). The UWMP includes information relevant to the identified water supply for the proposed Project and is incorporated herein. Relevant information includes: 1) current and projected water demands (*System Water Use*) through year 2040; 2) a description of the Chino Groundwater Basin (*System Supplies*); 3) the reliability of the water supply, projected supply and demand comparisons, and water shortage plans (*Water Supply*

Reliability and *Water Shortage Contingency Planning*); and 4) water demand management efforts (*Demand Management Measures*).[1]

The 2015 UWMP contains a Technical Memorandum that describes how the City's land use designations from the General Plan (TOP) were used to calculate future water demand by buildout in approximately 2040. The methods and calculations of the ultimate citywide water demand estimate are in Appendix B of the 2015 UWMP.

4.2 Groundwater Basin Descriptions (CWC Section 10910(f)(2))

The Chino Groundwater Basin is the direct source of groundwater for OMUC. Although water supplied to OMUC from SAWCo may include a combination of groundwater from other basins (i.e., San Antonio Tunnel, Cucamonga Basin, and Six Basins), the amount is minimal and the basins are described in the 2015 SAWCo UWMP (located in Appendix E).

Chino Groundwater Basin Description

The Chino Basin covers approximately 235 square miles in the upper Santa Ana River Watershed, and underlies parts of Los Angeles, San Bernardino, and Riverside Counties. The state Department of Water Resources (DWR) identifies the Chino Basin as Basin No. 8-002.01, which is a sub-basin of the Upper Santa Ana Valley (Bulletin 118).[2] It is estimated the Chino Basin has approximately 5 million AF of water in storage, and an estimated 1 million AF of additional unused storage capacity (UWMP, p. 6-2).[3] While still considered a single basin for hydrologic purposes, the Chino Basin is divided into five management zones based on similar hydrologic conditions.

[1] Words and phrases italicized parenthetically are in reference to chapters so titled in the 2015 UWMP.
[2] DWR collects, summarizes, and evaluates groundwater data in the "Bulletin 118" series, which present the results of basin evaluations and defines the boundaries of California's 515 alluvial groundwater basins. An update was provided in 2016. In Bulletin 118, DWR identifies each basin and sub-basin with a number code.
[3] The *2020 Safe Yield Recalculation Final Report* (May 15, 2020) indicates the estimated total volume of water in storage was 12.6 million AF in July 2018 (WEI 2020, p. 6-15).

Geographically speaking, the City is located in the approximate center of the Chino Basin. DWR Bulletin 118 (updated 03/05/18) describes the Chino Basin as follows:

> *The Chino Basin is bound on the northwest by the San Jose fault, on the north by the Cucamonga fault and impermeable rocks of the San Gabriel Mountains, and on the east by the Rialto-Colton fault. The basin is bound on the southeast by the Jurupa Mountains, Pedley Hills, La Sierra Hills, and the approximate location of the Santa Ana River. The Chino fault and impermeable rocks of the Chino Hills and Puente Hills bound the southwest side of the basin. In some areas, the basin boundary coincides with the Chino Basin (1978) groundwater adjudication boundary.*

The Chino Basin is an adjudicated basin and has been extensively studied by the court-appointed Chino Basin Watermaster (CBWM), with reports available at www.cbwm.org. The following is an excerpt that describes the Chino Basin geology from the Chino Basin Watermaster's management plan called the "Optimum Basin Management Program" or "OBMP" (1999, p. 2-2):

> *Chino Basin was formed when eroded sediments from the San Gabriel Mountains, the Chino Hills, Puente Hills, and the San Bernardino Mountains filled a structural depression. The bottom of the Basin – the effective base of the freshwater aquifer – consists of impermeable sedimentary and igneous rocks. The base of the aquifer is overlain by older alluvium of the Pleistocene period followed by younger alluvium of the Holocene period. The younger alluvium varies in thickness from over 100 feet near the mountains to a just few feet, south of Interstate 10 and generally covers most of the north half of the Basin in undisturbed areas. The younger alluvium is not saturated and thus does not yield water directly to wells. Water percolates readily in the younger alluvium and most of the large spreading basins are located in the younger alluvium. The older alluvium varies in thickness from about 200 feet thick near the*

southwestern end of the Basin to over 1,100 feet thick southwest of Fontana, and averages about 500 feet throughout the Basin.

Legal Right to Pump from the Chino Basin

Water rights to the Chino Basin were adjudicated by the Superior Court of the State of California for the County of San Bernardino in 1978 (a copy of the Judgment and amendments thereto are provided in Appendix M). The court's Judgment declared the safe yield of the Chino Basin at 140,000 acre-feet per year (AFY).[4] Withdrawal in excess of safe yield is termed overdraft. The Chino Basin Watermaster may determine that the operating safe yield (OSY) can be higher from year-to-year depending on factors including favorable precipitation and management efforts that maximize the beneficial use of the groundwater Basin.[5] The Chino Basin Watermaster has undertaken a safe yield redetermination. In July 2020, the court ordered that the safe yield be reduced by 3% and reset to 131,000 AFY for the period of July 1, 2020 to June 30, 2030. The court previously reset the safe yield from its initial 140,000 AFY to 135,000 AFY in 2017 for the period of 2010 to 2020.

The Chino Basin Watermaster is comprised of three stakeholder groups (or "pools"): Overlying Agricultural Pool Committee (representing dairymen, farmers, and the State of California); the Overlying Non-Agricultural Pool Committee (representing businesses and industries); and the Appropriative Pool Committee (representing local cities, public water districts and private water companies). The Chino Basin Watermaster carries out the provisions of the Judgment including monitoring of the Chino Basin and files an annual report on pumping and replenishment.

[4] Judgment (1978) defines Safe Yield as, "The long-term average annual quantity of groundwater (excluding replenishment or stored water but including return flow to the Basin from use of replenishment or stored water), which can be produced from the basin under cultural conditions of a particular year without causing an undesirable result."
[5] Judgment (1978) defines Operating Safe Yield (OSY) as, "The annual amount of groundwater which Watermaster shall determine, pursuant to criteria specified in Exhibit "I", can be produced from Chino Basin by the Appropriative Pool parties free of replenishment obligation under the physical solution herein."

The City is a member of both the Overlying Non-Agricultural Pool and the Appropriative Pool. The Judgment allocates a portion of the safe yield to the Overlying Non-Agricultural Pool and a portion of the OSY to the Appropriative Pool. Pursuant to the Judgment, the City has appropriative rights to 20.742 percent of the OSY allocated to the Appropriative Pool. The City has gained 53.338 percent of the safe yield assigned to the Overlying Non-Agricultural Pool. The assigned share of the safe yield and OSY change depending on the safe yield set by the court.

The Judgment allocates safe yield of the Chino Basin according to the three pools as described above (Appendix M, Paragraph 13). The members of each pool are then enjoined from producing water from the Chino Basin in excess of such allocated amount "except pursuant to the provisions of the Physical Solution" (Appendix M, Paragraph 13(a)-(c)).

The Physical Solution of the Judgment is described in broad terms by Paragraphs 39 through 57 of the Judgment. Paragraph 45 provides the Chino Basin Watermaster with the authority to levy and collect assessments for the purchase of water necessary to balance the production by any party in excess of that party's allocated share of safe yield of the Chino Basin. Paragraphs 49 and 50 then describe the sources of water which are authorized to function as sources of replenishment water and methods by which water can be replenished to the Chino Basin. Exhibit H, Paragraph 7, of the Judgment describes the way in which costs for replenishment water will spread among the members of the Appropriative Pool.

The afore-cited paragraphs of the Judgment evince a clear expectation that parties, including the City/OMUC, would produce water in excess of their adjudicated production rights. The injunction in Paragraph 13 of the Judgment should thus be interpreted to mean that parties are enjoined from producing water in excess of their adjudicated rights except to the extent that they will pay a replenishment assessment.

The ability to produce water from the Chino Basin is accordingly not a matter of availability, as contemplated and sanctioned by the Judgment for the reasons

discussed above, but rather a matter of cost. Water produced in excess of production rights will cost more than water produced within a party's production rights. Thus, the quantity and reliability of groundwater supplies under the Judgment for purposes of this Assessment is a matter of cost of the water produced from the Chino Basin rather than limitations on production which may otherwise operate to reduce the sufficiency of the groundwater supply.

In addition to the water supplies described in Section 3, OMUC has rights to groundwater held in the Chino Basin as described below (UWMP section 6.1.4) and in **Table 4-1** (next page):

- **Appropriative Right.** The City has appropriative rights to 20.742 percent of the OSY allocated to the Appropriative Pool. As of FY 19/20, the OSY is 44,834 AF; therefore, the City's assigned share is 9,299.5 AF. To supplement the 2017 decrease in safe yield, the City currently receives an additional 1,037 AFY transferred from unproduced Agricultural Pool rights ("Safe Yield Reduction").

- **Overlying Non-Agricultural Right.** The City has purchased and has rights to 53.338 percent of the safe yield assigned to the Overlying Non-Agricultural Pool, which is currently 7,350.3 AFY. As of FY 19/20, the City's assigned share is 3,921 AF.

- **Land Use Conversions.** The City gains rights to additional Chino Basin groundwater as a result of land use conversions from agricultural to non-agricultural uses. This is expected to increase from development of Ontario Ranch; the total of which is adjusted annually by the Watermaster. As of FY 19/20, the City received 4,254 AF from land use conversions.

- **Annual Early Transfers.** The Chino Basin Watermaster can approve an "Early Transfer" of water to the Appropriative Pool equal to the quantity of water not produced by the Overlying Agricultural Pool that is remaining after all land use

conversions are satisfied, pursuant to the Peace Agreement.[6] The Early Transfer Water is annually allocated among the Appropriative Pool members in accordance with their pro-rata share of the initial Safe Yield. For the City, this is 20.74 percent of the "early transfer" water that the Watermaster may transfer from the Overlying Agricultural Pool. The amount available for transfer changes from year to year but is projected to increase. In FY 19/20, the City received 5,178 AFY as its share of Early Transfer (CBWM 2020).

- **Groundwater Recharge Credits.** The City is entitled to water rights due groundwater recharge with stormwater and recycled water in the Chino Basin. The credited amount is based on the volume recharged and therefore varies annually but is projected to increase over time. In FY 2018/2019, 2,544 AF of recycled water was recharged for the City. In FY 19/20, no recharge was credited to the City (OMUC 2021).

- **Fontana Recycled Water Rights.** The City has a long-term contract to purchase up to 3,000 AFY of recharged recycled water rights from the City of Fontana (a copy of which is located in Appendix N). The City of Fontana does not operate a water system. The amount purchased by OMUC each year will vary. In FY 2018/2019, the City purchased 2,157 AF of Fontana's recycled water entitlement. In FY 19/20, no recharged water rights were purchased (OMUC 2021).

- **Groundwater Storage Accounts.** The City has rights to store water in the Chino Basin (Appropriative and Overlying Non-Agricultural) and has been increasing its various storage accounts in recent years. The City holds water in

[6] In 2007, the parties to the Chino Basin Judgement approved the "Peace Agreement" which is a set of measures proposed by Chino Basin Watermaster to supplement the OBMP Implementation Plan. Focus for the measures were placed on achieving hydraulic control (reduction of groundwater discharge from the Chino North Management Zone to the Santa Ana River). To achieve hydraulic control, re-operation (controlled overdraft) of the groundwater basin is proposed. Strategically placed wells would be constructed in the basin and the groundwater would be pumped to the Desalter to improve the long-term reliability of the basin.

both local storage accounts and supplemental accounts. Local storage accounts hold un-pumped OSY groundwater rights and stormwater that has been recharged into the Chino Basin. Supplemental accounts hold both imported water and recycled water that has been recharged into the Chino Basin. As of June 30, 2020, the City has 96,544 AF in storage pursuant to Appropriative rights and 3,461 AF in storage pursuant to Overlying Non-Agricultural rights (CBWM 2020).

Table 4-1 Ontario Groundwater Rights Summary

Right	Current FY 2019-2020	Future	Notes
Appropriative Pool	9,299.5 (20.742% of OSY)	8,470 (20.742% of OSY)	OSY determined by Watermaster.
Overlying Non-Agricultural Pool	3,921 (53.338% of SY)	At least 3,921 (53.338% of SY)	Current annual production right is 7,447.2 AF with carryover. Actual production was 1,552.7 AF.
Safe Yield Reduction	1,037	Varies	
Land Use Conversions	4,254	16,602	Varies annually.
Annual Early Transfer	5,178	20.742% of Early Transfer	Subject to change by Overlying Ag. Pool level of demand.
Groundwater Recharge Credits	0	9,600 (in 2035)	Based on volume of stormwater and/or recycled water recharged.
Fontana Recycled Water Rights	0	At least 3,000	Contract to purchase.
Subtotal (AFY)	23,689.5	±41,593	
SAWCo	600 (295 shares)	At least 765	Entitlement. Volume per share subject to change.
Total (AFY)	24,289.5	±42,358	
Groundwater Storage Accounts	39,261 (Excess Carry Over)	Varies (Excess Carry Over)	Dependent on annual availability of un-pumped OSY water, stormwater, imported water, and recycled water.
	57,283 (Local Supplemental)	Varies (Local Supplemental)	
Total Storage (AF)	96,544	±85,000	

Note: AF = acre-feet; AFY = acre-feet per year; OSY = operating safe yield; SY = safe yield.

4.3. Recorded Use of Groundwater by City of Ontario (CWC Section 10910 (f)(3))

The City's groundwater supply currently comes from 17 active groundwater wells located throughout the OMUC service area within the Chino Basin. As of FY 19/20, OMUC produced 18,395 AF from the basin (CBWM 2020, p. 20.1). The recorded groundwater production has generally decreased from 36,842 AFY in 2000, as shown in **Chart 4-1.**

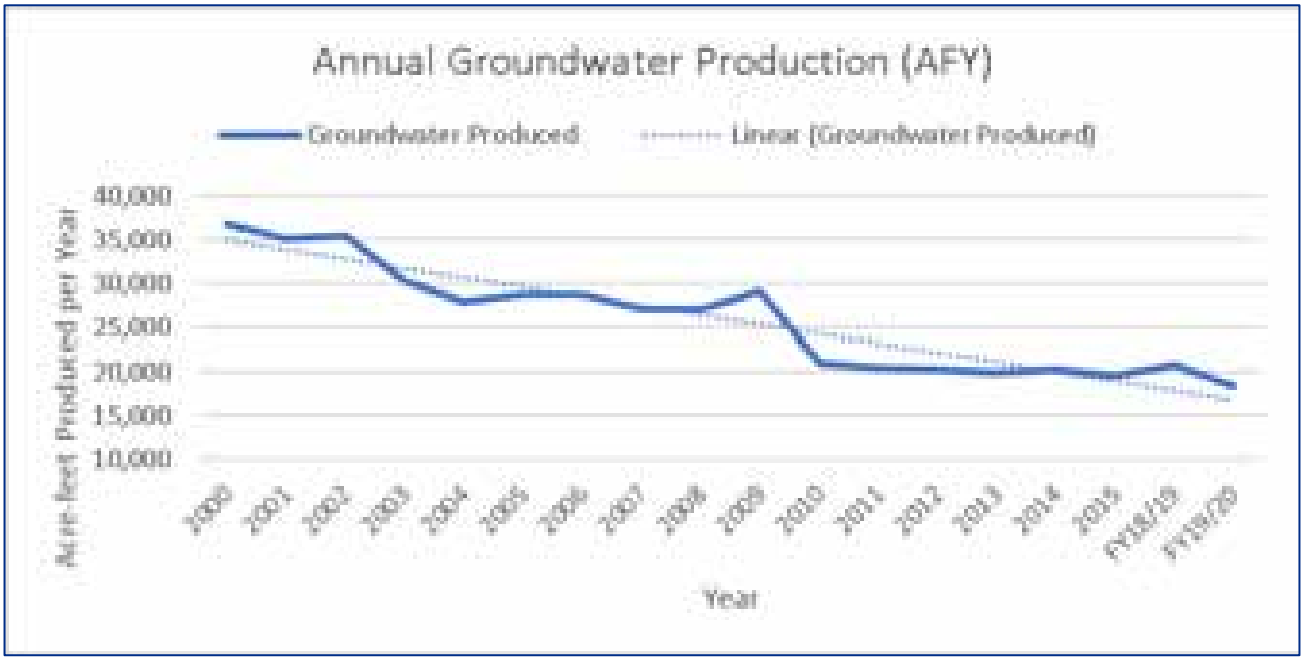

Chart 4-1 - Annual OMUC Groundwater Production, 2000 - FY19/20, (AFY)
(Sources: 2000-2009 from the 2012 Ontario Water Master Plan (Appendix K); 2010-2015 from City of Ontario's annual production reports and 2015 UWMP (Appendix A); FY 18/19 from CBWM, 2019, p. 9.1, FY 19/20 from CBWM, 2020, p. 20.1.

4.4. Projected Use of Groundwater by the City of Ontario (CWC Section 10910(f)(4))

The proposed Project will receive water from a combination of the City's groundwater wells, imported water from WFA, treated groundwater from CDA, and recycled water from IEUA.

Projected groundwater use by OMUC will continue as noted in Table 3-3. The use of groundwater will continue to be dependent upon the cost of extracting, treating, and transporting the water to customers. Groundwater from the Chino Basin will be utilized by OMUC either directly by pumping into its distribution system or by treating the groundwater (Wells 44 and 52) at the John Galvin Ion Exchange Plant and then pumping the treated groundwater into the City distribution system. The current and ultimate production capacity of OMUC wells is sufficient to meet current and ultimate demand (Table 3-4).

As shown in Table 4-1, the amount of water that OMUC expects to withdraw from the Chino Basin is well within appropriate right pursuant to the Chino Basin Adjudication of 1978 (Appendix M). In addition to its well production, OMUC will also purchase treated Chino Basin groundwater from CDA. OMUC has 1,500 AFY capacity rights in the Chino I Desalter and 7,033 AFY capacity rights in the Chino II Desalter. Projected use of groundwater via CDA is projected to remain at no more than 8,533 AFY.

4.5. Sufficiency of Groundwater Basin (CWC Section 10910(f)(5))

The City's legal right to pump water in an amount necessary to meet all demands as sanctioned and protected by the Judgment as discussed above, is buttressed by several programs and projects directed at ensuring the sufficiency of groundwater supplies from the Chino Basin, particularly during dry years. An adjudicated water right has perhaps the most substantial indicia of reliability of any water right that currently exists in California. An adjudicated right is based upon long-term studies whose purpose it is to protect the long-term functionality of the water source. These rights are coordinated in an established and binding manner with all the other users of the Chino Basin and are overseen by Chino Basin Watermaster which has the authority to mandate and proscribe activities whose purpose is to protect the water source and maximize its long-term beneficial use.

All Chino Basin Watermaster processes are governed by Rules and Regulations and receive active oversight from the Court which, as noted above, retains continuing

jurisdiction over the administration of the Judgment. Consequently, the sufficiency of the groundwater is not only directed by rigorous Chino Basin Watermaster management processes but validated and ensured by continuing Court oversight.

The OBMP for the Chino Basin has guided the Chino Basin Watermaster's activities since its adoption in 1998. Chino Basin Watermaster-led basin management activities to ensure the maximization of safe yield and OSY of the Chino Basin include objectives, projects, and programs identified in the Peace Agreement and the OBMP. Progress is reported in annual reports, biennial and triennial reports. The key programs include:

1) a comprehensive monitoring program;
2) a comprehensive recharge program;
3) development and implementation of a water supply plan for impaired areas of the Chino Basin;
4) development and implementation of a comprehensive groundwater management plan for Management Zone 1;
5) development and implementation of a regional supplemental water program;
6) development and implementation of cooperative programs with the California Regional Water Quality Control Board – Santa Ana Region and other agencies to improve Basin management;
7) development and implementation of a salt management program;
8) development and implementation of a groundwater storage program; and
9) development and implementation of storage and recovery programs.

As stated, the referenced elements of the OBMP collectively comprise a comprehensive regimen directed to ensuring and maximizing the long-term beneficial use of water in the Chino Basin. In particular, and specific to the location of current and future groundwater production facilities upon which the City relies or will rely to provide water to meet water demands within its service area, OBMP Program Element No. 3, "Develop and Implement Water Supply Plan for the Impaired Areas of the Chino Basin"

and Program Element No. 5, "Develop and Implement Regional Supplemental Water Program", address the sufficiency of groundwater from the Chino Basin. Fundamentally, the goal of Program Elements 3 and 5 is to develop a regional, long range, cost-effective, equitable, water supply plan for producers in the Chino Basin that incorporates sound basin management (OBMP, p. 4-16).

The "water demand planning assumptions" used to develop and evaluate water supply plans for Program Element Nos. 3 and 5 of the OBMP are reproduced below (OBMP, p. 4-17):

> ***Available Water Supply from the Impaired Area.*** *As urbanization of the agricultural areas of San Bernardino and Riverside counties in the southern half of the Chino Basin occurs, the agricultural water demands will decrease, and urban water demands will increase significantly. Future development in these areas is expected to be a combination of urban uses (residential, commercial, and industrial). The cities of Chino, Chino Hills, and Ontario, and the Jurupa Community Services District (JCSD) are expected to experience significant new demand as these purveyors begin serving urban customers in the former agricultural area. For planning purposes, the agricultural area is assumed to be fully developed by the year 2020. (OBMP, p. 4-17)*
>
> *Based on current [1999] estimates of overlying agricultural pool production, it is expected that at least 40,000 AFY of groundwater will need to [be] produced in the southern part of the Chino Basin to maintain the safe yield. It is anticipated that CDA will meet this requirement in FY 2019/2020.*
>
> ***Water Supply Plans.*** *Based on the data presented in Section 2 [OBMP, 1999], the municipal and industrial demands are projected to increase 30 percent between 2000 and 2020. Several agencies will experience increases in demand exceeding 30 percent over the next 20 years, including the cities of Chino, Chino Hills, Norco, Ontario, Cucamonga*

County Water District [now Cucamonga Valley Water District], Fontana Water Company (FWC), JCSD, and the West San Bernardino County Water District [now West Valley Water District]. Forecasts from municipal and industrial entities indicate that water supply sources for the Chino Basin in 2020 will consist predominantly of Chino Basin wells through direct use or treatment and use, groundwater and treated surface water from other basins, and the Metropolitan Water District of Southern California (MWD) supplies. (OBMP, p. 4-17)

For the purpose of the OBMP, it was assumed that there is approximately 48,000 AFY of agricultural production in the southern part of the Chino Basin in the year 2000, and that this production will reduce to about 8,000 AFY in the year 2020. This decline in agricultural production must be matched by new production in the southern part of the Chino Basin or the safe yield in the Chino Basin will be reduced. (OBMP, p. 4-18)

Recommended Water Supply Plan for the OBMP. *Considerable discussion of the alternative water supply plans occurred at the OBMP workshops in February through May of 1999. The discussions focused, in part, on the assumption and details of each alternative and cost. Based on technical, environmental, and cost considerations, the stakeholders selected Alternative 4A for detailed review and refinement. Alternative 6A was developed based on Alternative 4A and 5C, includes an accelerated desalting schedule and has no future supplemental water deliveries to the southern part of the Chino Basin. The Alternative 6A water supply plan consists of the following key elements. (OBMP, p. 4-19)*

Groundwater Production Pattern. *Groundwater production for municipal use will be increased in the southern part of the Chino Basin to: meet the emerging demand for municipal supplies in the Chino Basin, maintain safe yield, and to protect water quality in the Santa Ana River. All new southern*

Basin production will require desalting prior to use. The cities of Chino, Chino Hills, Ontario and Norco, and the JCSD will maximize their use of groundwater from the southern part of the Chino Basin prior to using other supplies.[7] *(OBMP, pp. 4-19 – 4-20)*

Imported Water. *Imported water use will increase to meet emerging demands for municipal and industrial supplies in the Chino Basin area, Chino Basin Watermaster replenishment, and conjunctive use. Expanded use of imported water in the northern part of the Chino Basin will have a lower priority than maintaining groundwater production in the southern part of the Chino Basin. (OBMP, p. 4-20)*

Recycled Water. *Recycled water use (direct use and recharge) will increase to meet emerging demands for non-potable water and artificial recharge. Under the current Chino Basin Plan, all new recycled water use will require mitigation for TDS and nitrogen impacts. Recycled water use will be expanded as soon as practical. The two new desalters [Chino I and Chino II Desalters] described above and the increase in storm water recharge will provide mitigation for the expanded use of recycled water. (OBMP, p. 4-20)*

As indicated in the foregoing OBMP text, the City overlies groundwater supplies in the southern part of the Chino Basin which must be pumped for purposes of meeting new demands, maintaining safe yield, and to protect water quality in the Santa Ana River. As agricultural production in the southern part of the Chino Basin declines, it will be necessary for these reasons to increase production for municipal uses. This is being achieved through the Chino I and Chino II Desalters, of which the City has a contractual right to purchase 8,533 AFY pursuant to the 2001 "Joint Exercise of Powers Agreement Creating the Chino Basin Desalter Authority" and subsequent

[7] Detailed discussion continues in this paragraph concerning the production capacity of the desalters and construction/expansion projects.

agreements. Thus, not only was increased Chino Basin water production by the City foreseen in the OBMP, but actually sanctioned and encouraged for purposes of achieving OBMP objectives.

The sufficiency of the groundwater supply that is available to OMUC is assured due to the abundance of groundwater in the central and southern portion of the Chino Basin, OBMP objectives that prioritize and assure production from the southern Chino Basin, coupled with desalting and ion-exchange treatment facilities that enable the use of this abundant supply for municipal (potable) purposes. As indicated in the quoted text of the OBMP, southern basin production, where the City is partially located, is the linchpin of several critical OBMP objectives. Thus, the sufficiency of groundwater is heightened and prioritized by the necessity of continued pumping from the southern Chino Basin under the OBMP which is administered by the Chino Basin Watermaster and ultimately enforced by continuing court jurisdiction over the Judgment.

The other referenced OBMP Program Elements are collectively directed to ensuring the sufficiency of Chino Basin groundwater supplies, particularly during dry years, and comprehensively address water quality and quantity, thus maximizing beneficial use over the long-term. Sufficiency of groundwater from the Chino Basin is further assured for the following reasons:

- IEUA is a member agency of MWD, which provides imported water from the State Water Project for direct use by parties to the Judgment in the Chino Basin and for Chino Basin recharge purposes (when supplies are available). IEUA has also reviewed the sufficiency of supplies for its service territory that includes the Chino Basin in connection with its 2015 UWMP.

- IEUA's UWMP is consistent with, and reiterative of, OBMP projects and programs (see Section 7.4 of IEUA/WFA in Appendix C). IEUA anticipates increased limitations for imported water for direct and recharge use while noting reductions during dry years (due to increased reliance on groundwater from the Chino Basin) and in the higher amount otherwise required in the absence of

OBMP projects and programs. The UWMP also analyzes the sufficiency of water supplies for single and multiple year drought scenarios and concludes the region is expected to meet 100 percent of its dry year demand under every scenario. Key assumptions included:

- Reliance on assurances provided by MWD in its 2015 UWMP that it could meet 100 percent of projected supplemental full-service water supply demands through 2040;
- Implementation of MWD's Chino Basin DYY Storage Program consistent with the contractual shift obligations of the participating agencies of up to 33,000 AF in a twelve-month period; and
- Sustain per capita water use reductions of 10 percent by 2015 and 20 percent by 2020.

IEUA concluded in its 2015 UWMP that the projected available water supply will meet projected water demand due to diversified water supply and water conservation measures. Based on IEUA water supply projections, there are sufficient water supplies to meet normal year water demands and single dry year demands. However, in the multiple dry year scenario a local supply gap of 283 AF is projected for 2040. IEUA and retail agencies plan to close the supply gap through utilizing local supplemental water supply opportunities and securing additional imported water as needed to accommodate for the variability in supply from the State Water Project (Appendix C, p. 3-16).

CWC section 10631(j) provides that urban water suppliers, that rely upon a wholesale agency for a source of water, such as IEUA, may rely upon water supply information provided by the wholesale agency in fulfilling UWMP informational requirements.

IEUA's independent analysis of contemporary regional water conditions in conjunction with MWD's most recent report, provide additional and reliable assurances concerning the sufficiency of imported water supplies that comprise a portion of overall Chino Basin supply sufficiency. As stated in the above-quoted OBMP text, however, "expanded use

of imported water in the northern part of the Chino Basin will have a lower priority than maintaining groundwater production in the southern part of the Chino Basin."

The City's participation in the DYY Storage Program described in Section 3, along with future water storage and recovery projects will drought-proof the Chino Basin and all other appropriative pool members from imported water shortages. This program is consistent with OBMP Program Element No. 9, "Develop and Implement Storage and Recovery Program." Benefits to the Chino Basin associated with this program include the construction of facilities to enhance imported water deliveries and the production of water from the Chino Basin. Further demonstrating the sufficiency of Chino Basin groundwater is MWD's DYY program to use the Chino Basin for dry year supply purposes, thus underscoring that sufficient Chino Basin groundwater is available during dry years not only for local use by agencies such as the City but also in connection with MWD's regional reliability programs.

In conclusion, the sufficiency of groundwater supplies available to OMUC is assured because of the OBMP programs overseen by the Chino Basin Watermaster and conducted under the auspices of continuing Court jurisdiction that specifically direct and assure the long-term production of water pursuant to the City's legal rights to produce such water necessary to meet ultimate water demands.

Conclusion

The City's total annual groundwater production has held relatively stable over the past 10 years at roughly 20,000 AFY (Chart 4-1). Production capacity meets current demands and is projected to increase to meet ultimate demand. The current water supply utilized by the City totals approximately 39,921 AFY (FY 19/20, Table 3-2). Currently, the City's water rights in the Chino Basin as recorded by the Chino Basin Watermaster total approximately 23,620 AFY, with an additional 96,544 AF in storage (Table 4-1). Although annual fluctuations will occur, the City's rights are projected to increase over the next 20 years due to more land use conversions and credits from recharge.

In conclusion, the water supplies available to OMUC currently meet and exceed citywide water demands. Groundwater production by OMUC is currently less than their existing rights and within their production capacity. Regardless, OMUC has the means and right to exceed their groundwater allocation in the Chino Basin when required to meet demand pursuant to the Judgment. Further, OMUC has rights to water held in storage that would supply all City demands for more than two years. In addition to groundwater, OMUC can supply water to the Project purchased from the WFA that is within their existing entitlements and capacities. Therefore, OMUC can meet the additional unplanned water demand of the proposed Project by producing additional groundwater or purchasing imported water supplies to which it has existing rights to and available capacity to use.

SECTION 5 - PRIMARY ISSUE FOR ASSESSMENT

The lead agency for a proposed project *…shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy demands of the project, in addition to existing and planned future uses* (CWC section 10911). The lead agency is expected to approve or disapprove the project based on several factors, including but not limited to the WSA.

Law

> CWC Section 10910(g)(1): *Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.*
>
> CWC Section 10911(b): *The city or county shall include the water assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision 9a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.*
>
> *(c) The city or county may include in any environmental document an evaluation of any information included in that environmental document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.*

The lead agency is expected to review the Assessment and decide whether additional water supply information is needed for its consideration of the proposed Project.

5.1 Findings

Whereas:

1. The City of Ontario Municipal Utilities Company (OMUC) has been identified as the water supplier for the proposed *Rich-Haven Specific Plan Amendment No. 3* project (Project). The Project modifies the previously approved land use plan to transfer 518 dwelling units (DUs) from the NMC East Mixed Use District to the Residential District of the Specific Plan, and replace approximately 50 acres of Commercial with Light Industrial use.
2. A previous WSA/WV was prepared in 2004 for the 8,200-acre New Model Colony that includes the Project site; however, it is no longer valid.
3. The estimated potable water demand for the Project is 2,260 AFY and the recycled water demand is 511 AFY for a total demand of 2,771 AFY.
4. The TOP land use plan and buildout assumptions located in Appendix B to the Ontario 2015 UWMP were used to calculate the Project site as it was described at the time of the 2015 UWMP. This estimated potable water demand is 1,716 AFY and 525 AFY of recycled water for a total demand of 2,241 AFY.
5. The 530 AFY increase in total water demand between what was assumed in the 2015 UWMP and the proposed Project is primarily the increase in potable water demand in the Project's Residential District as a result of transferring 518 units from the Mixed Use District.
6. The increased water demand for the Project was not included in the 2015 UWMP dated July 2016, which was adopted by the City of Ontario City Council by Resolution 2016-072 on July 21, 2016 (Appendix A).
7. OMUC produced 18,395 AF of groundwater in FY 19/20. OMUC has water rights in the Chino Groundwater Basin that currently total 23,620 AFY, as well as groundwater storage accounts that total 96,544 AF (Table 4-1). The water supply production capacity from City wells is currently 63,936 AFY, which is projected to increase to 100,224 AFY to meet demand (Table 3-5).

8. OMUC holds shareholder entitlements to potable water from SAWCo in the amount of 600 AFY, and capacity rights to imported water from the WFA in the amount of 28,452 AFY. OMUC also has capacity rights to potable water from the CDA in the amount of 8,533 AFY. In FY 19/20, OMUC purchased 565 AF from SAWCo, 6,513 AF from WFA, and 6,636 AF from CDA (Table 3-2).
9. OMUC is entitled to the recycled water generated by IEUA from the City's annual share of sewer flows. In FY 19/20, OMUC was entitled to 12,715 AF, of which 7,812 AF was put to non-potable direct use (Table 3-2).
10. As of FY 19/20, citywide potable and recycled water demand were 31,385 AF and 7,812 AF, respectively (Table 2-2); ultimate combined potable and recycled water demand is estimated at 73,640 AFY (Table 2-3). The current production capacities are greater than needed to meet the average day demands under citywide buildout conditions. Additional wells are planned to supply the anticipated ultimate maximum day demand.
11. OMUC has forecasted excess water supplies will be available to meet citywide demand during single-dry and multiple dry water years over the next 20 years (Table 3-10 and Table 3-11).
12. Based on the evidence provided herein, the total projected potable and recycled water supplies available to the OMUC during normal, single dry, and multiple dry water years over a 20-year projection will be sufficient to meet the projected water demand associated with the proposed Project in addition to the water supplier's existing and planned future uses, including agricultural and manufacturing uses. State mandated conservation efforts will reduce demand in the future.

SB 221 WRITTEN VERIFICATION OF SUFFICIENT WATER SUPPLY

1.1 INTRODUCTION

Senate Bill 221 (SB 221) was enacted in 2001 and became effective as of January 1, 2002. SB 221 establishes the relationship between the Water Supply Assessment (WSA) prepared for a project pursuant to Senate Bill 610 (SB 610), and the project approval under the Subdivision Map Act. SB 221 amends Section 11010 of the Business and Professional Code, and amends Section 65867.5 to add Sections 66455.3 and 66473.7 to the California Government Code. Pursuant to Government Code Section 66473.7, the public water supplier must provide a written verification of sufficient water supply (WV) prior to the approval of a tentative subdivision map, or a parcel map for which a tentative map was not required, or a development agreement for a subdivision of property of more than 500 dwelling units, except as specified, including the design of the subdivision or similar type of improvement.

1.2 Purpose

The purpose of the WV is to provide the legislative body of a city, county or the designated advisory agency with written verification from the applicable public water supplier that a sufficient water supply is available, or, in addition, a specified finding is made by the local agency that sufficient water supplies are, or will be, available prior to completion of the project.

The WV shall be supported by substantial evidence, which may include relevant portions of an applicable Urban Water Management Plan (UWMP) or a WSA prepared per SB 610. Many of the requirements for SB 610 compliance will satisfy the requirements of SB 221. There are four factors to be considered in a WV which are not required in a WSA as specified by Government Code Section 66473.7. Those four factors, which are specifically addressed in this WV are as follows:

1. Historical water supplies for at least 20 years;

2. Urban Water Shortage Contingency Analysis prepared for the water supplier's UWMP;

3. Supply reduction for "specific water use sector" per water supplier's resolution, ordinance, or contract; and

4. Amount of water that can be reasonably relied upon from specific supply projects, subject to the determinations outlined in Government Code Section 66473.7.

1.3 Project Description and Water Demand

This WV has been prepared in conjunction with a WSA for *Amendment No. 3* to the *Rich-Haven Specific Plan (PSPA19-006)* (SPA3 or "Project"). The Rich-Haven Specific Plan encompasses 602 acres within the City of Ontario's 8,200-acre Ontario Ranch. This includes Southern California Edison parcels and easements that are within the Project boundary. *Annexed in 1999, the presently agricultural Ontario Ranch is planned to be developed into residential, commercial, industrial, and public uses* (UWMP, p. 3-1). The proposed Project is the third specific plan amendment; the primary changes of which are to move 518 dwelling units (DUs) from the Mixed Use District to the Residential District of the Specific Plan, and replace approximately 50 acres of Commercial with Light Industrial use.

With the land use changes that are proposed by the Project implemented, the Rich-Haven Specific Plan will allow for up to a maximum of 7,194 DUs, a maximum of 990,902 square feet (SF) of commercial/office uses, and a maximum of 1,183,525 SF of light industrial uses. The Mixed Use District allows for combinations of commercial, office, light industrial, and residential development at various densities/intensities. The projected total water demand for ultimate development of the Rich-Haven Specific Plan with SPA3 is 2,771 acre-feet per year (AFY) (Table 2-6, Water Supply Assessment).

The City of Ontario Municipal Utilities Company (OMUC)[1] is the water supplier for the Project and for the City. OMUC commissioned a WSA and WV from Albert A. Webb Associates (WEBB) on January 25, 2021. The purpose of preparing this WV for the entire Project is to preclude the need for individual "Written Verification" letters being prepared for the individual residential development projects that will qualify for a WV within the Rich-Haven Specific Plan area. SB 221 applies to the Project because there will be residential subdivisions that will have more than 500 DUs which exceed the criteria set in 66473.7(a) of 500 DUs.

The key question for this WV to address per SB 221: whether the water supplier is able to provide a sufficient water supply based upon an analysis as to whether water supplies available during normal, single-dry, and multiple-dry years within a 20-year projection will meet the projected demand associated with the proposed subdivision, in addition to existing and planned future uses, including, but not limited to, agriculture and industrial uses (DWR 2003).

1.4 Verification of Sufficient Water Supply

A detailed evaluation of OMUC's water supply was performed under the attached WSA for the Project. Attached to the WSA is the adopted City of Ontario 2015 UWMP which addresses normal, single dry, and multiple dry year conditions (Appendix A). The 2015 UWMP determined that sufficient water supply exists to support the demands of the OMUC service area. The WSA determined that the water demand of the Project is greater than the water demand for the same site that was assumed in the 2015 UWMP; therefore, the increased demand was not accounted for in the 2015 UWMP. However, the WSA concludes that sufficient water supply exists to support the Project.

20-Year Water Supply Availability

OMUC has been able to meet all water demands with its available water supplies for the past 20 years. Table 3-2 of the attached WSA shows the recorded water supplies

[1] OMUC is a department of the City of Ontario and the terms may be used interchangeably herein.

from 2000-2020 that were utilized to meet the demand within OMUC's service area. A supply source that is available to OMUC that is not included in Table 3-2 are the groundwater storage accounts to which OMUC has rights to store water in the Chino Basin. As of FY 19/20, the City has approximately 96,544 AF held in storage (Table 4-1).

Urban Water Shortage Contingency Analysis

The urban water shortage contingency analysis prepared for the most recent UWMP is contained within Chapter 8 of Ontario's 2015 UWMP (Appendix A). The UWMP water shortage contingency analysis is based on the provisions adopted in City of Ontario Ordinance No. 3027 (effective Oct. 1, 2015), which updated the City's Water Conservation Plan that is codified in Chapter 8A of the City municipal code. The analysis includes stages of action, prohibitions on end uses, penalties and enforcement measures, determination of water shortage reductions, revenue and expenditure impacts, catastrophic supply interruption, and minimum supply for the next three years.

Ordinance No. 3027 made the City's Water Conservation Plan consistent with the more stringent emergency conservation regulations mandated by the State Water Resources Control Board in response to statewide drought conditions. The purpose of the ordinance and the Water Conservation Plan are to minimize the potential for a water shortage through the practice of water conservation, and to minimize the effect of a shortage of water supplies on the water customers of the City. In addition, it is the intent of the ordinance and the Water Conservation Plan to adopt provisions that will significantly reduce the inefficient consumption of water, thereby extending the available water resources necessary for domestic, sanitation, and fire protection of the community to the greatest extent possible (Municipal Code Sec. 6-8.21).

The City's Water Conservation Plan describes the methods to respond to a water supply shortage of up to 50 percent. Fives stages of conservation are described

(Stages 0-4) with Stages 1-4 being mandatory with increasing conservation requirements and penalties depending on the severity of the shortage (UWMP, p. 8-1).

The water supply and water demand comparisons incorporated herein from the 2015 UWMP do reflect the implementation of water shortage contingency measures corresponding to Stages 0-4. Specifically, during normal years and the first single dry year, voluntary Stage 0 reductions in water consumption of up to 10 percent are assumed. During the second dry year, a Stage 2 mandatory reduction in water demand of 15 percent is assumed in demand projections. Further, the third dry year is assumed to be in a Stage 3 with mandatory minimum reductions in water demands of 20 percent. (UWMP, p. 7-6)

Supply Reduction for Specific Water Use Sector

OMUC's current Water Conservation Plan establishes voluntary and mandatory water conservation requirements which shall take effect upon implementation. During a water shortage crisis, certain mandatory restrictions on water use will be imposed on the public. Stage 0 prohibitions are entirely voluntary. Stages 1 to 4 prohibitions will be progressively implemented according to the severity of the water crisis (UWMP, p. 8-2). The restrictions and prohibitions on end users that correspond to Stages 0 to 4 are outlined in Table 8-2 of the City's 2015 UWMP (p. 8-3). OMUC does not have a water supply allocation plan. No single water use sector is identified in the Water Conservation Plan for supply reductions in the event of a water shortage crisis.

Amount of Water That Can Be Reasonably Relied Upon from Specific Supply Project(s)

This requirement of the WV pertains to projected water supplies that the water supplier can reasonably rely on that are not currently available to the public water system. All projected water supplies are currently available to OMUC but may not be fully utilized to date. Descriptions of the supplies available to OMUC are in Section 3 of the attached WSA.

1.5 Substantial Evidence of Verification of Sufficient Water Supply

This WV does not rely on projected water supplies that are not currently available to OMUC. The water supplies that OMUC will continue to rely on that are projected to be sufficient to meet current and future needs are described in Section 3 of the attached WSA. Because projected supply sources are currently available to OMUC, supporting information pursuant to Gov. Code section 66473.7 is not provided herein. This would include This would include written contracts or other proof of valid rights to supplies under development, an adopted capital outlay program to finance delivery of supplies under development, permits to construct supply infrastructure for supplies under development, and regulatory approvals for conveyance or delivery of supplies under development. Copies of the rights, contracts, and other entitlements to water supplies available to OMUC are provided in the appendices to the attached WSA.

1.6 Impacts to Agricultural and Industrial Users

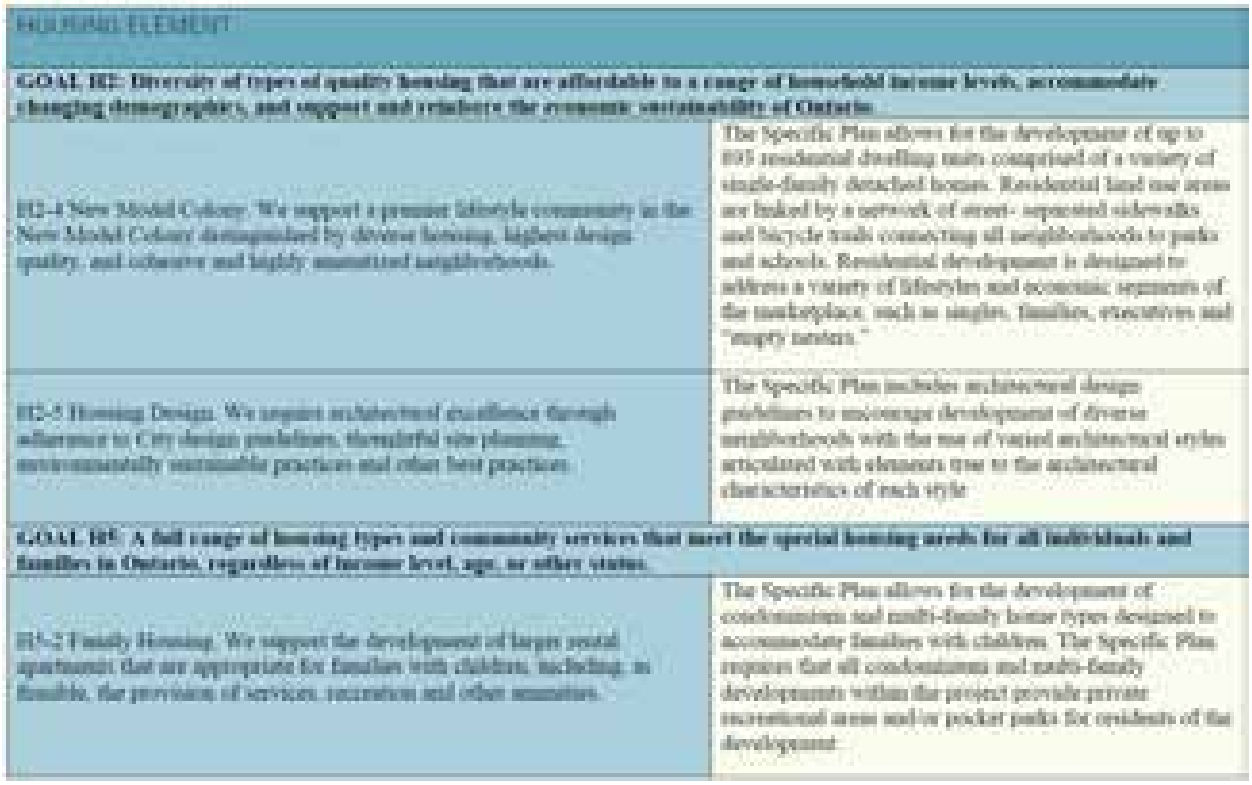
Gov. Code section 66473.7 requires this WV to contain a description of reasonably foreseeable impacts of the proposed subdivision on the availability of water resources for agricultural and industrial uses within the water supplier's service area that are not currently receiving water from the water supplier but are utilizing the same sources of water. Water supplies that industrial and agricultural users may be using that are not provided to them by OMUC would be their private wells to access the Chino Groundwater Basin, which OMUC also utilizes. Adverse impacts to such entities as a result of the Project is not anticipated because the Chino Basin is an adjudicated basin with a court appointed Watermaster who monitors and enforces the provisions of the 1978 Judgment and subsequent orders of the court. As discussed in Section 4 of the attached WSA, the Watermaster develops and implements an Optimum Basin Management Program to sustainably manage the basin for all users.

The *Rich-Haven Specific Plan Draft Environmental Impact Report* (EIR) prepared by MBA and dated July 3, 2007, addressed the conversion of the existing agricultural land use to a mixed urban use development. As stated in the Draft EIR section on

Significant and Unavoidable Impacts: *Implementation of this project would permanently convert agricultural operations and agricultural production on the project site to urban uses. Specifically, the Prime Farmland would be permanently converted and no longer available for agricultural uses or agricultural production* (p. 6-1). The document further states, *The project is being proposed despite significant and unavoidable impacts because it represents one of thirty planning subareas within the NMC [Ontario Ranch] planned for cohesive, identifiable neighborhoods within the NMC [Ontario Ranch] for the purpose of implementing the vision of the NMC [Ontario Ranch]* (p. 6-2).

As discussed in the attached WSA, agricultural properties are projected to decrease with the conversion of Ontario Ranch to non-agricultural activities (Table 2-4). Table 3-7 of the attached WSA forecasts declines in recycled water use by agriculture. Further, industrial is currently (2015) one of the two most common land use types in the City, making up approximately 4,671 acres or 15 percent (UWMP, p. 3-3). The ultimate citywide land use plan plans for an increase of business parks and industrial uses to cover about 8,103 acres or 25 percent at buildout (UWMP*, p. 3-6*). Table 2-3 in the attached WSA shows an increasing citywide projection of water use by industrial uses from 1,839 AFY in 2020 to 5,138 AFY in 2040.

For each acre of agricultural land that converts to urban use, the initial Safe Yield of the appropriative pool member serving the converted land is increased by 2 acre-feet. In addition, properties that were on private wells are expected to connect to OMUC infrastructure. Therefore, OMUC's share of the safe yield will continue to increase as Ontario Ranch develops, and a decline in private wells is expected.



1.7 Priority to Proposed Lower Income Housing Projects

Pursuant to Gov. Code section 65589.7, the determinations made by the WV shall be consistent with the obligation of a public water system to grant a priority for the provision of available and future water resources or services to proposed housing

developments that help meet the City's (or County's) share of the regional housing needs for lower income households.

The 2015 UWMP states that 2,592 very low income units are planned between 2013 and 2021, and half of those units are designated for extremely low income families (p. 3-9). Further, the 2015 UWMP estimates 15,143 AFY of water demand will come from lower income households by buildout in 2040 (p. 4-4).

The following excerpt from the Draft Rich-Haven SPA3 General Plan Consistency Analysis describes the Project's consistency with applicable policies from the TOP Housing Element (p. 9-20):

HOUSING ELEMENT	
GOAL H2: Diversity of types of quality housing that are affordable to a range of household income levels, accommodate changing demographics, and support and reinforce the economic sustainability of Ontario	
H2-4 New Model Colony. We support a premier lifestyle community in the New Model Colony distinguished by diverse housing, highest design quality, and cohesive and highly connected neighborhoods.	The Specific Plan allows for the development of up to 810 residential dwelling units comprised of a variety of single-family detached homes. Residential land use areas are linked by a network of street- separated sidewalks and bicycle trails connecting all neighborhoods to parks and schools. Residential development is designed to address a variety of lifestyles and economic segments of the marketplace, such as singles, families, executives and "empty nesters."
H2-5 Housing Design. We require architectural excellence through adherence to City design guidelines, thoughtful site planning, environmentally sustainable practices and other best practices.	The Specific Plan includes architectural design guidelines to encourage development of diverse neighborhoods with the use of varied architectural styles articulated with elements true to the architectural characteristics of each style.
GOAL H5: A full range of housing types and community services that meet the special housing needs for all individuals and families in Ontario, regardless of income level, age, or other status.	
H5-2 Family Housing. We support the development of larger rental apartments that are appropriate for families with children, including, as feasible, the provision of services, recreation and other amenities.	The Specific Plan allows for the development of condominium and multi-family home types designed to accommodate families with children. The Specific Plan requires that all condominium and multi-family developments within the project provide private recreational areas and/or pocket parks for residents of the development.

1.8 Verification That Relies on Groundwater

Law

> *Gov. Code Sec. 66473.7 (h) Where a water supply for a proposed subdivision includes groundwater, the public water system serving the proposed subdivision shall evaluate, based on substantial evidence, the extent to which it or the landowner has the right to extract the additional groundwater needed to supply the proposed subdivision. Nothing in this subdivision is intended to modify state law with regard to groundwater rights.*

Section 4 of the attached WSA describes OMUC's legal right to extract groundwater from the Chino Basin.

1.9 Finding of Sufficient Water Supply

As depicted in Table 3-2 and Table 3-9 of the attached WSA, the City's existing and future total water supply (39,921 AFY in FY 19/20 and 73,640 AFY in 2040, respectively) are sufficient to meet the existing and anticipated water demands from its service area including the proposed Project's demand of 2,771 AFY (Table 2-6 of attached WSA). Based on the analysis herein and the attached WSA, OMUC finds that "sufficient water supply" is available to support the projected subdivisions within the Rich-Haven Specific Plan as currently described in SPA3.

RE: Phase I Environmental Site Assessment
10601 E. Riverside Drive
Ontario, CA 91761
Hillmann Project Number: C3-6603

Dear Mr. Schafer:

Hillmann Consulting, LLC, is pleased to provide the results of our Phase I Environmental Site Assessment of the above referenced property. This assessment was performed in accordance with the scope and limitations of ASTM Practice E 1527-13, which is the latest version of the E1527 standard published by the ASTM, and All Appropriate Inquiries (AAI) Final Rule 40 CFR Part 312.

This report is for the exclusive use of the entities named on the front cover, and no other party shall have any right to rely on any service provided by Hillmann Consulting, LLC, without prior written consent.

We appreciate the opportunity to provide environmental due diligence services. If you have any questions concerning this report, or if we can assist you in any other matter, please contact the Project Manager at (714) 634-9500.

Very Truly Yours,
Hillmann Consulting, LLC

Scott Alburn
Environmental Technician

List of Abbreviations/Acronyms

Hillmann may use the following abbreviations and acronyms for common terminology described in our report. Not all abbreviations or acronyms may be applicable to this report:

ACM	– Asbestos Containing Material
AST	– Aboveground Storage Tank
ASTM	– American Standard for Testing Materials
CERCLA	– Comprehensive Environmental Response Compensation and Liability Act
CERCLIS	– Comprehensive Environmental Response Compensation and Liability Information System
CESQG	– Conditionally Exempt Small Quantity Generator
CORRACTS	– Corrective Action Sites
CREC	– Controlled Recognized Environmental Condition
DNPL	– Delisted National Priority List
DTSC	– Department of Toxic Substances Control
ENG	– Engineering
ERNS	– Emergency Response Notification System
FOI	– Freedom of Information
FOIA	– Freedom of Information Act
FOIL	– Freedom of Information Letter
HVAC	– Heating Ventilation & Air Conditioning
HREC	– Historic Recognized Environmental Condition
IAQ	– Indoor Air Quality
INST	– Institutional
LBP	– Lead-Based Paint
LQG	– Large Quantity Generator
LUST	– Leaking Underground Storage Tank
MSDS	– Material Safety Data Sheet
NFA	– No Further Action
NFRAP	– No Further Remedial Actions Planned
NPDES	– National Pollutant Discharge Elimination System
NPL	– National Priority List
RCRA	– Resource Conservation and Recovery Act
RCRIS	– Resource Conservation and Recovery Information System
REC	– Recognized Environmental Condition
RWQCB	– Regional Water Quality Control Board
SCAQMD	– South Coast Air Quality Management District
SQG	– Small Quantity Generator
TSDF	– Treatment Storage and/or Disposal Facility
USEPA	– United States Environmental Protection Agency
UST	– Underground Storage Tank

1.0 EXECUTIVE SUMMARY

Hillmann Consulting, LLC (Hillmann), performed a Phase I Environmental Site Assessment (ESA) of 10601 E. Riverside Drive in Ontario, California (the "Property"). This assessment has been conducted in accordance with the ASTM Standard Practice E 1527-13 for Phase I Environmental Site Assessments and All Appropriate Inquiries (AAI) Final Rule 40 CFR Part 312.

1.1 Project Details Summary Table

A summary of the pertinent details of the project is provided below:

PROJECT SUMMARY TABLE					
Name of Client	Richland Ventures, Inc.				
Client Project No.:	N/A				
Client Contact:	Mr. John Schafer				
Description of Project	Phase I Environmental Site Assessment				
Project Name:	N/A				
Street Address:	10601 E. Riverside Drive				
City:	Ontario	**County:**	San Bernardino	**State:**	California
Tax ID/Parcel Number:	0218-161-04-0000, 0218-161-05-0000, 0218-161-10-0000, 0218-161-11-0000				
Zoning Designation:	Field Crops, Dairy				
Approx. Property Area:	104.77 Acres				
Approximate Building Area:	2,500 SF Milk Barn, 3,000 SF Equipment Barn, 1,500 SF Mechanical Shed, one 2,200 SF home, one 1,400 SF home, one 1,300 SF home, 3,300 SF storage building, 1,800 SF dairy processing facility.				
Year Built:	Homes built in 1976, Dairy equipment built in 1982.				
General Type of Usage:	Field & Seed, Dairy Farm				
Property Owner:	L&F Properties				
Occupant(s):	Northview Dairy				
Assessment Personnel:	Mr. Jonathan McConnell				
Property Contact:	Mr. Daryl Koops				
Property Escort(s):	Mr. Daryl Koops				
Inspection Date:	July 12, 2016				
Weather Conditions:	Clear, 77 degrees F				

1.2 Findings Summary Table

The following table summarizes the key findings of this assessment. This table, alone, does not constitute the complete assessment. The report must be reviewed in its entirety.

Assessment Section	No Sig. Concern	Potential Env Concern	REC	Recommended Follow-up	Rep. Ref.
User Provided Info	X				3.0
Data Gaps	X				2.5
Regulatory Review		Property listed on numerous environmental databases for operations including the generating and disposal of wastes produced from Dairy operations.	No	NFA	4.1
Historical Review		Historical usage as agricultural/ orchard land	REC	Perform Phase II Investigation	4.4
Site Use		Use of the Property as a dairy farm.	REC	Perform Phase II Investigation	5.2
Adjoining Properties	X				4.1.2 5.2.8
Hazardous Materials		Usage and storage of various materials, hydraulic fluid, used oil, and lubricants were found in storage areas around the Property. Stained soil observed adjacent compressors.	REC	Perform Phase II Investigation	5.3
Bulk Petroleum Storage	X	Several unregulated underground storage tanks and above ground storage tanks of varying size were identified containing molasses, beer for livestock feed, water, and reclaimed water.		Additional investigation/ remedial actions	5.3
PCBs	X				5.3
Waste / Discharges		Water being discharged into leaching pond towards the southern portion of Northview Dairy. Several areas of landfilling were identified on the area.	REC	Perform Phase II Investigation	5.3
Asbestos Containing Materials (ACM)		Potential for ACM in Property buildings.		Compliance with regulations	7.1
Lead Based Paint (LBP)		Potential for LBP in Property buildings		Compliance with regulations	7.2
Radon	X				7.3
Mold	X				7.4

Assessment Section	No Sig. Concern	Potential Env Concern	REC	Recommended Follow-up	Rep. Ref.
Wetlands	X				7.5

NA = Not Applicable, TBD = To Be Determined, UNK = Unknown

1.3 General Description, Current and Historic Property Use

The Property consists of four rectangular and square shaped parcels on the south side of East Riverside Drive, between South Haven Avenue and Mill Creek Road. The Property is currently occupied by a dairy on the northern portion of the lot and vacant land on the southern portion. The Property is developed with three residential houses, one milk processing facility, and a storage building. The total Property area is approximately 104.77 acres and is located in a suburban developed area characterized by a mix of single and multi-family homes, plant nurseries, dairies, and a high school. The terrain of the Property appeared to be relatively flat. No natural surface bodies of water were observed.

The Property appears to have first been used as agricultural orchards in 1938 until a dairy was constructed on the northern portion of the Property in 1985. The dairy was listed as Northview Dairy and currently remains on the northern portion of the Property. By 2009, the southern portion of the Property changed from crops and orchards to undeveloped land. The Property currently resembles this configuration.

1.4 Findings, Opinions, and Conclusions

1.4.1 Notable Findings

WDS, HAZNET, EMI, ENF, San Bern. Co. Permit – Northview Dairy. The WDS listing indicates that the facility type is "Agricultural" and a facility status of "Active." The primary waste type includes "nonhazardous solid wastes or solid wastes that contain nonhazardous putrescible and non-putrescible solid, semisolid, and liquid wastes. These primary wastes have a moderate threat to water quality if a violation were to occur. The HAZNET listing indicates that in 1996 and 2000, the Property used a transfer station, treatment tank, and a recycler to dispose of aqueous solution with total organic residues less than 10 percent. No violations were noted on the Property. The EMI listing indicates that the site emitted up to six tons of total organic hydrocarbon gases and up to three tons of particulate matter between the years 2006 and 2014. The ENF listing indicates the site as "Agricultural" due to having solid wastes and NEC under stormwater runoff. No violations were noted on the Property. The San Bernardino County Permit listing indicates the site has a permit for a small quantity generator and hazardous materials 1-10 chemicals with San Bernardino County as the permitting agency. The FINDS listing indicates the environmental interest and information system is registered under the air emissions classification. The ECHO listing indicates the Property is listed under the National Pollutant Discharge Elimination System (NPDES) as a NPDES permit and a concentrated animal feeding operation. The site is also listed under the Emission Inventory System (EIS) which indicates the air emissions status as unknown. Considering a lack of reported spills or releases, as well as the relatively small quantity of reported wastes, the above listings are not considered to be RECs in connection with the Property.

A&E Project No. E96004.00, Report of Underground Storage Tank Removal – Northview Dairy, 10601 Riverside Drive, Ontario, California prepared by A&E Inc. and dated March 7, 1996. The Report references that on February 16, 1996, four underground storage tanks (USTs) at the Northview Dairy Farm were removed. Two 4,000-gallon storage tanks containing gasoline and two 6,000-gallon storage tanks containing diesel fuel were removed from the Property.

A&E observed no evidence of contaminated soil surrounding the USTs and a total of ten (10) soil samples were collected surrounding the storage tanks. Laboratory results detected no concentrations of diesel fuel or gasoline in any of the ten soil samples. Results also indicated no concentrations of benzene, toluene, ethylbenzene, xylenes, or methyl tert-butylethene in any of the ten soil samples. It was concluded by A&E Inc. that no significant release of fuels to the subsurface soil was observed at the subject site. A letter from the County of San Bernardino Fire Department, dated June 23, 1999, stated, "…it has been determined that the extent of contamination or lack thereof would indicate that no further investigation is warranted at this time."

File review issued at the Regional Water Quality Control Board (RWQCB) – Santa Ana Region (8) indicated records for the Property were found. Files included animal discharge reports, cleanup and abatement orders, and waste management plans for Northview Dairy. The provided Engineered Waste Management Plans state that in January of 2003, Northview Diary proposed to create measures of reducing potential run-off through construction of berms alongside the western and eastern borders. No violations were observed from Northview Dairy.

The truck trailer mounted above ground storage tank (AST) containing diesel fuel is considered a REC due to staining on the pavement from use of the attached pump station. Hillmann recommends that a sub-surface phase II inspection be conducted to measure the effects of petroleum in the soil. It is recommended that proper removal practices and disposal of diesel tanks prior to redevelopment on the central portion of the Property.

Storage of acid cleaners, zinc sulfate monohydrate powder, hydraulic fluid, used oil, and lubricants were all found within various storage areas around the Property. These materials should be removed and properly disposed prior to redevelopment of the Property.

Significant soil staining was observed in the vicinity of the operational and unused air compressors along the northeastern exterior wall of the garage.

Three locations of solid waste dumping was noted within a City of Ontario Assessor's Map. On the central portion of the Property, three locations of buried tree stumps, concrete rip rap, and buried construction debris are noted.

1.4.2 Non-ASTM Scope Considerations

Hillmann has also performed preliminary evaluations for ASTM "Non-Scope" items, such as asbestos-containing materials (ACM), lead-based paint, radon, mold and wetlands. Our observations and research did not identify any notable concerns, except for the following:

Considering the dates of construction of the existing buildings, asbestos containing materials (ACM) may be present at the Property. Suspected ACM observed during a preliminary visual screening included roofing materials, plaster walls, drywall, ceiling tiles, cove base, adhesive, and stucco. It is possible that additional quantities of suspect ACM may exist in enclosed areas or areas not accessed during the assessment. It is emphasized that this limited screening does not constitute a comprehensive asbestos survey of the premises and is meant only to provide a preliminary evaluation regarding the potential presence of ACM at the Property.

Considering the dates of construction of the existing buildings, lead-based paint may be present at the Property. In general, interior painted surfaces within the space were observed to be in fair condition with the exception of the ceiling within the garage where a majority of the paint was peeling from the roof and roof joists. It is emphasized that this limited screening does not constitute a comprehensive lead-based paint survey of the premises and is meant only to provide a preliminary evaluation regarding the potential presence of LBP at the Property.

1.4.3 Significant Data Gaps

No data gaps that significantly impacted Hillmann's ability to identify RECs in connection with the Property have been identified.

1.4.4 Recognized Environmental Conditions

Hillmann has performed a Phase I Environmental Site Assessment in accordance with the scope and limitations of ASTM Practice E 1527-13 of the Property as described in Section 2 of this report. Any additions to, exceptions to, or deletions from this practice are also described in Section 2 of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the Property, except for the following:

Recognized Environmental Conditions (RECs):

- Based on the historic usage as agricultural land, historical applications of pesticides have likely occurred at the Property. Therefore, there is the potential for residual pesticide levels to exist in shallow soils in the Property, which is considered to be a REC.

- Due to the current Property usage as a dairy farm, there is a potential for vapor intrusion by methane gas, which is considered to be a REC.

- The southern portion of the property was utilized as farmland and orchard from the late 1930's until the mid-2000's. This activity is considered a REC due to the likely usage of pesticides and fertilizers.

- Three areas of unregulated dumping were identified on the Property. This activity is considered a REC due to the unknown nature of the landfilling.

Controlled Recognized Environmental Conditions (CRECs):

- No evidence of any CRECs in connection with the Property was identified.

Historical Recognized Environmental Conditions (HRECs):

- Based on previous reports published by A&E Inc., four underground storage tanks were removed from the Property on February 16, 1996. Two 4,000-gallon storage tanks containing gasoline and two 6,000-gallon storage tanks containing diesel fuel were removed. Ten soil samples were taken from the surrounding area with no visual signs of leaking.

Laboratory results reported detected no concentrations of diesel fuel or gasoline in any of the ten soil samples. The removal of the four underground storage tanks creates a historical recognized environmental condition for the Property.

1.5 Recommendations

1.5.1 Recognized Environmental Conditions

Based on the findings of the Phase I Environmental Site Assessment, a phase two environmental site assessment is recommended in order to address the following items:

- Agricultural/ orchard usage of the southern portion of the Property,
- Methane Gas Testing for the northern portion of the Property,
- Soils in the areas of unregulated dumping, and,
- Soils in the area of the leaking air compressors in the garage.

1.5.2 Non-ASTM Considerations

The following should be considered with regard to further investigation or management of Non-ASTM considerations addressed by this report:

- Compliance with all applicable rules and regulations pertaining to the presence of ACM and lead based paint at the Property.

2.0 INTRODUCTION

2.1 Purpose and Scope

This assessment was conducted utilizing generally accepted Phase I ESA industry standards in accordance with the ASTM Standard Practice E 1527-13. The ASTM describes these methodologies as representing good commercial and customary practice in the United States of America for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and petroleum products. As such, this practice is intended to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner or bona fide prospective purchaser limitations on CERCLA liability (hereinafter, the "landowner liability protections," or "LLPs"): that is, the practice that constitutes all appropriate inquiries into the previous ownership and uses the property consistent with good commercial and customary practice as defined at 42 U.S.C. §9601(35) (B). The primary goal of the processes established by ASTM E1527-13 is to identify *recognized environmental conditions* in connection with the Property.

The term *recognized environmental condition (REC)* is defined by the ASTM as the presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

The ASTM has also defined the terms *historical recognized environmental conditions* and *controlled recognized environmental conditions* as two additional types of RECs. The term *historical recognized environmental condition (HREC)* is defined as a past release of any hazardous substances or petroleum products that has occurred in connection with the Property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the Property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls or engineering controls).

The term *controlled recognized environmental condition (CREC)* is defined as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

Conditions determined to be *"de minimis conditions"* are not considered to be RECs nor CRECs. *De minimis condition* is defined by the ASTM as a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

The chief components of this assessment are described as follows:

- A non-invasive visual reconnaissance of the Property and adjoining properties in accordance with ASTM guidelines for evidence of RECs.

- Interviews of past and present owners and occupants and state and local government officials, seeking information related to the potential presence of RECs at the Property.

- A review of standard physical record sources for available topographic, geologic and groundwater data.

- Review of standard historic record sources, such as fire insurance maps, city directories, aerial photographs, prior reports and interviews, etc., to determine prior uses of the Property from the present, back to the Property's first developed use, or back to 1940, whichever is earlier.

- Review of standard environmental record sources including federal and state environmental databases, and additional environmental record sources, to identify potential regulatory concerns with the Property, adjoining properties and properties located within the surrounding area.

These methodologies are described as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

2.1.1 Non-ASTM Scope Considerations

In accordance with our contract agreement, Hillmann may have addressed the following potential environmental concerns that are outside of the requirements of the ASTM E1527-13 standard:

Asbestos-Containing Materials (ACM): A preliminary visual inspection for the presence of suspect ACM within the accessed areas of buildings on the Property.

Lead-Based Paint (LBP): A preliminary visual inspection of the condition of painted surfaces in the accessed areas of buildings on the Property.

USEPA Designated Radon Potential: Review of general non-site specific data published by the USEPA regarding the potential for elevated indoor levels of radon gas to occur in the area of the Property.

Mold: A preliminary visual inspection within the accessed areas of buildings on the Property for evidence of systemic microbial problems, including visible mold growth, water damaged building materials or musty odors.

Wetlands: A preliminary review of data published by the US Fish and Wildlife Service regarding the presence or absence of mapped wetlands on the Property. The US Fish and Wildlife Service wetlands data is typically provided to Hillmann by Environmental Data Resources, Inc. (EDR).

2.2 Property Location/Legal Description

The Property is located at 10601 E. Riverside Drive in Ontario, California. The legal designations of the Property are Assessor's Parcel Numbers (APNs) 0218-161-04-0000, 0218-161-05-0000, 0218-161-10-0000, and 0218-161-11-0000. The Property is located along the south side of East Riverside Drive, between South Haven Avenue and Mill Creek Road. The latitude and longitude of the Property is approximately North 34.0171 degrees, and West 117.5724 degrees.

2.3 Significant Assumptions

The following significant assumptions are made:

- Hillmann can neither warrant nor guarantee the accuracy or completeness of the information obtained from EDR during the course of this assessment.

- Hillmann can neither warrant nor guarantee the accuracy or completeness of information that was obtained from ostensibly knowledgeable individuals, regulatory agency representatives or other secondary sources.

- Hillmann has assumed that the site operations at the time of the site visit reflect typical site conditions relative to potential environmental conditions and that no concealment of environmental conditions or releases by site owners or occupants has occurred. Likewise, Hillmann has also assumed that no areas of the Property with potential environmental concerns or RECs were concealed or otherwise not made known to us, intentionally or unknowingly, by the Property owners/occupants and/or site escort at the time of the site visit.

- For the purpose of estimating the approximate direction of groundwater flow in the absence of site specific groundwater data, unless indicated otherwise, Hillmann has assumed that the gradient of groundwater flow follows the surface topography of the Property and immediate surrounding area.

2.4 Limitations and Exceptions

2.4.1 Limiting Conditions

Hillmann was unaware of any significant limiting conditions at the time of the assessment.

2.4.2 Other Exceptions or Deletions:

No exceptions or deletions from the ASTM Standard E 1527-13 are reported.

2.5 Data Gaps

A *data gap* is defined by the ASTM as a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. A data gap is only significant if other information and/or professional experience raises reasonable concerns involving the data gap and the ability to determine the presence or absence of recognized environmental conditions.

Data Gap:	Significant (Yes/No)?	Discussion
Response to agency records requests not received as of date of report.	No	Any additional information indicative of a REC will be forwarded upon receipt.

2.6 Special Terms and Conditions

Hillmann has prepared this Phase I Environmental Site Assessment using reasonable efforts in each phase of its work to identify recognized environmental conditions associated with hazardous substances, wastes and petroleum products at the Property. The methodology of this Phase I Environmental Site Assessment was consistent with the ASTM Standard Practice for E 1527-13. Findings within this report are based on information collected from observations made on the day of the site visit and from reasonably ascertainable information obtained from governing public agencies and private sources.

This report is not definitive and should not be assumed to be a complete or specific definition of the conditions above or below grade. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation or other construction purposes. Hillmann makes no representation or warranty that the past or current operations at the Property are, or have been, in compliance with all applicable federal, state and local laws, regulations and codes.

Findings, conclusions and recommendations presented in this report are based on our visual observations of the Property, the research findings reasonably obtained, information provided by the Client, and/or a review of readily available and supplied drawings and documents. Hillmann relies completely on the information, whether written, graphic or verbal, provided by the subject Property contact(s) or as shown on any documents reviewed or received from the subject Property contact, owner or agent, or municipal source, and assumes that information to be true and correct. Although there may have been some degree of overlap in the information provided by these various sources, Hillmann did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this assessment.

Regardless of the findings stated in this report, Hillmann is not responsible for consequences or conditions arising from facts that were concealed, withheld or not fully disclosed at the time the assessment was conducted.

This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

The regulatory database report provided is based on an evaluation of the data collected and compiled by a contracted data research company. The report focuses on the Property and neighboring properties that could impact the Property. Neighboring properties listed in governmental environmental records are identified within specific search distances. The search distance varies depending upon the particular government record being checked. The regulatory research is designed to meet the requirements of ASTM Standard E 1527-13. The information provided in the regulatory database report is assumed to be correct and complete.

Subsurface conditions may differ from the conditions implied by the surface observations and can only be reliably evaluated through intrusive techniques.

Reasonable efforts have been made during this assessment to identify aboveground and underground storage tanks and ancillary equipment. "Reasonable efforts" are limited to information gained from visual observation of largely unobstructed areas, recorded database information held in public record and available information gathered from interviews. Such methods may not identify subsurface equipment that may have been hidden from view due to parked automobiles and other vehicles, snow cover, vegetative growth, pavement, construction or debris pile storage or incorrect information from sources.

Unless otherwise specified in Section 2.1 of this report, an ASTM Vapor Encroachment Screening of the Property utilizing the information collected during the course of this assessment is excluded from the scope of service for this assessment.

Hillmann is not a professional title insurance firm and makes no guarantee, explicit or implied, that the records which were reviewed represent a comprehensive or precise delineation of past Property ownership or tenancy for legal purposes.

In the event of any conflict between the terms and conditions of this report and the terms and conditions of the consulting services agreement between Richland Ventures, Inc. and Hillman Consulting, the consulting services agreement shall control.

3.0 USER PROVIDED INFORMATION

3.1 Prior Environmental Reports/Documentation

A&E Project No. E96004.00, Report of Underground Storage Tank Removal – Northview Dairy, 10601 Riverside Drive, Ontario, California prepared by A&E Inc. and dated March 7, 1996. The Report references that on February 16, 1996, four underground storage tanks (USTs) at the Northview Dairy Farm were removed. Below is a summary of the findings of the underground storage tank removal:

- Two 4,000-gallon storage tanks containing gasoline and two 6,000-gallon storage tanks containing diesel fuel were removed from the Property.

- A&E observed no evidence of contaminated soil surrounding the USTs and a total of ten (10) soil samples were collected surrounding the storage tanks.

- Laboratory results detected no concentrations of diesel fuel or gasoline in any of the ten soil samples. Results also indicated no concentrations of benzene, toluene, ethylbenzene, xylenes, or methyl tert-butylethene in any of the ten soil samples.

- It was concluded by A&E Inc. that no significant release of fuels to the subsurface soil was observed at the subject site.

- The report included a letter from the County of San Bernardino Fire Department, dated June 23, 1999, that stated, "…it has been determined that the extent of contamination or lack thereof would indicate that no further investigation is warranted at this time."

3.2 Title Records/Environmental Liens/Activity and Use Limitations

Review of title records is not included in the scope of work for this assessment project. No information regarding environmental liens or activity and use limitations was provided to Hillmann by the Client.

3.3 Specialized Knowledge or Experience

No indication of any specialized knowledge or experience regarding the Property was reported to Hillmann by the Client.

3.4 Commonly Known or Reasonably Ascertainable Information

No commonly known or specialized knowledge of the Property was reported to Hillmann by the Client.

3.5 Property Value Reduction due to Environmental Conditions

No information was provided by the Client to Hillmann regarding a reduction of the Property value due to environmental problems or conditions.

3.6 Reason for Performing Phase I ESA

It is Hillmann's understanding that the Phase I ESA was being performed in consideration of a pending real estate transaction involving the Property.

4.0 RECORDS REVIEW

4.1 Standard Environmental Record Sources

An EDR Radius Map report was obtained from Environmental Data Resources of Shelton, CT. The EDR Radius Map Report provided a search of standard environmental record sources in general accordance with the requirements of the ASTM E1527-13. Hillmann has reviewed the EDR Radius Map report and a summary of findings is presented in the following tables and report sections. Hillmann also reviewed the list of unmapped sites (referred to by EDR as "Orphan List" sites). Unmapped sites identified as falling within an applicable specific search distance or warranting discussion in the report, if any, have been included in the information presented below. Detailed descriptions of the meaning and significance of the regulatory databases can be found in the EDR Radius Map Report in Appendix E.

Regulatory Database	Search Distance	Property Listed?	Adj. Properties Listed?	Total Listings Within Search Distance
Fed. NPL/Proposed NPL	1-mile	No	No	0
Fed. Delisted NPL	½-mile	No	No	0
Fed. CERCLIS	½-mile	No	No	0

4.1.1 Property Listings

The Property was identified on the following databases:

WDS, HAZNET, EMI, ENF, San Bern. Co. Permit – Northview Dairy. The WDS listing indicates that the facility type is "Agricultural" and a facility status of "Active." The primary waste type includes "nonhazardous solid wastes or solid wastes that contain nonhazardous putrescible and non-putrescible solid, semisolid, and liquid wastes. These primary wastes have a moderate threat to water quality if a violation were to occur. The HAZNET listing indicates that in 1996 and 2000, the Property used a transfer station, treatment tank, and a recycler to dispose of aqueous solution with total organic residues less than 10 percent. No violations were noted on

the Property. The EMI listing indicates that the site emitted up to six tons of total organic hydrocarbon gases and up to three tons of particulate matter between the years 2006 and 2014. The ENF listing indicates the site as "Agricultural" due to having solid wastes and NEC under stormwater runoff. No violations were noted on the Property. The San Bernardino County Permit listing indicates the site has a permit for a small quantity generator and hazardous materials 1-10 chemicals with San Bernardino County as the permitting agency. The FINDS listing indicates the environmental interest and information system is registered under the air emissions classification. The ECHO listing indicates the Property is listed under the National Pollutant Discharge Elimination System (NPDES) as a NPDES permit and a concentrated animal feeding operation. The site is also listed under the Emission Inventory System (EIS) which indicates the air emissions status as unknown. Considering a lack of reported spills or releases, as well as the relatively small quantity of reported wastes, the above listings are not considered to be RECs in connection with the Property.

4.1.2 Adjoining Property Listings

San Bern. Co. Permit – TLC Sonlight Dairy #2, located at 13300 Haven, approximately 38 feet south-southwest at a lower elevation relative to the Property: The San Bernardino County Permit listing indicates the site has a permit category as "Hazmat Handler" and a facility status of "Inactive." Considering the status, the above listing is not considered to be a REC in connection with the Property.

San Bern. Co. Permit – OASIS Growers, Inc., located at 13210 Haven Ave, approximately 41 feet southwest at a lower elevation relative to the Property: The San Bernardino County Permit listing indicates the site has a permit category as "conditionally exempt small quantity generator" and a facility status of "Inactive." Considering the status, the above listing is not considered to be a REC in connection with the Property.

HIST UST, HAZNET – Jack Pinherio Dairy, located at 11011 Riverside Drive, approximately 85 feet north-northeast at a high elevation relative to the Property: The HIST UST listing provided a geotracker link that indicates the site had one 1,000-gallon tank containing unleaded fuel in 1978. The HAZNET listing indicates the site generated unspecified oil-containing waste, off-specification, aged or surplus organics, and other organic solids in 2006. Considering the lack of reported spills or releases the above listings are not considered to be RECs in connection with the Property.

San Bern. Co. Permit – Weststar Dairy, located at 10401 E. Riverside Drive, approximately 578 feet west-northwest and at a higher elevation relative to the Property: The San Bernardino County Permit listing indicates the site has a permit category as "Special Generator" and a facility status of "Inactive." Considering the status, the above listing is not considered to be a REC in connection with the Property.

San Bern. Co. Permit – Colony High School, located at 3850 E. Riverside Drive, approximately 1,226 feet northeast and at a higher elevation relative to the Property: The San Bernardino County Permit listing indicates the site has a permit category as "Conditionally Exempt Small Quantity Generator" and "Hazardous Materials 4-10 Chemicals" and a facility status of

"Active." Considering the status and lack of reported spills or releases, the above listing is not considered to be a REC in connection with the Property.

4.1.3 ASTM Search Distance Findings

The following is a summary of the findings of the regulatory database review with regard to sites identified as located within the ASTM specified search distance surrounding the Property. In order to keep this report informative and yet concise, Hillmann has provided a brief discussion of the listed site(s) for each database category that appears most likely to impact the Property based on distance, topography and/or case status. A copy of the full EDR Radius Map Report, including available details of all listed sites, is included in Appendix E.

Note that listings for the following databases, if identified, would be discussed above in Sections 4.1.1 and 4.1.2: Registered Storage Tanks, Federal RCRA Generators, Federal and State INST and ENG Controls, ERNS.

Federal NPL: No NPL listings were identified within a one-mile radius of the Property.

Federal Delisted NPL: No DNPL listings were identified within a ½-mile radius of the Property.

Federal CERCLIS: No CERCLIS listings were identified within a ½-mile radius of the Property.

Federal CERCLIS-NFRAP: No CERC-NFRAP listings were identified within a ½-mile radius of the Property.

Federal RCRA-CORRACTS: No CORRACTS listings were identified within a one-mile radius of the Property.

Federal RCRA-TSD: No TSD listings were identified within a ½-mile radius of the Property.

State/Tribal Hazardous Waste Sites: One (1) SHWS listings were identified within a one-mile radius of the Property on the EnviroStor database. The listing is described as Chaffey High School No. 10. This site is approximately 5,277 feet south and at a lower elevation relative to the Property. The listing indicates a "No Further Action" status as of 07/01/2005. The site type is noted as School Investigation. Soil was potentially affected by Toxaphene, TPH-diesel, Dieldrin, Heptachlor, Chlordane, DDD, DDE, and DDT. A Project Wide Inventory Project Report (INPR) was issues 09/08/2005. Considering distance and topographic relation, this site is not considered to be a REC in connection with the Property.

State/Tribal Landfill/Solid Waste Disposal Sites: No SWF/LF listing was identified within a ½-mile radius of the Property.

State/Tribal leaking Storage Tanks: No LUST listings were identified within a ½-mile radius of the Property.

State/Tribal Voluntary Cleanup Sites: No VCP listing was identified within a ½-mile radius of the Property.

State/Tribal Brownfields: No BROWNFIELDS listings were identified within a ½-mile radius of the Property.
Review of the sites identified within the ASTM search parameters did not identify any nearby or surrounding area sites that are considered to be a REC in connection with the Property, unless as discussed otherwise previously in this section.

4.2 Additional Environmental Record Sources

4.2.1 Supplemental Database Listings

Hillmann reviewed the EDR Radius Map report for listings on supplemental databases that were searched in addition to the Standard Environmental Record Sources. Any property or adjoining property listings on such databases, if identified, would be discussed in Section 4.1.1 and 4.1.2. None of the other supplemental database listings identified by the EDR Radius Map report are considered to be a REC in connection with the Property.

4.2.2 Local Agency & Internet Research

Hillmann performed a search of available local and municipal agencies for pertinent information pertaining to the Property, particularly with regard to potential environmental concerns such as petroleum storage tanks, storage and usage of hazardous substances and petroleum products, and/or known or suspected environmental contamination. Hillmann also conducted a cursory internet search of the Property address for information indicative of a REC. The following table summarizes the findings of the research:

Source:	Inquiry Made?	Type:	Outcome:
Environmental Protection Agency (EPA)	Yes	Online Request	Response not received prior to report issuance.
County of San Bernardino Fire Department Fire Department	No	FOIA Request	It was not reasonably ascertainable at the time of the Phase I ESA to obtain records from the San Bernardino County Fire Department.
Department of Toxic Substances Control (DTSC)	Yes	FOIA Request	Response indicates that no records for the Property address were found.
Regional Water Quality Control Board (RWQCB) – Santa Ana Region (8)	Yes	FOIA Request	Response indicated that records were found. Files indicated Animal Discharge annual reports, Notices to submit Nutrient Management Plans, and implementation of Engineered Waste Water Management Plans for Northview Dairy. These reports did not indicate any environmental concerns in relation to the Property. See below.
South Coast Air Quality Management District (SCAQMD)	Yes	FOIA Request	Response indicated that Northview Dairy obtained permits to operate the facility and engines.

Riverside County Geographical Information System (GIS)	Yes	On-line search	No information indicative of a REC was identified.
CA DTSC EnviroStor database http://www.envirostor.dtsc.ca.gov/public/	Yes	Internet	The Property address was searched. No results for the Property were found.
CA GeoTracker database http://geotracker.waterboards.ca.gov/	Yes	Internet	The Property address was searched. No results for the Property were found.
USEPA Envirofacts search http://www.epa.gov/enviro/index.html	Yes	Internet	The Property address was searched and Northview Dairy is listed as a general permit covered facility.
www.google.com	Yes	On-line search	The Property address search returns results as a dairy by the name of Northview Dairy.
www.realquest.com	Yes	On-line search	Basic Property information such as parcel number, date of construction, and building square footages were collected. Pertinent information, where obtained, is referenced in the appropriate sections of this report.
Other:	NA		

A file review issued at the Regional Water Quality Control Board (RWQCB) – Santa Ana Region (8) indicated records for the Property were found. Files included animal discharge reports, cleanup and abatement orders, and waste management plans for Northview Dairy. The provided Engineered Waste Management Plans state that in January of 2003, Northview Diary proposed to create measures of reducing potential run-off through construction of berms alongside the western and eastern borders. No violations were observed from Northview Dairy.

4.3 Physical Setting Sources

4.3.1 USGS 7.5 Minute Topographic Map

The USGS 7.5 minute series topographic maps covering the Property (Guasti, CA 2012 and Corona North, CA 2012) were reviewed. The maps indicated an approximate elevation at the Property of 789 feet above mean sea level. The topography indicated by the map appeared to be sloping downward to the south. The closest down gradient body of water appeared to be a channeled portion of the Santa Ana River, approximately 4.52 miles south.

4.3.2 Soils

Based on USDA Soil Conservation Service (SCS) data summarized by the EDR Geocheck-Physical Setting Source Addendum, the soil type at the Property is classified as "Delhi." The Delhi designation is described as fine sand, with somewhat excessively drained and high infiltration rates.

4.3.3 Geology

Based on geologic data summarized by the EDR Geocheck - Physical Setting Source Addendum, the geologic formation in the vicinity of the Property is described as a stratified sequence of the Cenozoic Era, Quaternary System, Quaternary Series.

4.3.4 Hydrology

No site specific hydro-geologic data was available for the Property.

4.4 Historical Use – Property and Adjoining Properties

Hillmann has conducted research in order to help identify the likelihood of past uses having led to recognized environmental conditions in connection with the Property. Standard historical sources have been sought in an attempt to document the past uses of the Property as far back as it can be shown that the Property contained structures; or from the time the Property was first used for residential, agricultural, commercial, industrial or governmental purposes.

4.4.1 Fire Insurance Maps

A search of Sanborn Fire Insurance Maps for the Property and surrounding area was conducted by Environmental Data Resources, Inc. (EDR) of Shelton, Connecticut. EDR provided a Sanborn report that stated fire insurance maps covering the target property were not found.

4.4.2 City Directories

Hillman obtained an EDR City Directory Abstract report to obtain data of historic city directory listings for the Property. The following is a generalized summary of the findings of City Directory Research:

YEAR(S)	SUMMARY	
2003 – 2013	**Property:**	The Property is not listed on the City Directory report.
	Adjacent Properties:	The adjoining properties to the north are listed as East Seals and After School Academy. The adjoining property to the northeast is listed as Colony High School and McMurray BE Construction. The adjoining property to the west is listed as Fremontia Horticultural.
1985 – 2002	**Property:**	The Property is not listed on the City Directory report.
	Adjacent Properties:	The adjoining property to the north are listed as La Petite Academy. The adjoining property to the west is listed as West Star Dairy, Wind Frank, and Slegers Milk.
1975 – 1984	**Property:**	The Property is not listed on the City Directory report.
	Adjacent Properties:	The adjoining property to the west is listed as Slegers Hubert Dairy, Wind Frank, and Wind Fred, and Slegers LM.

4.4.3 Historical Topographic Map Review

Hillmann obtained and reviewed an "EDR Historical Topographic Map Report" from EDR containing historic aerial photography of the Property and adjoining properties. The following interpretation of land usage was made by review of the maps:

YEAR(S)	DESCRIPTION	
1897, 1900, 1903	**Property**	The Property is depicted as undeveloped land with a small structure on the northwestern corner of the Property.
	Adjacent Properties	The adjoining properties are depicted as undeveloped land.

1953/1954	**Property**	The Property is depicted as undeveloped land, vineyards, and orchards with a small structure on the northwestern corner of the Property.
	Adjacent Properties	The adjoining property to the north is depicted with a mix of undeveloped land and vineyards and one small structure. The adjoining property to the northeast is depicted as undeveloped land, vineyards, and orchards. The adjoining properties to the east are depicted as undeveloped land. The adjoining properties to the south and west are depicted as vineyards.
1954	**Property**	The Property is depicted as undeveloped land, vineyards, and orchards with a small structure on the northwestern corner of the Property. A well is depicted on the central of the western border.
	Adjacent Properties	The adjoining property to the north is depicted with a mix of undeveloped land and vineyards and one small structure. The adjoining property to the northeast is depicted as undeveloped land, vineyards, and orchards. The adjoining properties to the east are depicted as undeveloped land. The adjoining properties to the south and west are depicted as vineyards.
1966/1967	**Property**	The Property is depicted as undeveloped land, vineyards, and orchards with a small structure on the northwestern corner of the Property. A well is depicted on the central of the western border.
	Adjacent Properties	The adjoining property to the north is depicted as undeveloped. The adjoining property to the northeast is depicted as undeveloped land, vineyards, and orchards. The adjoining properties to the east are depicted as undeveloped land. The adjoining properties to the south and west are depicted as vineyards.
1973	**Property**	The Property is depicted as agricultural land with a well in the center along the western border and a small structure in the northwestern corner.
	Adjacent Properties	The adjoining properties to the north, northeast, and east are depicted as undeveloped land. The adjoining property to the south is depicted as having agricultural land. The adjoining properties to the west are depicted to have agricultural land with various rectangular structures.
1981	**Property**	The Property is depicted as having agricultural land, one well in the center along the western border, and various structures along the northern portion of the Property.
